◆ **Office of Laboratory Animal Welfare** ([http://grants.nih.gov/grants/olaw](http://grants.nih.gov/grants/olaw)). OLAW, part of NIH, is responsible for the implementation of the Public Health Service Policy on Humane Care and Use of Laboratory Animals. The PHS policy implements the Health Research Extension Act of 1985 (and is based on the U.S. Government Principles for the Utilization and Care of Vertebrate Animals Used in Testing, Research, and Training). Standards for institutional programs and facilities are described in the *Guide for the Care and Use of Laboratory Animals* (published by the National Academy of Sciences). OLAW “fosters” compliance through the animal welfare assurance, which must be approved by OLAW and should describe the institution’s program in compliance with the PHS policy. OLAW “monitors compliance by evaluating institutional reports of noncompliance. Institutions are required to correct confirmed noncompliance and institute appropriate measures to prevent repeated noncompliance. Potential sanctions for continued noncompliance appear in the NIH Grants Policy Statement, Part II.”

◆ **Food and Drug Administration** ([www.fda.gov/AnimalVeterinary](http://www.fda.gov/AnimalVeterinary)). FDA has primary responsibility for enforcing the Federal Food, Drug, and Cosmetic Act. The FFDCA’s good laboratory practice regulations (21 CFR Part 58) “establish standards for the proper conduct of nonclinical laboratory studies that include animals. Compliance is assessed through an active program of periodic inspections carried out by trained field inspectors. Serious noncompliance is dealt with by procedures ranging from study rejection to laboratory disqualification.”
Implementing Financial Compliance Requirements by Focusing on the ‘How’

Ann Meehan Saputelli, University of Pennsylvania School of Medicine and Martin Smith, The George Washington University

Introduction

Financial compliance has evolved as the regulatory environment has changed over the years. What started as proactive initiatives with monitoring programs and internal audits has manifested into strict, reactive requirements mandated oftentimes with little time to implement and inconsistent guidance. Anyone who submitted ARRA reports this past quarter can attest to the overly dynamic nature of today’s compliance requirements. We are taking this opportunity to share our experiences that come from auditing sponsored awards and managing post-award transactions. These experiences have led us to general best practices that can be implemented from varying perspectives — a central sponsored programs office down to the department or project level. Our recommendations are not “blue sky” ideas, rather they are practical ways to implement the spirit of financial compliance requirements by focusing on the “how” when conducting the day-to-day business of financial research administration.

Brief Overview of Fundamental Elements of a Compliance Program

The Health and Human Services (HHS), Office of the Inspector General (OIG) published draft guidance in the Federal Register (Vol. 70, No. 227, Nov., 28, 2005) that outlined eight elements considered to be fundamental to an effective compliance program:

1. Implementing written policies and procedures,
2. Designating a compliance officer and compliance committee,
3. Conducting effective training and education,
4. Developing effective lines of communication,
5. Conducting internal monitoring and auditing,
6. Enforcing standards through well publicized disciplinary guidelines,
7. Responding promptly to detected problems and undertaking corrective action, and
8. Defining roles and responsibilities and assigning oversight responsibility.

---

1 This article is reprinted from the NCURA Magazine, Vol. XLII, No. 7, December 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Research institutions have adopted this guidance by writing policies and procedures, hiring compliance officers or staff to work in a compliance capacity, intensified training and education programs geared towards financial compliance, and reinforced roles and responsibilities documented in policies or in a formal responsibility matrix. Many research institutions have compliance hotlines, websites with links to OMB circulars, agency policy statements, etc. All of these efforts are very well intentioned — but research administrators still post questions to listserv groups, still attend conferences, still watch webinars, and still seek out assistance in meeting financial compliance requirements — why? Mostly because the field of research administration is ever changing, but partly because compliance requirements are not accompanied by instructions on how to implement them.

Research institutions have addressed most of the pertinent questions — who is responsible for adhering to compliance requirements, what are the rules we have to follow, when do rules need to be implemented and adhered to, where do we conduct training, look for problems, find information and go for help; and why do we want to be compliant — to avoid fines and penalties and to preserve the reputation of the institution. However, the answer may lay in the “How.”

Identifying your Institution’s Financial Compliance Model

Many people reading this article may be thinking right about now: “we don’t have a formal financial compliance program” — but we ask you to think about it again. When you go to New Hire Orientation and get a pencil with a compliance hotline phone number printed on it, someone in your institution made a decision to make this the “How” to communicate your institution’s approach to the Developing effective lines of communication element of OIG compliance guidance. When internal audit shows up unannounced to audit a list of transactions recently charged to the sponsored program you manage at a department level, this is your institution’s solution to the “How” to achieve the Conducting internal monitoring and auditing element of OIG compliance guidance. When you go through the list you can probably think of a number of initiatives attempted or ongoing at your institution which are intended to meet one or all of the suggested fundamental compliance elements.

The problem may be that your institution may have only incorporated a small number of the recommendations. For example, one institution may have decided to use existing resources in internal audit to focus on auditing financial transactions charged to sponsored awards. This may have resulted in new findings and disallowed expenditures, along with increased tension between the researchers and administration. Maybe even after a few new policies have been written, faculty and staff have been trained on the new policies, and the policies have been posted on a new website, when they were tested through auditing, the non-compliant behavior still exists.
Implementing Compliance Requirements Considering Your Institution’s Existing Structure

You know a well written policy when you see one — it has sections covering who should know the policy, the office responsible for the policy, the date it was implemented, the date it was last reviewed, sections pointing to the applicable regulations, the offices responsible for the policy and so on. Many institutions leave the implementation, and subsequent compliance, to the procedures — which may be documented or word of mouth. This is where the best intentioned policy simply does not translate into compliance best practices. How to write a good policy requires it to be written considering your institution’s existing structure. For example, let’s assume your institution drafts a policy on Allowable Costs and requires all costs to be approved by the PI. If your procurement process does not have a step in the workflow process that requires the PI’s approval, then your institution has hamstrung itself from ever being compliant with this well intentioned policy.

Another example would be an institution that writes a Cost Transfer policy that requires the department administrator to provide sufficient back-up documentation to support why the costs are allowable and necessary for the award being charged — yet if this is an electronic request, does not provide the means for someone to attach this documentation to the request. The list could go on and on as to how well intentioned policies prove difficult to comply with because of system, process or human limitations — a Record Retention policy where there may not be a solution for departments to actually keep documentation (be it online storage or physical storage for paper transactions) an Effort Reporting policy that defines an appropriate certifier as someone with suitable means to ensure the work was performed, yet does not clarify the OMB Circular A-21 guidance of that requirement.

Just because your institution may not have considered the practicality of the policies or procedures does not make you exempt from being compliant with the fundamental requirements of those policies — it can be done. Borrowing a philosophy from the for-profit world, Hewlett-Packard operates under the motto of the HP Way, which is based on the belief that people want to do a good job and will do so if given the right environment and tools. Financial compliance can be achieved with the right tools, including guidance to implement compliance requirements into day-to-day operations. On the left is a chart showing the fundamental elements of a compliance program along with suggestions as to how a central sponsored program office, department administrator, principal investigator and the research staff can comply regardless of any limitations your institution may have.

Conclusion — Be Positive, Take Ownership, and Succeed!
You are reading this article and belong to NCURA because you care about your role in research administration. Your commitment to staying informed is a critical requirement for the compliance success of your institution. No policy is perfect, no

2 Changing by Design, Organizational Innovation at Hewlett-Packard, by Deone Zell, Copyright 1997 Cornell University.
system is absent of flaws, all humans will make mistakes. Keep good intentions, stay positive and continue to take ownership of your role in financial compliance.

<thead>
<tr>
<th>Compliance Elements</th>
<th>Central Sponsored Programs Office Staff</th>
<th>Department Administrator</th>
<th>Principal Investigator (PI)</th>
<th>Research Staff</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Implementing written policies and procedures</td>
<td>Formal policies and procedures should exist for all areas of compliance, dated, assigning roles and responsibilities, referencing applicable sponsored regulations, while accurately representing what the institution is capable of achieving today.</td>
<td>Needs to keep aware of new policies, consider the impact on day-to-day operations, and incorporate the new or revised policies into their desktop procedures to assure compliance—while also communicating to the research staff.</td>
<td>The PI as the technical and financial director of the sponsored award; is the champion of financial compliance at the project / lab level; without their buy-in, the institution will not fare well.</td>
<td>These are the people who initiate transactions and ultimately make the initial decisions about the reasonableness, allocability, allowability, and consistent treatment of costs; therefore need to understand how to incorporate policies into their day-to-day operations.</td>
</tr>
<tr>
<td>2) Designating a compliance officer and compliance committee</td>
<td>Many institutions have assigned compliance staff to central sponsored programs offices, while others have created dedicated groups in internal audit, stand-alone compliance offices, or in the VP for Research areas.</td>
<td>The department administrator is the compliance official for their designated area; as the responsible person closest to the financial transactions.</td>
<td>The PI is the leader who fosters and environment of compliance and tolerates nothing less than complete adherence to policies and procedures.</td>
<td>The responsibility here is to send information back up the chain of command about the efficacy of compliance initiatives and the practicality of their implementation.</td>
</tr>
<tr>
<td>3) Conducting effective training and education</td>
<td>Develop meaningful training programs in a collaborative way to get the best compliance outcomes.</td>
<td>Participate in the development of training programs, attend training, implement to the department procedures, and train end users.</td>
<td>Conform to objectives of training initiatives by supporting institutional training goals.</td>
<td>Implement guidance into day to day operations.</td>
</tr>
<tr>
<td>4) Developing effective lines of communication</td>
<td>Provide websites with good content with easy to navigate layout, publish contact information for the office, and most importantly—answer your phone and emails within a reasonable time frame.</td>
<td>Listen, communicate, and collaborate.</td>
<td>Be engaged, accountable, and interested in resolving potential non-compliance issues.</td>
<td>Speak up when something is wrong or doesn’t feel right.</td>
</tr>
<tr>
<td>5) Conducting internal monitoring and auditing</td>
<td>Frequently monitor award transactions (i.e. not just at close-out); and develop formal monitoring programs using audit techniques.</td>
<td>Review detail expenditure transaction reports on a regular (i.e. monthly) basis</td>
<td>Meet with their department administrator at least on a quarterly basis to monitor award expenditures.</td>
<td>“Do it right the first time” by only engaging in compliant transactions.</td>
</tr>
<tr>
<td>6) Enforcing standards through well publicized disciplinary guidelines</td>
<td>The institution across the board needs to have a commitment to compliance and a code of conduct followed by all of its faculty, staff, and students engaged in research.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
7) Responding promptly to detected problems and undertaking corrective action

Be fair and consistent in identifying and mediating issues—regardless of faculty prestige, dollar value of the award, or history of good or bad interactions with the parties responsible for the potential non-compliance.

Follow-up, follow-up, follow-up … when overwhelmed with numerous responsibilities, the department administrator must be diligent in following up on detected problems and correcting those issues promptly.

Encourage research staff to openly report issues and cooperate with department or central administration when issues are communicated from the top down.

Tell people when something might have been done wrong and see through it to make sure it will be been fixed.

8) Defining roles and responsibilities and assigning oversight responsibility

Everyone involved in the financial administration of sponsored awards needs to be accountable for their role in each process and take personal ownership of their responsibilities.

About the Authors

Ann Meehan Saputelli, CHFP, CPA, Director of Financial Compliance, University of Pennsylvania School of Medicine. Ann has over 20 years of diversified research administration and healthcare financial management experience. Ann currently serves as the Director of Financial Compliance in the Office of Research Compliance and Integrity at the University of Pennsylvania, School of Medicine (SOM). Prior to joining the University in December 2001, Ann worked in the Health Care Consulting Practice of PricewaterhouseCoopers, LLP for over four years. One of Ann’s current responsibilities as Director is providing guidance to the SOM community on the application and interpretation of University Policy. Ann has extensive experience in clinical trials financial operations: budgeting, recording of revenue and expenditures, cash receipts and the development of research patient care rate agreements. Ann obtained her Bachelor’s degree in Accounting from La Salle University and is also a Certified Healthcare Financial Professional (CHFP) and a member of both the American and Pennsylvania Institutes of Certified Public Accountants.

Martin Smith recently joined The George Washington University as the Associate Director for Strategy and Compliance, in the Office of Grant and Contract Accounting Services. Martin earned an M.B.A. in Finance from La Salle University, and a B.B.A. in Accounting from Temple University. Martin has 9 years of research administration experience working directly for higher education institutions in financial compliance, finance, and post-award roles; and as a consultant performing compliance risk assessments and effort reporting system implementations.
Debarment for Lab Sabotage Signals ORI Expansion, May Spur Similar Efforts

AIS editors

About a year after a series of intentional “experimental busts” occurred in a cancer lab, the Office of Research Integrity has issued a misconduct determination and three-year debarment against a former University of Michigan post-doc student who confessed to being the culprit. This marks the first time ORI has taken action when the misconduct involved “intentional sabotage,” versus the more common falsification, fabrication and plagiarism typically involving grant applications, presentations, papers or other documents (see http://ori.hhs.gov/blog/2011/04/the-curious-case-of-vipul-bhrigu).

The case is likely to trigger similar complaints of possible misconduct stemming from sabotage, believed to be somewhat common in labs. This finding and debarment are an extension of previous ORI enforcement activities, John Dahlberg, director of ORI’s Division of Investigative Oversight, told RRC. What’s new, Dahlberg said, is that ORI “had not previously confronted an act of sabotage.”

ORI’s decision against Vipul Bhrigu was hailed by those familiar with the case who had been hoping the agency would take action. “Hallelujah!” was the reaction of Jennifer Shambrook, director of the Grant and Contract Management Office of St. Jude Children’s Research Hospital, when told of ORI’s finding by RRC. What Bhrigu had done was “horrendous,” and akin to “lying, cheating and stealing,” in her view.

ORI investigates possible misconduct based on reports from institutions that receive Public Health Service funding, and responds to complaints referred to the office by whistle-blowers and others. ORI became involved in summer 2010, by which time Bhrigu had already been caught on hidden camera and had confessed to sabotaging tissue in Petri dishes by spraying alcohol in them. Bhrigu, who could not be located for comment, pleaded guilty to “malicious destruction of public property” and was facing sentencing. (For more details, see box, p. 1520:31.)

The university did not consider the incident to be misconduct under federal law, intending to deal with it as a police matter and personnel issue. After learning of the circumstances, ORI officials contacted the university and ultimately disagreed that the case had to end there. Agency staff reviewed the lab notebooks, Bhrigu’s taped police confessions and court appearances, and gathered other information.

The fact that the post-doc’s actions affected his colleague’s lab results was sufficient grounds for a federal finding of misconduct, ORI believes. The regulations permit a misconduct finding related to an activity that occurs “during the conduct of the research,” Dahlberg explained. “The research record was compromised” as a result of the sabotage and did not occur as a “random” act, he added.

1 The article is reprinted from Report on Research Compliance, June 2011, www.reportonresearchcompliance.com
Notice Details Destructive Acts

According to the misconduct notice posted on the ORI website, and the debarment announcement in the April 27 Federal Register, ORI found that [Bhrigu] knowingly and intentionally tampered with research materials related to five (5) immunoprecipitation/Western blot experiments and switched the labels on four (4) cell culture dishes for cells used in the same type of experiments to cause false results to be reported in the research record.” ORI also found that Bhrigu “tampered with laboratory research materials by adding ethanol to his colleague’s cell culture media, with the deliberate intent to effectuate the death of growing cells, which caused false results to be reported in the research record.”

Bhrigu’s punishment lasts for a three-year period, beginning April 7, during which he is

- “Debarred from eligibility for any contracting or subcontracting with any agency of the United States Government and from eligibility for, or involvement in, non-procurement programs of the United States Government, referred to as ‘covered transactions,’ pursuant to HHS’ Implementation of OMB Guidelines to Agencies on Governmentwide Debarment and Suspension (2 CFR 376 et seq.)”; and

- “Prohibited from serving in any advisory capacity to the U.S. Public Health Service (PHS), including but not limited to service on any PHS advisory committee, board, and/or peer review committee, or as a consultant.”

ORI has the authority to ban someone for a range of time, typically three or five years. The most severe infractions can bring a lifetime debarment.

After issuing the finding, ORI officials posted a short note on the office’s blog, explaining the action. It posed the question, “Does ORI regularly pursue cases of sabotage? The answer is ‘It depends.’ ORI pursues cases involving plagiarism, falsification, and fabrication in PHS-funded research. The sabotage, itself, was not the reason that ORI made findings of research misconduct in the case against Bhrigu. In this case, ORI’s jurisdiction stemmed from false results that were recorded in the research record and were caused by Bhrigu’s intentional tampering with the graduate student’s PHS-funded research,” according to the blog entry.

Dahlberg clarified that a misconduct finding can be made in a lab with PHS funding, or when equipment is used that was purchased with PHS funding; it is not necessary that the research itself be funded by “core” PHS dollars for a finding to be made. However, in this case the lab did have a National Cancer Institute grant. While this case is “curious,” as ORI’s blog termed it, in many ways it’s more mundane.

Sabotage is “not infrequent” in labs, Dahlberg said, but in this case the act was extreme. “If he had been more subtle, the damage would have been far worse,” he added. If the cells had not died, for example, the research perhaps could have continued with the cells impaired, leading to false results that could have been reported in a paper someday. Dahlberg said this incident shows that it’s important to “keep an open mind” about misconduct, and perhaps reconsider “how to think about things that happen in the lab.” When in doubt, his office is always available to help
and answer questions, he added.

Misconduct most often is committed by young investigators under extreme stress, Dahlberg has found. His advice to universities to prevent misconduct is simple, he said, and consists of doing three things “better”:

- **Ensure better mentorship** of graduate and post-doc students by their supervisors and principal investigators.

- **Provide better ways of handling stress**. PIs put stress on post-docs and graduate students, who also put stress on themselves. Particularly students on VISAs can feel intense stress due to the short period allowed in the U.S. and the pressure to do well.

- **Insistence on visual inspection of data**. Too often, said Dahlberg, PIs review summary data or charts, graphs and Power Point presentations their fledgling investigators create. To put this into practice, universities could require PIs to look at raw data.

St. Jude’s Shambrook adds that a supportive leadership environment is also essential to preventing misconduct. “A lot of individuals are involved [when misconduct is suspected] and everyone has to take ownership. We need to have an environment where people feel safe enough to ask the [misconduct] question without fearing they are kissing their career goodbye.”

---

**Until Cameras Showed the Truth, Sabotage Victim Was Prime Suspect**

Theodora Ross, head of a cancer research lab at the University of Michigan, calls the incident that led to the first-ever misconduct finding and debarment by the Office of Research Integrity based on sabotage in a lab as “Bhrigu-gate,” “the case of the intoxicated HELA cells,” and “the crazy case of our sloppy saboteur” (among other terms).

And Ross, also an associate professor in the Internal Medicine Department, admits that the person she and her colleagues most strongly suspected of being the culprit was, in fact, the graduate student who was the victim of the “sloppy saboteur,” Vipul Bhrigu, a post-doc also in Ross’ lab. In her quest to understand what was happening and who was responsible, Ross followed the university’s directive and even sent the aggrieved student to a therapist, and the woman underwent a lie detector test.

Bhrigu was caught after cameras were installed in the lab; he pled guilty to destruction of property and is reportedly making restitution from India, where he is from. After his sentencing, ORI became involved and imposed a three-year debarment from participation in Public Health Service-funded research, due to a criminal act that altered the scientific record.

Since the incident was resolved, Ross has not been shy about discussing it. Indeed, she shared her experiences not only with RRC and other news organizations, but has spoken about them at a scientific meeting and upon invitation to institutions, including St. Jude Children’s Research Hospital. To her, the retelling of the tale is part of her duty. “[M]aybe this will scare off putative saboteurs,” she told RRC, adding that perhaps “it should become a professional responsibility to share our experiences widely — however devastating — so that they can help others.”

Ross became enmeshed in the saga of the doomed cells in February 2010 when her graduate student,
Heather Ames, emailed her to say she suspected someone of tampering with her work by “putting alcohol in her tissue media.” Ross herself came to the lab, where Ames “showed me the flask” that reeked of alcohol. Saying she had no suspects, Ames told Ross “she’d been having a lot of experimental busts recently and wondered if that were due to such felonious activities. I said, I’d have to sleep on the problem and get back to her in the a.m.,” Ross said at a January meeting of the National Science Advisory Board for Biosecurity in Washington, D.C. The theme of the meeting was “Public Consultation on Guidance for Enhancing Personnel Reliability and Strengthening the Culture of Responsibility at the Local Level.”

Deeply troubled, Ross frantically called her colleagues, with the consensus being that she should “relax,” because most likely Ames was behind the problems. Ross didn’t buy this thinking initially, but eventually “it did make sense because the method of ‘sabotage’ was just too obvious. Although it was sad to think this way, I figured we could just chalk this craziness up to stress,” she said at the meeting. The recommendation was made to send Ames to a “school therapist for eval and assistance,” and Ross told Ames the purpose was to “make the therapist available to her in this time of stress.” Ames was never told she was considered a suspect, Ross said.

The police were eventually called in and a decision was made to install hidden cameras in the lab, which revealed Bhrigu spraying a liquid into cell material. Ross was stunned. “Bhrigu was the only unsuspected lab member...the most cooperative, passionate, friendly guy that you could imagine,” she said to the NSABB attendees. After being confronted, he confessed and was later sentenced to pay restitution.

“Based on our experience with laboratory sabotage and the feedback we received from others with similar lab personnel mishaps, if you suspect somebody of wrongdoing in the laboratory, your suspicion is probably misplaced and the true criminal — and they are criminals — is somebody you don’t suspect,” Ross said. Ross told RRC she thought the incident was research misconduct under federal law and was “very happy” that ORI agreed.

The sabotage had repercussions beyond the one student’s work, Ross said. “We don’t trust anything he touched in the lab and discarded all of that data [and] re-agents he was ever involved in generating,” she told RRC. At the NSABB meeting, Ross said that her lab was “in a slow, painful recovery,” and that she was “completely distracted for close to a year. This was not good for the lab’s health or productivity.”

At St. Jude’s invitation, Ross delivered a lecture to its post-doctoral students as part of their training on research integrity so they could learn from the experience, according to Jennifer Shambrook, director of St. Jude’s Grant and Contract Management Office. At the time Ross spoke, ORI had not yet taken action against Bhrigu.

Regardless, Shambrook said the post-docs seemed to understand that what Bhrigu did was wrong, and got the message that “these kinds of things can happen,” and when they do, the “right thing” is to call them out.

Ross said she learned from the experience as well, including that her situation was not unique. “As to lessons learned, we found that there are a lot of cases like ours but people don’t routinely talk about it,” she told RRC. “It reminds me of the culture in the 1960s that surrounded cancer. If you had breast cancer you didn’t discuss it openly....It was taboo. Thank heavens Betty Ford came along and talked about her mastectomy openly. Anyway, we — me, the detective and the university regulatory affairs people — were on our own trying to figure out what to do. They had never heard of such a case before. But we learned of more cases during and after the investigation.”
During her NSABB talk, Ross said that when misconduct is suspected, for example, “get help,” and “keep detailed notes.” Should a similar incident be brought before a judge, institutions should encourage the police and prosecutor to be “emotionally invested” in the case, Ross said, and she noted that writing a detailed “victim’s impact statement” can help in obtaining a financial penalty.

Another piece of advice: “Don’t publicize anything until it is legally [concluded]. I have since heard about cases of fraud where papers were retracted before getting a confession from the suspects....That’s a mess.”

Implementing New Policies for Financial Conflict of Interest at the University of Central Florida

Andrea Adkins, Tammie McClellan, and John Miner, University of Central Florida

Introduction

In 1995 the Public Health Service (PHS) and the Office of the Secretary of Human Health Services under the Department of Health and Human Services (DHHS) published regulations (42 CFR 50 Subpart F and 45 CFR 94) to promote objectivity and ensure integrity in research endeavors funded by PHS agencies, which includes the National Institutes of Health (NIH) (The Federal Register, 53256, 76:165 [25 August 2011]). NIH is the largest federal research granting agency with $30.9 billion invested annually in medical research (NIH Budget, 2012).

Prior to the federal regulations, institutions and professional organizations implemented their own versions of the federal mandate. The 1995 regulations required institutions receiving federal research funding to create, maintain, and enforce written financial conflict of interest policies (FCOI) to ensure the FCOI is identified, mitigated, or eliminated in the conduct of research. The 1995 regulation also required principal investigators to disclose potential FCOI and to comply with their institution’s FCOI policies. The purpose of the 1995 regulations was to ensure that the design, conduct, and publication of research was reasonably free from bias generated through financial gain by an individual or institution conducting research (The Federal Register, 53256, 76:165 [25 August 2011]).

The 1995 regulations began to prove inadequate as private biomedical research funding soared from $37.1 billion in 1994 to $94.3 billion in 2003, well exceeding federal funding. Despite the billions of dollars in biomedical research funding from the NIH, industry or private sources provided more than 55% of total biomedical research funding. The financial relationships between industry and biomedical researchers that followed created the potential for compromises in research integrity, jeopardizing the public trust and the public health. The DHHS Office of the Inspector General (OIG) reported in 2009 that “vulnerabilities exist at grantee institutions regarding conflicts” (The Federal Register, p. 53257, 76:165 [25 August 2011]). This report and increased public scrutiny ultimately led to the adoption of changes to the 1995 regulation in 2011.

UCF’s Preparedness Background

In 2009 UCF’s Office of Research & Commercialization, University Compliance and Ethics Office, Office of Faculty Relations, and Office of General Counsel joined in an effort to overhaul and formalize the university’s procedures concerning financial conflict of interest (FCOI) and conflict of commitment (COC) to ensure compliance with federal regulations, state statutes, and university policies. At this time, a simplistic one-page document was replaced with a comprehensive electronic conflict of interest (COC) system.
interest (COI) and conflict of commitment (COC) reporting, monitoring, and tracking system. Requirements for reporting, reviewing, approving, and storing disclosures drastically changed from disassociated papers in file cabinets to a unified, central electronic repository containing detailed disclosures as well as state exemptions and monitoring plans. This new repository is available to the UCF administration, departments, and research administrators.

**Online Systems**

UCF’s conflict of interest and commitment on-line system is implemented within the university’s Academic Research and Grants Information System (ARGIS®), used exclusively by researchers, research administrators, staff, and university administrators for tracking all research contract and grant activity from pre-award through commercialization. By incorporating the disclosure submission, review, approval, monitoring, and tracking process digitally within ARGIS®, UCF gained the advantage of correlating each investigator’s submitted disclosure data with information on file for the investigator’s proposals, awards, subcontracts, other agreements, inventions, and technology transfer licenses. This was an important feature for UCF’s institutional reviewers who may not have always known the interrelated facets of an investigator’s research endeavors.

UCF’s ARGIS® system clearly identifies the types of potential conflict of interest activities requiring disclosure, as well as the rationale for the questions asked. During the reporting of potential conflicts, UCF investigators are provided with links to policies, regulations, and definitions of terms for each question asked through the use of underlined terms and an information icon next to each question. For those UCF investigators completing the disclosure but not involved with outside activities, the form is short with just 10 Yes/No style questions. When UCF investigators positively affirm that certain activities or situations apply, the on-line submission form expands to prompt for additional sub-questions. Multiple responses to each of the 10 questions can also be provided if the investigator works with more than one outside entity.

Once an investigator submits the report of potential conflict of interest, disclosures are directly routed for review and approval to the investigator’s immediate supervisor, the department chair, college dean, and, depending on the responses, the compliance officer in UCF’s Office of Research & Commercialization for a regulatory review. Lastly, the disclosure or amendment is routed to UCF’s Faculty Relations Office for a final administrative review. If during the review a disclosure indicates a potential conflict of interest, the disclosure is diverted to the UCF Conflict of Interest Committee for review and recommendations. The ARGIS® system requires comments from the reviewers, which are viewable by all reviewers, the investigator, and the COI committee members, thereby establishing context and an historical record. Figure 1520.6-1 provides an example and overview of UCF’s conflict of interest and commitment process and system.

**UCF’s 5 Steps to Implementation of the PHS 2011 Regulations**

Upon issuance of the PHS 2011 regulations for each PHS-funded grant or coopera-
Supplementary Material

Figure 1520.6-1. UCF Conflict of Interest & Commitment System—Overview

Step 1—Created a Potential COI and COC Research Policy

To effectively address both financial conflict of interest and commitment as it applies to research, UCF established a new conflict of interest or conflict of commitment in research policy. This new policy expands on the existing university policy, addressing FCOI and COC by expanding who must disclose, when they must disclose, why they must disclose, what they must report, and in the new FCOI guidelines, the remedies UCF will enforce in the event of noncompliance. To ensure
the policy conformed to the revised PHS regulations, the checklist published by the NIH was consulted. The checklist is available at: http://grants.nih.gov/grants/policy/oui/coi/checklist_policy_dev_20120412.pdf (NIH, 2012).

Under the final rule UCF is required to monitor significant financial interest for all investigators (including their spouses and children) responsible for the design, conduct, or reporting of research, not just the principal investigator. The financial threshold for disclosure dropped from $10,000 to $5,000 and requires disclosure of remuneration and/or equity interest and any income realized from non-university intellectual property rights that exceeds $5,000 to be reported. Additionally, all extramural travel costs paid on behalf of an investigator and related to the investigator’s institutional responsibilities must be disclosed. Implementing these procedures to comply with the final rule will result in additional federal reporting obligations for UCF, specifically for PHS sponsored awards. ARGIS® will be used to track, store and produce reports for submission to sponsoring agencies as required.

To communicate the revised policy and guidelines document across the university, the following communication plan was executed:

1. New policy announcement sent by the President and Provost to the Dean’s Council and Vice Presidents.
2. New policy announcement sent by the President and Provost to the Faculty Senate.
3. New policy announcement sent by the Vice President for Research Office to Deans, Associate Deans, and Chairs.
4. New policy announcement sent by the Vice President for Research to administrative unit directors affected by the policy change.
5. New policy announcement sent by the Director of Compliance, Office of Research & Commercialization, to academic and research unit faculty and administrators.
6. Policy information statement provided to new faculty upon appointment.
7. New web page was established and dedicated to the conflict of interest policy.
8. On-line COI system training updated to refer to new policy and to inform users of changes to the disclosure questions when completing their submission.

UCF’s policy can be found at: http://www.policies.ucf.edu/documents/4-504.2ReportingaPotentialConflictofInterestorConflictofCommitmentinResearch-FinalonLetterhead08-20-12.pdf

**Step 2—Created COI and COC Policy Guidelines**

Perhaps of equal or greater importance is ensuring that when a new policy is established, a guideline is created to advise administrative staff and investigators on the implementation and procedures to ensure FCOI and COC policy compliance. UCF has done this in a comprehensive guideline document incorporated into the new policy.

If an investigator has a financial interest exceeding $5,000, related to an investigator’s institutional responsibilities, UCF requires disclosure prior to applica-
tion to a sponsor and no later than time of award and prior to the expenditure of any funds. If new activity or discovery of a potential COI occurs after research has started, disclosure is required within 30 days.

UCF is requiring a disclosure from all of its investigators and also subrecipient’s investigators on all proposals and awards, not just PHS awards and agreements. The subrecipient can choose to either adhere to UCF’s policies or provide certification that its own conflict of interest policy complies with Title 42 CFR Parts 50 and 94. Should the subrecipient be unable to provide this certification, UCF will require the subrecipient and its investigators to be subject to UCF policies, procedures, and guidelines. This includes participation by the subrecipient’s investigators in UCF’s mandatory training programs on FCOI such as those described herein. UCF is preparing additional written guidelines for its subrecipient’s investigators to participate and comply with UCF’s FCOI policies.

Enforcement of policies requires careful consideration. In establishing its new policies and procedures, UCF formulated remedies within its guidelines that apply when an investigator fails to comply with the new policy. The institutional remedies require that a project account be suspended until the investigator complies; inactivation of projects and accounts; and delay, suspension, or termination of subrecipient agreements if their investigators have not completed training or not submitted the disclosures required. Lastly, personnel disciplinary action(s) may be implemented by UCF to ensure compliance with the university’s conflict of interest policies and procedures, should other measures prove to be ineffective.

**Step 3—Implemented Financial Conflict of Interest Training**

An important supplement to the FCOI guidelines is the inclusion of mandatory training for investigators prior to participation in any research, to occur no less than once every four years. UCF’s Office of Research & Commercialization has the responsibility of providing and overseeing the FCOI training as well as tracking the investigator’s completion. The training is designed to educate researchers, raising awareness of both the new policy and UCF’s reporting requirements. UCF’s training implementation plan requires online training through the Collaborative Institutional Training Initiative (CITI) for faculty, staff, and students responsible for the design, conduct, and reporting of research. At the time of proposal submission, any investigator expected to have these research responsibilities must be identified among the research team members, including students. Completion of two CITI modules is required prior to engaging in funded research activity, while Module 4 is optional.

◆ **Module #1:** Financial Conflicts of Interest: Overview, Investigator Responsibilities, and COI Rules

◆ **Module #2:** Institutional Responsibilities as They Affect Investigators

◆ **Module #4:** Conflicts of Commitment, Conscience, and Institutional Conflicts of Interest (optional)

The minimum requirement for any student responsible for the design, conduct,
and reporting of sponsored research is to complete CITI Module 1. Principal Investigators are also encouraged to provide conflict of interest and other ethical training to their graduate students during the sponsored research activity.

A Responsible Conduct in Research workshop series was also established by the UCF College of Graduate Studies and in concert with the Office of Research & Commercialization. This workshop series is required for each doctoral candidate and addresses conflict of interest scenarios as well as ethical decision making and personal integrity.

**Step 4—Establish Conflict of Interest Committee**

As UCF’s activities in research grow, so does the complexity of and opportunity for potential conflicts. For example, six years ago UCF expanded its program offerings with a new College of Medicine, concentrating on biomedical research which can be prone to FCOI issues. UCF will establish a new Conflict of Interest Committee to review significant financial interests reported by investigators. Appropriately applying the bias principle to determine true conflicts will require people who are trained and responsible, and who have a high level of appropriate expertise to understand the nuances of various research situations. In addition to establishing a Conflict of Interest Committee, UCF’s Office of Research and Commercialization intends to recruit a full-time, dedicated compliance officer to manage the FCOI program. The new compliance officer and committee will review and monitor reported significant financial conflicts of interest at UCF.

When a potential significant financial interest is reported, UCF’s compliance officer will refer the disclosure to UCF’s Conflict of Interest Committee which will determine whether a conflict may exist and the appropriate mitigation measures to manage or eliminate the conflict by requiring state exemption requests, monitoring plans, or other management plans to ensure the research is free from bias or financial conflicts. ARGIS® will track a disclosure throughout the review process, to include recommended actions, and will produce reports as required to be sent to the research sponsor. Some general information about an investigator’s significant financial interests will also be made publicly available on a UCF-dedicated web page.

**Step 5—Modified Proposal Form and Potential Conflict Disclosure Questions**

UCF is implementing its new policy on reporting of conflicts of interest through procedural updates to two key forms completed by investigators: 1) the proposal transmittal form used internally to initiate and receive approval for a research proposal, and 2) the annual employee disclosure of conflicts of interest and commitment.

The on-line UCF proposal transmittal and review form in ARGIS® was modified so that during the electronic routing of the proposal, the principal investigator is asked to indicate who among the project team will be responsible for the design, conduct, or reporting of research. Each person so identified is then notified via email of their need to respond to UCF’s FCOI disclosure questions. The ARGIS® system then tracks for compliance the date of disclosure and appropriately manages
for multi-year awards and changes in project staffing.

Although questions regarding financial conflict of interest were included in UCF’s existing COI disclosure, the final rule’s change of the significant financial threshold required UCF to modify the questions asked of investigators. The new questions have also been rephrased to refer to an investigator’s “institutional responsibilities” versus simply research. The type of remuneration an investigator receives, including the form of equity interests held, reimbursed or extramural travel, and non-university royalty income, including its sources, were added to the list of questions. Figure 1520.6-2 highlights the new, revised questions asked by UCF of in-

Figure 1520.6-2. UCF Revised Disclosure Form (showing questions 1-3 re: FCOI)
vestigators to assess whether a significant financial conflict of interest exists or not.

**Conclusion**

When asked whether or not the 2011 revised PHS regulations fixed something that was broken, Doug Backman, UCF’s Director of Compliance and Contracts and Grants, replied, “No. The final rule just demands a more complete disclosure in order to remain in compliance. And, this change puts more of the burden on the institution versus the investigator. Also, the new reporting requirements to the government are more stringent.” When faced with the choice of having federal funding suspended or remain in compliance, UCF acted swiftly to stay compliant. While this new rule still does not address institutional conflicts of interest, it places the burden on institutions receiving PHS funding to be the monitoring and enforcement arm for research integrity. UCF employees responsible for making policy and procedural changes, along with its web-based research administration system ARGIS®, made the plan for implementation of the new procedures within one year feasible and without unnecessary complications. The effectiveness of UCF’s newly revised conflict of interest policies and procedures to address the final rule will be judged over time and following the next A-133 or OIG audits.

**Author’s Note**

The authors wish to thank Mr. Doug Backman, Director of Compliance and Director of Contracts and Grants in the Office of Research and Commercialization, University of Central Florida, for providing institutional information on conflict of interest policies and procedures. The opinions expressed herein are those of the authors only and are not those of the University of Central Florida.

**About the Authors**

**Andrea Adkins** is an Assistant Director in the Technology Transfer Office at the University of Central Florida. Ms. Adkins works with faculty, students, and staff on intellectual property matters originating from research and educational activities at UCF and licensing technologies to industry and new business start-ups. Prior to
joining UCF in 1999, Ms. Adkins worked in the architecture, engineering and construction industry. Ms. Adkins also co-founded a small business that specialized in manufacturers’ representative services. Ms. Adkins expects to receive a Master of Science degree in Research Administration from UCF in August 2013.

**Tammie McClellan** is the Director of the University of Central Florida’s Center for Research Administration Technologies and Applications (CRATA) and Program Director of the Department of Information Systems Technology at UCF’s Institute for Simulation and Training (IST). She has managed over $16 million in external and internal awards, providing information technology consulting, application development and systems services utilizing the latest technologies in information systems and the public Internet. She develops advanced World Wide Web SQL applications to support data management, workflow, and decision-making. Her range of clientele spans every branch of the U.S. Armed Forces, universities, numerous commercial and non-profit agencies, as well as university departments where consulting and development support is offered to guide information system requirements. She is an author/co-author and holder of multiple software copyrights, to include the Academic Research & Grants Information System (ARGIS®), which have been successfully licensed by UCF. Ms. McClellan will receive a Master of Science degree in Research Administration in August 2013 from UCF.

**John Miner** has worked at the Office of Technology Transfer at UCF since 1999 and is an Assistant Director of Physical Sciences. He graduated with his undergrad degree from UCF in 2001 and is scheduled to graduate in August 2013 with his Master of Research Administration degree. He is active in the Association of University Technology Managers (AUTM), serving as an Assistant Vice President for Metrics and Surveys. He chairs the annual Salary Survey, a publication examining the salaries in the Technology Transfer field for academic and non-profit organizations across North America, Europe and Asia.
¶1520.7 NIH Guidance on Significant Changes to Animal Activities

National Institutes of Health

Guidance on Significant Changes to Animal Activities
Notice Number: NOT-OD-14-126

Key Dates
Release Date: August 26, 2014
Related Announcements: NOT-OD-14-063
Issued by: National Institutes of Health (NIH)

Purpose
This Notice provides guidance to Public Health Service (PHS) awardee institutions and Institutional Animal Care and Use Committees (IACUCs) on significant changes to animal activities.

Background
The PHS Policy on Humane Care and Use of Laboratory Animals (Policy) (IV.C.1.) and Animal Welfare Regulations (9 CFR 2.31 (d) (1) (i)- (iv)) define the responsibilities of the IACUC regarding review and approval of proposed significant changes to animal activities. Changes to approved research projects must be conducted in accordance with the institution’s Assurance, the United States Department of Agriculture (USDA) Animal Welfare Act and Animal Welfare Regulations and must be consistent with the Guide unless an acceptable justification for a departure is presented. Additionally, IACUCs are responsible for assuring that the changes to approved animal activities meet the requirements described in the PHS Policy IV.C.1.a-g.

IACUC approval of proposed animal activities or significant changes to previously approved animal activities is granted after full committee review (FCR) or designated member review (DMR). Additionally, institutions may establish and IACUCs may approve policies (e.g., guidance documents, standard operating procedures, drug formularies) for the conduct of animal activities. These policies must be reviewed by the IACUC at appropriate intervals of no less than once every three years to ensure they are appropriate and accurate.

Significant Changes to Animal Activities Previously Approved by the IACUC
The IACUC has some discretion to use IACUC-reviewed and -approved policies to define what it considers a significant change, or to establish a mechanism for determining significance on a case-by-case basis in accordance with the PHS Policy IV.C.1.a-g. It is the IACUC’s responsibility to clearly define and communicate its policy for determining significance to investigators.

In brief, significant changes include changes that have, or have the potential to have, a negative impact on animal welfare (see paragraph 1., below). In addition, some activities that may not have a direct impact on animal welfare are also consid-
ered to be significant (see paragraphs 2. and 3., below).

In support of the use of performance standards and professional judgment and to reduce regulatory burden, IACUC-reviewed and -approved policies (e.g., guidance documents, standard operating procedures, drug formularies) for the conduct of animal activities may be used for the administrative handling of some significant changes according to the following considerations:

1. Significant changes described in 1.a.-g., below, must be approved by one of the valid IACUC approval methods described in the PHS Policy IV.C.2., that is FCR or DMR, including changes:
   a. from nonsurvival to survival surgery;
   b. resulting in greater pain, distress, or degree of invasiveness;
   c. in housing and or use of animals in a location that is not part of the animal program overseen by the IACUC;
   d. in species;
   e. in study objectives;
   f. in Principal Investigator (PI); and
   g. that impact personnel safety.

2. The specific significant changes described in 2.a.-c., below, may be handled administratively according to IACUC-reviewed and -approved policies in consultation with a veterinarian authorized by the IACUC. The veterinarian is not conducting DMR, but is serving as a subject matter expert to verify that compliance with the IACUC-reviewed and -approved policy is appropriate for the animals in this circumstance. Consultation with the veterinarian must be documented. The veterinarian may refer any request to the IACUC for review for any reason and must refer any request that does not meet the parameters of the IACUC-reviewed and -approved policies. This includes changes in:
   a. anesthesia, analgesia, sedation, or experimental substances;
   b. euthanasia to any method approved in the AVMA Guidelines for the Euthanasia of Animals; and
   c. duration, frequency, type, or number of procedures performed on an animal.

3. A significant change that may be handled administratively according to an existing IACUC-reviewed and -approved policy without additional consultation or notification is an increase in previously approved animal numbers (PHS Policy IV.D.1.a.).

Other Changes

4. Changes that may be handled administratively without IACUC-approved policies, consultations, or notifications include:
   a. correction of typographical errors;
b. correction of grammar;
c. contact information updates; and
d. change in personnel, other than the PI. (There must be an administrative review to ensure that all such personnel are appropriately identified, adequately trained and qualified, enrolled in occupational health and safety programs, and meet other criteria as required by the IACUC.)

5. Investigators may use fewer animals than approved. This does not require IACUC approval, notification, consultation, or administrative handling.

The USDA Animal and Plant Health Inspection Service has reviewed and concurs with the guidance provided in this Notice.

\section*{1520.8 Summary of NPRM for Revisions to the Common Rule$^1$}
Department of Health and Human Services

The U.S. Department of Health and Human Services and fifteen other Federal Departments and Agencies have announced proposed revisions to modernize, strengthen, and make more effective the Federal Policy for the Protection of Human Subjects that was promulgated as a Common Rule in 1991. A Notice of Proposed Rulemaking (NPRM) was published in the Federal Register on September 8, 2015 (PDF 1063 KB). The NPRM seeks comment on proposals to better protect human subjects involved in research, while facilitating valuable research and reducing burden, delay, and ambiguity for investigators.

Some of the major changes being proposed that will better protect research subjects and help build public trust are the rules relating to informed consent. With regard to informed consent in general (such as consent to participating in clinical trials), the rules would be significantly tightened to make sure that the process becomes more meaningful. Consent forms would no longer be able to be unduly long documents, with the most important information often buried and hard to find. They would need to give appropriate details about the research that is most relevant to a person’s decision to participate in the study, such as information a reasonable person would want to know, and present that information in a way that highlights the key information. In addition, to assure that these rules do indeed change current practices, there will be a one-time posting requirement for the consent forms for clinical trials, so that anyone drafting a consent form will do so knowing that it will eventually be subject to public scrutiny.

In addition, informed consent would generally be required for secondary research with a biospecimen (for example, part of a blood sample that is left over after being drawn for clinical purposes), even if the investigator is not being given information that would enable him or her to identify whose biospecimen it is. Such consent would not need to be obtained for each specific research use of the biospecimen, but rather could be obtained using a “broad” consent form in which a person would give consent to future unspecified research uses.

The NPRM also attempts to strengthen the effectiveness and efficiency of the oversight system by making the level of review more proportional to the seriousness of the harm or danger to be avoided. Research that poses greater risk to subjects should receive more oversight and deliberation than less risky research. The NPRM seeks to avoid requirements that do not enhance protection and impose burden, which can decrease efficiency, waste resources, erode trust, and obscure the true ethical challenges that require careful deliberation and stakeholder input. Cumbersome and outdated regulatory standards overwhelm and distract institutions, IRBs, and investigators in ways that stymie efforts to appropriately address the real risks and benefits of research.

The result of these types of changes, as the NPRM proposes to implement them,

$^1$ Retrieved from http://www.hhs.gov/ohrp/humansubjects/regulations/nprmhome.html
is that some studies that currently require IRB review would now become exempt. Some that are currently exempt would specifically be declared as outside the scope of the regulations (“excluded”), and thus would not require any administrative or IRB review. Further, in terms of determining when a study is exempt, a web-based “decision tool” will be created. That decision tool will provide a determination of whether or not a study is exempt. That result, so long as the tool was provided with accurate information, will be presumed by the Common Rule agencies to be an appropriate determination of exempt status. It is expected that in many instances the tool would be used by the investigators themselves, thus obviating both the need for further review and the concern that the institution might be subjecting itself to future liability by allowing investigators to use the tool. For all of the excluded and exempt research activities, this NPRM also affirms the importance of applying the ethical principle of respect for persons, in addition to the importance of abiding by this principle in fully regulated non-exempt research involving human subjects.

The following list encompasses the most significant changes to the Common Rule proposed in the NPRM:

1. Improve informed consent by increasing transparency and by imposing stricter new requirements regarding the information that must be given to prospective subjects, and the manner in which it is given to them, to better assure that subjects are appropriately informed before they decide to enroll in a research study.

2. Generally require informed consent for the use of stored biospecimens in secondary research (for example, part of a blood sample that is left over after being drawn for clinical purposes), even if the investigator is not being given information that would enable him or her to identify whose biospecimen it is. That consent would generally be obtained by means of broad consent (i.e., consent for future, unspecified research studies) to the storage and eventual research use of biospecimens.

3. Exclude from coverage under the Common Rule certain categories of activities that should be deemed not to be research, are inherently low risk, or where protections similar to those usually provided by IRB review are separately mandated.

4. Add additional categories of exempt research to accommodate changes in the scientific landscape and to better calibrate the level of review to the level of risk involved in the research. A new process would allow studies to be determined to be exempt without requiring any administrative or IRB review. Certain exempt and all non-exempt research would be required to provide privacy safeguards for biospecimens and identifiable private information. New categories include:

   a. certain research involving benign interventions with adult subjects;

   b. research involving educational tests, surveys, interviews or observations of public behavior when sensitive information may be collected, provided that data security and information privacy protections policies are followed;
c. secondary research use of identifiable private information originally collected as part of a non-research activity, where notice of such possible use was given;

d. storing or maintaining biospecimens and identifiable private information for future, unspecified secondary research studies, or conducting such studies, when a broad consent template to be promulgated by the Secretary of HHS is used, information and biospecimen privacy safeguards are followed, and limited IRB approval of the consent process used is obtained.

5. Change the conditions and requirements for waiver or alteration of consent such that waiver of consent for research involving biospecimens (regardless of identifiability) will occur only in very rare circumstances.

6. Mandate that U.S. institutions engaged in cooperative research rely on a single IRB for that portion of the research that takes place within the United States, with certain exceptions. To encourage the use of IRBs that are otherwise not affiliated with or operated by an assurance-holding institution (“unaffiliated IRBs”), this NPRM also includes a proposal that would hold such IRBs directly responsible for compliance with the Common Rule.

7. Eliminate the continuing review requirement for studies that undergo expedited review and for studies that have completed study interventions and are merely analyzing data or involve only observational follow-up in conjunction with standard clinical care.

8. Extend the scope of the policy to cover all clinical trials, regardless of funding source, conducted at a U.S. institution that receives federal funding for non-exempt human subjects research.

In sum, the proposed modifications described above are designed to continue to uphold the ethical principles upon which the Common Rule is based, as applied to the current social, cultural, and technological environment.
NIH Human Subjects Protection Training Requirements FAQs

National Institutes for Health

Frequently Asked Questions on Requirements for Education

A. Who Must Comply with the Policy

Who needs to receive required education on the protection of human subjects?

Individuals who will be involved in the design or conduct of NIH-funded human subjects research must fulfill the education requirement. These individuals are considered to be “Key Personnel” on NIH awards and contracts that include research involving human subjects, this includes the Principal Investigator(s), all individuals responsible for the design or conduct of the study, and those individuals identified as key personnel of consortium participants or alternate performance sites.

Does the education requirement apply to awards that do not involve human subjects?

No, but it is important for all investigators, even those working with tissues or specimens derived from human sources to understand when proposed research triggers regulatory and policy requirements.

Human subject as defined in 45 CFR part 46 means a living individual about whom an investigator (whether professional or student) conducting research obtains: (1) data through intervention or interaction with the individual, or (2) identifiable private information.

Research using human specimens, tissues, or data that are unidentifiable may not be considered human subjects research. See: http://www.hhs.gov/ohrp/policy/cdebiol.pdf.

Investigators who conduct studies with human specimens, tissues, or data that are determined not to involve human subjects are not required to fulfill the education requirement

Are investigators involved in human subjects research that is described by one or more of the exemptions in 45CFR46 required to comply with the education requirement?

Yes. Investigators who conduct human subjects research that is exempt from Institutional Review Board (IRB) review and approval (six exempt categories defined in 45 CFR part 46.101(b)) must comply with the education requirement.

NOTE: From September, 2002 through March 9, 2005 NIH investigators conducting human subjects research meeting the criteria for Exemption 4 in the HHS regulations did not provide documentation of training. Effective January 10, 2005 all new, competing applications will require documentation of completion of the educational requirement for each investigator involved in the design and conduct of NIH-funded human subjects research prior to award (coincident with NIH imple-
mentation of the OHRP Guidance on Research Involving Coded Private Information or Biological Specimens, available at http://www.hhs.gov/ohrp/policy/cdebio.pdf. As stated above, the requirement applies both to human subjects research and exempt human subjects research.

Does the education requirement apply to new Key Personnel involved in human subjects research whose names are added on non-competing Progress Reports?

Yes. NIH expects that all Key Personnel will receive the required education before beginning research involving human subjects. If Key Personnel are added to an award in a non-competing year, documentation that they have received the required education should be included in the non-competing Progress Report.

Do individuals identified as Key Personnel who are not involved in the design and conduct of the human subjects portion of an award need to comply with the education requirement?

No. Investigators who are identified as Key Personnel, but are not involved in the design and conduct of human subjects research do not need to comply with this requirement. For example, those involved solely in the analysis of de-identified data.

Does the education requirement apply to Key Personnel involved in human subjects research supported by an NIH award if they will not be compensated by the award?

Yes. The education requirement applies to all individuals involved in the design and conduct of human subjects research supported by an NIH award whether or not they receive compensation from the award.

Do Key Personnel on foreign awards or on foreign subcontracts have to comply with the education requirement?

Yes. The education requirement applies to all investigators involved in the design or conduct of research involving human, including foreign awards and subcontracts. Foreign certification and documentation of the required education in languages other than English are acceptable.

If the grantee organization has difficulty obtaining documentation that Key Personnel on foreign subcontracts have received the required education, NIH staff may consider issuing awards that restrict third party participation until this documentation is provided to NIH. This will streamline issuing awards in situations where third party participation is not essential to the start of the project. See the September 5, 2001 NIH Guide Notice for additional information.

Do third party (subcontract) Key Personnel or consultants need to comply with the education requirement?

Yes. Third party Key Personnel and consultants must comply with the education requirement if they are involved in the design and conduct of research involving human subjects.
B. Human Subjects Protections Education Programs

Does NIH specify which educational programs should be used to fulfill the protection of human subjects education requirement?

No. The NIH does not endorse any specific educational programs. We believe that institutions are in the best position to determine what programs are appropriate for fulfilling the education requirement. Institutions may require a particular program or may choose to develop a program to meet the requirement.

As a public service, the NIH Office of Extramural Research offers a free tutorial on “Protecting Human Research Participants” that institutions may elect to use to meet the human subjects protections education requirement.

If the NIH tutorial “Protecting Human Research Participants” is taken to meet the education requirement, will NIH provide copies of the certificate of completion?

No. After completing the training module, the trainee may print out a certificate of completion that may be provided as documentation of compliance with the requirement. Should another copy of the certificate be required, the trainee may log in to the tutorial at any time to print the certificate associated with his or her account. NIH does not provide additional copies of the certificate.

How often do investigators involved in the design and conduct of human subjects research need to complete the education?

The NIH policy is silent on the frequency of education. The intent of the education requirement is for investigators to keep abreast of development in human subjects protection. We believe that institutions are in the best position to determine when renewed or additional education is warranted.

C. Award Mechanisms

Does the education requirement apply to Research and Development contract awards?

Yes. The education requirement applies to Research and Development Contract awards that include human subjects research. The contracting officer will request documentation that all Key Personnel involved in human subjects research have received the required education prior to the award of a new contract.

Does the education requirement apply to NRSA research fellowship awards?

Yes. The education requirement applies to individual fellowship applications that describe human subjects research. For individual fellows, the Institute/Center that will be funding the fellowship application will request the necessary information prior to issuing the award (Just-In-Time).

Does the education requirement apply to NRSA training grants?
Trainees on NRSA training grants are required to receive training in the responsible conduct of research (RCR), which may include the protection of human subjects as a topic. Trainees involved in the design or conduct of human subjects research only need to provide additional documentation of having received the required human subjects education if their required RCR training does not include the protection of human subjects as a topic.

Does the education requirement apply to responses to RFPs, RFAs and PAs as well as to investigator initiated grant applications?

Yes. The education requirement applies to all NIH awards that include human subjects research.

D. Documentation

When, in the award process, should documentation of the required human subjects education be provided to NIH?

The Institute/Center that would be funding the project will request documentation that all Key Personnel have received the required education prior to issuing the award. The information should be submitted to your Grants Management Official with other Just-In-Time requirements and must contain the signature of an authorized institutional official.

Will an award be delayed until documentation of completion of the required education is provided?

Yes. The award may be delayed in its entirety or NIH Staff may choose to issue an award restricting all human subjects research until documentation of completion of the education requirement has been received. If problems are encountered investigators should contact the program official or grants management specialist. Contractors and prospective contractors should consult with the project officer or contract officer.

Does the documentation that the required education has been received need to be a part of the document signed by an institutional official?

Yes. The documentation must be signed by an institutional official. It is, however, not required that the Principal Investigator also sign the documentation (see the September 5, 2001 NIH Guide Notice).

Do Key Personnel who have already submitted documentation of having received the required education for one award need to re-submit the documentation when involved in human subjects research supported by another award?

Yes. Individuals involved in the design and conduct of human subjects research supported by more than one award must provide certification that they have received the required education once for each award.

Can the same certificate of completion of the human subjects education be used on more than
one application or contract proposal?
Yes. The same certificate may be submitted to NIH to fulfill the human subjects education requirement for multiple applications and proposals.

How frequently do Key Personnel need to provide documentation of having received the required education?
Key Personnel only need to provide this documentation once for each competing award.

If new Key Personnel involved in human subjects research are included in a non-competing Progress Report, does documentation of their compliance with the education requirement need to be provided?
Yes. Documentation of compliance with the education requirement must be provided for all Key Personnel involved in human subjects research once for each competing award. If Key Personnel are added to an award in a non-competing year, documentation that they have received the required education should be included in the next non-competing Progress Report.
1520.10 NIH Policy on the Use of a Single Institutional Review Board for Multi-Site Research

National Institutes of Health

Notice Number: NOT-OD-16-094

Key Dates

Release Date: June 21, 2016
Effective Date: May 25, 2017

Related Announcements
NOT-OD-16-109

Issued by
National Institutes of Health (NIH)

Purpose

The National Institutes of Health (NIH) is issuing this policy on the use of a single Institutional Review Board (IRB) for multi-site research to establish the expectation that a single IRB (sIRB) of record will be used in the ethical review of non-exempt human subjects research protocols funded by the NIH that are carried out at more than one site in the United States. The goal of this policy is to enhance and streamline the IRB review process in the context of multi-site research so that research can proceed as effectively and expeditiously as possible. Eliminating duplicative IRB review is expected to reduce unnecessary administrative burdens and systemic inefficiencies without diminishing human subjects protections. The shift in workload away from conducting redundant reviews is also expected to allow IRBs to concentrate more time and attention on the review of single site protocols, thereby enhancing research oversight.

Background

Overview of the Public Comments

In general, most of the comments that were submitted on the draft policy were
supportive of NIH’s goal of enhancing and streamlining IRB review in multi-site research. Commenters, especially individual researchers, scientific and professional societies, and patient advocacy organizations, generally agreed that the use of a single IRB for multi-site studies involving the same protocol would help streamline IRB review and would not undermine and might even enhance protections for research participants. Most of the comments also favored the approach the NIH proposed to promote the use of single IRBs by making reliance on an sIRB an expectation for all non-exempt multi-site studies carried out at U.S. sites. At the same time, a number of commenters, mainly academic institutions and organizations representing them, did not agree with the scope of the proposed policy or that it should become a term and condition of funding, and suggested the NIH incentivize, not mandate, reliance on an sIRB.

Comments from researchers that supported the draft policy described unnecessary delays and additional costs caused by duplicative IRB reviews. They noted that IRB submission requirements at each site differ and take time to navigate and manage. They also indicated that review of the same protocol by multiple IRBs can sometimes lead to protocol and consent document changes that can introduce inconsistencies in the execution of the protocol across sites, lead to enrollment imbalances, and skew the analysis of the aggregated data. More often, however, multiple IRB reviews result in changes to consent documents that are merely stylistic and not substantive, or changes that focus on institutional interests (e.g., liability management) rather than human research protections. Commenters raised the concern that the current practice of requiring multiple IRB reviews may actually contribute to some researchers’ reluctance to participate in rigorous, multi-site research and may incentivize smaller and simpler study designs.

Scientific and professional societies generally favored the proposed policy. These stakeholders stated that the policy would decrease administrative burdens on clinical research staff, speed up participant recruitment, and streamline the research process and that these changes would result in enhancements to the efficiency of research and acceleration of research progress. They also suggested that the benefits of such a policy include enhanced adverse event monitoring and improvements to the quality and consistency of IRB reviews.

Most of the comments from patient advocacy groups and participant representatives were supportive of the proposed policy. These stakeholders pointed out that greater use of single IRBs will lead to enhanced protections through increased accountability and improved efficiency.

In general, comments from academic institutions, IRBs, and organizations that represent them cited concerns about the proposed policy, even though many also expressed support for its goal and agreed it could have a positive impact in reducing research review and initiation time to the study. These stakeholders suggested that the scope of the proposed policy is too broad and that the NIH should not make the policy a term and condition of award. They said that decisions about whether to use a single IRB should be voluntary and that the NIH should offer incentives to promote change. For example, they suggested that the NIH encourage investiga-
tors and institutions to use single IRBs in grant applications by providing additional funding to those grants that agree to use a single IRB. Some suggested that before issuing a broad policy, the NIH should pilot and evaluate a narrower use of single IRBs and provide appropriate resources to support the participating awardees. Others suggested that the NIH should fund research on existing central IRB models to evaluate potential benefits and costs before mandating single IRB review. A few commenters raised concerns about the timing of the policy in relation to the revisions of the Common Rule, stating their preference that the NIH not adopt a single IRB policy until Common Rule revisions have been finalized. However, other commenters praised the NIH for addressing the single IRB issue in the absence of an updated Common Rule. Finally, a few commenters discussed how the policy could be harmonized with other federal policies. One commenter recommended that the Office for Human Research Protections (OHRP) in the Department of Health and Human Services (HHS) provide guidance to support the policy’s stance on duplicative IRB review.

Stakeholders from academic institutions were concerned that the membership of any given sIRB would not be able to achieve the level of local support for a particular research study or its acceptability in terms of all the participating sites’ institutional commitments and regulations, applicable laws, and standards of professional conduct and practice. Some commenters contended that only a local IRB is able to understand the specific protections required for a vulnerable population that comprises their research participant base. Some suggested that site-specific practices for recruitment and retention, especially for vulnerable populations, would pose challenges for an sIRB. A number of commenters stated that their institutional IRBs are in the best position to know and understand competencies of and potential conflicts of interest of specific investigators. Others stressed the importance of the relationship between an investigator and the local IRB and noted that IRB members can serve as mentors to investigators whose protocols they oversee.

Some commenters asserted that the proposed policy does not recognize the time and effort needed to identify and establish a single IRB of record, including negotiating and executing authorization agreements and standard operating procedures, conducting study initiation meetings, creating account activities, and modifying information technology (IT) systems. They suggested that the policy would result in the formation of hundreds of different “single IRBs of record” with which institutions and investigators will need to interact. Some questioned whether an sIRB would be equipped to ensure local compliance at a relying institution and expressed the concern that a compliance problem for an sIRB would lead to compliance actions against the sites relying on that sIRB. Several commenters who supported the use of sIRBs recommended that rather than having participating sites identify a single IRB for each protocol, the NIH should establish a central IRB to review all multi-site research studies, akin to the National Cancer Institute’s Central Institutional Review Board (CIRB). They suggested that this approach would create an even “playing field” for every institution, big or small, regardless of whether their own IRB has the resources to act as a single IRB of record.
Many commenters, regardless of whether or not they supported the proposed policy, noted that over the past several decades, the IRB’s role has been expanded to include functions that go beyond ethical review of proposed research. For example, IRBs are often responsible for reviewing compliance with institutional policies, such as conflict of interest and investigator training. Commenters in favor of the proposed policy thought that greater use of sIRBs would help to return sIRB review to its primary mission of ensuring appropriate protections for human subjects rather than protecting the institution from legal liability or damage to its reputation. They also suggested that when institutions rely on a single IRB of record for multi-site research studies, IRB responsibilities are clearer, which helps institutions to develop policies and to provide resources beyond IRB review (e.g., human research protections experts) to facilitate compliance with the institutional human research protections program. Some commenters opposed to the proposed Policy suggested that the ancillary responsibilities of IRBs are so intertwined with the research oversight responsibilities that using a sIRB would disrupt the existing system of “checks and balances” at institutions. They also argued that the opportunity for the IRB to recommend protocol changes for reasons unrelated to ethical review (e.g., scientific improvements, changes to study design) would be lost.

Many commenters, regardless of whether they supported or opposed the proposed policy, made a number of specific practical suggestions about implementation. These are summarized below.

**Applicability**

Most commenters supported a broad application of the policy to all studies involving the same protocol carried out at multiple sites in the U.S. These stakeholders stated that use of a single IRB of record for all types of studies and populations and study arrangements would encourage standardization of clinical research protocols and more effective implementation of protocols and protocol amendments. In contrast, a number of commenters suggested that the NIH should narrow the application of the policy or phase it in over time. Ideas about how the applicability of the policy should be narrowed were wide-ranging. Some stakeholders suggested that the level of risk should be a consideration in whether the policy should apply, with some pointing to minimal risk research and others to research involving more than minimal risk as being more appropriate for single IRB review. Others suggested that the policy should apply only to multi-site studies that involve a large number of sites (e.g., greater than 10); only to research involving clinical trials; only to studies carried out within established cooperative groups; or only to lengthy studies requiring an extended period of IRB oversight, e.g., three years or more. Some commenters suggested that the applicability of the policy remain broad, but that it be phased in over time.

**Exceptions**

The draft policy proposed exceptions only if the designated single IRB of record is unable to meet the needs of specific populations or where local IRB review is required by federal, tribal, or state laws or regulations. Most commenters agreed
that there was a need to allow for exceptions to the uses of a single IRB. There were
a number of comments calling for additional exceptions to those proposed in the
policy. Commenters who generally supported the proposed policy stated that
exceptions should be very limited. Some were concerned that a determination that
the sIRB would be unable to meet the needs of specific populations was an overly
subjective criterion or that institutions would routinely request exceptions asserting
that the needs of specific populations could only be met by local IRBs. Tribal Nation
commenters pointed to the importance of firsthand knowledge of local tribal cus-
toms, cultural values, and tribal sensitivities and supported exceptions to address
those needs and also as a way of respecting tribal sovereignty. Other commenters
said that the policy should allow for situational exceptions, depending on the types
and complexity of studies and study teams, types and numbers of involved institu-
tions, resources available for the sIRB (including IT resources), available resources
for investigators, accreditation status of the human research protection program, or
when study sites have concerns regarding the constitution of the designated review-
ing IRB, that IRBs’ experience reviewing a particular type of research was inade-
quate, or if relying on the single IRB would affect the institutional IRB’s accredita-
tion status.

Assuring Consideration of Local Context
Commenters were divided about the extent to which individual sites’ local con-
texts would present a challenge for an sIRB. Some commenters suggested that in
today’s highly interconnected world, local contexts would not be unique or differ-
ent enough to affect the review of research protocols. Others suggested that local
context does vary, not only from state to state and community to community, but
even among institutions serving the same community.

Commenters identified a number of capabilities that the sIRB would need to
have in order to be effective, and one comment identified four such capabilities:

◆ Knowledge of state law and local standards relevant to human subject research,
e.g., age of majority and assent laws, mandatory reporting, data security, and
awareness of differences in laws that would affect research conducted at sites in
multiple states.

◆ Systems and procedures for collecting information from participating sites
in order to ascertain whether the research could feasibly be carried out at
the site. The sIRB would need to consider the number of competing studies
underway, limits to participant pools, and whether the site had the capabilities
and resources to execute research studies. Resources for consideration would
include space, equipment, drug/device storage, handling, and dispensing,
data storage capacities, and personnel, needed to support the research.
Institutional capabilities would include policies on issues such as confidentiality,
contraception, compensation for injury, or contacts who can answer research
subjects’ questions.

◆ Mechanisms in place to assess the experience and qualifications of site
investigators and study staff, including whether they are in good standing with
state board and other licensing authorities and have a good record of compliance with all laws and regulations. Other factors to be considered in this assessment would include financial conflicts of interest, research workload, and training in research ethics and the responsible conduct of research.

◆ Mechanisms for obtaining supplemental information when research would involve sensitive topics or when research would require the participation of discrete and insular communities. In some cases, the sIRB might need community-related information and demographic data including, but not limited to, race/ethnicity, religious affiliation, and language.

Selection of the IRB of Record

A number of commenters called on NIH to establish criteria or a minimum set of requirements to assist in the selection of the sIRB, as well as a need for criteria for an sIRB to use in its evaluation of participating sites. One commenter suggested that NIH’s Policy should require the applicant, offeror, or intramural investigator to justify their proposed sIRB. Since the NIH funding Institute or Center (IC) must approve the sIRB, one commenter suggested that NIH describe the criteria to be used in making a determination that the proposed sIRB is acceptable.

Some commenters offered specific suggestions for sIRB evaluation criteria. Suggestions for evaluation criteria included the following:

◆ Evidence of a commitment to the highest ethical standards and ability to meet rigorous standards for quality and protection of research participants, e.g., through accreditation or assessment of policies, procedures, and practices;

◆ Ability to meet regulatory requirements;

◆ Well-established track record of compliance and performing high quality reviews, e.g., no regulatory errors or failures to address Common Rule regulatory requirements or Food and Drug Administration regulations;

◆ Appropriate expertise and experience to review the proposed research and the capacity to review the study protocol and participating sites;

◆ Recognition of the importance of building trust across all sites;

◆ Capacity to develop and maintain the respect and trust of the research participants and the communities in which the research is performed;

◆ Willingness and ability to serve as a Privacy Board to fulfill the requirements of the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule for use or disclosure of protected health information for research;

◆ Adherence to communication standards and a commitment to transparency through sharing information about the review process, e.g., meeting minutes, approval status;

◆ Adequate institutional infrastructure and support, and evidence of quality and robustness of the institution’s human research protection program;

◆ Sufficient staff to handle communications between all sites for initial review,
continuing review, adverse events, amendments, etc.;
◆ Available interoperable information technology resources to facilitate communication and exchange of information between the participating institutions;
◆ Sufficient resources to negotiate and track authorization agreements;
◆ Ability to account for the IRB costs for review and management and how those costs will be met;
◆ Adequate processes in place and administrative support to handle additional review responsibilities;
◆ Adequate processes in place and administrative support to handle additional review responsibilities;

Defining IRB and Institutional Responsibilities

Many commenters pointed out the importance of defining the sIRB’s role and scope of responsibility in relation to the responsibilities of the participating research sites. These commenters noted that responsibilities of IRBs defined by the 45 CFR 46 often constitute only one part of institutions’ overall human research protections program. Commenters called on the NIH to establish a common approach to the division of responsibilities by providing model authorization agreements or even a uniform agreement that should be used in all cases. In addition to helping ensure a well-functioning review process, clear roles and responsibilities would, some suggested, also help mitigate concerns about added liability that an sIRB might assume.

A range of views were expressed relating to responsibilities that would be assumed by the sIRB and those that would remain with participating sites. Some commenters suggested that in addition to fulfilling the requirements set out in 45 CFR 46, i.e., conducting initial and continuing reviews of protocols, amendments, unanticipated problems, protocol deviations, and required regulatory IRB reporting, sIRBs should adopt some of the responsibilities that are frequently delegated to local IRBs, in particular, acting as a privacy board for all sites. One commenter noted that systems would be required to ensure that duplicative reviews are not conducted by the sIRB and local IRBs, and several commenters expressed concerns about the difficulty of coordinating required sIRB reviews with additional reviews that are not required by regulation, such as reviews for conflict of interest, investigator qualifications, and scientific merit. Some of these commenters questioned how sIRB reviews required by the HHS regulations should be coordinated with other required reviews that may have been delegated to the local IRB. These commenters noted that many institutions have established systems and standard operating procedures for coordinating local IRB review with other required reviews, such as institutional biosafety reviews, radiation safety reviews, pharmacy reviews, reviews required by state or local laws, post-approval monitoring and for-cause auditing purposes, and research billing. One commenter suggested that sIRBs should not be responsible for adverse event reporting. Another commenter suggested that sIRBs should be responsible for maintaining databases of relevant state laws. In addition,
a small number of commenters indicated that the regulations of other Common Rule agencies, FDA in particular, may create contradictory requirements, and called for clarification and a more unified approach.

Several commenters stated that coordinating these additional reviews with sIRB reviews would limit the gains in efficiency realized from reliance on an sIRB. One commenter recommended that the NIH develop a template IRB authorization agreement and guidelines to define the institutional obligations that are distinct from the IRB review responsibilities. Another commenter recommended that the NIH publish guidance delineating the specific regulatory requirements for which the sIRB would be responsible, shared responsibilities, and responsibilities that an sIRB could negotiate with IRBs at participating sites.

**Resources and Funding**

Several commenters described the proposed policy as an unfunded mandate, or stated that it would result in a shifting of expenses from one institution to another. Many commenters expressed the concern that if costs associated with using a single IRB are taken from a participating institution’s indirect costs, there would be insufficient funds for the local Human Research Protection Program (HRPP) that still has institutional oversight responsibilities, even if the IRB of record is external. Most commenters with experience using a single IRB of record for multi-site research studies recommended that indirect costs remain unchanged for relying institutions in order to ensure that the human research protections infrastructure are available for institutional responsibilities, e.g., post-approval compliance monitoring, conflict of interest reviews. Many commenters noted funding sIRBs through indirect costs would divert funds required to conduct research and serve as a disincentive to conducting multisite research. The majority of commenters stated a preference for including the additional costs associated with a single IRB review in the study budget as direct cost, although one commenter stated a preference that sIRB review be included as an indirect cost in order to maximize the amount of funding available for research.

Several commenters stated that the costs and resources needed to establish sIRBs were not addressed by the proposed policy. Infrastructure needs noted by these commenters included additional staff and/or staff time to perform sIRB-related activities, costs to create or adapt electronic managements systems that are interoperable with outside institutions, and the time and cost of developing communication tools to link investigators to IRBs outside their institution. Other commenters familiar with the operations and use of sIRBs noted that while initial financial support from the NIH may be required to establish or expand the capacity of some IRBs to serve as the IRB of record, most sIRBs should be able to become self-supporting eventually.

Commenters had questions about whether plans for single IRB review would be required in grant applications and how plans would be reviewed.
Need for Implementation Guidance

A number of commenters pointed out how important it would be for the NIH to provide practical guidance to facilitate the implementation of the policy, with some commenters stating that, in the absence of such guidance, burden and costs would only shift between institutions rather than adding efficiency to the IRB process. A few commenters noted that this guidance could be developed using the experiences of IRBs that have already implemented centralized IRB review processes.

In addition to general requests for implementation guidance, a number of commenters made specific guidance suggestions. These suggestions included the need for guidance covering:

♦ The specific criteria to use for evaluation of IRBs of record when selecting a single IRB for a multisite study;

♦ The process for determining roles and responsibilities of the sIRB versus IRBs of participating research sites and a standard authorization agreement template that specifies these roles and responsibilities. One commenter recommended that this guidance clearly define who is responsible for ensuring investigator compliance, while another recommended that this guidance cover review of modifications to approved research, addition of research sites, and other post-approval monitoring issues including the relationship between the IRB and a data monitoring committee (such as a data and safety monitoring board). A number of commenters asked the NIH to provide guidance about liability as part of this guidance;

♦ Processes for local IRBs working with an sIRB, including what types of reviews will be performed by the local IRB (radiation safety review, pharmacy review, conflicts of interest) and best practices for maintaining oversight of research reviewed and approved by a non-institutional IRB. Additionally, one commenter requested that NIH encourage and provide guidance for institutional review of the impact the sIRB will have on the institution’s HRPP business goals, policies, accreditation status, tracking and management processes;

♦ Consent forms, including the process of consent approval by the sIRB and participating sites, and whether and how local institutions could alter an sIRB informed consent document to fit local needs;

♦ Plans to ensure quality and processes for institutions relying on an sIRB to question or appeal sIRB decisions, and to address and resolve issues arising from duplicate reviews.

In addition, commenters requested:

♦ Guidance and tools to enable sIRBs to consider local context issues. Specific guidance was requested on the process by which sIRBs would collect local information (e.g., through a standard form or through an ad hoc member or consultant with local context knowledge), and what types of information should be provided to sIRBs (e.g., how to apply state and local laws). One commenter also recommended that the NIH develop a set of guidelines for how the sIRB
would apply local standards, knowledge of institutional policies, institutional capacity issues, investigator and study staff qualifications, and local community and subject considerations to their reviews;

◆ An explanation of costs associated with development and maintenance of sIRBs and guidance on how the use of an sIRB should be proposed at the grant level, including a fee structure to help investigators incorporate sIRB review into their budgets;

◆ A more detailed description of the standards for permitting exceptions for sIRB review;

◆ A description of what resources, if any, NIH would make available to assist in training IRBs and researchers regarding single IRB review.

◆ Some of the commenters who requested guidance recommended that any NIH guidance on sIRBs be released along with or prior to the issuance of the final Policy.

Implementation of the Policy

In developing the final policy set out below, the NIH carefully considered the many thoughtful comments we received on the Draft NIH Policy on the Use of a Single Institutional Review Board (IRB) for Multi-Site Research (NOT-OD-15-026). While we found no compelling reason to narrow the essential scope of the final policy—it will cover all domestic sites of NIH-funded non-exempt multi-site studies as was proposed—we have clarified the policy intent and modified several provisions. The final policy is intended to apply only to studies where the same research protocol is being conducted at more than one site; it does not apply to studies that involve more than one site but the sites have different roles in carrying out the research. Applicants/offerors will be expected to submit a plan identifying the sIRB that will serve as the IRB of record for all study sites. It will be the responsibility of the applicant/offeror to assure that the sIRB is qualified to serve; the applicant’s plan will not be evaluated in peer review. The additional costs associated with sIRB review may be charged to grants or contracts as direct costs, provided that such costs are well-justified and consistently treated as either direct or indirect costs according to applicable cost principles in the NIH Grants Policy Statement and the FAR 31.202 (Direct Costs) and FAR 31.203 (Indirect Costs). Exceptions to the policy will be granted, as was proposed, if the use of an sIRB is prohibited by federal, state, or tribal laws or regulations. We will also grant exceptions where the federal, state, or tribal prohibition on the use of an sIRB is established by policy, and we will consider granting an exception if a request is made and a compelling justification provided for why an exception is needed. Such justifications could be for reasons other than that the sIRB is unable to meet the needs of a specific population, as was proposed in the draft policy. The final policy also clarifies that multi-site studies within ongoing, non-competing awards will not be expected to comply with the policy until a competing renewal application is submitted.

The NIH recognizes that the policy will begin a paradigm shift in IRB review.
As such, the final policy will not take effect until May 25, 2017. In the interim, the NIH will issue guidance and provide resources to assist awardees in adapting to the shift.

Guidance on how costs associated with sIRBs may be charged as direct versus indirect costs can be found in Guide Notice NOT-OD-16-109. Other guidance materials will be issued before the policy’s effective date and posted along with the policy on the following site: http://osp.od.nih.gov/office-clinical-research-and-bioethics-policy/clinical-research-policy/models-irb-review. Among other topics, the guidance will address:

- How costs associated with sIRBs may be charged as direct versus indirect costs;
- Considerations in the selection of the sIRB;
- The content of the sIRB plan that must be submitted with applications and proposals;
- Process for applicants/offerees to submit a request for an exception and process for NIH review of the request for exception;
- Roles and responsibilities of the sIRB and participating sites;
- Model authorization agreement that lays out the roles and responsibilities of each signatory;
- Models for gathering and evaluating information from all the reliant sites about community attitudes and the acceptability of proposed research;
- A model communication plan that identifies when and which documents are to be completed and shared with those involved so each may fulfill their responsibilities.

Finally, while the NIH anticipates that there will be challenges associated with implementation, we expect these to be short-lived. Once the transition to the new way of operating is made, the benefits of widespread use of sIRBs will outweigh any costs and, ultimately, reduce burdens to the research process. At the same time, the NIH will also closely monitor the implementation of the policy, consider its impact on research such as improvements in time to initiation of research and reduction of unnecessary burden, and be vigilant about any diminution in the protection of human subjects.

National Institutes of Health Policy on the Use of a Single Institutional Review Board for Multi-Site Research

Purpose

The National Institutes of Health (NIH) Policy on the Use of a Single Institutional Review Board for Multi-Site Research establishes the expectation that all sites participating in multi-site studies involving non-exempt human subjects research funded by the National Institutes of Health (NIH) will use a single Insti-
tutional Review Board (sIRB) to conduct the ethical review required by the Department of Health and Human Services regulations for the Protection of Human Subjects at 45 CFR Part 46. This policy, which is consistent with 45 CFR Part 46.114, is intended to enhance and streamline the process of IRB review and reduce inefficiencies so that research can proceed as expeditiously as possible without compromising ethical principles and protections for human research participants.

Scope and Applicability
This policy applies to the domestic sites of NIH-funded multi-site studies where each site will conduct the same protocol involving non-exempt human subjects research, whether supported through grants, cooperative agreements, contracts, or the NIH Intramural Research Program. It does not apply to career development, research training or fellowship awards.

This policy applies to domestic awardees and participating domestic sites. Foreign sites participating in NIH-funded, multi-site studies will not be expected to follow this policy.

Consistent with the Roles and Responsibilities section, applicants/offerors will be expected to include a plan for the use of an sIRB in the applications/proposals they submit to the NIH. The NIH’s acceptance of the submitted plan will be incorporated as a term and condition in the Notice of Award or in the Contract Award. This policy also applies to the NIH Intramural Research Program.

Definitions
The **Authorization Agreement**, which is also called a reliance agreement, is the agreement that documents respective authorities, roles, responsibilities, and communication between an institution/organization providing the ethical review and a participating site relying on the sIRB.

A **multi-site study** uses the same protocol to conduct non-exempt human subjects research at more than one site.

**Participating site** in a multi-site study is a domestic entity that will rely on the sIRB to carry out the site’s IRB review of human subjects research for the multi-site study.

**sIRB** is the selected IRB of record that conducts the ethical review for participating sites of the multi-site study.

Roles and Responsibilities
**Applicant/Offeror.** In the application/proposal for research funding, the applicant/offeror is expected to submit a plan describing the use of an sIRB that will be selected to serve as the IRB of record for all study sites. The plan should include a statement confirming that participating sites will adhere to the sIRB Policy and describe how communications between sites and sIRB will be handled. If, in delayed-onset research, an sIRB has not yet been identified, applications/proposals should include a statement that awardees will follow this Policy and communicate plans to use a registered IRB of record to the funding NIH Institute/Center prior to initiat-
ing a multi-site study. The applicant/offeree may request direct cost funding for
the additional costs associated with the establishment and review of the multi-site
study by the sIRB, with appropriate justification; all such costs must be reasonable
and consistent with cost principles, as described in the NIH Grants Policy Statement
and the Federal Acquisition Regulation (FAR) 31.302 (Direct Costs) and FAR 31.203
(Indirect Costs).

Awardees. Awardees are responsible for ensuring that authorization agreements
are in place; copies of authorization agreements and other necessary documentation
should be maintained in order to document compliance with this policy, as needed.
As appropriate, awardees are responsible for ensuring that a mechanism for com-
munication between the sIRB and participating sites is established. Awardees may
delegate the tasks associated with these responsibilities.

Funding Institute or Center (IC). Funding ICs are responsible for management
and oversight of the award, including communicating with the awardee regard-
ing the implementation of its proposed plan to comply with the sIRB Policy. In the
event that questions arise about the awardee’s plan, including the IRB that has been
selected to serve as the sIRB, the funding IC will work with the awardee to resolve
them.

sIRB. The sIRB is responsible for conducting the ethical review of NIH-funded
multi-site studies for participating sites. The sIRB will be expected to carry out the
regulatory requirements as specified under the HHS regulations at 45 CFR Part 46.
In reviewing multi-site research protocols, the sIRB may serve as a Privacy Board, as
applicable, to fulfill the requirements of the HIPAA Privacy Rule for use or disclo-
sure of protected health information for research purposes. The sIRB will collabo-
rate with the awardee to establish a mechanism for communication between the
sIRB and the participating sites.

Participating Site. All sites participating in a multi-site study are expected to
rely on an sIRB to carry out the functions that are required for institutional compli-
ance with IRB review set forth in the HHS regulations at 45 CFR 46. Participating
sites are responsible for meeting other regulatory obligations, such as obtaining
informed consent, overseeing the implementation of the approved protocol, and
reporting unanticipated problems and study progress to the sIRB. Participating
sites must communicate relevant information necessary for the sIRB to consider lo-
cal context issues and state/local regulatory requirements during its deliberations.
Participating sites are expected to rely on the sIRB to satisfy the regulatory require-
ments relevant to the ethical review. Although IRB ethical review at a participat-
ing site would be counter to the intent and goal of this policy, the policy does not
prohibit any participating site from duplicating the sIRB. However, if this approach
is taken, NIH funds may not be used to pay for the cost of the duplicate review.

Exceptions

Exceptions to this policy will be made where review by the proposed sIRB would be
prohibited by a federal, tribal, or state law, regulation, or policy. Requests for excep-
tions that are not based on a legal, regulatory, or policy requirement will be consid-
ered if there is a compelling justification for the exception. The NIH will determine whether to grant an exception following an assessment of the need.

Effective Date
This policy applies to all competing grant applications (new, renewal, revision, or resubmission) with receipt dates on or after May 25, 2017. Ongoing, non-competing awards will not be expected to comply with this policy until the grantee submits a competing renewal application. For contracts, the policy applies to all solicitations issued on or after May 25, 2017. For the intramural program, the policy applies to intramural multi-site studies submitted for initial review after May 25, 2017.

\[152.11\] **FAQs on NIH Policy on the Use of a Single Institutional Review Board for Multi-Site Research**

National Institutes of Health

**What types of studies are expected to use a single IRB (sIRB) under the new NIH Policy?**

The sIRB policy applies to the domestic sites of NIH-funded multi-site studies where each site will conduct the same protocol involving non-exempt human subjects research, whether supported through grants, cooperative agreements, contracts, or the NIH Intramural Research Program. It does not apply to career development, research training or fellowship awards. Under the policy, “multi-site” is defined as two or more sites. Foreign sites participating in NIH-funded, multi-site studies will not be expected to follow this policy. The policy recognizes that it may not always be possible to use an sIRB, and it provides for exceptions.

**Are there any exceptions to the sIRB policy?**

Exceptions to the sIRB policy will be made when review by the proposed sIRB would be prohibited by federal, tribal, or state laws, regulations or policies. Requests for exceptions that are not based on a legal, regulatory, or policy requirement will be considered if there is a compelling justification for the exception. NIH will determine whether to grant an exception following an assessment of the need.

**Why is NIH promoting the use of a sIRB for multi-site research studies?**

The use of a single IRB of record for multi-site studies will help streamline the IRB review process and remove redundant hurdles to the initiation of such studies. The policy will allow research to proceed as effectively and expeditiously as possible. Eliminating duplicative IRB review is expected to reduce unnecessary administrative burdens and systemic inefficiencies while maintaining appropriate human subject protections. The shift in IRB workload away from redundant reviews is also expected to allow IRBs to concentrate more time and attention on the review of single site protocols, thereby enhancing research oversight.

**Who is responsible for selecting the sIRB and when must this be done?**

In the application/proposal for research funding, the applicant/offeror is expected to submit a plan describing the use of an sIRB that would be selected to serve as the IRB of record for all study sites. Where possible, the plan would include the registration number issued to the IRB by the HHS Office for Human Research Protections. For delayed-onset research, where the IRB cannot be identified, applications/proposals should include a statement that awardees will follow the sIRB policy and communicate plans to use a registered IRB of record to the funding NIH Institute/Center prior to initiating a multi-site protocol.

**What will happen if the applicant is not able to identify the sIRB, for example,
because the sites are in disagreement about the selection?
If the sIRB cannot be identified prior to award, terms and conditions restricting human subjects research will be placed on the award. If sites are unable to agree on the sIRB, the IC funding the research will assist in resolving the matter. The sIRB will need to be identified before the release of funds under the award.

How will the sIRB policy be enforced?
Compliance with the sIRB policy will be a term and condition of award. Failure to comply with the terms and conditions of an award may result in enforcement actions, including termination of funding.

What is the role of the human subjects protections programs at a site that is part of a multi-site trial but not the site of the sIRB?
Except for the IRB review described in HHS regulations (45 CFR 46) human subjects protections programs at participating sites will be responsible for meeting all of their current responsibilities. Participating sites are also responsible for meeting other regulatory obligations, such as obtaining informed consent, overseeing the implementation of the approved protocol, and reporting unanticipated problems and study progress to the sIRB. Participating sites must communicate relevant information necessary for the sIRB to consider local context issues and state/local regulatory requirements during its deliberations.

Where can I find more information on the sIRB policy?
More information about the sIRB policy may be found on the OSP Website. NIH will continue to provide additional resources and guidance to this page prior to the implementation date.

Additionally, questions about the sIRB policy may be sent to SingleIRBPolicy@mail.nih.gov

When does the sIRB policy take effect?
The sIRB policy applies to all competing grant applications (new, renewal, revision, or resubmission) with receipt dates on or after May 25, 2017, all contract solicitation issued on or after May 25, 2017, and all NIH Intramural studies submitted for initial IRB review after May 25, 2017.

What is the difference between a central IRB and a sIRB?
Both are designed to help streamline IRB review, and the terms are sometimes used interchangeably. However, the term central IRB is generally used to refer to an IRB that reviews many different research protocols. Central IRBs are also sometimes referred to as independent IRBs. As used in the policy, the term single IRB refers to the IRB (which may be a central IRB or an institution-based IRB) that is selected to serve as the one IRB of record for the review of one protocol that will be carried out at many sites.
NIH Policy on Dissemination of NIH-Funded Clinical Trial Information

Issued by

National Institutes of Health (NIH)

Purpose

Summary

The National Institutes of Health (NIH) is issuing this policy to promote broad and responsible dissemination of information from NIH-funded clinical trials through ClinicalTrials.gov. The policy establishes the expectation that all investigators conducting clinical trials funded in whole or in part by the NIH will ensure that these trials are registered at ClinicalTrials.gov, and that results information of these trials is submitted to ClinicalTrials.gov. The policy is complementary to the statutory and regulatory reporting requirements. These are section 402(j) of the Public Health Service Act, as amended by Title VIII of the Food and Drug Administration (FDA) Amendments Act of 2007 (FDAAA), and the regulation Clinical Trial Registration and Results Information Submission, at 42 CFR Part 11. Hereafter, we refer to section 402(j) as the statute and 42 CFR Part 11 as the rule or regulation. This policy as well as the rule were posted in the Federal Register.

Supplemental Information

On November 19, 2014, and in tandem with the publication of the Notice of Proposed Rulemaking (NPRM) on Clinical Trial Registration and Results Submission, the NIH issued a complementary draft policy for public comment on the Dissemination of NIH-funded Clinical Trial Information\textsuperscript{1,2}. The draft policy proposed that all NIH-funded awardees and investigators conducting clinical trials, funded in whole or in part by the NIH, regardless of study phase, type of intervention, or whether they are subject to the statutory registration and results information submission requirements, would be expected to ensure that those clinical trials are registered and results information is submitted to ClinicalTrials.gov. It further stated that submission of the same type of registration and results information would be expected and in the same timeframes as the trials subject to the statute, and that this information would be made publicly available through the ClinicalTrials.gov website.

The NIH received approximately 240 public comments on its proposed policy. The comments came from a range of stakeholders including researchers, academic/
research institutions, medical practitioners, patients, patient/disease advocacy groups, scientific/professional societies and associations, device manufacturers, trade associations, not-for-profit non-governmental organizations, and the general public. The NIH appreciated the public interest in the proposed policy and the time made and effort taken by stakeholders to provide comments. The NIH carefully considered those comments in the development of the final policy. In the next section, we provide an overview of the comments on the proposed policy. Because those in compliance with the policy would be expected to follow specific provisions of the rule, a number of commenters on the policy reiterated comments that they submitted to the docket in response to the NPRM. Since these comments are discussed at length in the preamble of the rule, we are limiting the discussion of comments here primarily to those that identified issues specific to the policy, such as its scope, applicability, and impact on NIH-funded awardees and investigators.

Overview of the Public Comments
A significant majority of the public comments were supportive of the proposed NIH policy and of its application to the full range of NIH-funded clinical trials. Most commenters appreciated the impetus behind the policy and agreed that it was important to provide ways other than journal publication for clinical trial results to be disseminated and made publicly available to researchers, health care providers, and patient communities. They recognized that increased availability of information from NIH-funded clinical trials would help researchers by informing the design and development of their future studies, address the needs of patients and health care providers seeking information about NIH-funded trials, and serve the public’s interest by preventing duplication of unsafe and unsuccessful trials and mitigating publication bias. They also agreed that improving the availability of clinical trial information will strengthen the public’s trust in biomedical research as well as assure volunteers that their participation in clinical trials has advanced knowledge on human health and disease. A number of commenters also suggested that the policy is particularly appropriate because NIH-funded clinical trials are supported by public funding, and recipients of those funds have a special obligation to ensure that the nation’s investment is maximized.

A number of comments from academic investigators and stakeholder organizations were supportive of the policy and its goals. Others, however, disagreed with the policy, suggesting that it was ill-advised and/or unnecessary. These commenters suggested that the benefit of greater transparency was outweighed by the burden and cost of the policy to those who conduct clinical trials and that the NIH had not made a sufficient case for the policy or that it was not evidence-based. Some commenters suggested that the NIH should simply encourage investigators to be more transparent or that the NIH’s public access policy made the policy unnecessary since it requires NIH-funded investigators to make their published articles publicly available through PubMed Central.

Scope and Applicability of the Policy
Although the majority of commenters fully supported the scope of the policy, i.e.,
that it should apply to NIH-funded clinical trials of FDA-regulated drugs regardless of phase, small feasibility studies of devices, and trials of interventions not regulated by FDA, including surgical and behavioral interventions, there were comments suggesting that the scope was too narrow, or conversely, too broad.

One commenter suggested that the policy ought to encompass more detailed summary results, such as Clinical Study Reports, as well as de-identified individual patient-level data. One commenter suggested that the NIH should consider extending the policy to preclinical in vivo (laboratory) animal studies because the arguments for the registration and required reporting of preclinical in vivo (laboratory) animal studies are similar to those of human clinical trials. Some commenters suggested that the policy should be retroactive and apply to clinical trials that are underway as of the policy’s effective date as well as those that have already been completed as of the effective date.

On the other hand, there were other comments suggesting that the policy should not apply to phase 1 or so called phase 0 trials, pilot trials designed to examine the feasibility of an approach, trials mounted by an investigator at a small organization, or trials that are unable to enroll a statistically significant number of participants. One suggested that even pilot trials that reach their enrollment target should not be expected to submit results information because the results might be more misleading than helpful. Another proposed that reporting on phase 1 clinical trials should be limited to adverse events information because these trials are designed to assess safety rather than efficacy, and reporting non-safety outcomes could be misleading. Another suggested that clinical trials not covered under the statute should not submit adverse event information unless a regulatory authority or equivalent body has first performed an analysis of the event in order to prevent public misunderstanding. Another commenter suggested that submission of data from early phase research could divert limited research resources and time from phase 3 studies. Another suggested that only information about phase 3 clinical trials should be included in ClinicalTrials.gov because information about early stage trials could confound, rather than enhance, public understanding of human health and could, thereby, inadvertently adversely affect patient safety.

One commenter suggested that the policy should apply only to the registration of clinical trials, not the submission of results information. This commenter asserted that registration information was sufficient because any interested party could follow up with an investigator to learn more about the trial and because submission of registration information takes a fraction of the time needed to submit results information.

There were a few commenters who took issue with the application of the policy to trials that are only partially funded by the NIH. They asserted that the policy would entail the disclosure of confidential commercial information and that the NIH’s authority to do so is limited to a trial that is wholly NIH-funded and involves a product with research and development costs wholly government-funded. A few other commenters suggested that the policy should exclude clinical trials that use NIH-supported infrastructure, but involve no NIH funds.
**NIH Definition of Clinical Trial**

Some commenters addressed the NIH definition of clinical trial, which is key to determining the policy’s applicability. There was support for the breadth of the definition, i.e., encompassing all interventional studies with biomedical outcomes (e.g., pharmacokinetic and behavioral outcomes, as well as health-related outcomes). One commenter, however, thought more elaboration on the definition was needed to clarify the meaning of “health-related biomedical or behavioral outcomes.” They thought that without such specificity, the definition might be interpreted to exclude studies that contain valuable information for public health research, science, and clinical medicine. Commenters believed that addressing this issue would be vital to ensure a common understanding that the NIH policy applies to all clinical trials involving a biomedical or behavioral intervention. Another suggested that a study involving only one participant should not be considered a clinical trial since a trial with a sample size of one would not provide any valid data to share with the public.

Some commenters noted that the wording of the NIH definition was not identical to the wording of the definition of clinical trial in the proposed rule or to how other organizations, e.g., the World Health Organization (WHO), International Committee of Medical Journal Editors (ICMJE), and Centers for Medicare & Medicaid Services (CMS), use the term. They were concerned that investigators would have difficulty understanding their obligations under the policy and under the rule and in meeting requirements of others. They called for reconciliation of any actual or apparent differences in the definitions.

A commenter urged the NIH to issue guidance to help determine whether a study is a clinical trial under the definition and to clarify how disagreements in the matter would be resolved and communicated.

**Results Information Submission Timeline**

A few commenters raised concerns about the proposed rule’s timeline for reporting results information, asserting that 12 months after the primary completion date of the clinical trial (i.e., the date of final data collection for the primary outcome measure) is too soon, particularly for NIH-funded academic investigators. These commenters suggested that academic investigators will have more difficulty meeting the timeframe because they must also spend time teaching, fulfilling clinical care responsibilities, and writing grant applications. Another commenter suggested that a 12-month timeframe would also be more challenging for academic investigators because, unlike industry investigators, they generally cannot count on support from a central administrative service to help them carry out their reporting responsibilities. Decentralization of information in academic centers would also present a particular challenge to those covered by the NIH policy, according to another commenter, who also suggested that the mobility of new investigators may make it difficult to meet timelines. These commenters urged the NIH to allow a longer submission timeframe, e.g., 18 or 24 months. A few noted that providing more time would also give investigators time to prepare journal publications, and one also expressed concern about the possibility that journal editors will begin to consider submission
of results information to ClinicalTrials.gov as prior publication, which could thwart journal publication altogether.

**Structured Results Data Elements**

A few commenters suggested that the data submission structure, which is determined by the provisions of the statute, does not work well for clinical trial types that will be covered only the policy, e.g., phase 1 trials of drugs/biologics, small feasibility device studies, trials of social and behavioral interventions, or those with non-standard designs. These commenters thought that other fields would need to be added to the ClinicalTrials.gov to enable investigators to report data elements for those trials appropriately and accurately. They also suggested increasing the character limit on data fields to allow for more careful and nuanced explanations. Commenters also suggested that if the ClinicalTrials.gov cannot accommodate these types of trials, investigators should be exempted from the policy. One commenter requested that an additional data element should be included to allow an investigator to indicate that the trial’s hypothesis had been confirmed.

**Protecting Privacy**

One commenter raised a concern about the policy’s impact on the privacy of clinical trial participants suggesting that it might be easy to re-identify participants in many NIH-funded pilot studies with small sample sizes. The commenter pointed to the five percent threshold for non-serious adverse events and site location information as the data elements creating the vulnerability. The commenter urged the NIH to allow an investigator to obtain a waiver from results information submission where participant privacy was at risk.

**Compliance Issues**

The proposed policy noted that compliance with the policy would be a term and condition of award and that non-compliance may provide a basis for enforcement actions, including termination. A few commenters discussed the importance of compliance. One suggested that the NIH should take compliance records into account when considering future applications for funding. They suggested that such an approach could be more effective than terminating funding of a current grant since most of the research may already be completed. Another thought that making compliance a term and condition of award was important and that it would incentivize good behavior and help change attitudes about the value of enhancing availability of clinical trial information.

Other commenters raised concerns about the costs that will be incurred by NIH-funded academic institutions to ensure that clinical investigators are following the policy. They suggested institutions will need to provide more administrative support and other resources to help investigators comply and that this would be difficult given the indirect cost cap of 26 percent. Commenters urged the NIH to allow the time and effort required for ClinicalTrials.gov compliance to be included as a direct cost on NIH grants. Another commenter suggested that the increased results
information submissions brought on by the NIH policy will stretch the NIH’s capabilities and that it will be important for the NIH to ensure that sufficient resources are available to manage high volume data uploads and customer service requests.

**Overview of Final NIH Policy**

The NIH considered all the comments received on the proposed policy as well as those that were submitted in response to the NPRM. There was overwhelming support for both the proposed policy and the NPRM, particularly among concerned citizens, scientific societies, medical practitioners, and individual scientists. There were also concerns expressed, particularly in the comments from academic commenters. We appreciate those concerns and understand that the policy will create additional work for many investigators. However, we believe that the work should not be seen as a burden, but, rather, an inherent part of an investigator’s commitment to the advancement of science. The benefits will, in the long run, accrue to the investigators as well as to the public, patients, and the enterprise as a whole because transparency will improve future research designs and maximize the public’s investment – and their trust – in research. Equally important, it will help investigators fulfill the ethical obligation they have to clinical trial participants, namely to ensure that the findings from their participation contribute to generalizable knowledge and the advancement of public health.

As we noted in the preamble to the proposed policy, a fundamental premise of all NIH-funded research is that the results of such work must be disseminated in order to contribute to the general body of scientific knowledge and, ultimately, to the public health. The NIH awardees have always been expected to make the results of their activities available to the research community and to the public at large because it is intrinsic to the scientific process. In research involving human beings, moreover, scientists also have an ethical obligation to ensure that the burden and risk that volunteers assume by participating in research comes to something, at the very least by ensuring that others are aware of the study and that its findings contribute to the advancement of human health.

We disagree with commenters who suggested that there is no need for coverage of certain types of trials, such as early exploratory trials, small trials, trials assessing only safety, or trials that terminate before reaching enrollment targets. The benefits of transparency and the need to fulfill the ethical obligation to participants is as relevant to these types of trials as to any other type. We were also not persuaded that the timeframe for results information submission should be longer for academic investigators because of their competing responsibilities or that they should be allowed more time to publish their results in a journal. The timeframe of 12 months from the primary completion date should provide enough time for investigators to organize their data and submit results information. We are also confident that academic institutions can develop central support services as necessary to assist investigators should they need it. We also believe that 12 months represents an appropriate balance between investigators’ interests and the interests of the public in having access to the results of a publicly funded trial. In addition, it will be possible to
delay results information submission for up to two years beyond the initial deadline with a certification that regulatory approval of the trial product is being sought.

Some commenters suggested that a policy on clinical trial information dissemination is not needed because it duplicates other NIH policies. This policy is certainly in keeping with our principles, longstanding expectations, and other policies as well as the more recent broad policy call for scientific agencies to increase public access to scientific data. However, it does not duplicate any other NIH policy, nor does any other NIH policy accomplish what this one will.

Some commenters also contended that this policy is not necessary because the results of clinical trials will be published or because they can be obtained via direct requests to the trial’s principal investigator. In fact, research has shown that the results of a significant portion of clinical trials are not published or published in a timely manner. For example, a 2012 study of NIH-funded clinical trials found that after a median of 51 months following trial completion, 32 percent were unpublished. A more recent study of the trial publication rate among 51 U.S. academic medical centers found that 43 percent of their clinical trials were unpublished two years after the trial was completed. While the ability to seek results information from the original investigator is useful to facilitate collaborations, to access individual-level data, and to gain insights from those who conducted the trial, it is not a surefire way to increase access to trial results nor is it efficient or transparent, particularly for the public.

We believe that the public availability of clinical trial results information will be beneficial to all parties in the long run, including those who are covered by this policy. All investigators stand to benefit from this policy. For example, science may progress more quickly because investigators will be able to learn from trials to which they otherwise would not have had access because they were unpublished. In addition, the public availability of results information helps investigators design trials and Institutional Review Boards (IRBs) review proposed trials, by allowing them to weigh the proposed study’s risks and benefits against a more complete evidence base than is currently available through the scientific literature. Submission and posting of results information will also help investigators avoid repeating trials on interventions that have been found to be unsafe or unsuccessful while also providing access to information that may help verify findings.

For all of these reasons, we have not changed the essential contours of the policy. In terms of scope, the policy still applies to all NIH-funded awardees and investigators conducting clinical trials funded in whole or in part by the NIH regardless of study phase, type of intervention, or whether they are subject to the statute and to the rule. It clarifies that the policy is an expectation, that applicants and offerors are required to submit a plan outlining how they will meet the policy’s expectations, and, that upon receipt of an award, an awardee will be obligated to adhere to their plan through the terms and conditions of the award. The required plan can be a brief statement explaining whether the applicant/offeror intends to register and submit results information to ClinicalTrials.gov as outlined in the policy or to meet the expectations in another manner. It is important to remember that an NIH-
funded clinical trial that meets the definition of an applicable clinical trial is subject to the regulation and, therefore, register and submission of results information to ClinicalTrials.gov is a requirement.

The policy applies to both the extramural and intramural programs. For the NIH extramural program, the policy applies to applications for funding including for grants, other transactions, and contracts submitted on or after the policy’s effective date that request support for the conduct of a clinical trial that is initiated on or after the policy’s effective date. This means that the policy does not apply to clinical trials in ongoing, non-competing awards, but that it will apply if the grantee submits a competing renewal application that includes a new clinical trial, i.e., a clinical trial initiated on or after the effective date of the policy. For the intramural program, the policy applies to clinical trials initiated on or after the policy’s effective date. The policy’s effective date is January 18, 2017. The policy clarifies that a clinical trial that uses NIH-supported infrastructure, but does not receive NIH funds to support its conduct, is not subject to the policy.

The policy outlines the responsibilities for NIH-funded investigators according to whether the trial is covered by the policy only or also the rule. For those covered by the policy only, NIH-funded awardees and investigators will be expected to submit the same registration and results information in the same timeframes as those subject to the statute and rule. The timeline for registration is not later than 21 calendar days after the enrollment of the first participant. The standard timeline for results information is not later than one year after the trial’s primary completion date, but the policy also allows for delayed submission of results information in certain circumstances for up to two additional years for trials of products regulated by the FDA that are unapproved, unlicensed, or uncleared or for trials of products for which approval of a new use is being sought.

Although the policy does not apply to NIH-funded clinical trials initiated before the effective date, we encourage all ongoing NIH-funded clinical trials to follow it. It is also critical for investigators conducting NIH-funded applicable clinical trials that are subject to the statute and rule to be sure they are in compliance with those requirements.

The policy continues to use the NIH definition of “clinical trial” as proposed in the draft policy to determine which research studies are covered by the policy. This definition was developed in 2014 to reflect the NIH research mission and the scope of clinical trials within the NIH portfolio. With regard to the concern expressed by a public commenter that the phrase “health-related biomedical or behavioral outcomes” might be too narrow, we note that the definition considers biomedical and behavioral outcomes to be health-related outcomes in interventional studies that meet the other components of the definition. Also, regarding the concern that the wording of the definitions of clinical trial in this policy and the rule differ, this is so mainly in reference to outcomes, i.e., the NIH definition explicitly references behavioral outcomes whereas the definition in the rule encompasses them within the term “health related.” These distinctions are not significant in terms of defining what is covered by the NIH policy. All NIH-funded clinical trials, whether they
are assessing biomedical or behavioral outcomes or whether they are employing an FDA regulated product, are covered by the policy. An NIH-funded clinical trial assessing a behavioral intervention that is not regulated by the FDA would meet both definitions of clinical trial, and, thereby, be covered by the policy. However, such a trial would not be subject to the rule because it does not meet the rule’s definition of “applicable clinical trial.” Guidance available on the NIH’s website can help awardees and investigators understand whether a research study is a clinical trial for purposes of the NIH policy (see first website listed below). Questions should be directed to the NIH program staff. To understand whether an NIH-funded clinical trial is also subject to the statute and the rule, awardees and investigators should look to the rule’s definition of “applicable clinical trial.”

NIH-funded awardees and investigators will be expected to follow the provisions of the rule in terms of when they register their trials, what information they provide as part of the registration process, when they submit their results information, and what results information is submitted. All of the alternate approaches in the rule will also be available to those covered by the policy, e.g., for delayed posting of device registration information, delayed submission of results information for trials involving unapproved products or products for which a new use is sought, extensions for good cause, and waivers that might be needed for privacy or national security reasons.

With regard to the concern that ClinicalTrials.gov is not set up to accept NIH-funded trials that are small or exploratory in nature or involve behavioral interventions, it is important to note that the ClinicalTrials.gov does accommodate the submission of all trial types and that a variety of study and trial types have been entered into ClinicalTrials.gov since its inception. In addition, ClinicalTrials.gov has resources available to assist investigators in navigating the registration and results information submission processes. These resources will continue to be updated over time to be responsive to investigators’ needs and the evolving clinical research enterprise. Therefore, it should not be necessary for a clinical investigator of an NIH-funded clinical trial to seek an exemption from the policy for reasons related to the capacity of ClinicalTrials.gov to accommodate all types of clinical trials.

Registration and results information submission to ClinicalTrials.gov complements publication of trial results in peer-reviewed scientific journals. Information submitted to ClinicalTrials.gov is displayed in a structured way and includes a complete list of all pre-specified outcome measures and all adverse events. Journal articles, on the other hand, typically focus on a select set of outcome measures and adverse events and include background and discussion of the implications of the results. Information submitted to ClinicalTrials.gov undergoes a quality control review whereas journal articles will be peer reviewed. With regard to the concern that submission of results could make journal publication more difficult or impossible, the ICMJE has stated that submission of summary results to ClinicalTrials.gov will not be considered prior publication and will, thus, not interfere with journal publication. We encourage all NIH-funded investigators to publish the results of their studies in peer-reviewed journals.
We have no doubt that this policy will be beneficial for the research community as well as the public generally, but we recognize that adhering to it will be a new obligation. We will provide additional guidance to facilitate implementation and help awardees and investigators understand the policy as well as the tasks described in the rule that they will be expected to undertake. In terms of the costs of complying with the policy, grantees are permitted to charge the salaries of administrative and clerical staff as a direct cost. Such staff could assist investigators in meeting their responsibilities under the policy. In addition, administrative costs can be covered through indirect cost recovery.

We intend for this policy to benefit all communities who seek information about NIH-funded clinical trials, and we are confident that the benefits of transparency will become evident soon after the policy is implemented. We plan to evaluate the implementation and impact of the policy from the perspective of those who comply with it as well as from the perspective of ClinicalTrials.gov users, including patients, providers, and investigators.

We look forward to engaging with NIH-funded investigators and awardees as they work to meet the expectations of this important public policy. Information to assist applicants, offerors, and investigators is available at the following websites. The NIH will continue to add guidance materials to these sites as the policy’s implementation continues.

**NIH Policy on Dissemination of NIH-Funded Clinical Trial Information**

**Purpose**

The National Institutes of Health (NIH) Policy on Dissemination of NIH-funded Clinical Trial Information establishes the expectation that all NIH-funded awardees and investigators conducting clinical trials, funded in whole or in part by the NIH, will ensure that their NIH-funded clinical trials are registered at, and that summary results information is submitted to, ClinicalTrials.gov for public posting. The purpose of the policy is to promote broad and responsible dissemination of information from NIH-funded clinical trials through ClinicalTrials.gov. Disseminating this information supports the NIH mission to advance the translation of research results into knowledge, products, and procedures that improve human health.

This policy is complementary to requirements in the Clinical Trial Registration and Results Information Submission regulation at 42 CFR Part 11, hereinafter referred to as the regulation. Clinical trials that are subject to the regulation are, in general, clinical trials of drug, biological, and device products regulated by the Food and Drug Administration (FDA), except phase 1 trials of drug and biological prod-
ucts and small feasibility studies of device products. A pediatric post-market surveillance study of a device product required by the FDA is also subject to the regulation. Clinical trials subject to the regulation are generally called “applicable clinical trials.” Applicable clinical trials are required to be registered in ClinicalTrials.gov not later than 21 calendar days after the enrollment of the first participant. Results information from those trials generally must be submitted not later than one year after the trial’s primary completion date. Submission of results information can be delayed in certain circumstances for up to two additional years for trials of products regulated by the FDA that are unapproved, unlicensed, or uncleared or for trials of products for which approval, licensure, or clearance of a new use is being sought.

**Scope and Applicability**

This policy applies to all NIH-funded clinical trials regardless of study phase, type of intervention, or whether they are subject to the regulation. For example, NIH-funded phase 1 clinical trials of an FDA-regulated product are covered by this policy as are clinical trials studying interventions not regulated by the FDA, such as behavioral interventions. As such, the policy encompasses all NIH-funded clinical trials, including applicable clinical trials subject to the regulation. All NIH-funded clinical trials will be expected to register and submit results information to ClinicalTrials.gov.

This policy applies to clinical trials funded in whole or in part through the NIH extramural and intramural programs. For the NIH extramural program, the policy applies to applications for funding including for grants, other transactions, and contracts submitted on or after the policy’s effective date that request support for the conduct of a clinical trial that is initiated on or after the policy’s effective date. For the NIH intramural program, the policy applies to clinical trials initiated on or after the policy’s effective date.

This policy does not apply to a clinical trial that uses NIH-supported infrastructure but does not receive NIH funds to support its conduct.

**Responsibilities**

As part of their applications or proposals, applicants and offerors seeking NIH funding will be required to submit a plan for the dissemination of NIH-funded clinical trial information that will address how the expectations of this policy will be met. NIH-funded awardees and investigators conducting clinical trials funded in whole or in part by the NIH will be required to comply with all terms and conditions of award, including following their plan for the dissemination of NIH-funded clinical trial information.

Consistent with those terms and conditions, the responsibilities of such awardees and investigators will fall within one of the three categories. The category depends on whether, under the regulation, the clinical trial is also an “applicable clinical trial” and the awardee or investigator is the “responsible party.”

1. If the NIH-funded clinical trial is an applicable clinical trial under the regulation and the awardee or investigator is the responsible party, the awardee or investigator will ensure that all regulatory requirements are met.
2. If the NIH-funded clinical trial is an applicable clinical trial under the regulation but the awardee or investigator is not the responsible party, the awardee or investigator will coordinate with the responsible party to ensure that all regulatory requirements are met.

3. If the NIH-funded clinical trial is not an applicable clinical trial under the regulation, the awardee or investigator will be responsible for carrying out the tasks and meeting the timelines described in regulation. Such tasks include registering the clinical trial in ClinicalTrials.gov and submitting results information to ClinicalTrials.gov.

In addition, informed consent documents for clinical trials within all three categories are to include a specific statement relating to posting of clinical trial information at ClinicalTrials.gov.

Each NIH-funded clinical trial should have only one entry in ClinicalTrials.gov that contains its registration and results information. Awardees and investigators need not and should not create a separate record of the applicable clinical trial to comply with this policy.

The NIH will publicly post registration information and results information in ClinicalTrials.gov.

Definitions

Clinical Trial. For purposes of this policy, a “clinical trial” means “a research study in which one or more human subjects are prospectively assigned to one or more interventions (which may include placebo or other control) to evaluate the effects of those interventions on health-related biomedical or behavioral outcomes.”

This definition encompasses phase 1 trials of FDA-regulated drug and biological products, small feasibility studies of FDA-regulated device products, and studies of any intervention not regulated by the FDA, e.g., behavioral interventions. This definition of “clinical trial” is broader than the term “applicable clinical trial” as defined in the regulation.

Responsible Party. In the policy, the awardee or the investigator is responsible for meeting the expectations of this policy. In the regulation, a “responsible party” means, in part, “with respect to a clinical trial, the sponsor of the clinical trial, as defined in 21 CFR 50.3 (or any successor regulation); or the principal investigator of such clinical trial if so designated by a sponsor, grantee, contractor, or awardee, so long as the principal investigator is responsible for conducting the trial, has access to and control over the data from the clinical trial, has the right to publish the results of the trial, and has the ability to meet all of the requirements under [42 CFR Part 11] for the submission of clinical trial information.”

Primary Completion Date. In the policy, this term has the same meaning as the term “primary completion date” in the regulation, which is “the date that the final subject was examined or received an intervention for the purposes of final collection of data for the primary outcome, whether the clinical trial concluded according to the pre-specified protocol or was terminated.”
Registration Information. In the policy, this term has the same meaning as the term “registration information” in the regulation. In the regulation, registration information consists of descriptive information, recruitment information, location and contact information, and administrative data.8

Results Information. In the policy, this term has the same meaning as the term “results information” in the regulation. In the regulation, results information includes participant flow, demographic and baseline characteristics, outcomes and statistical analyses, adverse events, the protocol and statistical analysis plan, and administrative information.9

Compliance
If the clinical trial is NIH-funded in whole or in part, expectations for clinical trial registration and summary results submission will be included in the terms and conditions of the award. Failure to comply with the terms and conditions of the NIH award may provide a basis for enforcement actions, including termination, consistent with 45 CFR 75.371 and/or other authorities, as appropriate. If the NIH-funded clinical trial is also an applicable clinical trial, non-compliance with the requirements specified in 42 USC 282(j) and 42 CFR Part 11 may also lead to the actions described in 42 CFR 11.66.

Effective Date
This policy is effective January 18, 2017.

Footnotes
1. ClinicalTrials.gov is operated by the National Library of Medicine within the NIH.
2. The Clinical Trial Registration and Results Information Submission regulation at 42 CFR Part 11 was issued in the Federal Register in September 2016. The regulation implements section 402(j) of the Public Health Service Act.
4. Note that the regulation also includes a definition of “clinical trial.” That definition is “a clinical investigation or a clinical study in which human subject(s) are prospectively assigned, according to a protocol, to one or more interventions (or no intervention) to evaluate the effect(s) of the intervention(s) on biomedical or health related outcomes” (see 42 CFR 11.10 (a)). For the purposes of this policy, the regulatory definition and the definition in this policy are treated as synonymous.
5. In the regulation, applicable clinical trial is defined as an applicable device clinical trial or an applicable drug clinical trial. The regulation defines an applicable device clinical trial to mean, in part, “a prospective clinical study of health outcomes comparing an intervention with a device product subject to section 510(k), 515, or 520(m) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 360(k), 21 U.S.C. 360e, 21 U.S.C. 360j(m)) against a control in human subjects (other than a small clinical trial to determine the feasibility of a device product, or a clinical trial to test
prototype device products where the primary outcome measure relates to feasibil-
ity and not to health outcomes).” The regulation defines an applicable drug clinical
trial to mean, in part, “a controlled clinical investigation, other than a phase 1 clini-
cal investigation, of a drug product subject to section 505 of the Federal Food, Drug,
and Cosmetic Act (21 U.S.C. 355) or a biological product subject to section 351 of
the Public Health Service Act (42 U.S.C. 262), where “clinical investigation” has the
meaning given in 21 CFR 312.3 (or any successor regulation) and “phase 1” has the
meaning given in 21 CFR 312.21 (or any successor regulation).

6. See 42 CFR 11.10 (a) and 42 CFR 11.4.
7. See the complete definition at 42 CFR 11.10 (a).
8. See 42 CFR 11.10 (b) and 42 CFR 11.28 for the specific data elements.
9. See 42 CFR 11.28 for complete results information and specific data elements.

Final Revisions to the “Common Rule”
Department of Health and Human Services

The U.S. Department of Health and Human Services and 15 other federal agencies today issued a final rule to update regulations that safeguard individuals who participate in research. Most provisions in the new rule will go into effect in 2018.

The new rule strengthens protections for people who volunteer to participate in research, while ensuring that the oversight system does not add inappropriate administrative burdens, particularly to low-risk research. It also allows more flexibility in keeping with today’s dynamic research environment.

The current regulations, which have been in place since 1991, are often referred to as the “Common Rule.” They were developed at a time when research was conducted predominantly at universities and medical institutions, and each study generally took place at a single site. Since then, research with human participants has grown in scale and become more diverse and data has become digital.

In September 2015, HHS and the other Common Rule agencies published a Notice of Proposed Rulemaking (NPRM), which drew more than 2,100 comments. In response to concerns raised during the extensive review process, the final rule contains a number of significant changes from the proposed rule, including the removal of a provision that would have required researchers to obtain consent before using a study participant’s non-identified biospecimens. The final rule maintains the current practice with respect to oversight of these specimens.

The final rule will now generally expect consent forms to include a concise explanation – at the beginning of the document – of the key information that would be most important to individuals contemplating participation in a particular study, including the purpose of the research, the risks and benefits, and appropriate alternative treatments that might be beneficial to the prospective subject.

“Over the years, many have argued that consent forms have become these incredibly lengthy and complex documents that are designed to protect institutions from lawsuits, rather than providing potential research subjects with the information they need in order to make an informed choice about whether to participate in a research study,” said Jerry Menikoff, MD, who directs the HHS Office for Human Research Protections, which led the government’s efforts to overhaul the regulations. “We are very hopeful that these changes and all the others that reduce unnecessary administrative burdens will be beneficial to both researchers and research participants.”

Important elements in the final rule issued today include:

◆ The requirement for consent forms to provide potential research subjects with a better understanding of a project’s scope, including its risks and benefits, so they can make a more fully informed decision about whether to participate.

◆ Requirements, in many cases, to use a single institutional review board (IRB) for multi-institutional research studies. The proposal from the NPRM has been modified, however, to add substantial increased flexibility in now allowing
broad groups of studies (instead of just specific studies) to be removed from this requirement.

- For studies on stored identifiable data or identifiable biospecimens, researchers will have the option of relying on broad consent obtained for future research as an alternative to seeking IRB approval to waive the consent requirement. As under the current rule, researchers will still not have to obtain consent for studies on non-identified stored data or biospecimens.

- The establishment of new exempt categories of research based on the level of risk they pose to participants. For example, to reduce unnecessary regulatory burden and allow IRBs to focus their attention on higher risk studies, there is a new exemption for secondary research involving identifiable private information if the research is regulated by and participants protected under the HIPAA rules.

- Removal of the requirement to conduct continuing review of ongoing research studies in certain instances where such review does little to protect subjects.

- Requirement that consent forms for certain federally funded clinical trials be posted on a public website.

The final rule differs in important ways from the proposed rule. Some examples of proposals that, based on feedback from the public, are not being adopted, include:

- The final rule does not adopt the proposal to require that research involving non-identified biospecimens be subject to the Common Rule, and it does not require that consent be obtained in order to conduct such research. In general, researchers can continue to use such biospecimens in the way they are currently using them.

- To the extent that some of the NPRM proposals relied on tools or standards that had not yet been proposed, the final rule either does not adopt those proposals or includes revisions to eliminate such reliance. Examples of items that were not included in the final rule include a template to be used for broad consent forms, and a decision tool to be used for making exemption determinations.

- The final rule does not expand the policy to cover clinical trials that are not federally funded.

- The final rule does not adopt the NPRM’s proposed concept of “excluded” activities. Generally, activities proposed to be excluded are now described as not satisfying the definition of what constitutes research under the regulations or are classified as exempt.

- The final rule does not include the proposed standardized privacy safeguards for identifiable private information and identifiable biospecimens. Instead, in most respects, it retains the current approach to privacy standards.

- The final rule does not adopt the proposal for more stringent criteria for obtaining a waiver of the consent requirements for identifiable biospecimens.

Medical advances would not be possible without individuals who volunteer to participate in research. Oversight and protection of research participants is an important safeguard and essential to advancing the research enterprise. Today’s ac-
tion reaffirms the federal government’s commitment to all those who participate in research studies.

§1520.14 **Summary of Changes to the Common Rule**

Council on Governmental Relations

**Effective Dates**

The final rule is effective January 19, 2018 with the exception of cooperative research (mandated single IRB review) for which the compliance date is January 20, 2020. Research approved, waived or determined to be exempt prior to January 19, 2018 will continue to be subject to the pre-2018 rule. Institutions can choose, on a study-by-study basis, whether to subject research to the new or pre-2018 regulations.

**Biospecimens and Private Information**

The final rule does not expand the definition of “human subject” to include non-identified biospecimens. The preamble to the final rule questions the premise that the majority of the public wishes to be consented for secondary research use of biospecimens based on public comments submitted in response to the NPRM, but notes that Federal departments and agencies have the authority to establish policies with additional requirements related to consent for research with nonidentifiable biospecimens. The definition of “human subject” has been changed, however, (per the preamble, for clarification) to explicitly include identifiable biospecimens. Per the rule:

> Human subject means a living individual about whom an investigator (whether professional or student) conducting research:

   (i) Obtains information or biospecimens through intervention or interaction with the individual, and uses, studies, or analyzes the information or biospecimens; or
   
   (ii) Obtains, uses, studies, analyzes, or generates identifiable private information or identifiable biospecimens.”

   The final rule provides a definition of “identifiable biospecimens.” The definition of “identifiable biospecimen” and “identifiable private information” will be re-examined within one year of publication of the rule and every four years thereafter. See section 46.103 below for additional information.

   The final rule does not adopt the proposal for more stringent waiver criteria that would have made waiver for secondary research use of biospecimens “very rare.” Per the preamble to the rule, the Newborn Screening Saves Lives Reauthorization Act, which does not allow for waiver of consent for federally funded research with newborn dried blood spots will not be effective as of January 19, 2018, the effective date of the final Common Rule.

   The final rule allows for the optional use of broad consent for storage and secondary research use of identifiable private information or identifiable biospecimens in lieu of obtaining study-specific informed consent. Investigators can continue to use biospecimens that are coded or to seek waiver of consent for use of biospecimens with identifiers retained consistent with current practices. Where broad con-
sent is obtained, storage and secondary research use is exempt with a requirement for limited IRB review. This exemption does not apply if the investigator includes returning individual research results in the study plan. The preamble indicates that HHS expects to develop guidance on broad consent at a later date which could include a template.

Six additional elements of consent are required for broad consent none of which can be omitted or altered where broad consent is solicited. These include a “general description of the types of research that may be conducted”; a description of the identifiable information or biospecimens that might be used in research, whether sharing might occur, and the types of institutions or researchers that might conduct the research; a description of the period of time identifiable information and biospecimens might be stored and used for research; “a statement that the subject will not be informed of the details of any specific research studies that might be conducted...and that subjects might have chosen not to consent to some of those specific research studies”; unless determined otherwise a statement that research results may not be disclosed to the subject; and contact information for questions and “in the event of a research- related harm.” Detailed language is included in section 46.116 below.

Per the rule, “if an individual was asked to consent to the storage or maintenance for secondary research use of identifiable private information or identifiable biospecimens in accordance with the proposed broad consent provisions and such individual refused to consent, the IRB would be prohibited from waiving informed consent for the storage, maintenance or secondary research use of such biospecimens and information.” A concern is that broad consent sought for one study with one type of form and set of conditions might then apply to other departments and studies using different forms with different information. This would require tracking at the institutional level. Per the preamble, tracking is expected to be managed by investigators or teams of investigators but over time tracked at the institutional level. This would suggest that refusal to consent might be applicable to studies using a particular consent form, particularly as the information provided for the six additional elements of consent will vary by study, but this requires follow-up. Many institutions with biorepositories currently employ broad consent via multiple forms from various departments. Per the preamble, broad consent and institution-wide tracking are expected to be pursued only in situations where it yields net benefits. With respect to waiver, per 46.116(f)(3)(iii) in order for an IRB to waive or alter consent it must find and document that the research could not practicably be carried out without using information or biospecimens in an identifiable format.

Per the final rule, “An IRB may approve a research proposal in which an investigator will obtain information or biospecimens for the purpose of screening, recruiting, or determining the eligibility of prospective subjects without the informed consent” if certain conditions are met.

**Informed Consent**

The final rule indicates that the prospective subject or legally authorized representa-
tive must be provided with the information that a reasonable person would want to have in order to make an informed decision about whether to participate, and an opportunity to discuss that information. See detailed information in section 46.116 below. Per the preamble, “the final rule does not adopt a requirement that certain information be included only in the appendices.” “In general, our expectation is that this initial presentation of the key pieces of information will be relatively short. This section of the consent could, in appropriate circumstances, include a summary of relevant pieces of information that are explained in greater detail later in the consent form.” The preamble also notes, however, that “information included at the beginning need not be repeated later in the body of the informed consent.” Additional details on expectations are included in the preamble. Further guidance may be provided in the future.

Additional elements of informed consent have been added. The final rule adds a requirement for language indicating that identifiers might be removed from identifiable private information or biospecimens and whether such information or biospecimens could or will not be used for future research studies without additional informed consent. In addition, “when appropriate,” one or more of the following elements of information are to be provided: information on whether biospecimens will be used for commercial profit; whether results will be disclosed to the subject; and whether the research might include whole genome sequencing. See detailed language in section 46.116 below. Per the preamble, the final rule does not include an element providing subjects or their representatives “the option to consent or refuse to consent to being re-contacted to obtain additional information or biospecimens, or for future research” as proposed in the NPRM.

The final rule allows waiver of consent if subjects are members of “a distinct cultural group or community for whom signing documents is not the norm” where there is no more than minimal risk of harm and there is an appropriate alternative method for documenting informed consent.

With respect to posting clinical trial consent forms, the final rule includes a requirement that a copy of an IRB approved consent form for clinical trials conducted or supported by a Common Rule department or agency be posted by the awardee or agency in a publicly available federal repository. There are no restrictions on which version must be posted. Posting can take place any time after recruitment closes but not later than 60 days after the last study visit by any subject. See information on specific changes in section 46.116 below. The final rule allows for redaction. “If the Federal department or agency supporting or conducting the clinical trial determines that certain information should not be made publicly available on a Federal website (e.g. confidential commercial information), such Federal department or agency may permit or require redactions to the information posted.” Per the preamble, “in rare instances, it could be the case that the federal department or agency would determine that the very existence of a particular clinical trial should not be publicly disclosed, in which case no posting related to such a trial would be required.” The preamble suggests that HHS is considering whether to use ClinicalTrials.gov as the repository.
Exclusions and Exemptions

The final rule does not include the proposed concept of “excluded” activities. The rule modifies the definition of research, “what constitutes research.” Under the definition of research, the rule identifies activities that do not meet the definition of research (are excluded; per the preamble, “explicitly removes four categories of activities that would meet that definition”), including: “Scholarly and journalistic activities (e.g., oral history, journalism, biography, literary criticism, legal research and historical scholarship)...that focus directly on the specific individuals about whom the information is collected.”; public health surveillance activities authorized by a public health authority to assess onsets of disease outbreaks or conditions of public health importance.; and certain criminal justice and intelligence activities. See changes to the definition of research in 46.103. Per the preamble, the proposed exclusion in the NPRM for QA/QI activities was dropped “because it could create more confusion than it resolved” and “might have inadvertently created inappropriate obstacles” to those activities that should not fall under the rule. The proposed exclusion of program improvement activities was not included for similar reasons.

The rule adds to and modifies existing exemptions. Eight categories of research are considered exempt (previously six). Some “exempt” activities now require limited IRB review. See information on specific changes in section 46.104 below. This includes modifying previous exemptions to allow use of identifiable information with limited IRB review; inclusion of benign behavioral interventions; and storage, maintenance and secondary use of identifiable private information and identifiable biospecimens where broad consent is obtained consistent with the final rule, including six additional consent elements. Secondary research using identifiable private information or identifiable biospecimens without consent is exempted if the research only involves collection and analysis of identifiable information regulated under HIPAA or non-research government information in compliance with applicable federal requirements. A decision tool for exemptions was not included. Per the preamble, such a tool may be developed at a future date. Use would be voluntary and it would be publicly vetted.

Continuing Review

Per the preamble, “continuing review is eliminated for all studies that undergo expedited review, unless the reviewer explicitly justifies why continuing review would enhance protection of research subjects.” Continuing review has also been eliminated for research that has progressed to the point that it involves only data analysis or “accessing follow-up clinical data from procedures that subjects would undergo as part of clinical care.” See information on specific changes to section 46.109 below. Per 46.115, the reviewer must “provide a rationale for conducting continuing review of research that otherwise would not require continuing review as described in 46.109(f)(1).” As noted in the preamble, the final rule does not require investigators to provide annual confirmation to the IRB that research is ongoing and that no changes have been made.

Per the preamble, “the final rule does not adopt the privacy and security provi-
sions proposed in the NPRM, but rather retains and acknowledges the IRB’s role in ensuring that privacy safeguards are appropriate for the research studies that require IRB review.” The final rule includes a new provision that requires the Secretary of HHS to issue guidance to assist IRBs in assuring appropriate privacy and security safeguards. See section 46.111. Per the preamble, the guidance might address: the extent to which identifiable private information is or has been de-identified and the risk that it can be re-identified; the use of the information; the extent to which it will be shared, transferred to a third party or otherwise disclosed; the likely retention period; the security controls that are in place to protect confidentiality; and, the potential risk of harm should the information be lost, stolen, compromised or “otherwise used in a way contrary to the contours of the research under the exemption.”

**Extending the Common Rule to All Clinical Trials**

The final rule does not extend coverage to non-federally funded clinical trials.

**Privacy and Security Safeguards**

Per the preamble, “the final rule does not adopt the privacy and security provisions proposed in the NPRM, but rather retains and acknowledges the IRB’s role in ensuring that privacy safeguards are appropriate for the research studies that require IRB review.” The final rule includes a new provision that requires the Secretary of HHS to issue guidance to assist IRBs in assuring appropriate privacy and security safeguards. See section 46.111. Per the preamble, the guidance might address: the extent to which identifiable private information is or has been de-identified and the risk that it can be re-identified; the use of the information; the extent to which it will be shared, transferred to a third party or otherwise disclosed; the likely retention period; the security controls that are in place to protect confidentiality; and, the potential risk of harm should the information be lost, stolen, compromised or “otherwise used in a way contrary to the contours of the research under the exemption.”

**Cooperative Research**

Mandates the use of a single IRB for multisite studies covered by the policy. OHRP is suggesting that agencies have significant flexibility in implementing this policy. From the HHS press release: “The proposal from the NPRM has been modified, however, to add substantial increased flexibility in now allowing broad groups of studies (instead of just specific studies) to be removed from this requirement.”

Senior OHRP officials have suggested that agencies could determine that all of their research should be removed from this requirement but the rule does not make this explicit. The following is the new language: “The following research is not subject to this provision: (ii) Research for which any Federal department or agency supporting or conducting the research determines and documents that the use of a single IRB is not appropriate for the particular context.” The final language allows the lead institution to propose the reviewing IRB, “subject to the acceptance of the federal department or agency supporting the research.” The effective date for this provision is 01/20/20. See information on specific changes to section 46.114 below.
Regulatory Impact

The final rule suggests net cost savings of over $1 billion over a ten year period. For cooperative research the analysis suggests $538 million in benefits over 10 years and $157 million in costs, or $381 million in net benefits. The analysis assumes a reduction in burden associated with site-specific review but an increase in burden in the form of coordination with other sites. Estimated quantified benefits were “revised downward by 27%.” The rule estimates that investigators will spend half as much time engaging in the review process. The preamble to the final rule suggests that “RIA comments did not provide the evidence necessary to improve our estimates, and thus, limited changes have been made.” Per the impact analysis, “some cost shifting may occur as certain IRBs assume the role of reviewing IRB. However, these will be offset by savings at other IRBs that are no longer required to conduct additional reviews of the same research study.” “It is expected that, over time, reliance agreements and other methods of documenting external reliance will become standardized, which will result in reduced costs associated with multiple reviews and time savings for investigators who no longer must wait for multiple reviews.” As part of the impact analysis it is estimated that 40,523 multisite studies are reviewed each year and that 40% are funded by NIH. The analysis also suggests $798 million in benefits for the expansion of exempt categories of research and $326 million for eliminating the requirement that the grant application undergo IRB review and approval.

Other Changes of Interest

The final rule notes the intent to “eventually’’ amend subparts B, C, D and E and to consider updates to FDA and other relevant federal regulations.

HHS plans to “implement the proposed nonregulatory change to the assurance mechanism to eliminate the voluntary extension of the FWA to nonfederally funded research.” The preamble notes that institutional policy can require IRB review of research not funded by Common Rule departments and agencies. Per the preamble, this change is expected to encourage institutions to explore flexible approaches to overseeing low-risk research not covered by the Common Rule.

The final rule eliminates the requirement that “grant applications undergo IRB review and approval for the purpose of certification.” See section 46.102.

The Secretary’s list of categories of research that may be reviewed through expedited review will be evaluated at least every 8 years. Proposed changes to the list will be published in the Federal Register to allow for public comment. If a reviewer determines that a study on the list involves more than minimal risk and is not eligible for expedited review this must be documented.

The final rule removes pregnant women as an example of populations that are potentially vulnerable to coercion or undue influence.

46.101 To what does this policy apply?

The following language is omitted:

“Research that is conducted or supported by a federal department or agency,
whether or not it is regulated as defined in §46.102, must comply with all sections of this policy.”

“Research that is neither conducted nor supported by a federal department or agency but is subject to regulation as defined in §46.102(e) must be reviewed and approved, in compliance with §46.101, §46.102, and §46.107 through §46.117 of this policy, by an institutional review board (IRB) that operates in accordance with the pertinent requirements of this policy.”

Agency waiver of applicability now requires identification of conditions to which it will be applied, justification and how it is consistent with the principles of the Belmont Report.

The final rule clarifies that the Common Rule does not affect AI/AN tribal law that may provide additional protections for human subjects.

As proposed in the NPRM, for the purposes of harmonization, federal guidance “shall be issued only after consultation” with other federal agencies, unless it is not feasible.

46.102 Assuring compliance

The final rule eliminates the requirement that “grant applications undergo IRB review and approval for the purpose of certification”; the requirement that institutions provide a statement of ethical principles by which they will abide by as part of the assurance; and the requirement to designate one or more IRBs on an institution’s FWA. An updated list of IRB members is no longer required to be submitted with an institution’s assurance; instead the institution must maintain a current list. The rule removes the requirement that a department or agency head’s evaluation of the assurance consider the adequacy of the proposed IRB with respect to the anticipated scope of activities and types of populations anticipated. It requires that for review that takes place by an IRB not operated by an institution, the institution and organization operating the IRB “must document the institution’s reliance on the IRB for its research oversight.”

46.103 Definitions

The final rule includes a definition for “clinical trial” (adopted the NPRM definition); “Federal department or agency”; “public health authority” (per the preamble, to clarify the scope of activities removed from the definition of research); “written or in writing” (per the preamble to clarify that these terms include electronic formats and other media) and “identifiable biospecimen” (previously considered part of “identifiable private information”).

The definition of “identifiable biospecimen” and “identifiable private information” will be re-examined within one year and every four years thereafter (upon consultation with appropriate experts and by collaboration among federal agencies and departments). “If appropriate and permitted by law, such Federal departments and agencies may alter the interpretation of these terms, including through the use of guidance.” A similar process will be followed to “assess whether there are analytic technologies or techniques that should be considered by investigators to generate
"identifiable private information," or "identifiable biospecimens." "Any such technologies or techniques will be included on a list of technologies or techniques that produce identifiable private information or identifiable biospecimens. This list will be published in the Federal Register after notice and an opportunity for public comment. The Secretary, HHS, shall maintain the list on a publicly accessible website.” Per the preamble, recommendations might then be made with respect to consent and privacy and data security protections. These technologies might then only be used where consent has been provided or where an IRB has waived consent. Notice and comment would take place before a technology or technique was placed on this list. Per the preamble, “the expectation is that whole genome sequencing will be one of the first technologies to be evaluated to determine whether it should be placed on this list.” Further, “...apart from the consequences of placing technologies and techniques on the new list, the most significant effect of 46.102(e)(7) may be the issuance of guidance from time to time that facilitates understanding of and compliance with existing interpretations.”

The definition of “human subject” has been changed from:

“(f) Human subject means a living individual about whom an investigator (whether professional or student) conducting research obtains
(1) Data through intervention or interaction with the individual, or
(2) Identifiable private information.”

To:

“(e)(1) Human subject means a living individual about whom an investigator (whether professional or student) conducting research:
(i) Obtains information or biospecimens through intervention or interaction with the individual, and uses, studies, or analyzes the information or biospecimens; or
(ii) Obtains, uses, studies, analyzes, or generates identifiable private information or identifiable biospecimens.”

Under the definition of research, the rule identifies activities that do not meet the definition of research (are excluded; per the preamble, “explicitly removes four categories of activities that would meet that definition”), including: “Scholarly and journalistic activities (e.g., oral history, journalism, biography, literary criticism, legal research and historical scholarship)...that focus directly on the specific individuals about whom the information is collected.”; public health surveillance activities authorized by a public health authority to assess onsets of disease outbreaks or conditions of public health importance.; and certain criminal justice and intelligence activities.

The term “legally authorized representative” has been modified to address jurisdictions without applicable law and now refers to institutions’ policies.

**46.104 Exempt Research**

For research that includes only interactions involving educational tests, survey or interview procedures or observation of public behavior, identifiable information can
now be used with limited IRB review and appropriate privacy and confidentiality protections.

An exemption is added for research involving benign behavioral interventions (defined in the revised rule) in conjunction with the collection of information from an adult subject if the subject prospectively agrees and one of three criteria are met. The exemption is not applicable for research involving deceit unless the subject authorizes deception through prospective agreement.

Storage or maintenance of identifiable private information or biospecimens for potential secondary research use (for which broad consent is required) is exempt if an IRB conducts a limited review. Secondary research use of identifiable private information or biospecimens is exempt if broad consent for storage, maintenance and secondary research use was obtained; documentation of informed consent or waiver of consent was obtained; an IRB determines that the research is within the scope of the broad consent; and the study plan does not include return of research results. Secondary research use of identifiable private information and identifiable biospecimens does not require consent if the information is publicly available; is recorded in a way that the identity of the subject cannot readily be ascertained and the investigator does not contact or re-identify subjects; is identifiable health information regulated under HIPAA used for “healthcare operations” or “public health activities”; and research conducted by or on behalf of a federal department or agency using government-generated or government-collected information and maintained in information technology in compliance with applicable laws/privacy protections.

Federal departments or agencies conducting or supporting demonstration projects must publish a list of projects prior to their commencement.

**46.105 and 46.106 Reserved**
No change.

**46.107 IRB Membership**
Removed considerations of gender and profession.

**46.108 IRB Functions and Operations**
No change.

**46.109 IRB Review of Research**
*The following language on continuing review has been added as proposed in the NPRM:

```
“(f)(1) Unless an IRB determines otherwise, continuing review of research is not required in the following circumstances:
   (i) Research eligible for expedited review in accordance with §__.110; [expedited review procedures]
   (ii) Research reviewed by the IRB in accordance with the limited IRB review described
        in §__.104(d)(2)(iii), (d)(3)(i)(C), or (d)(7) or (8); [exemptions requir-
```
ing limited IRB review] (iii) Research that has progressed to the point that it involves only one or both of the following, which are part of the IRB-approved study:

(A) Data analysis, including analysis of identifiable private information or identifiable biospecimens, or

(B) Accessing follow-up clinical data from procedures that subjects would undergo as part of clinical care.”

Per the preamble, “continuing review is eliminated for all studies that undergo expedited review, unless the reviewer explicitly justifies why continuing review would enhance protection of research subjects.”

The following has been added:

“(g) An IRB shall have authority to observe or have a third party observe the consent process and the research.”

The language at 46.109(a) clarifies that IRBs have the authority to conduct limited review with respect to certain categories of exempt research.

46.110 Expedited review procedures for certain kinds of research involving no more than minimal risk, and for minor changes in approved research.

*Changed to indicate that the Secretary’s list of categories of research that may be reviewed through expedited review will be evaluated at least every 8 years [previously “amended as appropriate”]. Per the preamble, the proposed changes to the list will be published in the Federal Register to allow for public comment.

*A third condition for expedited review has been added:

“(iii) Research for which limited IRB review is a condition of exemption under §__.104(d)(2)(iii), (d)(3)(i)(C), and (d)(7) and (8).”

Per the preamble, a study is eligible for expedited review if it involves only activities on the Secretary’s list, unless the reviewer determines that the study involves more than minimal risk and documents the rationale. This documentation requirement is new. It is suggested that this will lead to greater consistency across institutions and could provide a basis for future determinations about the appropriateness of the list.

46.111 Criteria for IRB approval of research.

*Removed pregnant women and “handicapped or physically disabled individuals” as examples of populations that are potentially vulnerable to coercion or undue influence. Replaced “mentally disabled persons” with “individuals with impaired decision-making ability.”

Added that informed consent will be appropriately documented or “appropriately waived” in accordance with the regulations.

*With respect to privacy of subjects and confidentiality of data, the following was added:
*(i) The Secretary of HHS will, after consultation with the Office of Management and Budget’s privacy office and other Federal departments and agencies that have adopted this policy, issue guidance to assist IRBs in assessing what provisions are adequate to protect the privacy of subjects and to maintain the confidentiality of data. Per the preamble, the guidance might address: the extent to which identifiable private information is or has been deidentified and the risk that it can be reidentified; the use of the information; the extent to which it will be shared, transferred to a third party or otherwise disclosed; the likely retention period; the security controls that are in place to protect confidentiality; and, the potential risk of harm should the information be lost, stolen, compromised or “otherwise used in a way contrary to the contours of the research under the exemption.”

*Adds the following:

“(8) For purposes of conducting the limited IRB review required by §__.104(d)(7)), the IRB need not make the determinations at paragraphs (a)(1) through (7) of this section, and shall make the following determinations:

(i) Broad consent for storage, maintenance, and secondary research use of identifiable private information or identifiable biospecimens is obtained in accordance with the requirements of §__.116(a)(1)-(4), (a) (6), and (d);
(ii) Broad consent is appropriately documented or waiver of documentation is appropriate, in accordance with §__.117; and
(iii) If there is a change made for research purposes in the way the identifiable private information or identifiable biospecimens are stored or maintained, there are adequate provisions to protect the privacy of subjects and to maintain the confidentiality of data.”

46.112 Review by an institution.
No changes.

46.113 Suspension or termination of IRB approval of research.
No Changes

46.114 Cooperative research.
Changed the language to mandate single IRB approval for studies covered under the policy and involving more than one U.S. institution:

Previous language:

“With the approval of the department or agency head, an institution participating in a cooperative project may enter into a joint review arrangement, rely upon the review of another qualified IRB, or make similar arrangements for avoiding duplication of effort.”
New language:

“(b)(1) Any institution located in the United States that is engaged in cooperative research must rely upon approval by a single IRB for that portion of the research that is conducted in the United States. The reviewing IRB will be identified by the Federal department or agency supporting or conducting the research or proposed by the lead institution subject to the acceptance of the Federal department or agency supporting the research.”

OHRP is suggesting that agencies have significant flexibility in implementing this policy. From the HHS press release: “The proposal from the NPRM has been modified, however, to add substantial increased flexibility in now allowing broad groups of studies (instead of just specific studies) to be removed from this requirement.” A senior OHRP official suggested that agencies could determine that all of their research should be removed from this requirement but the rule does not make this explicit. The following is the new language:

“(2) The following research is not subject to this provision:

(i) Cooperative research for which more than single IRB review is required by law (including tribal law passed by the official governing body of an American Indian or Alaska Native tribe); or

*(ii) Research for which any Federal department or agency supporting or conducting the research determines and documents that the use of a single IRB is not appropriate for the particular context.”

The final language allows the lead institution to propose the reviewing IRB, “subject to the acceptance of the federal department or agency supporting the research.” The effective date for single IRB compliance is delayed until 1/20/2020.

46.115 IRB records.

*To records of continuing review adds: “including the rationale for conducting continuing review of research that otherwise would not require continuing review as described in §__.109(f)(1).”

*Adds the following language:

“(8) The rationale for an expedited reviewer’s determination under §__.110(b)(1)(i) that research appearing on the expedited review list described in §__.110(a) is more than minimal risk.”

“(9) Documentation specifying the responsibilities that an institution and an organization operating an IRB each will undertake to ensure compliance with the requirements of this policy, as described in §__.103(e).”

Indicates that records can be maintained electronically or in printed form.

46.116 General requirements for informed consent.

The following language has been added:

“(4) The prospective subject or the legally authorized representa-
tive must be provided with the information that a reasonable person would want to have in order to make an informed decision about whether to participate, and an opportunity to discuss that information.

(5) Except for broad consent obtained in accordance with paragraph (d) of this section:

(i) Informed consent must begin with a concise and focused presentation of the key information that is most likely to assist a prospective subject or legally authorized representative in understanding the reasons why one might or might not want to participate in the research. This part of the informed consent must be organized and presented in a way that facilitates comprehension.

(ii) Informed consent as a whole must present information in sufficient detail relating to the research, and must be organized and presented in a way that does not merely provide lists of isolated facts, but rather facilitates the prospective subject’s or legally authorized representative’s understanding of the reasons why one might participate.”

*The following language has been added to “Basic elements of informed consent” (“the following information shall be provided” except as otherwise provided). Added to increase transparency:

“(9) One of the following statements about any research that involves the collection of identifiable private information or identifiable biospecimens:

(i) A statement that identifiers might be removed from the identifiable private information or identifiable biospecimens and that, after such removal, the information or biospecimens could be used for future research studies or distributed to another investigator for future research studies without additional informed consent from the subject or the legally authorized representative, if this might be a possibility; or

(ii) A statement that the subject’s information or biospecimens collected as part of the research, even if identifiers are removed, will not be used or distributed for future research studies.”

*The following language has been added to “Additional elements of informed consent” (where “one or more of the following elements of information, when appropriate, shall also be provided to each subject or the legally authorized representative”):

“(7) A statement that the subject’s biospecimens (even if identifiers are removed) may be used for commercial profit and whether the subject will or will not share in this commercial profit;

(8) A statement regarding whether clinically relevant research results, including individual research results, will be disclosed to subjects,
and if so, under what conditions; and

(9) For research involving biospecimens, whether the research will (if known) or might include whole genome sequencing (i.e., sequencing of a human germline or somatic specimen with the intent to generate the genome or exome sequence of that specimen).”

Per the preamble, the final rule does not include an element providing subjects or their representatives “the option to consent or refuse to consent to being re-contacted to obtain additional information or biospecimens, or for future research.”

*The following language has been added*:

“(d) Elements of broad consent for the storage, maintenance, and secondary research use of identifiable private information or identifiable biospecimens. Broad consent for the storage, maintenance, and secondary research use of identifiable private information or identifiable biospecimens (collected for either research studies other than the proposed research or nonresearch purposes) *is permitted as an alternative to the informed consent requirements in paragraphs (b) and (c) of this section. If the subject or the legally authorized representative is asked to provide broad consent, the following shall be provided to each subject or the subject’s legally authorized representative:

(1) The information required in paragraphs (b)(2), (b)(3), (b)(5), and (b)(8) [basic elements of informed consent] and, when appropriate, (c)(7) and (9) of this section [use for commercial profit or whole genome sequencing];

*(2) A general description of the types of research that may be conducted with the identifiable private information or identifiable biospecimens. This description must include sufficient information such that a reasonable person would expect that the broad consent would permit the types of research conducted;

(3) A description of the identifiable private information or identifiable biospecimens that might be used in research, whether sharing of identifiable private information or identifiable biospecimens might occur, and the types of institutions or researchers that might conduct research with the identifiable private information or identifiable biospecimens;

(4) A description of the period of time that the identifiable private information or identifiable biospecimens may be stored and maintained (which period of time could be indefinite), and a description of the period of time that the identifiable private information or identifiable biospecimens may be used for research purposes (which period of time could be indefinite); (5) Unless the subject or legally authorized representative will be provided details about specific research studies, a statement that they will not be informed of the details of any specific research studies that might be conducted using
the subject’s identifiable private information or identifiable biospecimens, including the purposes of the research, and that they might have chosen not to consent to some of those specific research studies;

(6) Unless it is known that clinically relevant research results, including individual research results, will be disclosed to the subject in all circumstances, a statement that such results may not be disclosed to the subject; and

(7) An explanation of whom to contact for answers to questions about the subject’s rights and about storage and use of the subject’s identifiable private information or identifiable biospecimens, and whom to contact in the event of a research-related harm.”

Per the preamble, broad consent may be obtained for the use of identifiable private information or identifiable biospecimens for storage and maintenance for secondary research use and secondary research use in lieu of obtaining study-specific informed consent. Investigators can continue to use biospecimens that are coded or to seek waiver of consent for use of biospecimens with identifiers retained.

“(e) Waiver or alteration of consent in research involving public benefit and service programs conducted by or subject to the approval of state or local officials—(1) Waiver. An IRB may waive the requirement to obtain informed consent for research under paragraphs (a) through (c) of this section, provided the IRB satisfies the requirements of paragraph (e)(3) of this Section [requirements for waiver and alteration]. *If an individual was asked to provide broad consent for the storage, maintenance, and secondary research use of identifiable private information or identifiable biospecimens in accordance with the requirements at paragraph (d) of this section, and refused to consent, an IRB cannot waive consent for the storage, maintenance, or secondary research use of the identifiable private information or identifiable biospecimens."

“(2) Alteration. An IRB may approve a consent procedure that omits some, or alters some or all, of the elements of informed consent set forth in paragraphs (b) and (c) of this section provided the IRB satisfies the requirements of paragraph (e)(3) of this section [requirements for waiver and alteration]. An IRB may not omit or alter any of the requirements described in paragraph (a) of this section. If a broad consent procedure is used, an IRB may not omit or alter any of the elements required under paragraph (d) of this section.”

Under “Requirements for waiver and alteration” (in order for an IRB to waive or alter consent it must find and document that) adds:

“(iii) If the research involves using identifiable private information or identifiable biospecimens, the research could not practicably be carried out without using such information or biospecimens in an identifiable format;”
The following language has been added:

“(g) Screening, recruiting, or determining eligibility. An IRB may approve a research proposal in which an investigator will obtain information or biospecimens for the purpose of screening, recruiting, or determining the eligibility of prospective subjects without the informed consent of the prospective subject or the subject’s legally authorized representative, if either of the following conditions are met:

(1) The investigator will obtain information through oral or written communication with the prospective subject or legally authorized representative, or

(2) The investigator will obtain identifiable private information or identifiable biospecimens by accessing records or stored identifiable biospecimens.”

“(h) Posting of clinical trial consent form. (1) For each clinical trial conducted or supported by a Federal department or agency, one IRB-approved informed consent form used to enroll subjects must be posted by the awardee or the Federal department or agency component conducting the trial on a publicly available Federal website that will be established as a repository for such informed consent forms.

(2) If the Federal department or agency supporting or conducting the clinical trial determines that certain information should not be made publicly available on a Federal website, e.g., confidential commercial information, such Federal department or agency may permit or require redactions to the information posted.

(3) The informed consent form must be posted on the Federal website after the clinical trial is closed to recruitment, and no later than 60 days after the last study visit by any subject, as required by the protocol.”

46.117 Documentation of informed consent.

Minor variations to the language and adds the following (IRBs may waive the requirement for signed informed consent if): “(iii) If the subjects or legally authorized representatives are members of a distinct cultural group or community in which signing forms is not the norm, that the research presents no more than minimal risk of harm to subjects and provided there is an appropriate alternative mechanism for documenting that informed consent was obtained.”

46.118 Applications and proposals lacking definite plans for involvement of human subjects.

No changes (minor language variation).

46.119 Research undertaken without the intention of involving human subjects.

Adds: “Except for research waived under §__.101(i) or exempted under §__.104,”
46.120 Evaluation and disposition of applications and proposals for research to be conducted or supported by a federal department or agency.
No changes.

46.121 Reserved.
No changes.

46.122 Use of Federal Funds
No changes.

46.123 Early termination of research support: evaluation of applications and proposals.
No changes.

46.124 Conditions.
No changes.

Common Rule Summary Table

<table>
<thead>
<tr>
<th>Effective Date</th>
<th>January 19, 2018. The effective date for cooperative research is January 20, 2020.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biospecimens and Private Information</td>
<td>The final rule does not expand the definition of “human subject” to include non-identified biospecimens but does alter the definition which now includes identifiable biospecimens. Identifiable Biospecimens and identifiable private information are treated equally in the final rule and these definitions will be re-examined within one year of publication and every four years thereafter. “If appropriate and permitted by law, such Federal departments and agencies may alter the interpretation of these terms, including through the use of guidance.” A similar process will be followed to “assess whether there are analytic technologies or techniques that should be considered by investigators to generate “identifiable private information,” or “identifiable biospecimens.” The final rule does not adopt the proposal for more stringent waiver criteria that would have made waiver for secondary research use of biospecimens “very rare.”</td>
</tr>
<tr>
<td>Informed Consent</td>
<td>Per the final rule, “Informed consent must begin with a concise and focused presentation of the key information that is most likely to assist a prospective subject or legally authorized representative in understanding the reasons why one might or might not want to participate in the research.” It does not include the NPRM proposal that certain information be included only in the appendices. Additional elements of informed consent have been added, including a requirement for language indicating that identifiers might be removed from identifiable private information or identifiable biospecimens and whether such information or biospecimens might or will not be used for future research studies. In addition, “where appropriate,” information on whether biospecimens will be used for commercial profit; whether results will be disclosed to the subject; and whether the research might include whole genome sequencing. Any version of an IRB approved consent form for clinical trials conducted or supported by a Common Rule department or agency must be posted on a publicly available federal website after recruitment ends but not later than 60 days after the last study visit by any subject. The final rule allows for redaction with approval.</td>
</tr>
<tr>
<td>Exclusions and Exemptions</td>
<td>The final rule does not include the proposed concept of “excluded” activities. It modifies the definition of research, “what constitutes research,” and now names activities not considered research such as certain scholarly and journalistic (including oral history), public health surveillance and criminal justice and intelligence activities. A proposed exclusion for QA/QI activities was dropped because it “might have inadvertently created inappropriate obstacles.” The rule adds to and modifies existing exemptions. This includes modifying previous exemptions to allow use of identifiable information with limited IRB review; inclusion of benign behavioral interventions; and storage, maintenance and secondary use of identifiable private information and identifiable biospecimens where broad consent is obtained consistent with the final rule, including six additional consent elements. Secondary research using identifiable private information or identifiable biospecimens without consent is exempted if the research only involves collection and analysis of identifiable information regulated under HIPAA or non-research government information in compliance with applicable federal requirements. A decision tool was not included but may be developed at a future date.</td>
</tr>
</tbody>
</table>
### Continuing Review

Continuing review is eliminated for all studies that undergo expedited review and research that has progressed to the point that it involves only data analysis or accessing follow-up clinical data as part of clinical care, unless the reviewer documents a rationale for conducting continuing review. The final rule does not require investigators to provide annual confirmation to the IRB that research is ongoing and that no changes have been made.

### Extending Coverage

The final rule does not extend coverage to non-federally funded clinical trials.

### Cooperative Research

The final rule mandates the use of a single IRB for multisite studies. Federal departments or agencies supporting or conducting the research can determine that the use of a single IRB is not appropriate for particular contexts. The final language allows the lead institution to propose the reviewing IRB, “subject to the acceptance of the federal department or agency supporting the research.” The agreement for oversight between the institution and the organization operating the IRB must be documented and include the responsibilities of each.

### Privacy and Security Safeguards

Per the preamble, “the final rule does not adopt the privacy and security provisions proposed ...but rather retains and acknowledges the IRB’s role in ensuring that privacy safeguards are appropriate...” The final rule includes a new provision that requires the Secretary of HHS to issue guidance to assist IRBs in assuring appropriate privacy and security safeguards.

### Other Changes

HHS plans to eliminate the voluntary extension of the FWA. The final rule eliminates the requirement that grant applications undergo IRB review and approval. The Secretary’s list of categories of research eligible for expedited review will be evaluated at least every 8 years.
\section*{Practical Tools}

This section includes practical guidance and tools on specific research compliance topics. These materials are culled from a variety of authoritative sources.

\section*{Financial Conflict of Interest Compliance}

In compliance with the National Institutes of Health’s (NIH) “Objectivity in Research” regulations promulgated in 1995, colleges and universities have created appropriate policies and practices to ensure compliant education, disclosure, management (or divestment), and reporting of financial interests associated with its investigators receiving funding from the Public Health service (PHS), of which NIH is a part. Similar requirements from the National Science Foundation (NSF) were issued in 1994.

\begin{reminder}
Currently, only a few federal agencies have financial conflict of interest regulations:

FDA, “Financial Disclosure by Clinical Investigators,”
www.access.gpo.gov/nara/cfr/waisidx_00/21cfr54_00.html

HHS final guidance document on FCOI for research involving human subjects,
www.hhs.gov/ohrp/humansubjects/firreltn/fguid.pdf
\end{reminder}

\section*{New Developments at NIH}

Published in the Aug. 25 Federal Register, the rule also updates the existing regulations because “interactions among government, research

\begin{reminder}
\end{reminder}
institutions, and the private sector have become increasingly complex. This complexity, as well as a need to strengthen accountability, led to changes that expand and add transparency to” principal investigators’ disclosure of significant financial interests and “enhance” compliance and institutional oversight and management of FCOI. In a recent blog posting, NIH Office of Extramural Research Deputy Director Sally Rockey said that also driving the changes “has been increased scrutiny of investigators’ financial relationships from Congress and the public” (http://nexus.od.nih.gov/all/rock-talk).

Key changes in the new rules create “an additional layer of careful oversight,” NIH Director Francis Collins said. Rocky added that for a number of requirements, they take a “more rigorous approach.” For the most part, the final rule closely follows the notice of proposed rulemaking published in May 2010. (For further discussion of the new regulations and FCOI and biomedical research, see ¶2130.1)

Compliance Date for New Rule. Although the rule has an “effective” date of September 26, 2011, the “compliance dates” for applicant institutions are August 24, 2012, and “immediately” after an institution makes its FCOI policy publicly accessible as described in the regulation. NIH, decided not to extend the implementation date beyond one year, as suggested by several commenters.

The revised regulations will apply to each grant or cooperative agreement with a Notice of Award issue date after the compliance date of the final rule (including noncompeting continuations) and to research solicitations issued and contracts awarded subsequent to that date.

Until August 2012, grantees are to remain in compliance with the 1995 regulations.

What Do the Regulations Say?
The PHS and NSF policies are consistent with each other, although the procedures for compliance differ. While only these federal agencies have promulgated regulations, conflict of interest issues can arise in many arenas. Consequently, many institutions in their implementation of the regulations have expanded coverage to all federally funded projects, and a great number have expanded the requirements to cover all research projects, particularly those involving human research participants. Others have expanded the disclosure requirements to all faculty, regardless of whether or not they have external sources of support for their research and scholarly activities.

Institutions have taken a variety of approaches with respect to conflict disclosures. Some institutions have had their designated institutional official appoint a
committee to review the disclosures made and make recommendations on appropriate action. Others have left the review and disposition to one institutional official. One of the most difficult issues is often that of determining when a significant financial interest exists and the requirements to manage, reduce, or eliminate the conflict. In many instances, this is a subjective determination, and, for that reason, guidelines have been developed for both the disclosure reviewers and the individual faculty.

Once implementation of the new PHS regulations begins, PHS requirements will differ from those of NSF.

**Terminology.** In understanding the Public Health Service (PHS) requirements, the regulations use a number of definitions and accurate understanding of the requirements depends upon an accurate understanding of each term’s meaning. In PHS’s codification of its policies, the terms are defined as follows below. (The National Science Foundation definitions parallel those of PHS.)

**Investigator:** This term refers to the principal investigator and any other person who is responsible for the design, conduct, or reporting of research funded by the agency or proposed for such funding. The term includes the investigator’s spouse and dependent children.

**Research:** Research means a systematic investigation designed to develop or contribute to generalizable knowledge. The term encompasses basic and applied research and product development.

**Significant financial interest:** This is anything of monetary value, including but not limited to, salary or other payments for services (e.g., consulting fees or honoraria); equity interests (e.g., stocks, stock options, or other ownership interest); and intellectual property rights (e.g., patents, copyrights and royalties from such rights). The term does not include

1. salary, royalties, or other remuneration from the applicant institution;
2. any ownership interests in the institution, if the institution is an applicant under the Small Business Innovation Research (SBIR) program;
3. income from seminars, lectures, or teaching engagements sponsored by public or nonprofit entities;
4. income from service on advisory committees or review panels for public or nonprofit entities;
5. an equity interest that when aggregated for the investigator and the investigator’s spouse and dependent children, meets both of the following tests: does not exceed $10,000 in value as determined through reference to public prices or other reasonable measure of fair market value, and does not represent more than a five percent ownership interest in any single entity; or
6. salary, royalties, or other payments that when aggregated for the investigator and the investigator’s spouse and dependent children over the next twelve months, are not expected to exceed $10,000.
**Institutional Responsibilities.** Under the regulations, which are applicable only to investigators with PHS or NSF research support, institutions have certain responsibilities including the following

- Maintaining a written and enforced policy that complies with the regulations
- Informing each investigator of the policy and their reporting responsibilities under the policy
- Taking reasonable steps to ensure that subawardees, contractors, or collaborators comply either with your institutional policy or equivalent policies at their home organizations
- Designating an institutional official to solicit and review financial disclosure statements from each investigator who is planning on participating in the appropriate agency’s funded research programs
- At the time of application, requiring an investigator to have submitted a listing of his/her known “significant financial interests,” along with those of his/her spouse and dependent children (The statement is applicable to personal remuneration and/or those interests in entities that would reasonably appear to be affected by the proposed research project.)
- Requiring that during the course of the research, financial disclosures be updated at least annually or when reportable “significant financial interests” occur
- Providing guidance for the designated official(s) in identifying conflicting interests and in taking the necessary actions to manage, reduce, or eliminate such conflicts
- Maintaining records of all financial disclosures and actions taken on the same for at least three years beyond the date of submission of the financial expenditures report for the project
- Establishing appropriate and adequate enforcement mechanisms including sanctions, when appropriate

When each proposal is submitted, the institution must certify it has met all the above requirements. In the case of proposals submitted to the PHS, the certification includes assurance that the institution will report the existence of any conflict of interest and that the interest has been managed, reduced, or eliminated prior to the expenditure of any project funds. The report to the agency only has to note the existence of a conflict; the institution is not required to provide details. The certification also includes the institution’s agreement to make information available to the funding agency, upon request, which elaborates on the conflict and identifies how the institution will manage, reduce, or eliminate the conflict.

**Managing Conflicts.** The regulations require the designated official to review all financial disclosures made and to make a determination with respect to managing, reducing, or eliminating any conflict identified. The regulations specifically state “a conflict of interest exists when the designated official(s) reasonably determines
that a Significant Financial Interest could directly and significantly affect the design, conduct, or reporting of the … funded research."

The following are examples of conditions or restrictions that can be put into place to either manage or eliminate conflicts:

◆ public disclosures of significant financial interest;
◆ monitoring of research by independent reviewers;
◆ disqualification from participation in all or a portion of the research funded by the agency;
◆ divestiture of significant financial interests; or
◆ severance of relationships that create actual or potential conflicts.

Assuring Compliance. At a minimum, an institution’s compliance with these regulations should include

◆ a written and enforceable policy;
◆ a requirement for disclosure; and
◆ a review and appropriate disposition of each disclosure and any interests identified therein.

Institutional Conflicts of Interest

Institutional conflict of interest (iCOI) is becoming a more popular focus of attention. In its August 2011 final rule amending its 1995 FCOI regulations for grantees and contractors, NIH said it is a significant and timely topic worthy of serious consideration, but it declined to regulate such conflicts at this time.

Two of the biggest hurdles at institutions considering such a policy are the review and determination of a conflict and the question of who will make such a review and determination. The definition of an institution’s financial interest that may lead to conflict will depend upon institutional needs and culture, and it could be defined more broadly than financial interests directly related to research. Typically, iCOI policies will encompass the following types of financial interests:

◆ University ownership of equity interests, other corporate securities, or entitlements to entities that sponsor research at the university or that are obtained through technology transfer transactions with such entities. As with individual conflict of interest, institutions may differentiate between equity interests that are held in non-publicly vs. publicly traded companies.

◆ University receipt of royalties (or potential royalties) that depend upon future sales of products or technology.

◆ Master agreements with a company sponsor that provide significant and long-term funding support that may give, or appear to give, special preferences to the company.

◆ University receipt of substantial or recurring gifts, equipment donations, or promises thereof that may raise questions about the influence of the company on
the university’s research, or if there is an actual or implied quid pro quo owed to the donor that relates to, or could give the appearance of relating to, the research.

◆ Procurement of goods and services from corporations in which the university has a financial interest.

◆ University participation or investment in economic development corporations or venture capital funds.

The Council on Governmental Relations has also produced a practical document on the development and implementation of iCOI policies, regardless of the emphasis of the research focus at the institution. Link: www.cogr.edu/files/publications_Conflicts.cfm.

A 2008 report from the Association of American Medical Colleges (AAMC) and the Association of American Universities (AAU) recommends that AAU institutions and AAMC schools of medicine and teaching hospitals develop and put in place an iCOI policy within two years (www.aamc.org/jointcoireport).

---

**Educational DVD**

NCURA is making available for purchase a DVD of its ninety-five minute program, “Promoting Objectivity in Research: The Faculty Perspective.” The program has four modules:

- Objectivity in Research
- Intellectual Property
- Facilities Use
- Conflict of Commitment

The DVD includes a workshop guide with supplemental resources. Institutions are granted an exclusive license to use the workshop for on-campus education including posting the modules to a secure website.

Faculty are David Richardson, Pennsylvania State University; Jilda Garton, Georgia Institute of Technology; Denise McCartney, Washington University; and Lillie Ryans-Culclager, Director of Contracts, SRI International.

Link: www.nura.edu
Institutional COI: OIG Recommendations

Oversight of investigators’ financial conflicts of interest is insufficient to guarantee that federally funded research is unbiased, according to a report released in January 2011 by the Office of Inspector General of the Department of Health and Human Services. Instead, the report says, NIH should require institutions to develop their own financial conflict of interest policies and disclose to NIH conflicts that do arise, along with a management plan.

This is not the first time OIG made such a recommendation; it expressed a similar sentiment in a 2009 report (OEI-03-07-00700). The agency said the presence of institutional COIs is undisputed, and organizations such as the Institute of Medicine have recommended the adoption of policies that manage them (see www.nap.edu/catalog.php?record_id=12598). “An institution’s financial interests (for example, royalties, equity, stockholdings, and gifts) or those of its senior officials can become institutional conflicts when the financial interests pose a risk of undue influence on decisions involving the institution’s research,” OIG said.

The report includes data on 156 institutions that responded to a survey OIG undertook; of these, 52 had reported an investigator COI to NIH and 104 had not. The survey found that “although not required for institutional financial interests, 70 of 156 responding NIH grantee institutions have written policies and procedures addressing institutional interests.”

OIG called for NIH to issue regulations addressing institutional FCOIs that would include

• the definition of an institutional FCOI;

• a requirement that grantee institutions have written policies regarding the identification and oversight of such and the elements required in an institution’s policy (such as the identification and management of conflicts);

• a requirement that institutions report institutional conflicts to NIH, including reporting the details regarding the nature and management of such conflicts (details should include the value of the financial interest, a description of how the financial interest relates to the research, a description of how the institutional conflict will be managed, and a description of how the management of the institutional conflict will ensure objectivity in the research); and

• guidance on how institutional conflicts should be identified, managed, reduced, or eliminated.

Until institutional FCOI regulations are promulgated, OIG said that NIH should “encourage” grantee institutions to develop such policies.

In his response to the OIG report, NIH Director Francis Collins said that his agency agrees with OIG that institutional COI “is a significant and timely topic worthy of serious consideration.” However, Collins backed off from agreeing to regulate such conflicts at this time.

1530.2  **Responsible Conduct of Research Resources for Administrators And Others**
AIS editors

The Department of Health and Human Services Office of Research Integrity (ORI) has at its Web site an “Administrators and the Responsible Conduct of Research” tutorial. “Frequently, administrators encounter ethical decisions in an environment of competing obligations and responsibilities. In order to function effectively and make appropriate ethical decisions, administrative staff need to develop the skills to (1) identify when situations present ethical conflicts, (2) reason among possible courses of action, and (3) effectively implement their best solution to the problem” according to the preparers of the tutorial. The tutorial is designed to assist research administrators develop these skills.

Currently the tutorial offers modules in five areas:

* Conflict of interest
* Financial management
* Mentor-trainee responsibilities
* Collaborative research
* Data management

Modules addressing research misconduct, intellectual property, research involving human participants, and research involving animals eventually will be developed.

According to the Web site, the modules will help research administrators gain

1. An understanding of ethical issues covered in the modules
2. Improved skills and knowledge on how to work with researchers
3. Improved knowledge on how to identify conflicts of interest and how to handle allegations of conflicts of interest
4. Improved knowledge in the administration of funding and other financial responsibilities
5. Improved knowledge of the responsibilities of research mentors and trainees
6. Improved skills in administration of collaborative research between organizations and researchers
7. Improved knowledge of the responsibilities of researchers to collect, store, manage, report, and share data

The “Administrators and the Responsible Conduct of Research” tutorial was prepared for ORI by Stephen Erickson, Ph.D., Director, Office for Research Compliance, Boston College and Karen M.T. Muskavitch, Ph.D., Program Coordinator Responsible Conduct of Research, Boston College. To access the material, visit http://ori.hhs.gov/education/products/rcradmin/index.html.
Other Help From ORI. The RCR Educational Resources webpage contains a variety of materials for RCR education. ORI notes that some resources, those not produced with support from ORI or other federal agencies, may require permission or purchase. Federal-supported resources are free to use. Topics covered include the following: General, Animals, Collaboration, Conflicts, Data, Humans, Mentorship, Misconduct, peer Review, and Authorship. For the latest information on the availability of these and other resources, visit www.ori.hhs.gov/education.

Online Database of RCR Educational Materials

Elizabeth Heitman, Vanderbilt University and Debie Schilling, University of California, Davis

Clinical research educators have a new resource for curricular materials on research integrity made possible by the Clinical and Translational Science Award (CTSA) Consortium’s Clinical Research Ethics Key Function Committee (CRE KFC).

The CRE KFC Educational Materials Group, together with the creators of CTSpedia at the University of California, San Francisco, has produced a searchable online inventory of syllabuses, PowerPoint slides, videos, lecture notes, handouts, and links for use in education and training in the responsible conduct of research (RCR). These resources are intended to assist with the development of instructional programs in RCR within the CTSA Consortium as well as in other related contexts within the United States and abroad.

Materials, posted at www.ctspedia.org/do/view/ResearchEthics/WebHome, are indexed by topic, format, and originating institution. CTSpedia was created as a central repository for tools, educational materials, bits of wisdom, and other resources that may be useful to students and investigators in clinical and translational research. All materials are freely accessible and, unless otherwise stated, may be copied, adapted, and redistributed for non-profit educational purposes, provided that appropriate credit is given to the original authors and affiliate institutions, which hold copyright.

The available RCR materials were collected as part of a larger inventory of CTSA-related RCR education activities, conducted by the CRE KFC Educational Materials Group. A full report of the inventory project was published earlier this year in Clinical and Translational Science (DuBois JM, Schilling D, Heitman E, Steneck NH, Kon AA. Instruction in the responsible conduct of research: An inventory of programs and materials within CTSAs. Clinical and Translational Science 2010; 3(3): 109-111. PMID: 20590680).

This project was funded through a CTSA Administrative Supplement grant from the National Center for Research Resources (3UL1 RR024146-03S2. PI: Lars Berglund, University of California, Davis). The project workgroup included: Debie Schilling, University of California, Davis; James DuBois, Washington University/Saint Louis University; Nicholas Steneck, University of Michigan, Ann Arbor; Elizabeth Heitman, Vanderbilt University; Jon Merz, University of Pennsylvania; David Bui, University of California, San Francisco; Nancy Hills, University of California, San Francisco; Mary Banach, University of California, San Francisco; and Alexander Kon, University of California, Davis.

ORI has also recently made available a “video simulation on research integrity.” According to ORI, the “interactive movie” contains a scenario where “research misconduct causes a noted lab to lose funding, creates bad publicity to the university, and eventually causes the withdrawal of a multi-million dollar endowment. ... [V]iewers have the opportunity to undo the damage by assuming the roles of a graduate student, post doc, principal investigator, and a research integrity officer and make decisions to prevent misconduct from occurring unnoticed.” There is also a facilitator’s guide. The video and guide are accessible at http://ori.hhs.gov/TheLab.

**NIH's Policy ‘Ensures’ Public Trust**

“I believe only when the highest standards of research integrity are upheld do we maintain the public’s trust in the research we conduct, support and administer,” wrote Sally Rockey, the director of NIH’s Office of Extramural Research (OER), in a recent issue of OER’s newsletter, *Extramural Nexus*.

OER has developed a web page that explains research integrity and the processes that ensue from allegations of inappropriate conduct in research (http://grants.nih.gov/grants/research_integrity). The site provides information on the definition of research misconduct, what is expected and/or required of investigators and trainees, and what happens when NIH learns of an allegation of research misconduct.

NIH requires every NIH-supported trainee to receive instruction in the responsible conduct of research. The responsible conduct of research plan for every training and career development grant application is assessed as part of the peer review of the application. There is not a defined curriculum or format, but each plan must address five components: format, subject matter, faculty participation, duration of instruction, and frequency of instruction.

Every institution that receives funding from the NIH, as a PHS agency, must have written policies and procedures in place for handling allegations of misconduct. This assurance is on file with the HHS Office of Research Integrity (www.ori.hhs.gov), under which all NIH-supported research falls for investigation of allegations of research misconduct.

**NSF Requires RCR Training for Students**

Section 7009 of the America COMPETES Act of 2007 (Pub.L. No. 110-69) requires that the National Science Foundation director mandate “that each institution that applies for financial assistance from the foundation for science and engineering describe in its grant proposal a plan to provide appropriate training and oversight in the responsible and ethical conduct of research to undergraduate students, graduate students, and postdoctoral researchers participating in the proposed research project.”

Because the definition of “supported by” became an issue for many in the re-
search community, NSF clarified in a frequently asked questions document that “students (undergraduates and graduates) and postdoctoral researchers who receive NSF funds (support from salary and/or stipends to conduct research on NSF grants) will obtain RCR training.” This FAQ (#3) and others are available at the NSF’s RCR Web site, www.nsf.gov/bfa/dias/policy/rcr.jsp. In devising its policy on RCR training, NSF gave institutions flexibility and did not mandate specifics for what constituted a training program but instead left the details up to the institution.

**International Subs Covered.** How the training requirement applies to international subrecipients is another source of confusion for grantees. NSF has a dedicated international research integrity Web page, which should provide assistance. The site is www.nsf.gov/od/oise/intl-research-integrity.jsp. NSF has indicated that it will continue to focus on RCR training as applied internationally as it develops additional RCR resources.

**More Resources Coming.** To further assist institutions with compliance, NSF decided to make a serious investment in Web-based tools and “support a multidisciplinary team” to create a resource center. In August 2010, NSF awarded a $5 million, five-year grant to the University of Illinois at Urbana-Champaign, which is partnering with the National Academy of Engineering, Howard University, and Public Responsibility in Medicine and Research, to create an online ethics center. The site will offer training resources that are specific to different scientific disciplines.

---

**Figure 1530.2-1: Elements of the Process**

The following are suggested elements of a research misconduct process:

- Know your policy; use your policy
- Exercise independence; make referrals as appropriate
- Secure evidence
- Maintain records
- Ensure confidentiality
- Consider potential conflict of Interest
- Have separate stages to an investigation
- Be sure all practices are fair, timely, fact- and document-based, objective and impartial
- Explain the elements of a research misconduct finding
- Consider standard practices of the research community
- Know when and how misconduct should be reported to a federal funding agency

*Source: Adapted from a presentation by Peggy Fischer, NSF OIG, January 18, 2008, www.nsf.gov/oig/BMCCResearchIntegrityandPlagiarism.ppt*
Preparing for a Select Agent Inspection

The Office of Inspector General (OIG) within the Department of Health and Human Services (HHS) is planning to look at how well HHS agencies oversee compliance with select agent regulations, according to the OIG’s FY 2008 work plan. The 2008 plan indicates a focus on select agents is planned for the Centers for Disease Control and Prevention (CDC), National Institutes of Health, and the Food and Drug Administration. OIG plans to review how well agencies comply with regulations internally, but in the case of CDC, an added focus is being put on reviewing how well the agency is enforcing the regulations among entities it oversees. (The OIG work plan, issued annually, lays out the projects OIG plans to undertake, either initiate or continue, in the new federal fiscal year (which begins each Oct. 1.).)

In its work plan, OIG mentions that it “continues to receive requests for information and investigations of alleged terrorist and bioterrorist activities relating to select agents.” And there has been recent congressional interest in the topic as well. In light of the OIG’s current focus on select agents compliance, now might be a good time to review your compliance and be prepared in case of an inspection.

Overview

The Public Health Security and Bioterrorism Preparedness and Response Act of 2002 and the Agricultural Protection Act of 2002 require entities to register with the U.S. Department of Health and Human Services (HHS) or Agriculture (USDA) if they possess, use, or transfer biological agents or toxins (i.e., select agents and toxins) that could pose a severe threat to public health and safety; to animal or plant health; or animal or plant products.

Select agents or toxins are agents that the HHS considers to have “the potential to pose a severe threat to human health.” A list of these agents are found in the select agent regulation (42 CFR 73). HHS, with authority delegated to the CDC, regulates the possession, use, and transfer of select agents that could pose a severe threat to public health and safety. The CDC Select Agent Program Website is www.cdc.gov/od/sap.

The USDA, with authority delegated to the Animal and Plant Health Inspection Service (APHIS), has similar authority as the CDC to regulate select agents that pose a severe threat to animal and plant health and/or animal and plant products. The agents and toxins regulated by APHIS are found in 7 CFR Part 331 (Plants) and 9 CFR Part 121 (Animals). The APHIS Select Agent Program Website is www.aphis.usda.gov/programs/ag_selectagent.

Agents that pose a severe threat to animal health, animal products, and also public health are referred to as “overlap agents.” These agents appear on both the HHS and USDA list of agents and toxins. A listing of these agents/toxins can be found on the select agents and toxins page (http://www.selectagents.gov/agentToxinList.htm). In the regulations, the two agencies — CDC and APHIS — attempt to standardize the regulations.
In addition to ensuring that laboratories safely handle these select agents and toxins, the acts also require increased safeguards and security measures for these agents, including controlling access, screening entities and personnel (i.e., security risk assessments), and establishing a comprehensive and detailed national database of registered entities. The acts also impose criminal and civil penalties for the inappropriate use of select agents and toxins (see Figure 1530.3-1).

**Preparing for an Inspection**

Organizations that register to handle select agents are subject to inspection by CDC or APHIS. Inspections are conducted to verify the information that institutions provide to the government in registering to work with select agents, to ensure compliance with safety and security requirements of the rule, and to review records that must be maintained for compliance with the rule.

Prior to inspection, institutions should perform self-assessments to assure compliance. The following steps are recommended:

◆ Review the select agent rule requirements to be sure you understand what’s necessary.

◆ Review applicable biosafety requirements and guidelines to ensure you understand what they’re specific recommendations and requirements entail.

◆ Review your institution’s application to the Select Agent Program to ensure it is current, accurate, and complete.

◆ Conduct an internal audit to ensure compliance with the rule.

◆ Review all records, and safety and security plans.

◆ Contact the Select Agent Program with questions.

CDC uses specific checklists to guide its inspections, available at the National Select Agent Registry Web site (www.selectagents.gov). These checklists have been developed from the select agent regulations and nationally recognized safety standards. The information entered on the checklists is derived from inspectors’ observations of the physical safety and security components of the facility, an examination of the documentation available, and from interviews with laboratory personnel.
Also available at the National Select Agent Registry Web site are inspection videos that describe how to prepare for an inspection and what transpires during and after an inspection.

Guidance is posted at the National Select Agent Registry Web site to assist entities in complying with the security requirements of the select agent regulations. Note that the security plan mandated by the select agent rule must address inventory control procedures; minimum education and experience for individuals with access to select agents; provisions for routine maintenance; security training for personnel; provisions for securing the area where select agents are present; procedures for dealing with lost or stolen keys, passwords, etc.; provisions for inspecting packages upon entry and exit; and protocol for transferring select agents.

**Figure 1530.3-1: Settlements Involving Allegations of Noncompliance**

A review of recent settlement agreements posted by the Department of Health and Human Services (HHS), Office of Inspector General (OIG) involving select agents and universities and research institutes uncovered the following. (Note: In each civil monetary penalty (CMP) case resolved through a settlement agreement, the settling party has contested the OIG’s allegations and denied any liability. No CMP judgment or finding of liability has been made against the settling party.)

◆ **September 2007.** The Regents of the University of California, Lawrence Livermore National Laboratory (LLNL), California, agreed to resolve its liability for an alleged violation of the Select Agent Program. The OIG alleged that LLNL transferred vials of anthrax to two laboratories located in Florida and Virginia. During the transfers, anthrax was released from the shipped vials. An investigation of the packaging for the shipments revealed several violations of regulations governing the shipment of anthrax. The OIG specifically alleged that LLNL violated the transfer requirements of the select agent regulations by failing to comply with the applicable shipping and packaging laws when transferring a select agent. In addition, the OIG also alleged that LLNL failed to comply with security and access requirements by allowing an individual not authorized to have access to select agents to package the shipments of anthrax, and that LLNL’s Responsible Official failed to ensure compliance with the shipping and packaging requirements of the select agent regulations. Under the terms of the settlement, LLNL agreed to pay the OIG $450,000 to resolve these allegations.

**CDC Select Agent Activity**

Since the publication of the select agent interim final rule in 2003 (followed by the final rule in 2005, CDC in collaboration with federal partners has (as of September 2007): (1) conducted 607 inspections to ensure that appropriation security and safety measures are in place to deter the theft, loss, or release of select agents; (2) authorized 2,199 requests to transfer select agents; and (3) granted access approvals to 14,868 individuals to work with select agents, following a security risk assessment.

**Source:** Richard E. Besser, MD, Centers for Disease Control and Prevention, Department of Health and Human Services, “Oversight of Select Agents by the Centers for Disease Control and Prevention,” Congressional Testimony, Oct. 4, 2007.
Figure 1530.3-1 (continued)

◆ **October 2006.** The University of South Carolina agreed to pay $50,000 to resolve its liability for an alleged violation of the Select Agent Program. The OIG alleged that USC violated the program in the following ways: (1) failure of Responsible Official to apply for an amendment to USC’s Certificate of Registration; (2) inadequate security plan; (3) inadequate biosafety plan; (4) inadequate incident response plan; (5) failure to maintain adequate training records; and (6) failure to maintain adequate inspection and inventory records.

◆ **November 2005.** Southern Research Institute (SRI), Maryland, agreed to pay $150,000 to resolve its liability for an alleged violation of the Select Agent Program. The OIG alleged that SRI made an unauthorized transfer of Bacillus anthracis (anthrax) to an unregistered entity. The unregistered entity, a research facility, had requested that SRI send it nonviable anthrax cells. The preparations that SRI sent, however, contained viable anthrax spores.

◆ **September 2005.** National Jewish Medical and Research Center (NJC), Colorado, agreed to pay $20,000 to resolve its liability for an alleged violation of the Select Agent Program. The OIG alleged that NJC made an unauthorized transfer of Staphylococcal enterotoxins to Toxin Technology, Inc., without first obtaining authorization from the Centers for Disease Control and Prevention.

1530.4  **Complying with New Chemical Security Rule: First Request Extension**  
AIS editors

The first thing institutions might want to consider is filing for an extension for more time to comply with Appendix A of the Department of Homeland Security's Chemical Facility Anti-Terrorism Standards. Compliance is required within 60 days of its publication in the Nov. 20 Federal Register (72 Fed. Reg. 65396). The standards themselves went into effect June 8, 2007. The standards and appendix require that universities and others conduct an inventory of a host of chemicals and report those that exceed certain levels to DHS, which then would decide what actions an institution must take to secure them (see www.dhs.gov/xprevprot/programs(gc_1169501486179.shtm.)

Universities that must comply with the Department of Homeland Security’s Chemical Facility Anti-Terrorism Standards can apply for an extension using a form posted on the Web site operated by the Council on Governmental Relations (http://206.151.87.67/docs/DHSCFATSeXtTemplate.doc). The Campus Safety, Health and Environmental Management Association also has published a template (available at www.cschema.org/about/documents/dhs_top_screen_extension_letter.doc) as well as an FAQ (at www.cschema.org/about/documents/dhs_cfats_topscreen_faq.pdf).

An extension request, DHS said, should be signed by the “president, dean, provost, or other senior official at a college or university” and submitted to the Assistant Secretary for Infrastructure Protection.

Once the institution has addressed the extension issue, it should move quickly to conduct an actual inventory so it knows what must be reported. According to the final appendix, if quantities of the chemicals listed in the appendix exceed the allowable thresholds, they must be reported to DHS, using an assessment tool called a “Top Screen.” The final rule gave organizations some flexibility in how they report their chemical holdings, stating that, “if appropriate,” an organization could submit a Top-Screen on a building-by-building basis or a campus-wide basis. Keep in mind that DHS will look at an organization’s Top Screen filing and determine whether it is high risk and if a security plan is required.

The DHS Chemical Security Assessment Tool (CSAT) includes four Web-based tools: a Facility Registration Questionnaire, the consequence screening questionnaire (or Top-Screen), the Security Vulnerability Assessment (SVA) tool, and the Site Security Plan (SSP) tool. CSAT is available on the DHS Web site at www.dhs.gov/xprevprot/programs(gc_1169501486197.shtm).
Creating a Research Integrity Policy

AIS editors

In March 2009, President Obama issued an executive memorandum on scientific integrity. In follow-up, Office of Science and Technology Policy Director John Holdren issued a December 17, 2010, memorandum that set forth minimum scientific integrity standards and directed federal agencies and departments to develop and implement policies. OSTP has established a Web site that offers resources and tracks the initiative’s ongoing progress (www.whitehouse.gov/administration/eop/ostp/library/scientificintegrity).

At least one new policy, from the U.S. Department of the Interior, is posted at the OSTP Web site. Several components of the policy have been adapted and are included here (Figures 1530.5-1 thru 1530.5-4) as research administrators may wish to use them to develop new or review existing policies. (DOI’s entire policy is posted at www.whitehouse.gov/sites/default/files/microsites/ostp/DOI-DM-sci-integ.pdf.)
Figure 1530.5-1: Elements of a Scientific and Scholarly Integrity Policy

Policy Goals
- Decisions are based on science and scholarship and are respected as credible.
- Science is conducted with integrity and excellence.
- There is an enduring culture of scientific and scholarly integrity.
- Scientists and scholars are widely recognized for excellence.
- Faculty/staff/employees are proud to uphold the high standards and lead by example.

Purpose
Scientific and scholarly information considered in decision making must be robust, of the highest quality, and the result of as rigorous scientific and scholarly processes as can be achieved. Most importantly, it must be trustworthy.

Scope
Applies to all faculty/staff/employees, as well as students, contractors, _________.

Principles
1. Define expectations of behavior for all
2. Encourage the free-flow of information
3. Establish transparency expectations
4. Make scientific credentials part of hiring criteria
5. Encourage scientists to communicate openly
6. Reinforce principles of whistleblower protection
7. Ensure training makes expectations clear to all
8. Encourage scientists to engage with communities of practice
9. Examine issues and correct any problems that arise
10. Establish best practices throughout the organization

Definitions and Responsibilities
- Explanations of terms
- Sets expectations for all levels of leadership

Reporting and Resolving Allegations
- Allegations must be submitted in writing
- Allegations may be submitted by internal or external entities
- ________ office will track status of allegations
- Fact finding regarding the allegation will be conducted by the appropriate person
- Appropriate others will be involved depending upon whom the alleged perpetrator is (faculty, contractor, etc.)
Figure 1530.5-1: Elements of a Scientific and Scholarly Integrity Policy, continued

**Applicability**

The policy applies to faculty/staff/employees who engage in scientific and scholarly activities, defined as individuals who conduct or directly supervise scientific and scholarly activities including, but not limited to, proposing, performing, or reviewing inventory, monitoring, research, and assessment or in reporting results thereof. The policy also applies to individuals who directly supervise or personally perform work involving the compilation and translation of scientific and scholarly data or information into formats used by the institution’s decision makers and other nonscientists.

**Scientific and Scholarly Misconduct**

- Fabrication, falsification, or plagiarism in proposing, performing, or reviewing scientific and scholarly activities, or in the products, reporting, or application of results
- Intentionally circumventing policy that ensures integrity of science and scholarship
- Actions that compromise scientific and scholarly integrity—does not include honest error or differences of opinion

**Finding of Scientific and Scholarly Misconduct**

A finding of scientific and scholarly misconduct requires the following:

- A significant departure from accepted practices of the relevant scientific and scholarly community has occurred
- The misconduct be committed intentionally, knowingly, and recklessly
- The allegation be proven by a preponderance of evidence

**Employee Responsibilities**

- Be aware of and upholding the principles in the Code of Scientific and Scholarly Conduct
- Comply with the policy and any guidance
- Reporting knowledge of scientific misconduct
- Ensure that any outside person covered by this policy with whom they are executing contracts, written agreements, grants, etc. are aware of their responsibilities
- Uphold responsibilities and conduct outlined in the Code of Scientific and Scholarly Conduct
- Adhere to ten “I will” statements
- Adhere to six additional “I will” statements that apply to scientists and scholars
- Adhere to three “I will” statements that apply to decision makers in addition to the ten that apply to all faculty/staff/employees subject to this policy

**Reporting and Resolving Allegations of Loss of Integrity**

- Allegations must be submitted in writing within 60 days of discovery of alleged misconduct
- Allegations may be submitted by internal or external individuals or entities
- Cases of waste, fraud, and abuse should be reported to ________
- ________ will review the allegations
- ________ may convene a review panel to conduct fact finding
- Corrective action may be taken in consultation with human resources and the appropriate manager/supervisor

Source: Adapted from a presentation by A. Thornhill, Department of the Interior, www.whitehouse.gov/sites/default/files/microsites/ostp/A.Thornhill%20presentation.pdf
Figure 1530.5-2: Sample Code of Scientific and Scholarly Conduct

A. All ________ employees and _________ [any others] will abide by the following code of scientific and scholarly conduct to the best of their ability:

(1) I will act in the interest of the advancement of science and scholarship for sound decision making, by using the most appropriate, best available, high quality scientific and scholarly data and information to support the mission of ____________.

(2) I will communicate the results of scientific and scholarly activities clearly, honestly, objectively, thoroughly, accurately, and in a timely manner.

(3) I will be responsible for the resources entrusted to me, including equipment, funds, my time, and the employees I supervise.

(4) I will adhere to the laws and policies related to protection of natural and cultural resources and to research animals and human subjects while conducting science and scholarship activities.

(5) I will not engage in activities that put others or myself in an actual or apparent conflict of interest.

(6) I will not intentionally hinder the scientific and scholarly activities of others or engage in scientific and scholarly misconduct.

(7) I will clearly differentiate among facts, personal opinions, assumptions, hypotheses, and professional judgment in reporting the results of scientific and scholarly activities and characterizing associated uncertainties in using those results for decision making, and in representing those results to other scientists, decision makers, and the public.

(8) I will protect, to the fullest extent allowed by law, the confidential and proprietary information provided by individuals, communities, and entities whose interests and resources are studied or affected by scientific and scholarly activities.

(9) I will be responsible for the quality of the data I use or create and the integrity of the conclusions, interpretations, and applications I make. I will adhere to appropriate quality assurance and quality control standards, and not withhold information that might not support the conclusions, interpretations, and applications I make.

(10) I will be diligent in creating, using, preserving, documenting, and maintaining scientific and scholarly collections, records, methodologies, information, and data in accordance with all policy and procedures.

B. In addition, for scientists and scholars:

(1) I will place quality and objectivity of scientific and scholarly activities and reporting of results ahead of personal gain or allegiance to individuals or organizations.

(2) I will maintain scientific and scholarly integrity and will not engage in fabrication, falsification, or plagiarism in proposing, performing, reviewing, or reporting scientific and scholarly activities and their products.

(3) I will fully disclose methodologies used, all relevant data, and the procedures for identifying and excluding faulty data.

(4) I will adhere to appropriate professional standards for authoring and responsibly publishing the results of scientific and scholarly activities and will respect the intellectual property rights of others.

(5) I will welcome constructive criticism of my scientific and scholarly activities and will be responsive to their peer review.
Figure 1530.5-2: Sample Code of Scientific and Scholarly Conduct, continued

(6) I will provide constructive, objective, and professionally valid peer review of the work of others, free of any personal or professional jealousy, competition, non-scientific disagreement, or conflict of interest. I will substantiate comments that I make with the same care with which I report my own work.

C. In addition, for decision makers:

(1) I will do my best to support the scientific and scholarly activities of others and will not engage in dishonesty, fraud, misrepresentation, coercive manipulation, censorship, or other misconduct that alters the content, veracity, or meaning or that may affect the planning, conduct, reporting, or application of scientific and scholarly activities.

(2) I will offer respectful, constructive, and objective review of my employees’ scientific and scholarly activities and will encourage their obtaining appropriate peer reviews of their work. I will respect the intellectual property rights of others and will substantiate comments that I make about their work with the same care with which I carry out and report the results of my own activities.

(3) I will adhere to appropriate standards for reporting, documenting, and applying results of scientific and scholarly activities used in decision making and ensure public access to those results in accordance with policy and established laws.

Figure 1530.5-3: Sample Notification of Allegation of Scientific Misconduct

TO:
FROM:
CC:
SUBJECT: Allegation of Scientific Misconduct

An allegation of scientific misconduct has been filed with the ____________ regarding the following: [Insert as specific and detailed a description of the allegation as possible here, but do not disclose the name of the person who filed the allegation.] This allegation has not yet been investigated or determined to have merit. However, pursuant to the ____________’s scientific integrity policy, I will be conducting an inquiry to determine its merits. Under the procedures, you must preserve and provide to my office all original research records and materials relevant to the above allegation. An interview will be scheduled with you to discuss the allegation and will be part of the official record. You may also provide for the record a written response to the allegation. Once an inquiry into this matter is concluded, I will inform you in writing that:

(1) a review of this matter has dismissed the allegation and the matter is closed;
(2) a review of this matter has verified that scientific misconduct has taken place and you will be contacted about possible additional action; or
(3) the allegation has been referred to ____________ for further fact-finding. You will be notified of your rights concerning the review, your obligations during the investigation, and your opportunity to respond to the allegation.
Figure 1530.5-4: Sample Closure Memorandum

TO:
FROM:
SUBJECT: Resolution of Allegation of Scientific Misconduct

I am pleased to inform you that, after an inquiry into the allegation of scientific misconduct that was filed against you, I have found no merit in the charge.

[Insert as specific and detailed a description of the allegation as possible but do not disclose the name of the person who filed the allegation.] As a result, the concerns of this allegation are considered closed. I appreciate your cooperation in this important process.
Financial Conflict of Interest and NSF

The national Science Foundation’s (NSF) conflict of interest policy requires grantees that employ more than 50 people to maintain a policy under which institutions must manage, reduce, or eliminate all conflicts prior to the expenditure of award funds. Institutions are only required to notify NSF in cases when a conflict cannot be managed satisfactorily.

In a recent review of NSF grantee conflicts of interest, the NSF Office of Inspector General looked at individual policies and procedures at nine grantee institutions. In conducting its review, OIG identified 17 policy and procedural standards in the NSF policy (see www.nsf.gov/oig/11-2-009-COI.pdf). The following were identified by the NSF OIG as those that institutions “must include in their conflicts of interest policies” (#1-13) and those they “must follow when implementing their conflicts program” (#14-17).

The institution must take reasonable steps to ensure that its subawardees, contractors, or collaborators have their own policies in place that meet NSF’s COI policy standards or that investigators working at these entities follow the policies of the primary institution. |                                                                      |
| 16. Grantee notifications of COIs that cannot be managed, reduced, or eliminated must be submitted via NSF FastLane. | GPM Ch. V, sec. 510f, footnote 11; AAG Ch. IV, sec. A.6, footnote.   |
| 17. The institution maintains records of all financial disclosures and of all actions taken to resolve COIs for at least 3 years beyond date of grant termination/completion, or until the resolution of any action involving records, whichever is longer. | GPM Ch. V, sec. 510g;  
AAG Ch. IV, sec. A.7                                               |

1530.7 NSF Public Access Policy Frequently Asked Questions
National Science Foundation

General

1. What is NSF’s public access policy?
NSF requires that either the version of record or the final accepted manuscript in peer-reviewed scholarly journals and papers in juried conference proceedings or transactions (also known as “juried conference papers”) be deposited in a public access compliant repository designated by NSF; be available for download, reading and analysis free of charge no later than 12 months after initial publication; possess a minimum set of machine-readable metadata elements in a metadata record to be made available free of charge upon initial publication; be managed to ensure long-term preservation; and be reported in annual and final reports during the period of the award with a persistent identifier that provides links to the full text of the publication as well as other metadata elements. For more information, see section 3.1 of “Today’s Data, Tomorrow’s Discoveries: Increasing Access to the Results of Research Funded by the National Science Foundation,” at http://www.nsf.gov/pubs/2015/nsf15052/nsf15052.pdf.

2. Why does NSF have a public access policy?
On February 22, 2013, the White House Office of Science and Technology Policy (OSTP) released a memorandum entitled “Increasing Access to the Results of Federally Funded Research.” It directed Federal agencies with more than $100 million in research and development (R&D) expenditures to develop plans to make the published results of federally funded research freely available to the public within one year of publication, and it required researchers to better account for and manage the digital data resulting from federally funded scientific research. NSF’s response, Today’s Data, Tomorrow’s Discoveries, is posted at: http://www.nsf.gov/pubs/2015/nsf15052/nsf15052.pdf. The response builds upon NSF’s long history of encouraging data sharing. The Foundation requires that each proposal submitted to NSF include a data management plan, as set forth in the Grant Proposal Guide (GPG) Chapter II.C.2.j. The data management plan describes how the proposal will conform to NSF policy on the dissemination and sharing of research results (see the Award & Administration Guide (AAG) Chapter VI.D.4 for additional information).

3. How does NSF’s public access policy work?
The Foundation’s approach to implementing public access goals is based, to the greatest extent possible, on existing policies and procedures.

Data. Existing NSF policies on preparing data management plans will be retained. In 2011, the Foundation updated implementation of its data sharing policy by requiring proposers to include a two-page supplementary document to their proposals in which they describe a data management plan (DMP) for data created under an award that result from the proposal. More information on preparing DMPs is
available in the GPG Chapter II.C.2.j and at: http://www.nsf.gov/bfa/dias/policy/dmp.jsp. If an award is made, the investigator must manage data described in the DMP in accordance with the plan and should report these data-related activities in annual and final project reports. Investigators are expected to share with other researchers, at no more than incremental cost and within a reasonable amount of time, the primary data created or gathered in the course of their work under an NSF grant. Grantees are expected to encourage and facilitate such sharing.

Publications. Peer-reviewed journal articles and juried conference papers, based wholly or partially on NSF support, must be deposited in the designated NSF repository. Either the final accepted version of the manuscript or the version of record may be submitted. NSF expects to make the repository service available in the fall of 2015 for voluntary compliance. In accordance with the applicable award terms and conditions, NSF “expects significant findings from research and education activities it supports to be promptly submitted for publication, with authorship that accurately reflects the contributions of those involved” (Grant General Conditions (GC-1) Article 45). NSF also requires grantees to acknowledge NSF support, assure that any publication of NSF-funded material contains the appropriate disclaimer, and provide the cognizant NSF program officer with a copy of the publication, together with the award number and other appropriate identifying information, promptly after publication (GC-1 Article 27). The public access policy concerning publications, including juried conference papers, will go into effect for articles resulting from awards made for proposals submitted, or due, on or after January 25, 2016. NSF’s Public Access requirements will be imposed via the addition of a new award term and condition that will be applied to awards resulting from proposals submitted, or due, on or after January 25, 2016.

4. Who must comply with NSF’s public access policy?
Awards to institutions will include conditions to implement NSF Public Access requirements. Principal Investigators must ensure that all researchers who work on projects funded in whole or in part by NSF grants or cooperative agreements comply with the public access policy.

5. Does the public access policy apply to NSF staff?
NSF employees who generate published journal articles and juried conference papers in the course of official business must comply with NSF’s public access policy.

6. Who is responsible for meeting the public access requirement (e.g., submitting material to a designated repository; managing the data in accordance with the DMP)?
Principal Investigators are responsible for meeting the public access requirements.

7. What material is covered by NSF’s public access policy?
NSF’s public access policy covers articles in peer-reviewed journals, juried conference papers, and data that result from NSF funding. These research outputs are a subset of the outcomes that should be reported in annual and final project reports.
NSF’s public access policy for data is covered by NSF’s data management plan requirements.

Principal Investigators are already required to include a two-page data management plan (DMP) as a supplementary document in their proposals (see GPG II.C.2.j), and the DMP is evaluated during the merit review process. The scope of the material covered by the DMP (for example, whether it includes software) is governed by guidance at the directorate, division, and program levels. PIs are encouraged to consult with the cognizant program officers.

8. When does the policy go into effect?
The public access requirement will apply to new awards resulting from proposals submitted, or due, on or after January 25, 2016, which will be the effective date of the updated Proposal & Award Policies & Procedures Guide (PAPPG). For further information, see the GPG, Chapter II.C.2.j and http://www.nsf.gov/bfa/dias/policy/dmp.jsp.

9. What repository does NSF require PIs to use for depositing publications?
NSF requires principal investigators who publish peer-reviewed journal articles or juried conference papers to deposit a copy of the item (either the final accepted version or the version of record, as defined in NSF’s public access plan) in the NSF public access repository hosted by the Department of Energy (DOE). The NSF public access repository is expected to be available for voluntary compliance by the end of the 2015 calendar year.

10. What is a “final accepted version” of a manuscript?
The final accepted version is the author’s final manuscript of a peer-reviewed paper accepted for journal publication, including all modifications resulting from the peer-review process. It is the version before the journal makes edits that will constitute the final “version of record.”

11. What is a “version of record”?
The version of record is the publisher’s authoritative copy of the paper, including all modifications from the publishing peer-review process, copyediting, stylistic edits, and formatting changes.

12. What are “page charges”?
A “page charge” may be imposed by the publisher to help cover the costs of publication. These also may be known as publication and printing costs. See the Grant Proposal Guide II.C.2.g.(vi) b., Publication/Documentation/Dissemination for additional information.

13. What is an Article Processing Charge (APC)?
As defined by Wikipedia and based on research by David Solomon and Bo-Christer Björk, “An article processing charge (APC), also known as a publication fee, is a fee
which is sometimes charged to authors in order to publish an article in an open access academic journal”

(http://en.wikipedia.org/wiki/Article_processing_charge). These also may be known as “publication costs”. See the Grant Proposal Guide II.C.2.g.(vi) b., Publication/Documentation/Dissemination for additional information.

14. Does NSF require PIs to deposit their publications in a “trusted repository”?

As stated above, NSF requires principal investigators who publish peer-reviewed journal articles or juried conference papers to deposit a copy of the items (either the final accepted version or the version of record, as defined in NSF’s public access plan) in the NSF public access repository hosted by the Department of Energy (DOE). The NSF public access repository is expected to be available for voluntary compliance by the end of the 2015 calendar year. At this time, NSF has not formally adopted ISO 16363, a recommended practice for assessing the trustworthiness of digital repositories. As outlined in NSF’s public access plan (section 7.7), “DOE stores and preserves the information in a dark archive in a climate-controlled, appropriate environment in Oak Ridge, Tenn., with redundant, backup systems in geographically distinct locations. DOE accommodates both the widely used non-proprietary PDF and PDF/A formats and can convert material in PDF to PDF/A, should the need arise.”

15. Does the NSF public access policy cover data as well as publications?

Yes. All proposals submitted to NSF must include a supplementary document of no more than two pages labeled “Data Management Plan.” (DMP). For further information, see the GPG Chapter II.C.2.j and http://www.nsf.gov/bfa/dias/policy/dmp.jsp.

16. What repository does NSF require PIs to use for depositing data?

Data management requirements and plans specific to the Directorate, Office, Division, Program, or other NSF unit, relevant to a proposal are available at: http://www.nsf.gov/bfa/dias/policy/dmp.jsp. If guidance specific to the program is not available, then the requirements established in the GPG, Chapter II.C.2.j apply.

17. Are repositories going to be linked? If multiple repositories are acceptable for a particular discipline, how do PIs know which one to use?

NSF requires principal investigators to deposit a copy of their peer-reviewed journal publications or juried conference papers in the public access repository hosted by the Department of Energy, which will become available by the end of calendar 2015. Deposit of data and software should be addressed in the data management plan (DMP), which is a required element of every proposal and is evaluated as part of the merit review process. NSF encourages investigators to seek guidance from the cognizant program officer on selection of an appropriate repository.

18. Does NSF require PIs to deposit software, code, etc.?

The scope of material covered by the DMP (for example, whether it includes soft-
ware or code) is governed by guidance at the directorate, division, and program levels. Investigators are encouraged to consult with the cognizant program officer.

19. How does NSF handle situations in which the journal that has accepted a paper requires the PI to submit the data on which the paper is based in a specified repository? Does NSF require the PI to deposit the data in another repository, as well?

Data resulting from the award should be managed according to the data management plan that accompanied the proposal. If the repository identified by the journal is different from the one in the DMP or if the principal investigator is only depositing a subset of the data collected by the award, then the PI should consult the cognizant program officer about appropriate deposit.

20. Does NSF allow for an embargo or delay for access to journal publications? And if so, how long is it?

NSF allows an embargo or administrative delay for access of up to 12 months from the date of publication for journal articles or juried conference papers. Individual journal titles (or proceedings or transactions) may institute shorter periods. If a publisher’s embargo exceeds 12 months, NSF will make available the version deposited in the NSF public access repository.

21. How can the public search material resulting from NSF’s awards?

NSF offers several ways to search for publications resulting from NSF awards. Through Research.gov and the NSF website, the public can search active and expired awards by keywords. The results of those queries provide a list of relevant awards, abstracts and other information about the awards, and publications that have been reported. Search capability will also be provided in the NSF public access repository hosted by the Department of Energy (DOE). Finally, commercial search services, such as Google and Bing, also provide access to NSF-funded research. More information and guidance on searching for publications resulting from NSF awards is provided at: https://www.research.gov/research-portal/appmanager/base/desktop?_nfpb=true&_eventName=viewQuickSearchFormEvent_so_rsr.

22. Why does NSF use the term “public access” (instead of “open access”)?

NSF is following the practice established by the National Institutes of Health (NIH) in using the term “public access” to characterize the policy that implements the objectives of the OSTP memorandum of February 22, 2013.

From the Investigator’s Perspective

23. Do NSF’s public access requirements apply to me?

It depends. Are you a principal investigator of research that is funded, wholly or in part, by NSF? Is it a new award that resulted from a proposal that was submitted or due on or after January 25, 2016? If your answer to both questions is “Yes,” the public access requirements apply to you.
24. I am working on an article supported by an award that was made prior to January 25, 2016. Is this work subject to the public access requirements?

No, material resulting from awards made prior to the January 2016 effective date is not subject to public access requirements for publications. However, the data resulting from your award should be managed according to the data management plan included in your proposal.

25. May I submit an article to NSF’s designated public access repository on a voluntary basis?

Yes. NSF encourages principal investigators to make their peer-reviewed journal publications and juried conference papers available to the public through the public access repository.

26. What repository must I use for depositing publications?

NSF requires principal investigators who publish peer-reviewed journal articles or juried conference papers to deposit a copy of the item (either the final accepted version or the version of record, as defined in NSF’s public access plan) in the NSF public access repository hosted by the Department of Energy (DOE). It is expected to be available for voluntary compliance by the end of the 2015 calendar year.

27. Do I have to deposit an article into NSF’s designated public access repository in order to report it in my annual or final project report?

Yes. You must deposit a copy of any peer-reviewed journal publication (either the final accepted version or the version of record) or any juried conference paper in NSF’s designated public access repository for articles (eligible publications or conference papers) resulting from an award made for a proposal submitted, or due, on or after January 25, 2016 in order to report that publication or conference paper in your annual or final project report. We are developing a streamlined process to support the entry of publications and related metadata in annual and final project reports.

28. I am publishing an article in an Open Access journal; do I still have to deposit a copy of the article in a designated repository?

Yes. You must deposit a copy of any peer-reviewed journal publication (either the final accepted version or the version of record) or any juried conference paper in NSF’s designated public access repository for articles (eligible publications or conference papers) resulting from an award made for a proposal submitted, or due, on or after January 25, 2016, even if the article was published in an Open Access journal, in order to report that publication or conference paper in your annual or final project report.

29. I am publishing an article in an Open Access Journal that is a member of the publisher coalition CHORUS. Do I still have to deposit a copy of the article in a designated repository?

Yes. You must deposit a copy of any peer-reviewed journal publication (either the final accepted version or the version of record) or any juried conference paper in NSF’s designated public access repository for articles (eligible publications or conference papers) resulting from an award made for a proposal submitted, or due, on or after January 25, 2016, even if the article was published in an Open Access journal, in order to report that publication or conference paper in your annual or final project report.
conference papers) resulting from an award made for a proposal submitted, or due, on or after January 25, 2016, even if the article was published in an Open Access journal that is a member of CHORUS, in order to report that publication or conference paper in your annual or final project report. CHORUS: Clearinghouse for the Open Research of the United States is a coalition of publishers that provides a set of services to increase access to the publicly funded journal literature.

30. I am publishing an article in a journal that does not have a public or open access policy. Am I still required to comply with the public access deposit requirement?
Yes. You must deposit a copy of any peer-reviewed journal publication (either the final accepted version or the version of record) or any juried conference paper in NSF’s designated public access repository for articles (eligible publications or conference papers) resulting from an award made for a proposal submitted, or due, on or after January 25, 2016 in order to report that publication or conference paper in your annual or final project report.

31. My university maintains an institutional repository. If I deposit a copy of my article there, do I still have to deposit a copy in the NSF-designated repository?
You may deposit a copy of your juried article in your institution’s repository. But depositing a copy of your article in the institutional repository does not satisfy NSF’s deposit requirement. You must also submit a copy (either the final accepted version or the version of record) to NSF’s public access repository.

32. If I deposit a copy of my article in my university’s institutional repository, do I still have to deposit a copy of the article in a repository designated by NSF?
Yes.

33. I am required to deposit a copy of my article in my university’s institutional repository. Do I still have to deposit a copy in a repository designated by NSF?
Yes.

34. May I post a copy of my article to my personal webpage?
NSF’s public access policy permits you to post to your personal webpage a copy of the article version that has been deposited in the public access repository. You should consult your journal publisher to determine what restrictions may be imposed on the publisher’s version of record.

35. If I post a copy of my article to my personal webpage, am I still required to deposit a copy in a repository designated by NSF?
Yes.

36. Who owns the copyright to my journal articles arising from NSF grants?
Unless otherwise provided in the award, grantees own or may permit others to own copyright, subject to the Federal Government’s license.
37. What is the Federal Government’s license?
The Federal Government has a non-exclusive, irrevocable, worldwide, royalty-free license to exercise or authorize others to exercise all rights under copyright to use a federally-funded work for Federal purposes. The Federal Government license includes the right to have the copyrighted material included in a repository where the public can search, read, download, and analyze the material in digital form.

38. Am I required to use a license to allow others to use my journal article?
You should consult with your publisher or the repository in which the article is housed to ascertain conditions that may be imposed on future uses of the article. The Federal Government has a non-exclusive, irrevocable, worldwide, royalty-free license to exercise or authorize others to exercise all rights under copyright to use a federally-funded work for Federal purposes. The Federal Government license includes the right to have the copyrighted material included in a repository where the public can search, read, download, and analyze the material in digital form.

39. My article has been submitted but is not yet accepted. How do I report this article in my annual or final project report?
If the article does not result from an award made for a proposal submitted, or due, on or after January 25, 2016, refer to current Research Performance Progress Report (RPPR) requirements for reporting instructions.

40. My article has been accepted but is not yet published. How do I report this article in my annual or final project report?
If the article does not result from an award made for a proposal submitted, or due, on or after January 25, 2016, refer to current Research Performance Progress Report (RPPR) requirements for reporting instructions.

41. I have deposited a copy of my article in one of the disciplinary repositories (e.g., SSRN, arXiv, etc.). How do I report this paper in my annual or final project report?
Juried articles deposited in one of the disciplinary repositories must also be submitted to NSF’s public access repository. These should be reported in annual and final reports during the period of performance with a unique persistent identifier that provides links to the full text of the publication as well as other metadata elements.

42. Do I have to deposit the data that support findings in my article in a public access repository?
Mandatory deposit of data on which an article is based may be required by the journal publisher or other funders. Data collected as part of NSF-funded research, whether or not they are used to support a given publication, should be managed according to the data management plan.

43. I am not the lead author on an article that has been partially supported by research funding provided by NSF. Does NSF still require a copy of the article to be deposited in the
NSF-designated repository?
Yes. The principal investigator of the award is responsible for ensuring deposit in the NSF-designated repository of all articles based on research funded under that award.

44. More than one Federal funding agency, in addition to NSF, has supported the research on which an article is based. Where do we deposit a copy of the article? Do we need to deposit a copy at every agency that has supported the research?
Deposit of a copy, either the final accepted version or the version of record, in the designated NSF repository is required if NSF has supported part of the research. You should consult the policies of the other funders to determine if deposit in another repository is also required.

45. Funding for the research supporting an article is provided by several sources, including NSF and private philanthropies. Do I need to deposit a copy at every organization that has supported the research?
Deposit of a copy, either the final accepted version or the version of record, in the designated NSF repository is required if NSF has supported part of the research. You should consult the policies of the other funders to determine if deposit in another repository is also required.

46. May I use funds from my NSF award to pay for article processing charges, publication or page charges, or charges for preparing data for deposit?
You may request funds to cover costs of publication, page charges, or preparation of data as a direct cost in your budget proposal, which is evaluated as part of the merit review process. See the Grant Proposal Guide II.C.2.g.(vi) b., Publication/Documentation/Dissemination for additional information.
Disclosure, Evaluation and Management of Financial Conflict of Interest in Research

Winona Ward and Carolyn Strong, University of Central Florida

Abstract

The most difficult aspect of financial conflict of interest (FCOI) and compliance with federal regulations involves the assessment and management of identified FCOIs. While some federal agencies provide examples of the structure and content of management plans, it is up to institutions to evaluate FCOI to determine whether and how research may be conducted when conflict is present. Unfortunately, there is minimal federal guidance on the evaluation and management aspect of FCOI and institutions must carefully consider and implement appropriate procedures to ensure compliance. Once a conflict has been disclosed and is known by the institution, the burden of responsibility falls squarely on the institution. Without clear direction from federal agencies, institutions may become paralyzed with indecision or refuse to allow any research to proceed where there is known conflict. Sources exist which provide some guidance on how to mitigate conflicts of interest. This paper provides information and steps to assist institutions with the evaluation and management of FCOI.

Introduction

Objectivity is essential in scientific research in order to maintain public trust and protect the health and safety of research participants, as well as those relying on the integrity of the research results. While it is understood that university researchers may engage in the pursuit of outside economic interests, due consideration must be given to determining whether such interests could bias, or have the appearance of biasing, the design, conduct, or reporting of research. In addition, certain organizational interests constitute a financial conflict of interest (FCOI) and must also be scrutinized. While federal agencies including the National Institutes of Health (NIH) and the National Science Foundation (NSF) have implemented specific policies regarding the disclosure of FCOI, what remains vague is how institutions should evaluate and manage FCOI.

Federal Regulations

Federal FCOI regulations are aimed at ensuring that the design, conduct, or reporting of research funded under the Public Health Service (PHS), NSF and other applicable agency-funded grants and cooperative agreements will not be biased by any conflicting financial interest of investigators responsible for the research. Current FCOI regulations include 42 CFR Part 50 Subpart F (grants and cooperative agreements), 45 CFR Part 94 (contracts) effective October 1, 1995, Final Rule on Financial Conflict of Interest Regulations (Federal Register, 2011), and National Science Foundation Award and Administration Guide, chapter IV. A. These FCOI regulations establish standards for the identification and mitigation of potential, actual, and apparent FCOI.

1 This article is reprinted from Research Management Review, Volume 21, Number 1. It is used with permission of the publisher.
Disclosure

When a researcher has an outside economic interest that could affect the (apparent or real) conduct of a research project, FCOI may threaten the objectivity and integrity of research. In order to ensure that FCOIs are identified and appropriately addressed, the National Institutes of Health (NIH) and NSF have specific policies for the disclosure, management, and reporting of FCOI. A summary of these policies is as follows:

NIH

An investigator is responsible for complying with their institution’s FCOI policies and procedures, completing training on FCOI, and disclosing required significant financial interest (SFI) information to their institution whether the investigator is planning to participate in or is participating in PHS or other applicable agency-funded research.

Investigator

Investigator refers to “the project director or principal investigator and any other person, regardless of title or position who is responsible for the design, conduct, or reporting of research funded by the PHS (e.g., NIH), or proposed for such funding, which may include, for example, collaborators or consultants” (NIH, 2014).

A Financial Conflict of Interest (FCOI) exists when an institution “reasonably determines that an Investigator’s Significant Financial Interest is related to a NIH-funded research project and could directly and significantly affect the design, conduct or reporting of the NIH-funded research” (NIH, 2014). A Significant Financial Conflict of Interest “is defined by the regulation as anything of monetary value, including but not limited to salary or other payments for services (e.g., consulting fees or honoraria); equity interests (e.g., stocks, stock options, or other ownership interests); and intellectual property rights (e.g., patents, copyrights, and royalties from such rights)” (NIH, n.d.). A reportable Significant Financial Interest (SFI) is one that an investigator has that could directly and significantly affect the design, conduct, or reporting of NIH-funded research. The determination regarding whether or not there is a Significant Financial Interest is made by the institution’s designated official(s).

The investigator must disclose SFIs, including those for their spouse and dependent children (1) at the time of application for research funding; (2) within thirty days of discovering or acquiring a new SFI; and (3) at least annually, in accordance with the specific time period prescribed by the institution, during the period of award.

Institutions are responsible for maintaining an up-to-date, written, enforced FCOI policy that complies with federal regulations and making the policy publicly accessible. If no publicly accessible website is available to display the Institution’s FCOI policy, access to the written policy must be provided upon request within five business days. Additional institutional responsibilities include, but are not limited to:

1. Soliciting and reviewing disclosures of investigators’ SFIs that are reasonably related to an investigator’s institutional responsibilities via a designated institutional official;
2. Determining whether an investigator’s SFI is related to the funded research and, if so related, whether the SFI is a FCOI (SFI that could directly and significantly affect the design, conduct, or reporting of the funded research);

3. Developing and implementing management plans, as needed, to manage FCOIs for awardee investigators and subrecipient investigators, if applicable;

4. Submitting initial and annual FCOI reports to the sponsor in accordance with the regulation;

5. Completing retrospective reviews when there is noncompliance with the institution’s policy or the FCOI regulation and updating any previously submitted FCOI report, if required after the retrospective review is complete;

6. Submitting mitigation reports when bias is found in funded research as a result of the finding from a retrospective review; and

7. Adequate record-keeping of disclosure, encompassing the institution’s response to and all actions taken regarding such disclosures. Records must be maintained for at least three years from submission date or as specified in 45 C.F.R. 74.53(b) and 92.42 (b).

**NSF**

Investigators must disclose all SFIs (including those of the investigator’s spouse and dependent children) (1) that would reasonably appear to be affected by the research or educational activities funded or proposed for funding by NSF; or (2) in entities whose financial interests would reasonably appear to be affected by such activities.

SFI means anything of monetary value, including, but not limited to, salary or other payments for services (e.g., consulting fees or honoraria); equity interest (e.g., stocks, stock options or other ownership interests); and intellectual property rights (e.g., patents, copyrights and royalties from such rights).

Institutions employing more than 50 persons must maintain an appropriate written and enforced policy on conflict of interest. NSF refers institutions to university associations and scientific societies for guidance in the development of FCOI policies. At a minimum, an institutional policy must ensure that investigators have provided all required financial disclosures at the time a proposal is submitted to NSF, and during the period of the NSF award, either on an annual basis or as new reportable SFIs are obtained. Additional NSF policy requirements include:

1. Designation of one or more persons to review SFI disclosures, determine whether a conflict of interest exists, and determine what conditions or restrictions, if any, should be imposed by the institution to manage, reduce, or eliminate such conflict of interest.

2. Adequate enforcement mechanisms, and provision for sanctions where appropriate.

3. Arrangements for keeping NSF’s Office of the General Counsel appropriately informed if the institution finds that it is unable to satisfactorily manage a conflict of interest.
4. Maintenance of records of all financial disclosures and of all actions taken to resolve conflicts of interest for at least three years beyond the termination or completion of the grant to which they relate, or until the resolution of any NSF action involving those records, whichever is longer.

**Exclusions**

The applicability of financial conflict of interest disclosures varies between PHS and NSF. NSF exempts organizations with fewer than 50 employees from the FCOI requirements. However, with PHS there are no exemptions from the requirements.

The term “significant financial conflict of interest” (SFI) excludes the following specific types of interests:

1. Salary, royalties, or remuneration from the employing institution
2. Income from seminars, lectures, or teaching engagements sponsored by public or nonprofit entities
3. Income from service on advisory committees or review panels for public or nonprofit entities
4. An equity interest that when aggregated for the investigator and the investigator’s spouse and dependent children, meets both of the following tests: (1) does not exceed $10,000 in value (NSF) or $5,000 (PHS) as determined through reference to public prices or other reasonable measures of fair market value, and (2) does not represent more than a 5% ownership interest in any single entity
5. Salary, royalties, or other payments that, when aggregated for the investigator and the investigator’s spouse and dependent children, are not expected to exceed $10,000 (NSF) or $5,000 (PHS) during the next 12-month period.

**Evaluation and Management**

As described above, both NIH and NSF have detailed, written policies regarding FCOI requirements, including a requirement for institutions to evaluate and manage FCOI. Institutions have implemented certain policies and procedures to comply with the regulations, but many institutional policies focus primarily on what constitutes FCOI, and whether and how to disclose FCOI. And while institutional policies may include procedures for the evaluation of FCOI, what is unclear is how to evaluate and mitigate risk factors related to known conflicts of interest. This uncertainty can lead to institutional paralysis or a complete refusal by institutions to allow research to proceed under any circumstance when there is FCOI.

On the other hand, lack of proper institutional controls and disregard for identified conflicts can lead to research misconduct. Unmitigated conflict can also lead to injury or harm to research study participants and can damage the entire research enterprise by reducing public trust in research (Columbia University, n.d.).

The Bayh-Dole Act of 1980 was established to allow universities to retain ownership rights to intellectual property developed from federally funded research. It also allowed universities to share royalties with faculty inventors. This gave institutions...
and researchers a financial stake in the outcome of research, and created an inherent conflict particularly with respect to industry-sponsored clinical research (Beinkowski & Goldfarb, 2011).

A case at Duke University in 2010 involving Dr. Anil Potti provides a prime example of both individual and institutional conflict of interest, and the risks when successful research leads to potential commercialization and financial gain. In this case, Dr. Anil Potti was a research scientist who claimed to have found the “holy grail of cancer” (CBS News, 2012). Dr. Potti claimed to have “discovered how to match a patient’s tumor to the best chemotherapy drug” (CBS News, 2012). Dr. Potti and his colleague, Dr. Joseph Nevins, showed tremendous advances with their research, including research that resulted in patent applications and a startup company to market their technology. A team of biostatisticians from MD Anderson Cancer Center, Drs. Keith Baggerly and Kevin Combes, attempted to reproduce the work in order to use the new technique. Serious flaws in the research were noted and although Dr. Potti and Dr. Nevins made attempts to publicly correct errors, many more were identified. Concerns were expressed to the administrators at Duke University. Research was temporarily halted for an external review, yet no problems were found in the review and the research was allowed to resume.

Upon Dr. Potti’s resignation from Duke in 2010, allegations from scientists elsewhere were being made, claiming that Dr. Potti had “stolen their data for inclusion in his paper in the New England Journal” (The Economist, 2011). Further investigation into the matter began and Duke made national headlines with this scientific misconduct investigation. The university found “lapses and errors including being slow to deal with potential financial conflicts of interests” (The Economist, 2011) that were declared by the investigators. While the research misconduct became the focal point in this case, the layers of FCOI involved cannot be ignored.

An earlier case in 1999 involving a gene therapy trial at the University of Pennsylvania resulted in the death of 18-year-old Jesse Gelsinger (Wilson, 2010). The Gelsinger case brought to light not only the importance of the proper vetting of FCOI, but also the need for post-approval monitoring. In this case, the principal investigator, Dr. James Wilson, and Penn both had an interest in the biotech startup company funding the study, Genovo. In addition, Genovo agreed to give Penn $21 million to fund research at Penn in exchange for a license to existing technology, and first right to license new technology resulting from such research (Wilson, 2010). While Penn had obtained outside counsel to develop and approve a management plan for the trial in light of the investigator and Penn’s conflicts of interest, what occurred during the conduct of the trial is what led to the death of Jesse. Namely, the protocol consent was modified by Wilson and co-investigators after approval by the IRB, and information about the death of animals and potential for toxicity and death were removed. In addition, Wilson continued to be directly involved in the conduct of the study despite Penn’s requirement that such participation be “avoided” (Wilson, 2010). Proper oversight, independent monitoring and random study audits could have saved Jesse.

As demonstrated by the Potti and Gelsinger case, proper controls are needed
when FCOI is present, and most importantly when research involves human subjects. The Association of American Medical Colleges (AAMC) - Association of American Universities (AAU) Advisory Committee Report on Financial Conflicts of Interest in Human Subjects Research (2008) includes a template for analyzing conflicts of interest in research involving human subjects. The steps for evaluation and management of conflicts included in the AAMC report can be applied to FCOI in non-human research, as well. Once a conflict of interest has been disclosed, the first step in assessment is a risk benefit analysis to determine if the conflict of interest can be managed, reduced or eliminated (AAMC, 2008). Figure 1530.8-1 illustrates considerations for a risk-benefit analysis.

The next step in FCOI evaluation is determining whether the conflict can be managed, reduced or eliminated. If a conflict cannot be eliminated, and the benefits outweigh the risks, a management plan must be created. According to the NSF policy, examples of conditions or restrictions that might be imposed to manage, reduce, or eliminate conflicts of interest include, but are not limited to:

1. public disclosure of significant financial interests;
2. monitoring of research by independent reviewers;

![Figure 1530.8-1. FCOI Risk-Benefit Analysis](image-url)
3. modification of the research plan;
4. disqualification from participation in the portion of the NSF-funded research that would be affected by significant financial interests;
5. divestiture of significant financial interests; or
6. severance of relationships that create conflicts.

According to NIH, conditions or restrictions that might be imposed to manage a financial conflict of interest include, but are not limited to:
1. Public disclosure of financial conflicts of interest (e.g., when presenting or publishing the research);
2. For research projects involving human subjects research, disclosure of financial conflicts of interest directly to participants;
3. Appointment of an independent monitor capable of taking measures to protect the design, conduct, and reporting of the research against bias resulting from the financial conflict of interest;
4. Modification of the research plan;
5. Change of personnel or personnel responsibilities, or disqualification of personnel from participation in all or a portion of the research;
6. Reduction or elimination of the financial interest (e.g., sale of equity interest); or
7. Severance of relationships that create financial conflicts.

The NSF and NIH guidance can be used by institutions in the creation of appropriate FCOI management plans.

As discussed in the book, *Rescuing science from politics* (Wagner & Steinzor, 2006), certain fundamental principles should be followed to protect research integrity, including independence, or the ability to conduct research without restriction, including sponsor influence and transparency via honest communication of data and research results to the research community and public. What is also discussed and perhaps most critical is the preservation of “disinterestedness” in the conduct of science. That is, science must be pursued objectively without external influence and for the pure benefit of scientific discovery. In the Duke situation, the FCOI created with the establishment of a company and a clear opportunity for financial gain, disinterestedness is lost and risks are great. Similar conflict is created when private companies (e.g., pharmaceutical companies) sponsor research or enter into consultancy agreements with faculty for assistance with writing protocols, FDA submissions, journal articles, etc.

Figure 1530.8-2 includes components necessary for proper evaluation and management of financial conflict of interest. In cases where human subject research is proposed and an individual conflict of interest has been identified, the AAMC report (2008) indicated that there should be a presumption that the individual should not be allowed to conduct human subject research. This presumption is rebuttable, but there must be a thorough review and determination by institutional representatives, and such review must include compelling circumstances for participation by the conflicted individual. The Gelsinger case demonstrates the importance of
further institutional vigilance in the form of independent monitoring and oversight, even after appropriate approvals are given.

**Compliance**

Federal regulations require that institutions establish adequate enforcement mechanisms, provide for employee sanctions, and take other administrative action, where appropriate. Institutions may determine the nature of the enforcement mechanisms and sanctions.

**NIH**

After determination has been made of an existing FCOI, the institution has 60 days to report the FCOI. If disclosure of a FCOI is not made in a timely manner by the investigator, the Institutional Official has 60 days to review the identified SFI and make a determination as to whether the FCOI exists and if it is related to the NIH-funded research. The institution must then implement a management plan and report these actions to NIH.

If an investigator fails to comply with an institution’s FCOI policy or a FCOI management plan, the institution must complete a retrospective review within 120 days of determining noncompliance. This review will include evaluation of the
investigator’s activities and the NIH-funded research, documentation of the institution’s methodology of reviewing the SFI, and determination of whether the design, conduct, or reporting of research was biased.

If bias is found, the institution must submit a mitigation report to the NIH, in accordance with 42 CFR 50.605(b)(3). Depending on the nature of the FCOI, an institution may determine that additional interim measures are necessary with regard to the investigator’s participation in the research until such time that the institution completes the retrospective review in accordance with 42 CFR 50.605(a)(3) and 42 CFR 50.605(b)(3).

As part of the management plan, the institution is responsible for annually updating the agency with the status of the FCOI, along with any changes made to the management plan. Descriptions of the following elements must be provided in the management plan:

1. Role of investigator identified as having a FCOI and the duties in the research project;
2. Stipulations of the management plan;
3. Design of the management plan and the safeguards that will be in place for the research project;
4. Confirmation from the investigator indicating agreement with the management plan;
5. Steps the institution will take in order to monitor the management plan to ensure compliance by the investigator; and
6. Additional information as needed (Arango et al., 2014).

NIH will review FCOI information and take appropriate action, or require the institution to take further action. NIH may advise the institution on how to promote and maintain appropriate objectivity in the NIH-funded research project. NIH may further require institutions employing such an investigator to enforce corrective actions prior to receipt of an NIH award involving the investigator.

Institutions are responsible for maintaining an up-to-date, written, enforced FCOI policy that complies with federal regulations and making the policy publicly accessible.

NSF
The NSF FCOI policy did not adopt the same changes as NIH that became effective August 24, 2012. Instead, NSF relies on the Office of the General Counsel (OGC) to follow up with the institution once an unmanageable conflict of interest is reported. Institutions are responsible for notifying the NSF OGC when an identified FCOI for an NSF-funded project cannot be managed. Notification of any conflict of interest that cannot be managed, reduced, or eliminated, and notifications when research will proceed without conditions or restrictions when a COI exists must be submitted to NSF via the Fastlane System (NSF AAG, 2014). Upon receipt of notification from an institution, the OGC will evaluate the case as follows:
1. Examine a copy of the institution’s conflict of interest policy to determine if it includes procedures for addressing unmanageable conflicts.

2. Contact the authorized institutional representative to determine what actions the institution plans/has taken with respect to unmanageable conflict of interest.

3. Request confirmation from the institution when such actions have been completed.

Conclusion
While federal agencies including the NIH and NSF have implemented specific policies regarding the disclosure of FCOI, what remains vague is how institutions should evaluate and manage FCOI. Federal regulations related to FCOI have been established to manage the conflict created in situations such as the Potti and Gelsinger cases, and to ensure proper controls for the preservation of scientific integrity and, most importantly, protection of human subjects.

Institutional policies have been written and implemented to ensure compliance with federal regulations, but the burden of disclosure and management falls squarely on the scientist and the institution. Proper procedures, internal controls, an FCOI management committee including unbiased members, an empowered IRB, and a culture of transparency and compliance are critical to successful management of FCOI. When there is complete refusal by institutions to allow research to proceed in the presence of FCOI, or when questionable research sits idle on the desk of paralyzed institutional officials who are just not sure how to proceed, everyone loses. Institutions must look directly into the face of conflict, utilize available tools, and take appropriate steps to evaluate and mitigate risks associated with individual and institutional FCOI. Institutions and investigators must ensure that the safety of human subjects is paramount, and that FCOI management plans are detailed and enforced, including proper post-approval monitoring. Admittedly, in some cases, FCOI may not be manageable by an institution and other options must be explored. But we hope this paper will help mobilize officials into making informed decisions so that research may continue for the public good.

**About the Authors**

**Winona Ward** is a Certified Research Administrator (CRA) with twenty-three years of experience in sponsored project administration. She holds a Master in Research Administration (MRA), from the University of Central Florida, and is an expert in the management of sponsored research. She is the lead principal investigator on a multi-institutional, international agreement where she is working to develop a model for research operation and administration at an engineering university in...
Abu Dhabi, UAE. Throughout her career, she has served on several committees charged with recommending and implementing administrative changes in support of the research enterprise. She is currently the Director, Office of Sponsored Research at the University of California, San Francisco (UCSF). She is charged with facilitating research by minimizing administrative burden, while maintaining compliance with institutional policies, and federal and state regulations. Ms. Ward possesses a keen awareness of the many facets of research administration, and the changing needs of a research institution. She works directly and constructively with faculty and administration to advance UCSF’s goals, as they relate to externally funded research.

Carolyn Strong received an Associate of Arts from Pellissippi State Technical Community College, a Bachelor of Science in Business Administration from The University of Tennessee and a Master in Research Administration (MRA) from the University of Central Florida. She is a Certified Research Administrator (CRA) with thirteen years of experience in compliance and research administration and has been a member of NCURA since 2012. Ms. Strong was charged with the creation of the Office of Research Integrity at James Madison University (JMU), where she currently serves as the Director. She also serves on numerous compliance committees and task forces, as well as chairs the Research Administration Policy Review Committee. Ms. Strong is responsible for the oversight of compliance in the areas involving human subject research (IRB), animal subject research (IACUC), biosafety research (IBC), financial conflict of interest, responsible conduct of research, and export controls related to research at JMU.
Monitoring Financial Conflict of Interest

Lorraine Hickson, Celebration Health Research Institute at Florida Hospital

Abstract
Conflict of interest is heavily intertwined with research. The purpose of this study was to examine the literature and regulations in order to describe efforts required to properly monitor and disclose conflict of interest as researchers become steadily involved in innovation and discovery. The public assumes that when a conflict is disclosed, it means negative or unlawful behavior, but conflict of interest is not always bad. The primary effort should be expended on acknowledging conflicts and being transparent about whatever the conflict entails. To handle conflict of interest in an upfront manner, it is necessary for institutions to maintain strict policies, review conflicts on at least an annual basis, and have guidelines in place to manage the conflict and follow up with ongoing monitoring of the conflicts.

Introduction
“Conflict of interest means that because of activities or relationships with other persons or organizations, a person is unable or potentially unable to render impartial assistance or advice to the Government, that the person’s objectivity in performing the contract is or might be otherwise impaired, or that the person has or might acquire an unfair competitive advantage” (U.S. Food and Drug Administration, 2014, para. 1). This paper primarily focuses on financial conflict of interest, but the terms financial and conflict of interest are used interchangeably. The majority of conflicts of interest reported are associated with financial issues.

This article will discuss how Financial Conflict of Interest (FCOI) is viewed by academia and research institutions and their efforts to remain in compliance. In the 1980s several prime examples of bad decisions within the research community helped raise the public’s awareness of how conflict of interest may impact research integrity. Early in the 1990s guidelines were introduced to handle conflicts of interest although the academic medical institutions were reluctant to get on board (Korn, 2000). In 1995 federal regulations required institutions conducting research to develop conflict of interest policy (42 CFR Part 50); whereas FDA 21 CFR Part 54 required sponsors to ensure compliance of investigators. On August 24, 2011, 42 CFR Part 50 was revised and published with institutional implementation required by August 24, 2012.

Background
The updated regulation promotes objectivity in research by establishing principles that provide a reasonable expectation that the design, conduct, and reporting of research will be free from bias resulting from financial conflicts of interest (42 CRF Part 50, 2011). Two new stipulations came from this revised regulation—investigator training in COI was required and COI information had to be accessible to the

1 This article is reprinted from Research Management Review, Volume 21, Number 1. It is used with permission of the publisher.
public (42 CRF Part 50, 2011). With this in mind it was hoped that end results could improve research integrity, transparency, human subject protection, and the public’s perception (U.S. Food and Drug Administration, 2015).

Editors of scientific journals have grave concern over conflict of interest. The World Association of Medical Editors (WAME) has called upon all journals to take this issue seriously and to manage conflict of interest to preserve the trust held by its readers (Ruff, 2015). In 2013 WAME, Committee on Publication Ethics (COPE), the Directory of Open Access Journals, and the Open Access Scholarly Publishers Association released a publication entitled *The principles of transparency and best practice in scholarly publishing* (Ruff, 2015). The general opinion is that some journals have policies in place to adhere to these principles, but it does not appear that many enforce them. Ruff provided several examples of conflict of interest that were brought to the attention of various publishers. Most of these publishers stated that they follow the COPE guidelines, yet no action was taken to update their policies with regard to conflict of interest.

It is clear that the scientific community remains unclear on how to control accountability and transparency within scientific writings. Ruff provided some call for action steps from the ethical scientific community to help eliminate corruption within research and to promote accountability and regain “public trust and scientific integrity” (Ruff, 2015, conclusion, para. 1). Examples include: having a proven ethical scientist to create a Center for Monitoring and Implementing Publication Ethics to oversee reports of unethical behavior; having a Center that can enforce sanctions and report their findings; and having several oversight organizations provide a small percent of funds to the Center that could be charged to the organization’s members which would also send a message that they are serious about transparency (Ruff, 2015).

There are many reasons financial conflict of interest occurs in the research world. It can be for job advancement, monetary rewards, genuine interest in taking a product to market, accepting gifts from sponsors, or publishing notoriety, among many others. Not all instances of financial conflict of interest are ill-intended, but all still need to be disclosed. Being transparent about financial conflicts of interest takes the assumptions out of the equation when the public or scientific community is making a decision about a discovery, drug, or device, or simply reading an article. The public needs to have complete trust and be able to make an informed opinion with all facts presented to them. Disclosing conflicts is mandated; however, it should not stop at that point. Once a conflict has been disclosed, it is imperative for the institution to create a management plan based on their current policies and to monitor this conflict throughout its lifespan.

**Monitoring**

Financial conflict of interest can be difficult to track and monitor as it is dependent on the honor system, which trusts investigators and academia to report their financial holdings honestly. Some instances of financial conflict of interest are not disclosed because the investigator did not consider it to be a financial conflict of
interest or overlooked the potential conflict altogether. Financial conflict of interest is not necessarily unlawful, but can be unlawful if it is used as an unethical means to someone’s financial advantage (Hutchens, 2012). In fact, it is acceptable to have a conflict as long as the COI is disclosed, managed, and subsequently monitored. Hutchens (2012) stated that regardless of how robust your training program is, it will not be successful unless you have a strong way to “identify, manage, audit and document the COI compliance workflow” (p. 48).

Technology has increased the ability to monitor but there must be ample training to correspond with this technology to aid in identifying and creating a system-wide process (Hutchens, 2012). All staff should be informed of the management plan in place and know what types of monitoring will take place once a COI has been identified. Technology also allows for easier tracking mechanisms to provide oversight when suspicion arises. When institutions transfer the financial conflict of interest from paper to technology, there needs to be a gatekeeper which monitors the information regularly, and standard operating procedures (SOPs) in place for this monitoring process. The SOPs should also clearly delineate what actions are to be taken should non-compliance occur.

Monitoring financial conflict of interest takes planning and resources to provide consistent oversight and compliance. Institutions should have sound policies in place in accordance with regulations for all researchers and research staff so that financial conflicts of interest “do not adversely affect the protection of participants, the integrity of the research, or the credibility of the Human Research Protection Program” (Association for the Accreditation of Human Research Protection Programs [AAHRPP], 2014 para. 1). Researchers and research staff are defined by AAHRPP as “anyone responsible for the design, conduct, or reporting of research” (2014, para. 1). AAHRPP provides tips for establishing effective policies that will ensure all areas of financial conflict of interest are covered effectively and to which regulation is being referenced. The U.S. Food and Drug Administration, U.S. Department of Health and Human Services, and National Science Foundation have regulations for financial conflict of interest, but it is important to reference which set of regulations have been identified by the institution as applicable to its staff.

The following is a summary of the tips provided (AAHRPP, 2014, recommended comment section):

1. Cite or identify the laws or regulations related to financial conflict of interest that your organization must follow.
2. Define the individuals who are covered by the financial conflict of interest policy.
3. Define the financial interests that must be disclosed.
4. Provide education to staff and investigators.
5. Describe the process for disclosing financial interests.
6. Describe the time frame for reporting changes in financial interests related to approved research.
7. Describe the process used to evaluate and, when necessary, to manage finan-
cial conflicts of interest.

8. Describe the process used to monitor and enforce management plans and provide employee sanctions or other administrative actions to ensure research compliance.

9. Describe the role of the IRB.

10. Describe how reporting requirements are completed.

11. Maintain good record keeping.

Disclosures

There are advantages and disadvantages to disclosing conflicts of interest. By disclosing conflicts, it is often assumed that the intended audience will understand that the transparency provided is enough for them to know the conflict at hand has not affected the outcome. However, it can have the opposite effect. Loewenstein, Cain, and Sah (2011) stated that “two major psychological mechanisms” can influence the recipients of the disclosure. These two psychological mechanisms are strategic exaggeration and moral licensing.

Strategic exaggeration is when the disclosure is artificially inflated for fear the normal disclosure would be taken too lightly (Loewenstein et al., 2011). Strategic exaggeration is indicated when a physician has made a conflict of interest disclosure, but is compelled to overstate the benefits of the research results, such as a new drug. How a disclosure is presented can influence the interpretation by the public. If the conflict of interest is presented with facts and comes across as an honest testimonial, it is perceived as trust in the person or institution disclosing (Loewenstein et al., 2011).

Moral licensing refers to a lack of professional behavior as a result of making a disclosure (Loewenstein et al., 2011). Moral licensing can be described as allowing yourself to act dishonest or immoral when you have previously been known as honest and moral. A researcher may perceive that disclosing a conflict provides the rationale for or justifies biased outcomes or results.

These two psychological mechanisms can potentially cause confusion when a conflict of interest is disclosed due to exaggeration or minimization of the conflict or lack of moral behavior during the implementation of the research. The intended audience may not receive a perfectly clear picture of the extent of the reported conflict or measures taken to monitor the conflict of interest.

Revisions to UCF’s Conflict of Interest Disclosure System

The University of Central Florida (UCF) took a proactive approach to conflict of interest (COI) and Conflict of Commitment (COC) prior to the final regulations by implementing an electronic system capturing all disclosures by their researchers. That system is the Academic Research and Grants Information System (ARGIS®) (Adkins, McClellan, & Miner, 2013). Once the PHS 2011 regulations were finalized, UCF realized the need to make further commitments to enhancing its conflict of interest disclosure system.

Revised steps were implemented by UCF to ensure conflicts were captured and
monitored. First, UCF created a Potential Conflict of Interest & Conflict of Commit-
ment Research Policy. This policy was revised to include whom and when someone
must disclose. UCF also used a checklist provided by the National Institutes of
Health to ensure the revised Public Health Service regulations would be followed.
In addition to the standard proposed financial earnings to be reported, UCF added
another layer by expanding its policy requiring researchers to report all extramural
travel costs paid on their behalf. UCF took dramatic steps to ensure all staff were
aware of this policy, such as distributing an announcement from the Vice President
for Research Office to all Deans and creating a new web page, among other avenues
of communication (Adkins et al., 2013).

Second, UCF created a conflict of interest and conflict of commitment policy
guideline. This guideline is an all-inclusive guideline to aid investigators in iden-
tifying what is to be reported. Per this policy, COI is to be reported prior to any
awards, or within 30 days of newly discovered COI. This guideline includes sub-
recipients to either produce certification that a COI is in place or adhere to UCF’s
policies. Should an investigator be found non-compliant, all activities will be con-
sidered suspended until a proper COI is in place. If necessary, disciplinary actions
can be taken (Adkins et al., 2013).

Third, UCF implemented financial conflict of interest training. This training is
required prior to conducting any research and must be repeated every four years.
UCF has mandated that all researchers, including students, utilize the CITI training
prior to any funded research. The two modules required through CITI are Financial
Conflict of Interest: Overview, Investigator Responsibilities and COI Rules and Institution-
al Responsibilities as They Affect Investigators. A UCF workshop that addresses COI,
integrity, and ethical decisions was also created for graduate students and required
for doctoral candidates involved with funded research (Adkins et al., 2013).

Fourth, UCF established a conflict of interest committee. This committee and
a Compliance Officer review significant financial interest as reported to determine
whether a monitoring plan is needed (Adkins et al., 2013).

Fifth and finally, UCF created a modified electronic proposal submission form
that includes potential conflict disclosure questions (Adkins et al., 2013). When
using these electronic forms, the investigator will trigger a task to name the project
team. The project team will in turn receive notice to complete a FCOI form in AR-
GIS®. UCF felt that being prepared and disclosing all conflicts was better than tak-
ing the risk of losing reputation or federal grant funding (Adkins et al., 2013).

UCF remains proactive in the collection of disclosures from all staff and students
affiliated with research projects. The website provides all regulations and forms
required along with ample guidance of what is needed. When a conflict is disclosed,
a monitoring plan is put into place and approved by authorized reviewers and the
Chair of the UCF Board of Trustees (University of Central Florida, 2015).

The UCF IRB does not allow research to continue if a significant financial con-

flict exists unless the conflict of interest committee “(a) determines that an indi-

vidual’s participation is essential for the conduct of the research and (b) establishes
an effective mechanism for managing the conflict and protecting the integrity of the

research” (University of Central Florida, 2016).

**Conclusion**

Conflict of interest is a serious matter that needs to be handled proactively. Each university and institution needs to have sound policies with adequate training on a continual basis. These policies should be reviewed and updated regularly. When a conflict of interest happens, this should influence the leaders to enhance the policies so the same occurrence does not repeat itself. The only way to discern whether disclosing practices have improved and the effects on the products will be based on “what information is delivered, how it is delivered, and how it is utilized by receivers” (Loewenstein et al., 2011, p. 427). Ruff (2015) pointed out many suggested actions that would help with monitoring publications for conflict of interest. At this stage some journals require authors to disclose their conflicts, but there doesn’t seem to be follow up or noted attention from the publishers. Loewenstein et al. believed that the scientific community needs to formulate a better mechanism to immediately ensure transparency and to eliminate undisclosed conflicts. By establishing clear institutional policies and processes for COI monitoring in addition to taking more proactive actions to identify COI by editors of science journals; the scientific community can maintain integrity and public trust with their published findings.

¶1590 Knowledge Check

AIS editors

The Q&As at ¶1590.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 1500 has been understood. Note: For the answer key for ¶1590.1, see ¶1590.3, which appears on a separate page (page 1590:5) for testing purposes.

Discussion topics at ¶1590.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶1590.1 Q&As

1. The university’s “public mission” requires that academic work be disseminated through, for example, which of the following:
   (a) Publications
   (b) Public performances or presentations
   (c) The licensing of intellectual property
   (d) All of the above

2. A university’s *fiduciary* responsibility with respect to research projects generally relates to
   (1) Managing participation in the peer review process
   (b) Overseeing respect for human subject protections
   (c) Proper fiscal management of sponsored funding
   (d) Safeguarding scientific progress under an award

3. The compliance guidance originally proposed by the Department of Health and Human Services Office of Inspector General (OIG) in November 2005 has been withdrawn and is now under the purview of the
   (a) Institute of Medicine
   (b) Research Business Models Subcommittee
   (c) National Academy of Sciences
   (d) Office of Extramural Research

4. Although not required to do so, some institutions have developed compliance programs using the “basic tenets” of which of the following as “core principles”:
   (a) The Belmont Report
   (b) U.S. Sentencing Guidelines
   (c) Federal False Claims Act
   (d) OMB Circular A-28
5. According to ¶1505, business stewardship of sponsored funding might encompass management of all of the following EXCEPT:
   (a) Purchasing
   (b) Property
   (c) Subcontracting
   (d) Animal care and use

6. All of the following could be thought of as the risks of noncompliance with sponsored funding requirements EXCEPT:
   (a) Costly fines and/or penalties
   (b) Reduced research funding either as a grantee or subrecipient
   (c) Sponsor-imposed special award terms and conditions
   (d) Increase in expanded authorities

7. To be most effective, assessments generally should be
   (a) Conducted on a “snap-shot” basis only
   (b) Conducted specifically by internal parties with knowledge of the institution’s policies
   (c) Conducted exclusively by outside experts
   (d) Conducted objectively and without fear of what might be found

8. What mechanism would NIH typically use to review how institutions of higher education were complying, for example, with its financial conflict of interest requirements relating to sponsored funding?
   (a) A-133 audits
   (b) Site reviews
   (c) Subpoenas
   (d) IOM audits
1590.2 Discussion Topics

1. The number and complexity of requirements relating to sponsored programs funding have grown over the years. Why do you think this is? Do you think this trend is likely to continue? Why or why not?

2. What is your role in ensuring compliance with sponsored programs requirements? How does your role differ depending upon the source of the sponsored funding (e.g., federal funds, state money, foundation funding)?

3. Discuss how sponsored program personnel are “trained” in research compliance at your institution. In your opinion, is this training adequate?

4. In ¶1505, sponsored programs compliance is called a *continuum*. What does this mean?

5. In a recent presentation, an official from the National Science Foundation listed the following items as “risk areas.” Where do you think your institution is particularly vulnerable in terms of internal controls for each of these compliance areas?

Risk Areas
- Lack of adequate documentation
  - travel documentation
  - cost-sharing
  - records retention
  - credit card receipts (would likely not constitute adequate documentation)
- Time and effort reporting and procedures
- Separate financial administration for each award, no pooling
- Abuse or violations of institutional conflict of interest disclosure policies and procedures
- Updated/adequate research misconduct policies and procedures
- Subawardee monitoring (and A-133s)
- Residual funds
- Oversight activities (conflict of interest, human subjects protections, animal subjects welfare)

More Risk Areas
- Allowable activities supported
- Allowable costs and cost principles
- Cash management
- Eligibility for awards
• Equipment and real property management
• Period of availability of funds
• Procurement suspension and debarment
• Program income
• Participant support
• Timely required reporting
• Special tests and provisions
• Holding accounts
• Summer salaries
\[1590.3 \quad Answer \ Key\]

Following are the correct answers to the questions included at \[1590.1\].
1. (d) All of the above
2. (c) Proper fiscal management of sponsored funding
3. (b) Research Business Models Subcommittee
4. (b) U.S. Sentencing Guidelines
5. (d) Animal care and use
6. (d) Increase in expanded authorities
7. (d) Conducted objectively and without fear of what might be found
8. (b) Site reviews

Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter addresses a range of topics relating to facilities and administrative (F&A) costs.

While death and taxes may be the only certainties for many people, for research administrators there is the added certainty that there will always be debate and controversy concerning F&A costs. Whether labeled “indirect costs,” “overhead,” or “F&A costs,” this topic has long been one that is guaranteed to stir passions at colleges and universities. Patrick Fitzgerald of Harvard University provides a highly accessible review of the essential concepts of indirect costs. This chapter is not aimed at cost accountants who analyze and calculate F&A rates. Rather, Fitzgerald presents a very complete overview of this topic for administrators and faculty who have to apply indirect cost rates and who need to understand the impact of actions taken, or not taken, with regard to F&A cost recovery.

In an earlier time, the topic of indirect costs was treated as an extremely arcane, complex subject that could be understood only by members of the indirect cost “high priesthood.” The subject was portrayed to be generally beyond the grasp of faculty members and research administrators. Fitzgerald goes a long way toward demystifying the F&A concepts so that they can be understood by mere mortals.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶1705, as appropriate. Content added to other sections of the chapter over time will provide readers supplementary discussions of related topics (at ¶1720), practical tools (at ¶1730), case studies (at ¶1740), trends data and other related statistics (at ¶1760) and a knowledge check (¶1790).
Facilities and Administrative Costs

Patrick Fitzgerald
Associate Dean for Research Administration
Faculty of Arts & Sciences
Harvard University

Research administrators often have to educate faculty on the importance of indirect cost recovery and the relationship that this reimbursement has on the institution’s ability to reinvest in critical infrastructure improvements and maintain the appropriate level of campus services, including the sponsored programs office. It is not necessary to have a detailed working knowledge of the calculation of indirect cost rates; what is needed is a basic understanding of the essential concepts of indirect costs that will enable a research administrator to explain indirect cost recovery to others.

An overview of indirect/facilities and administrative (F&A) costs follows. This chapter then discusses several of the basic concepts embodied in the indirect cost rate process and explores key issues related to indirect cost recovery, including cost sharing, indirect cost waivers, and strategies for the distribution of indirect cost recoveries.

Research administrators should note that the federal policies and principles that govern reimbursement of costs associated with externally sponsored activities are promulgated by the Office of Management and Budget (OMB) in 2 CFR 200, “Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards” commonly referred to as “Uniform Guidance.”

What Are F&A Costs?

Universities conduct sponsored research and other scholarly activities and seek funding for these projects from external sponsors. The performance of research, and other major activities, incurs expenditures that can be readily identifiable to a specific project or activity and are assigned to the project as direct costs. Conversely, costs incurred to support the institution’s mission activities that cannot be readily identifiable or directly assigned to a major project or activity with a high degree of accuracy are considered to be indirect costs. Ideally the funding from sponsors will reimburse the institution for the total cost of the project, including all direct and indirect costs.

Indirect costs are expenses that colleges and universities incur in support of the institution’s major, mission-related activities, primarily identified as instruction, organized research, and public service. The term “facilities and administrative” (F&A) costs, “indirect” costs, and “overhead” costs are used interchangeably in this chapter.

Another way to think of direct and indirect costs is as primary and secondary.

Reminder
Total project costs = direct costs + indirect costs
costs. Direct costs are considered to be primary because these costs are attributable to specific projects. Indirect costs are secondary costs that cannot be precisely assigned to projects and these costs are assigned to a project as a percentage of direct costs. Although F&A costs are necessary for the performance of a project or activity, the fact that these costs cannot be directly attributable to a specific project or activity contributes to a perception that these costs are nonessential or are for activities that are significantly less important than direct activities.

In fact it is not uncommon to hear faculty suggest that the indirect cost rate is simply an arbitrary tax that the institution places on a project that leaves the faculty less money to perform the research work. Misunderstanding by faculty about the nature of indirect costs and the importance of indirect cost recovery as a source of unrestricted revenue to the institution can breed contentiousness or even mistrust.

An informed research administrator can dispel some of the myths about indirect costs that are prevalent on campuses. The office of sponsored programs (OSP) has a close working relationship with faculty and is charged with interpreting federal regulations and the institution’s policies. It is essential, therefore, that sponsored programs staff members have an understanding of the fundamentals of the indirect cost process so they can explain this critical information to faculty and campus administrators.

§1705.2 The F&A Calculation

Institutions which receive more than $10 million in direct federal funding are required to use the “Standard Form for Submission” (“long-form”) F&A rate proposal for the negotiation of an indirect cost rate with the federal government.1 Because of the complexity of the long-form process, most institutions have staff that specializes in the calculation of the rate. Which office is responsible for the F&A calculation and negotiation varies from institution to institution. In some cases the responsibility rests with the office responsible for post-award financial administration, for example, the controller’s office. In other institutions the function is part of the pre-award sponsored programs office or the budget office. A common title used for the F&A office is “cost analysis” and F&A specialists are often called “manager of cost analysis” or “director of cost analysis.”

Regardless of the institution’s organizational structure, the office responsible for cost analysis and F&A rate calculation must coordinate its activities and responsibilities with other central administrative offices and academic departments. The F&A calculation is truly a joint responsibility because of the vast array of data and institutional knowledge that is necessary to compute the rate.

Cost Categories

The research F&A rate is composed of two general cost categories: facilities (“F”) costs and administrative (“A”) costs. These categories are discussed individually below.

1 2 CFR 200, Section 200.414
Facilities Costs. The facilities category includes costs associated with buildings and improvements used directly for, or in support of, sponsored research. Facilities costs include

◆ depreciation expenses for buildings and equipment,
◆ plant operations and maintenance (e.g., maintenance, utilities, and custodial costs),
◆ externally paid interest, and
◆ library costs.

Each of the subcategories of facilities costs (which are commonly referred to as cost pools) is allocated to research as well as the other direct and indirect functions of the institution.

The portion of the institution’s facilities costs included in the research F&A rate is based on the functional use of the institution’s buildings and space — primarily, the proportion of the square footage of campus buildings used for research compared to the total campus square footage. Institutions maintain a detailed space inventory database to capture and compile data related to campus facilities. The space inventory includes all campus rooms and important attributes of each room including the physical dimensions, the room type (laboratory, classroom, etc.) and the functional use of the room (i.e., instruction, organized research, etc.)

Many institutions use a space survey to determine the functional categorization of rooms used for multiple purposes, for example, research and instruction. The space inventory system and the space survey are critical processes in the F&A rate calculation because the room use data determines the amount of facilities costs that the institution allocates to the organized research function. Accurate space inventory data requires the expertise and cooperation of PIs and departmental administrators, and emphasizing the importance of the data can help garner the cooperation of the academic community in helping to ensure the integrity of the space data.

It is also common for universities to install utility meters on buildings to more accurately assign costs to specific buildings in order to recoup the higher utilities costs typically associated with research-intensive facilities.

Administrative Costs. The administrative cost category includes costs for offices that provide institution-wide general and administrative support services, school or college administration, department administration, and sponsored programs services. A fraction of the costs of each of these offices is assigned to the research F&A rate to reflect the level of support that each office provides to the institution’s sponsored research programs.

For example, an office such as human resources, which provides general administrative services to the entire campus, will have a smaller percentage of its costs allocated to research than the sponsored programs office, which, of course, is primarily focused on the administration of sponsored research projects. Each of the subcategories (cost pools) of administrative costs is allocated to research and other
direct functions of the institution based on expenditures.

For central services that benefit the entire institution, total campus expenditures are used in the allocation formula. For college and departmental administration expenses, the allocation to research and other functions is based on the college’s expenditures or the department’s expenditures.

Once each of the facilities and administrative cost pools is allocated across the institution’s direct functions, the amount of each cost pool’s allocation to research is aggregated to arrive at total facilities and administrative costs assignable to research. The research rate is calculated by dividing the F&A costs allocated to research by the modified total direct cost of research (MTDC). The ratio of F&A costs to direct costs, expressed as a percentage of MTDC, is the basis for the F&A rate the institution negotiates with its cognizant federal agency. (See Figure 1 for background on a cognizant federal agency.)

It is important to note that the federal government limits the reimbursement of administrative costs and the administrative components of the F&A rate cannot exceed 26 percent, i.e., 26 points in the rate.

Once the F&A rate is negotiated, it is documented in a formal agreement with the cognizant agency and, subject to exceptions described later in this chapter, is applied to research projects sponsored by all federal agencies during the period covered by the rate agreement.

For purposes of calculating and applying the F&A rate, direct costs are expressed as modified total direct costs (MTDC). MTDC is direct costs less certain costs called “modifiers” (e.g., capital expenditures, equipment, tuition, subcontracts over $25,000, etc.).

¶1705.3 Recovering F&A Costs from Sponsors

When a research project is sponsored by an external entity, the sponsor is expected to reimburse the institution for the full cost of the project, including both the costs

Reminder

Modified total direct costs (MTDC) =
direct costs – modifiers
that are directly identifiable to the project and a proportionate share of the F&A costs that the institution incurs in support of all its research projects. The reimbursement of direct costs is based on actual expenses incurred in the performance of the project. Because F&A costs cannot be identified to specific projects, reimbursement of these costs is based on a rate that reflects the average of F&A costs incurred by the university in the performance of all its sponsored research projects.

The F&A rate is negotiated with the federal government and is automatically applied to the project’s modified total direct costs (MTDC), which enables the institution to recoup indirect costs as well as direct costs. However, in some instances Federal and non-federal sponsors pay less than the negotiated rate and a waiver of indirect cost is necessary. Waivers are discussed later in this chapter.

**Example**

An F&A rate of 60% (MTDC) for sponsored research means that for every dollar of modified total direct costs the institution spends on its research projects, it incurs an average of an additional $0.60 for F&A costs.

**Short-Form Method**

The process described above is used by large research institutions that employ a procedure for calculating the F&A rate known as the “long-form” method. For institutions which receive less than $10 million in direct federal funding, a simplified procedure known as the “short-form” method may be used to compute the F&A rate. Under this simplified approach, the institution’s most recent annual financial statements and supporting documentation are the basis for determining the F&A cost rate applicable to all sponsored agreements. The institution has the option to compute a rate using either a formula based on salaries and wages (S&W) base or the MTDC base used in the long-form calculation. The rate has to be applied to the same base on which the rate is calculated.

The simplified method compares total F&A costs to total direct costs (S&W or MTDC) to compute a single rate. This process does not differentiate between the institution’s major functions (i.e., instruction, organized research, public service, etc.) in the allocation of F&A costs or the development of the direct cost base. The rate derived from the simplified method is applied to all types of sponsored agreements.

**Recovery vs. ‘Recoverable’**

The F&A rate is an approximation of the costs that an institution incurs in support of its major programs. The rate is calculated based on historical costs for the most recently completed fiscal year, which is known as the “base year.” As explained earlier, the rate is negotiated with the federal government and is applied to externally

**Reminder**

\[
\text{Recoverable F&A - actual F&A recovery = under-recovery}
\]
sponsored programs. Theoretically all sponsored projects will pay a fair share of the institution’s F&A costs by paying the negotiated rate. In reality this is not true; sponsors all too often do not pay the full F&A rate.

The “recoverable” amount of F&A represents the theoretical level of reimbursement that the institution would receive by applying the negotiated rate to all sponsored projects. “Recovery” refers to the actual reimbursement of F&A costs that an institution receives from sponsors. The difference between the recoverable F&A costs and actual F&A recovery is referred to as an “under-recovery.” (See example below.) When the sponsor doesn’t pay the full rate the shortfall in F&A reimbursement must be absorbed by the institution using other resources.

**Example**

If an institution has a negotiated rate of 60% and a sponsor limits the payment of F&A costs to 20% MTDC on a project with direct expenses of $100,000, the recoverable F&A cost is $60,000 ($100,000 x 60%), actual recovery is $20,000 ($100,000 x 20%) and the under-recovery is $40,000 ($100,000 x (60%-20%)).

**Waivers**

If an institution accepts a project that has an “under-recovery” of F&A costs, a source other than the sponsor will have to pay the difference between the negotiated rate and the rate the sponsor is willing to pay. Accepting a project that doesn’t pay the full F&A rate results in a reduction of revenue from the sponsor — a process known as a waiver. The waiver may be explicit or implied, depending on the institution’s policies and practices.

Institutional policies concerning waivers vary as to

◆ how and when waivers occur,
◆ who is authorized to approve a waiver, and
◆ what funds are used to absorb the waived F&A costs.

In some cases the PI, department, or school may be asked to provide discretionary funds to pay the waived F&A, or the institution may absorb these costs by using other institutional resources to fund the under-recovery. (Strategies for dealing with under-recovery are discussed below.)

**Sponsor Limitations on F&A Reimbursement.** In assessing the amount of under-recovery on an award, it is important to note that not all sponsors pay F&A costs on the same basis as federal sponsors. As described above the institution negotiates the F&A rate with its cognizant federal agency and the rate is applied to all awards from all federal agencies (although, as discussed later, there are exceptions). Federal rules dictate that the rate be computed on a modified total direct cost (MTDC) base and applied to awards on a MTDC base.

However, nonfederal sponsors are not bound by the federal rules and they often pay reduced F&A rates that are applied on a total direct cost (TDC) basis, not MTDC. While the exact formula may vary depending on the sponsor, the normal
practice with a TDC rate is to apply the sponsor’s overhead rate to all direct costs on the project; there are no direct cost “modifiers” that don’t receive an F&A charge.

When a project with a TDC rate is awarded, the institution should charge overhead in accordance with the sponsor’s rules, not automatically apply the MTDC formula. For nonfederal awards, this means that F&A should be charged to equipment, capital expenditures, tuition, and subcontracts, unless this violates the sponsor’s policy or terms of the agreement. The appropriate way to measure the under-recovery on a TDC award is to compute what the under-recovery would be if the federal MTDC rules were applied and compare this result to the actual indirect cost recovery generated using the sponsor’s TDC formula.

**Oversight.** Because F&A recovery constitutes a significant source of income for most research-intensive universities, the revenue stream that is generated from the application of the F&A rate must be carefully managed. Institutions should have a policy governing F&A waivers that will minimize under-recovery and maximize recovery. F&A reimbursement is critical since it enables the institution to reinvest in the infrastructure needed to support the research enterprise. Request for waivers should be carefully reviewed and approved by a senior official at the institution with budget authority. In decentralized institutions where indirect cost recovery flows back to a college or school, the waiver request should be directed to a dean or other senior official.

The institution should also have a system to track under-recoveries that result from waivers so that the budget impact of the waiver policy is clearly understood by management. It is unwise to allow waivers to happen without careful consideration of the budgetary implications and approval by senior management. Institutions of higher education typically have effective policies and procedures to monitor and control the expenditure of institutional funds. Institutions should employ the same rigor in implementing processes to control the loss of recovery that occurs when indirect costs are not recovered because of waivers.

**Use and Distribution of F&A Recoveries**

One common misconception is that F&A recovery received from federal sponsors (or nonfederal sponsors) must be used to support the institution’s research programs. In fact F&A recovery is an *unrestricted* revenue source for the institution and there is no externally imposed restriction on how these funds can be used. For most private institutions F&A recovery dollars are commingled with tuition, unrestricted gifts, and endowment earnings, and all are used to support the university’s activities. For public institutions the state may place restrictions on the use of F&A recoveries. From the federal government’s perspective, however, there are no restrictions on the use of these funds.

Although F&A recovery is a reimbursement for costs an institution spends in support of sponsored research; the institution has discretion over the use of these funds. Many universities have a policy that provides for the sharing of F&A recovery with departments, schools, or principal investigators (PIs). How these funds are
distributed across the institution, if at all, is an institutional decision and there are nearly as many different formulas for the distribution of F&A recovery as there are institutions that receive F&A recovery.

An institution may keep all F&A recovery in the general fund and distribute none of this revenue to schools, departments, or investigators. In fact most institutions have a formula to distribute at least a portion of the recovered F&A. For example, an institution may return to departments the portion of F&A recovery related to the departmental administration pool. Or an institution may choose to return to a department the depreciation expense on equipment purchased by the department. The decision whether to return F&A recovery, and the formula used to distribute the recovery, are the prerogatives of the institution.

Universities that employ a “responsibility center management” (RCM) approach to institutional budgeting and revenue sharing may give schools or departments greater control over the use of F&A recovery. RCM institutions typically assess a “tax” to each school to pay for its fair share of central administration and support services. In return the schools keep all, or a portion of, unrestricted revenue, including tuition, gifts, and F&A recoveries.

When an RCM process is used (a concept that is often described as “each tub on its own bottom”) the school that waives indirect cost on research projects is waiving its own revenue. Each school is responsible for paying its own operating costs, along with a share of the central services it receives, and has a greater degree of control over its revenue streams. One effect of RCM budgeting is to shift the decision on whether to waive or reduce indirect cost recovery on projects from the central administration to the RCM unit level. This greater level of unit responsibility for controlling revenues and expenses in a RCM model typically causes the RCM unit to evaluate waiver requests much more carefully.

The important point to consider when evaluating the different policies on F&A recovery is that it is the institution’s decision as to how or if to distribute F&A recovery received from external sponsors, not the decision of the federal government or the nonfederal sponsor. Public institutions may have state regulations that govern the use of F&A recovery; however most institutions individually make the decision on how these funds are used.

**Strategies for Dealing with Under-Recovery of F&A Costs**

Under-recovery of F&A is a significant issue for every university. Some of the factors that cause under-recovery cannot be controlled. Certain federal agencies or federal programs have F&A rates that are significantly lower than the institution’s negotiated rates. For example awards from the U.S. Department of Agriculture (USDA) typically carry congressionally mandated F&A rates which are significantly lower than an institution’s negotiated rate and training grants from the National Institutes of Health (NIH) pay F&A rates of 8 percent. Funding from nonfederal sponsors, including charitable foundations, and nonprofit associations often has indirect cost rates that are significantly lower than the institution’s federal negotiated rate.

---

2 For FY 2014, USDA capped indirect costs at 30% of awarded federal funds
In many cases the sponsor has no flexibility in the amount of F&A it can pay and the institution has no choice but to accept the lower rate or turn down the funding. However even in these situations there are strategies that universities can employ to minimize under-recovery.

Nonfederal Sponsors. A university has more flexibility with policies governing nonfederal sponsors than it does with federal agencies, and the institution can use this flexibility to its advantage. Since nonfederal sponsors are not subject to federal regulations, there may create opportunities to charge these sponsors a F&A rate higher than the negotiated rate. For example the 26 percent federal administrative cap does not have to be applied to awards from nonfederal sponsors. Therefore an institution may decide to charge a higher “uncapped” F&A rate to industrial sponsors to recover an amount that is closer to its true costs.

Similarly other types of costs that are not allowed to be direct charged to federal projects may be charged to nonfederal agreements, with sponsor approval. This could include costs that are normally included in the F&A rate, such as administrative and clerical costs, rent, maintenance, or other facilities-related costs. It may also include costs that are expressly unallowable in federal agreements such as first-class or business-class airfare or entertainment costs, with sponsor approval.

When a nonfederal sponsor with a reduced indirect cost rate agrees to pay for costs that are considered “normally indirect” by the federal government, this can help offset the loss of F&A revenue. Other institutional resources that would otherwise be used to pay for the “unallowable” costs now can be used for other purposes because sponsor funds will be used to pay these costs.

For an institution that tracks under-recovery, or requires a school, department, or PI to pay for under-recovery, it may choose to give “credit” to the unit for costs it charges directly to nonfederal grants and contracts that could not be charged to federal grants and contracts. This credit will reduce the amount of under-recovery and serve as an incentive to the unit or PI to direct-charge costs it would not otherwise assign to the sponsored project. In situations where an institution treats federal and nonfederal sponsors differently, it is important that these circumstances be adequately disclosed in the Cost Accounting Standards (CAS) disclosure statement (DS-2) and the institution’s written policies. (See Figure 2 for background on the CAS.)

Figure 2: The Cost Accounting Standards

The Cost Accounting Standards (CAS) were established by the Cost Accounting Standards Board (CASB) for colleges and universities in 1994. CAS have had a profound effect on the direct charging of certain costs such as clerical salaries and has impacted the charging of office supplies, membership costs, postage costs, and local phone charges. Under CAS universities receiving federal awards of $50,000,000 or more must complete a lengthy and detailed Cost Accounting Standards disclosure statement (DS-2).

In many cases the sponsor has no flexibility in the amount of F&A it can pay and the institution has no choice but to accept the lower rate or turn down the funding. However even in these situations there are strategies that universities can employ to minimize under-recovery.

Nonfederal Sponsors. A university has more flexibility with policies governing nonfederal sponsors than it does with federal agencies, and the institution can use this flexibility to its advantage. Since nonfederal sponsors are not subject to federal regulations, there may create opportunities to charge these sponsors a F&A rate higher than the negotiated rate. For example the 26 percent federal administrative cap does not have to be applied to awards from nonfederal sponsors. Therefore an institution may decide to charge a higher “uncapped” F&A rate to industrial sponsors to recover an amount that is closer to its true costs.

Similarly other types of costs that are not allowed to be direct charged to federal projects may be charged to nonfederal agreements, with sponsor approval. This could include costs that are normally included in the F&A rate, such as administrative and clerical costs, rent, maintenance, or other facilities-related costs. It may also include costs that are expressly unallowable in federal agreements such as first-class or business-class airfare or entertainment costs, with sponsor approval.

When a nonfederal sponsor with a reduced indirect cost rate agrees to pay for costs that are considered “normally indirect” by the federal government, this can help offset the loss of F&A revenue. Other institutional resources that would otherwise be used to pay for the “unallowable” costs now can be used for other purposes because sponsor funds will be used to pay these costs.

For an institution that tracks under-recovery, or requires a school, department, or PI to pay for under-recovery, it may choose to give “credit” to the unit for costs it charges directly to nonfederal grants and contracts that could not be charged to federal grants and contracts. This credit will reduce the amount of under-recovery and serve as an incentive to the unit or PI to direct-charge costs it would not otherwise assign to the sponsored project. In situations where an institution treats federal and nonfederal sponsors differently, it is important that these circumstances be adequately disclosed in the Cost Accounting Standards (CAS) disclosure statement (DS-2) and the institution’s written policies. (See Figure 2 for background on the CAS.)

3 2 CFR 200, Section 200.419
Incentives. Institutions can encourage PIs, departments, and schools to seek full reimbursement of F&A by implementing an incentive system. For example, if an industrial sponsor is willing to pay an F&A rate higher than the negotiated federal rate, a portion of F&A in excess of the negotiated rate could be given back to the PI or department.

Another type of incentive is to encourage service centers to add F&A on billings to non-university external users. Service centers are units within the institution that bill users for goods or services.

When a service center charges the grant of an internal user the institution automatically applies the applicable F&A charge to the service center fee. However, when the service center generates a bill to an external user the indirect cost is not automatically applied. Unless the service center adds an indirect charge to its invoice, the external user will pay a lower rate than the internal user. If the service center adds the indirect cost to the invoice it collects the F&A whereas the F&A that gets applied to the charge to the internal grant or contract flows back to the institution, not the service center. (For a discussion of some challenges in managing a service center, see ¶1720.1.)

Another incentive that can be used is to return to a PI, department, or school a fraction of the F&A recovery on all sponsored projects that pay the full F&A rate. In situations where the sponsor has some flexibility in the amount of F&A it pays, industrial sponsors for example, the opportunity to share in the recovery of F&A may encourage the PI to advocate for full F&A reimbursement from the sponsor or support the institution’s position to charge a higher rate than the federal rate.

Accountability. The key to maximizing indirect cost recovery and effectively managing and minimizing under-recovery is accountability. Since under-recovery represents a reduction of revenue to the institution and places greater demand on the use of institutional resources to pay for costs that would otherwise be borne by the external sponsor, it is critical that under-recovery be monitored and controlled. If the institution retains most of its indirect cost revenue and distributes only a portion, it should tightly control waivers and track the amount of under-recovery. (See earlier discussion of waivers.)

If the institution has a policy of retaining F&A recovery centrally and it permits a unit to waive F&A, there will be little incentive for the unit to limit F&A waivers. In fact such a policy creates a situation that may make the PI more willing to try to influence the sponsor to reduce F&A on his or her project. A waiver helps the PI by reducing the indirect costs on the project, thereby making more funding available for direct costs. However, this is a loss of revenue to the institution.

Although the waiver benefits the PI, it negatively impacts the institution’s bottom line by increasing the F&A under-recovery. A more prudent policy is to establish a review and approval process for waivers to ensure that they are granted in situations where it is necessary and in the best interest of the institution, not an individual investigator.

Establishing a mandatory high-level approval for waivers and a system of
tracking indirect costs waivers and under-recovery will provide management with a process to assign responsibility, ensure accountability, and control the amount of reduced F&A. These measures will provide greater institutional awareness and can help to minimize lost revenue due to under-recovery.

1705.4 Administrative and Clerical Costs

Uniform Guidance (UG) specifies that administrative and clerical salaries and other costs such as office supplies, postage, and local telephone should normally be treated as F&A costs. UG does provide for exceptions to this general rule and allows the direct charging of administrative staff when the costs are integral to the project and meet other conditions specified in section 200.412.

Direct charging of costs that are normally considered to be indirect costs places a burden on the institution to ensure that it follows a process to identify and justify these costs. The treatment of these costs must be consistent with the requirements of UG, the policy of the sponsor, the terms and conditions of the award, and the institution’s policy and disclosed cost accounting practices (i.e., the DS-2 disclosure statement).

When administrative and clerical costs are direct charged, the potential may exist that the PI is “double-dipping” by charging the project for administrative support both directly and indirectly through the F&A rate. According to CAS inconsistent treatment occurs when costs incurred for the same purpose and circumstance are charged both directly and indirectly. It is the responsibility of the PI and the institution to substantiate that the project budget is prepared in a manner consistent with sponsor requirements and institutional policy and to justify how administrative costs direct charged to a project represent a different purpose and circumstance than similar costs billed through the F&A rate.

To ensure that there is adequate substantiation that the PI has complied with the various federal requirements, it is recommended that the proposal explicitly budget the administrative and clerical costs and include a written justification describing why the administrative costs are necessary for the performance of the project. By specifically identifying and justifying the administrative costs in the budget, the institution enables the agency to review the appropriateness of these charges. By following this policy, the institution will develop an audit trail supporting its “exceptional” treatment of administrative costs as direct costs as well as a process to facilitate sponsor review. (Note: inclusion of costs in the award budget does not constitute sponsor approval.)

There are alternative strategies available to an institution that will help to avoid the problems and requirements associated with the direct charging of “normally indirect” costs. Although the UG provides an opportunity for the institution to direct charge administrative costs to a project under certain conditions, some institutions prohibit this practice and charge all allowable administrative costs through the F&A rate. The difficulty with this strategy is that institutions with administrative costs in excess of the 26 percent cap do not recover the full costs of administration.
If an institution that is over the cap increases its administrative costs, or shifts administrative costs from direct charges to indirect, it will receive zero recovery of these additional administrative costs. In situations where it is justifiable and approved by the sponsor it would be advantageous for the institution to direct charge administrative costs and recover a higher proportion of the costs.

‘Substitution’

Another strategy to deal with the hurdles associated with the direct charging of administrative costs is one of “substitution.” Prior to the regulatory changes enacted in the mid-1990s, direct charging of administrative costs was more prevalent than it is today. At that time it was not uncommon for PIs to view grants and contracts as a source of funding to pay for administrative support.

Despite the limitations, some PIs may attempt to direct charge administrative personnel because institutional funding does not provide adequate support for administrative staff. Some of these same institutions also do not charge the full amount of research staff salaries that are billable to the sponsored agreements worked on.

For example, some institutions have a policy to pay faculty academic year salary and not charge faculty research effort to grants and contracts, during the academic year. In these situations institutions may be direct charging costs that are problematic (i.e., administrative salaries) and not direct salary that is fully justifiable. This situation presents an opportunity for substitution and align the institution’s costing practices more closely to the requirements of UG. The institution may choose to direct charge faculty salaries and return to the PI the budget savings resulting from sponsor payment of these salaries. The PI can use the salary “savings” to pay for administrative support, thereby minimizing, or eliminating, the need to direct charge this administrative support.

¶1705.5 Avoiding F&A Costs

The sponsored programs office should recognize that PIs may look for ways to minimize indirect cost charges on their sponsored projects. One method is to “bundle” equipment purchases so that the cost exceeds the institution’s dollar threshold for the capitalization of equipment. This threshold can be as high as $5,000 per unit cost and is determined by the institution.

Because F&A is assessed on non-capitalized costs, including materials and supplies and equipment purchases below the capitalization threshold, but not on equipment and other capital purchases, it is to the PI’s advantage if equipment purchases exceed the capitalization level, thereby avoiding F&A costs. It is important to examine equipment purchases to ensure that they are classified based on the “per unit” cost in accordance with the institution’s capitalization policy. For example, coding two $2,500 workstations as a purchase of a $5,000 “computer system” rather than two separate units may be inconsistent with the institution’s policy and done simply to avoid overhead charges. Other costs, such as a maintenance agreement may be coded as “equipment” to avoid indirect costs.
Rebudgeting

“Rebudgeting” of project costs is another way to avoid F&A charges. For example, an approved project budget may include salary for a research technician, a cost that is subject to F&A. If a PI subsequently uses the amount budgeted for the technician salary to pay for equipment, F&A recovery on the project will be lowered because the funds were used for a non-overhead-bearing cost.

Rebudgeting may be necessary because the focus of the project changed, thus creating the need to purchase equipment that was not anticipated when the project budget was prepared. Or the rebudgeting may simply be a tactic to reduce F&A on the project or to circumvent the sponsor’s policy requiring approval of equipment purchases. Sponsored programs staff and departmental administrators should carefully review significant differences between budgeted F&A recovery and actual F&A recovery to ensure that the circumstances are appropriate and rebudgeting is done in accordance with the sponsor’s policies.

Subcontractor or Consultant?

Another way of avoiding F&A is the misclassification of a consulting arrangement as a subcontractor relationship. There is a clear distinction between a subcontractor’s role on a project versus the role a consultant plays. The following are characteristics of a subcontractor:

◆ Working independently, the subcontractor performs a portion of the work scope of the project and acts as a PI in directing this portion of the project. The work under the subcontract is done at a location other than the awarding institution.

◆ The consultant provides needed expertise but does not independently pursue a line of inquiry on the project. A consultant works under the direction of the PI, and the consultant’s work may take place at the awarding institution.

A PI may attempt to characterize the consultant as a subcontractor to reduce the F&A charge on a project because only the first $25,000 of a subcontract is subject to F&A and the entire amount of a consultant’s cost is subject to F&A. However, this treatment is inappropriate and most universities have policies differentiating subcontractors from consultants.

Aside from differences in F&A treatment, there are other significant implications for classifying a consulting agreement as a subcontract. For example, a subcontractor typically owns any intellectual property created on its portion of the project; the consultant has no intellectual property rights. It is important that PIs and administrators understand the difference between subcontracts and consulting agreements and review proposals and awards to ensure that the costs are properly classified.

1705.6 Impact of Cost Sharing on F&A Rate

Cost sharing is the cost of a project not borne by the sponsor. A sponsor may require an institution to contribute to the cost of a research project, or the institution may choose to offer to cost share a portion of the project cost to make its research proposal more attractive to the sponsor. Section 200.306 of the Uniform Guidance includes
the following provision for cost sharing, which should limit “voluntary” commitments by institutions: “Under federal research proposals, voluntary committed cost sharing is not expected. It cannot be used as a factor during the merit review of applications or proposals, but may be considered if it is both in accordance with Federal awarding agency regulations and specified in a notice of funding opportunity.”

To be eligible as cost sharing, contributed costs must meet the same requirements as direct-charged project costs; the costs must be allowable, reasonable, and necessary for the performance of the project. When an institution includes a cost sharing commitment in a research proposal, the commitment becomes part of the agreement with the sponsor.4

Sources of cost sharing are
◆ cash,
◆ contributed effort of faculty and other researchers,
◆ graduate student tuition,
◆ equipment,
◆ materials and supplies, and
◆ in-kind and third-party contributions.

Waived or reduced F&A recovery may also be used as cost sharing with the prior approval of the sponsor.

Whether cost sharing is mandated by the sponsor or is a voluntary contribution, the institution must be able to demonstrate to the sponsor that it has fulfilled the cost sharing commitment and the actual cost sharing has been properly classified as a project cost. The classification of cost sharing can have a significant impact on the institution’s F&A rate. Since cost sharing is a direct research cost, identifying institutional cost sharing generally results in an increase to the direct cost (modified total direct cost or MTDC) base, which reduces the F&A rate.

Figure 3 illustrates the impact on the F&A rate when cost sharing is added to the organized research base. By identifying $10 million in direct research cost sharing, the institution’s rate is reduced by nearly 3 points, from 60.0 percent to 57.4 percent, despite the increased allocation of administrative costs.

| Figure 3: Organized Research F&A Rate Calculation (000’s omitted) |
|---------------|-----------------|-----------------|-----------------|
|               | Before Cost Sharing | Cost Sharing | After Cost Sharing |
| Administrative Costs | 31,200 | 2,600 | 33,800 |
| Facilities Costs | 40,800 | 0 | 40,800 |
| Total F&A Costs | 72,000 | 0 | 74,600 |
| Direct (MTDC) Base | 120,000 | 10,000 | 130,000 |
| F&A Rate | 60.00% | 57.40% |

4 For more information on cost sharing commitments please refer to OMB Memoranda M-01-06, “Clarification of OMB A-21 Treatment of Voluntary Uncommitted Cost Sharing and Tuition Remission Costs” https://www.whitehouse.gov/omb/memoranda_m01-06/
Cost sharing can have a profound impact on an institution’s budget. Whether cost sharing is mandatory or voluntary the institution must provide the resources to meet the cost sharing commitment it makes. The institution also absorbs the F&A costs associated with the cost sharing expenditures. It is important to realize this secondary impact when the institution computes the amount of cost sharing included in the research proposal. The F&A associated with the committed cost sharing should be included in the total amount of cost sharing on the project.

In summary, it is important for the institution to recognize the full impact of cost sharing. Because the impact can be significant, an institution should be prudent in the amount of cost sharing it offers on research projects and should consider limiting such commitments to only those situations in which cost sharing is required by the sponsor.

Gift vs. Grant

External resources come to the university in many forms, including as sponsored agreements (grants, contracts, and cooperative agreements) for research, educational, and public service purposes; funds appropriated from federal, state, and local governments; and gifts. Making a distinction between external funds that support specific projects (“grants”) from those funds that have few, or no, restrictions on the use of the funds (“gifts”) is not always easy.

Depending on the institution’s policies, differentiating between a grant and a gift can have significant indirect cost ramifications which can trigger disagreements over the proper classification.

From the PI’s perspective, coding a transaction as a gift may be preferable to classification as a grant because there is a lower institutional assessment on gifts. From the institution’s perspective, a grant classification may result in higher indirect cost recovery. However, it is common for a non-federal entity to provide funds that may restrict the F&A that can be charged in order to provide more money for the direct support of the PI.

The office of sponsored programs may lean towards classifying external funds as a “grant” because it will increase the institution’s sponsored research volume and enhance its institutional research ranking, and perhaps bolster the reputation of the sponsored programs office. On the other hand, staff from the institution’s development office may argue for a “gift” classification because this would add to the institution’s fundraising total and likely enhance the reputation of the institution and the performance of the development office. In some cases a compromise is reached and the funds are counted both as a gift and a grant for internal reporting purposes.

Factors that are used to distinguish grants from gifts include

◆ whether the funds require a defined statement of work,
◆ period of performance,
◆ set of deliverables,
◆ reporting requirements to the sponsor, and
◆ restrictions on the use of unused funds, or return of funds to the sponsor.

Gifts typically do not include any of these requirements and carry fewer restrictions. However, for funding received from foundations, industrial companies, and individuals, the distinction between a grant and a gift sometimes can be blurred and officials within the institution may differ on the proper classification of the funds.

Every institution should have a policy for classifying gifts versus grants. Disagreements over the classification of these funds will occur without clear policies defining gift versus grant. Clarifying the distinctions of each will help to ensure a consistent process for classifying funds and resolving disagreements.

**Impact on F&A Calculation**

The classification of external funds as a grant means that the award is subject to the institution’s full F&A rate. If the grantor doesn’t pay the full F&A rate, an F&A rate under-recovery will occur and the institution will have to use other resources to pay the portion that the sponsor does not reimburse to the institution. Gift funds may be assessed a nominal F&A rate by the institution or the institution may choose to exempt gifts from internal assessments of F&A.

**¶1705.8 The Research Dollar**

The F&A process is complicated; therefore, the F&A rate is frequently the subject of misunderstanding on campuses, at Federal agencies, and in Congress. Research administrators often encounter misconceptions of what costs the rate includes and how it is calculated and applied. An example of a common misconception is the belief that an institution with an F&A rate of 60 percent collects $0.60 cents in F&A for every dollar of research funding. This, of course, is not true. The F&A rate is applied to modified total direct costs (MTDC) not total direct costs (TDC).

Every dollar of research funding an institution receives from sponsors is used to pay for both direct costs and indirect (F&A) costs of research. Although certain direct costs such as equipment, subcontracts, and tuition are “modifiers” and not subject to F&A, these are essential and significant project costs. When one considers that the research funding an institution receives is used to pay for direct costs, “modifiers,” and F&A costs, the ratio of F&A costs to total research costs is much lower than the MTDC rate.

Survey information collected by the Council on Governmental Relations (COGR), an organization of major research universities, provides an insight into the relationship of direct and indirect costs and how much of a dollar of federal research funding is used to support indirect (F&A) costs. The 102 COGR institutions included in the 1998 survey reported a total of $7.6 billion in federal sponsorship for the

---

year. This was made up of $5.7 billion in expenditures for direct costs ($4.5 billion in “MTDC” and $1.2 billion in “modifiers”) and $1.9 billion in F&A costs. For this group of universities, F&A reimbursements represented only 25 percent of total federal funding for research ($1.9 billion out of $7.6 billion). Based on this survey one can observe that only $0.25 of every dollar of federal research funding is used to pay for F&A costs, whereas $0.75 of every dollar pays for direct costs.

An analysis of research expenditures for Harvard University supports the COGR data (see Figure 4: The Federal Research Dollar in the Harvard University Rate Area). For Harvard, $0.69 of every dollar of Federal funding was for direct costs and $0.31 was for the reimbursement of F&A costs. The administrative component of the F&A recovery was $0.12 and the facilities component was $0.19.

The “research dollar” is a simple and effective analysis that institutions can prepare to explain how research funding is used at the institution. It is an especially useful tool to counteract the misconception held by many on campus, that a majority of sponsored research funds are used to support indirect activities.

### Conclusion

Indirect/F&A costs are real costs that are incurred to support an institution’s primary activities, including research and instruction. For externally sponsored activities, if the sponsor doesn’t pay its share of F&A, the costs don’t disappear; the costs must be paid from other resources. Institutions that waive or reduce F&A costs on a research project are subsidizing the cost of the research. When research projects are subsidized, the resources used to pay for this portion of the project must come from other unrestricted resources, including tuition, gifts, and endowments, and strain the institution’s ability to support its non-research activities.
The determination of the F&A rate can be a complicated and, at times, confusing process. It is often difficult to accurately separate instructional activities from research activities since both activities often involve the same people and occur in the same “spaces.” Nonetheless the costs of infrastructure and support activities that make up the F&A pools are essential to the operation of institutions of higher education. The recovery of these costs is also essential since it enables the institution to reinvest in the infrastructure and continue to provide the services necessary to support its mission activities.

Because the F&A process is complicated, few individuals on campus have an in-depth understanding of it. For many the F&A recovery is a misunderstood process and misunderstanding can lead to disagreement. Sponsored programs administrators must be knowledgeable about the nature of the indirect cost rate, the components of the rate, and the way the rate is applied. Sponsored programs staff should possess this basic knowledge of the fundamentals of the F&A process so they can explain this mission-critical process to faculty, help to counteract misconceptions about F&A, and help to minimize disagreements over F&A recovery on campus.
1720 Supplementary Material

This section includes expanded coverage of topics relating to facilities and administrative cost issues and related topics. These materials are culled from a variety of authoritative sources.

1720.1 Common Challenges in Managing a Service Center

Tracey Fraser, Associate Controller, Post-Award Administration, California Institute of Technology

Service centers raise an interesting array of research compliance issues. This article discusses a few of the more common challenges as well as how to compute the basic rate calculation.

Service centers, sometime known as recharge centers, are units that provide goods or services (either technical or administrative) to other users within an organization. Service centers recover the cost of operations through charges to users and are expected to break even over a period of time. Research activities are normally not undertaken within a service center itself, but the goods or services provided to other units allow those units to conduct research.

<td>There is no specific mention of “service centers” in Circular A-21.</td>
</tr>
</tbody>
</table>

Little Available Guidance

Specific regulatory guidance is somewhat lacking in this area. Universities tend to develop service center policies and procedures based upon the interpretation of (somewhat dated) audit reports and brief, almost anecdotal, references to service centers in the OMB Circular A-133 Compliance Supplement and the Cost Accounting Standards, and hold it all together with the application of general costing concepts established by OMB Circular A-21.

The compliance issues come into play when service center rates are charged to federal awards. Universities should have in place processes to ensure that (1) the rates charged are based upon allowable costs and do not include any element of profit, and (2) the federal government is in no way subsidizing other users of the facility.

1 This discussion is based on material presented at the NCURA FRA Conference, April 4, 2006.
Rate Calculation

The basic service center rate calculation is as follows:

\[
\text{budgeted cost (+/- prior period under-/over-recoveries)} = \text{rate} \times \text{budgeted usage base}
\]

Ensuring that a service center rate is composed of only allowable costs with no element of profit involves reviewing and understanding all cost components included in the budgeted costs. Ensuring that there is no subsidization requires a thorough review of the base to make sure that all users are included. Managing these risks is explored in more detail below.

Budgeted Costs. Let’s first concentrate on the numerator, budgeted costs. Service center rates are normally developed in advance of the center’s fiscal year and are therefore based upon estimates. As always, care needs to be taken to ensure that only allowable, allocable, and reasonable costs are included in the rate.

Service center costs typically include personnel costs (e.g., salary and benefit costs), materials and supplies, and, depending on university policy, the depreciation on nonsponsor-funded equipment. Allowable costs that are sometimes overlooked at the rate-development stage but should be included are equipment maintenance contracts and prior period under- or over-recoveries. Utility, maintenance, and building costs will not typically be included in the rate as these costs are normally recovered through the university’s facilities and administrative (F&A) rate (an exception exists for very large and/or specialized service centers).

One of the main challenges in managing equipment-intensive research centers is figuring out how to pay for the cost of equipment. Though the service center has to fund the total cost of an item of equipment in the year of purchase, the recovery of that cost is spread out among the years that benefit from the use of the equipment. Thus if an item of equipment costs $100,000 in Year 1 and the useful life for that item is estimated to be five years, then only one-fifth of the cost of the equipment ($20,000) may be included in the allowable costs to be recovered in the rate in each of the five years. Of course the service center still has to find a means to pay for that equipment in Year 1. This dilemma frequently results in service center management wanting to include an equipment reserve component in the costs. To the extent that this cost component represents the recovery of future costs it is unallowable. Federal sponsors will not pay now for a cost that may be incurred at some point in the future (because, for example, what if the technology changes or the research focus shifts resulting in those services no longer being required?).

While there is no perfect solution to this challenge of how to fund equipment, a few suggestions can be made:

◆ Would it be possible to enter into an operating lease for the equipment in which case the lease payments could be included as allowable costs?

◆ Is gift or internal funding available?
**Is there an opportunity to bring external users into the facility and charge them a higher price than internal users?**

The premium paid by external users could then be used to fund an equipment reserve. Of course external use should be incidental. Additionally, universities need to be aware that external usage can involve different types of compliance concerns, such as unrelated business income tax (UBIT), indemnification and liability issues, and potential program income (if the equipment used in the service center was federally funded) (For a discussion of UBIT and program income, see ¶2905.4 and ¶3305.14, respectively.)

**Budgeted Usage Base.** Let’s now turn to the denominator, the budgeted usage base. This is the volume of work expected to be performed expressed in reasonable units of measurement. The unit of measurement depends upon the nature of the facility. For example, an equipment-intensive facility could express costs in terms of machine hours; a labor-intensive activity in terms of labor hours, and a center that delivers a measurable product may use budgeted volume. The key is that there should be a strong relation between the chosen base and the natures of the costs being charged. In order to recover costs, it is important that the center uses realistic base estimates, i.e., the amount of time that a machine is likely to be used compared to the amount of time that it is available for use.

A center can make a business decision to offer discounted or free rates to some users. This should be categorized as an intentional subsidy and the cost of that subsidy must be borne by the center (or the university) rather than federal users. The following example will help illustrate this point:

**Example**

A machine shop makes its services available to support faculty research and also provides hands-on instructional experience for students. The shop manager estimates annual operating costs of $100,000 and 1,000 hours of machine usage, of which 80% will be supporting sponsored projects and 20% will be student usage. The shop wants to encourage student use and as such decides that they can use the facility free of charge. If the student usage was excluded from the base then, the center would recover all of its costs and the federal users would effectively be subsidizing the students, i.e., the rate would be calculated as $125/hour ($100,000/800 hours). Instead, the rate should be calculated as $100/hour ($100,000/1,000 hours) with the center (or university) funding the subsidy.
As noted above a service center’s rates generally are based upon estimated costs and estimated usage; it is unlikely that actual costs will be exactly as estimated, therefore the center will most likely generate an unintentional under- or over-recovery of costs in any given year. As long as the under- or over-recoveries is not significant (and not intentional) it is generally acceptable to liquidate it in a future year’s rate.
§1720.2 Reviewing Your Admin & Clerical Cost Policies: Help From the OIG
AIS Editors

A special form of cost misallocation is the direct charging to a federal project of costs that by their nature are indirect or facilities and administrative (F&A) costs (see ¶1705.4). For example, most costs of clerical staff are considered F&A costs and are charged to federal projects through application of the institution’s F&A rate. In some special situations, however, OMB Circular A-21 expressly permits direct charging of costs that are normally considered F&A costs (see Figure 1730.3-1).

Audits by the OIG

The concerns about specific compliance requirements that are addressed in Circular A-133 audits often are reinforced by audit work performed by federal offices of inspector general (OIGs) or by public accounting firms under contract to them. Typically, most OIG audits are post-award and take place after the conclusion of the contract or grant or other assistance agreement and before the end of the required record retention period (usually three years). In general, the subjects of post-award audits are the costs incurred, and the audits will be conducted either in person or via a desk audit. Documentation of expenses is closely looked at during these audits. (Like auditors performing the Circular A-133 audit, auditors from the OIG or independent auditors performing audits under contract to the OIG must follow the Government Auditing Standards (the Yellow Book).)

Identifying OIG Audit Targets

The OIG annual audit/work plans provide insight into the audit areas it plans to target for the fiscal year. These plans are issued usually in October. OIGs also summarize the results of high-profile audits in semiannual reports to Congress. These reports can provide indicators of the areas that are receiving greater scrutiny or that are causing compliance difficulties.

Another resource for identifying OIG audit targets is the audit of the agency’s grants management programs conducted by the OIG or the Government Accountability Office. Whatever weaknesses are exposed in the audit of the agency is likely to surface in an audit of the grantee as well. For example, if an agency is criticized for not ensuring timely delivery of reports, it is likely that during an audit of the institution, the auditor will review the filing dates of the required reports.

The Department of Health and Human Services (HHS) OIG has indicated in recent audit plans that it is targeting treatment of administrative and clerical support charges. To date, the OIG has issued three audit reports on the issue (see Figure 1730.3-1) and others are expected.

Therefore now may be a good time to review what the OIG has found and ways to ensure your own institution’s compliance with the requirements. Be sure to not
only look at your polices but also how they are being followed. The closeout process may be the perfect preparation for a post-award audit. This process is the final review of items such as direct charges of clerical and administrative costs before submission of the final financial report. Unallowable costs not previously detected should be removed at this time, and documentation not previously provided should be obtained for costs.

In its response to the OIG’s recent audit report of its administrative and clerical costs, Duke University cited a number of steps it took to fine-tune its policies and practices including the following:

- Establishment of a formal process for reviewing and approving direct-charged administrative costs at the proposal stage and again when the award is made
- A training tool-kit on the monthly reconciliation process, a key element of which looks at direct charges of administrative costs
- A “Post-Award Closeout Checklist” that identifies directly charged administrative costs at time of grant closeout if they have not already been identified in the monthly reconciliation process
- Development of a risk assessment process by the Research Costing Compliance Office that includes monitoring and reporting for risks related to this topic

**Documents Reviewed.** As a reminder, auditors often request the following documents for review to support administrative and clerical salaries charged to grants:

- Your cost accounting standards disclosure statement
- Your chart of accounts and related descriptions
- Policies and procedures on administrative and clerical costs and other costs normally charged as indirect costs
- Job descriptions and job titles for employees charged to the administrative and clerical account codes
- Grant application budgets, contract proposals, and related justifications for charging costs as direct that are normally charged as indirect

**Assessing Internal Controls.** The purpose of the audits is to check for allowability of administrative and clerical salary costs and other types of administrative and clerical costs that were charged directly to HHS grants. The university’s internal controls over administrative and clerical expenses are assessed as part of the review. For example, according to the OIG in one audit, the root cause of the unallowable charges revealed in the audit was the failure of the university’s internal controls over federally charged administrative and clerical costs. The university’s general accounting procedures cited Circular A-21, OIG said, but “the University had largely left it to the discretion of its individual colleges, departments, and principal investigators to interpret” the procedures. The report said the office of sponsored research “did not provide adequate scrutiny for charges proposed and subsequently charged by colleges, departments, and principal investigators (PIs). The University’s
policies essentially allowed direct charges to any project needing any administrative or clerical support.”

Projects Must Be ‘Major.’ Circular A-21 prohibits direct charging of clerical and administrative salaries except in the case of “major projects,” which are defined as projects that require an “extensive amount of administrative or clerical support, which is significantly greater than the routine level of such services provided by academic departments” and provides examples of such projects in Exhibit C to A-21 (see Figure 1730.3-1).

In one audit report, the OIG listed the examples in A-21 section F.6.b and Exhibit C of projects for which direct charges for administrative and clerical expenses may be appropriate, but said “… many of the projects [to which the university had direct charged] had little in common with the programs and activities listed in Exhibit C to the Circular as examples of what might actually be considered major projects.” The OIG cited the following: A PI stated that he considered clerical salaries specific to creating, copying, and assembling the annual progress report to be allowable. However, he provided no explanation why the production of an annual report, which is required of almost every sponsored award, might be interpreted as requiring an “extensive amount of administrative or clerical support.”
HHS OIG Audits to Date

◆ The HHS OIG audit of administrative and clerical costs at Duke University found that the university "claimed approximately $1.7 million in unallowable charges as direct costs to grants, contracts, and other agreements with HHS components during fiscal years 2003 and 2004." OIG also recommended that the university revise its policies to comply with Circular A-21 and "ensure consistent treatment of administrative and clerical costs." In its comments, the university maintained that the audit report did not fairly represent its policies and internal controls and that the university has complied with federal requirements. It pointed out that it had developed additional training programs and implemented additional monitoring procedures since the review. Duke also said that no OIG audits of universities had used statistical sampling to extrapolate reimbursement amounts since 2001 and found the extrapolation "inequitable."

◆ The OIG made no recommendations after conducting an audit of administrative and clerical costs claimed between July 2004 to July 2006 at the University of California, San Francisco. The audit concerned UC-SF's claimed costs of $635 million for 2,153 federal grants, contracts, and other agreements with NIH." The university made minor clerical errors in charging costs. However, university officials stated that the errors have been corrected," the audit stated.

◆ An audit of Brandeis University found that the university misclassified $31,303 of $393,881 charged to grants and contracts for clerical and administrative costs and other direct costs during fiscal years 2004 and 2005. Of the misclassified funds, $24,958 in other direct costs and $6,345 in related indirect costs were spent on books, subscriptions, and public relation costs, which "should have been included" in the university's facilities and administrative costs, OIG said. OIG recommended that Brandeis "update its procedures to include books, subscriptions, and other supplies as costs claimed under F&A costs unless adequately justified, budgeted, and approved by NIH as a direct grant cost and work with NIH to resolve the $31,303 in misclassified costs." Brandeis agreed with the findings and the recommendations.

Figure 1720.2-1: Overview of A-21 Requirements for Charging Direct Costs

Circular A-21 sets forth a few key requirements that apply to direct costs, and administrative costs must meet these requirements in order to be considered direct costs.

Specifically Identified Costs. Sec. D.1 of A-21 describes direct costs as “those costs that can be identified specifically with a particular sponsored project, an instructional activity, or any other institutional activity, or that can be directly assigned to such activities relatively easily with a high degree of accuracy.” It is usually not possible to identify administrative salary costs, or non-salary administrative costs such as office supplies, with a specific project “relatively easily with a high degree of accuracy” because typically such costs “are incurred for common or joint objectives” — the definition of indirect or F&A costs (sec. E.1). A-21 is clear, however, that “[i]dentification with the sponsored work rather than the nature of the goods and services involved is the determining factor in distinguishing direct from F&A costs of sponsored agreements” (Sec. D.2). This means that the fact that a particular cost is labeled “administrative” or “clerical” does not necessarily mean that it must be treated as an indirect cost.

Consistently Treated Costs. Sec. C.11.a of A-21 provides that “[a]ll costs incurred for the same purpose, in like circumstances, are either direct costs only or F&A costs only with respect to final cost objectives.” This requirement is reiterated in the circular’s discussion of direct costs (Sec. D.1 states, “Costs incurred for the same purpose in like circumstances must be treated consistently as either direct or F&A costs.”). This means that to the extent that administrative costs that are specifically identifiable with research are charged to sponsored research projects, administrative costs specifically identifiable with other functions (such as instruction) must in like circumstances be directly charged to those functions.

Salary Costs. Sec. F.6.b(2) of A-21 provides that “[t]he salaries of administrative and clerical staff should normally be treated as F&A costs.” The section goes on to say, however, that direct charging of such costs is allowable “where a major project or activity explicitly budgets for administrative or clerical services and individuals involved can be specifically identified with the project or activity.” Of course, the costs must also meet the specific identification and consistency standard.

Budget Requirement. A-21 states that in order to charge administrative or clerical salaries directly to a grant, the institution must have “explicitly budgeted for such costs. “

Technical Personnel. It is sometimes overlooked that Sec. F.6.b(2) of A-21 does not apply to staff who are performing a technical function, even if they might typically be classified as clerical personnel. It applies only to personnel who are providing “administrative or clerical services.” Neither the “major project” condition nor the budgeting provision of Sec. F.6.b(2) applies to personnel performing technical functions, such as database management or manuscript technical editing. Sec. F.6.b(1) recognizes that “salaries of technical staff, laboratory supplies (e.g., chemicals), telephone toll charges” and other items “shall be treated as direct cost[s] wherever identifiable to a particular cost objective.”

Non-Salary Admin Costs. Sec. F.6.b.3 of A-21 states that, “Items such as office supplies, postage, local telephone costs, and memberships shall normally be treated as F&A costs.” These administrative costs are “normally” treated as F&A costs because they typically represent the kinds of costs “that are incurred for common or joint objectives and therefore cannot be identified readily and specifically with a particular sponsored project, an instructional activity, or any other institutional activity” (Sec. E.1). There are some cases, however, where a non-salary administrative cost can be “identified readily and specifically with a particular sponsored project,” and in such cases, the cost may be charged directly. A-21 makes it clear that whether a particular cost can be “identified” with a particular sponsored project does not depend on the nature of the charge (e.g., administrative vs. technical): “Identification
with the sponsored work rather than the nature of the goods and services involved is the determining factor in distinguishing direct from F&A costs of sponsored agreements” (Sec. D.2).

‘Major Projects.’ Sec. F.6.b(2) of A-21 defines major project as “a project that requires an extensive amount of administrative or clerical support, which is significantly greater than the routine level of such services provided by academic departments.” Exhibit C to A-21 provides six examples of major projects “where direct charging of administrative or clerical staff salaries may be appropriate”:

1. Large, complex programs such as general clinical research centers, primate centers, program projects, environmental research centers, engineering research centers, and other grants and contracts that entail assembling and managing teams of investigators from a number of institutions.
2. Projects that involve extensive data accumulation, analysis and entry, surveying, tabulation, cataloging, searching literature, and reporting (such as epidemiological studies, clinical trials, and retrospective clinical records studies).
3. Projects that require making travel and meeting arrangements for large numbers of participants, such as conferences and seminars.
4. Projects whose principal focus is the preparation and production of manuals and large reports, books and monographs (excluding routine progress and technical reports).
5. Projects that are geographically inaccessible to normal departmental administrative services, such as research vessels, radio astronomy projects, and other research field sites that are remote from campus.
6. Individual projects requiring project-specific database management; individualized graphics or manuscript preparation; human or animal protocols; and multiple project-related investigator coordination and communications.

It’s worth noting that examples #2, #3, #4, and #6 relate to projects that may not involve inherently large or complex programs, but that nevertheless have specific requirements that make it necessary to use unusual amounts or types of administrative or clerical services.

Exhibit C makes it clear that the examples presented are not exhaustive. There can be other circumstances in which the “major project” designation would be appropriate.
1720.3 **Service Centers: Reinforcing Roles & Responsibilities to Achieve Compliance**

Martin Smith, Attain, LLC

As we begin a new year, many institutions are beginning the budget process to project how fiscal year 2012 (FY12) will finish and plan for fiscal year 2013 (FY13). The budget process typically includes budget analysis of the operating, sponsored programs, discretionary, and other funding sources. This annual process should also include a review of service centers in preparation for the upcoming cost analysis based on actual FY12 activity and rate setting for FY13.

Service Centers for another consecutive year have made the federal Department of Health and Human Services (DHHS) Office of Inspector General (OIG) FY12 Audit Work Plan. There is very little concrete guidance as to how to operate service centers making compliance requirements challenging to achieve.

There are many misconceptions about service centers, ranging from understanding the correct terminology, to applying the right compliance requirements, to knowing your institution’s position on defining what constitutes a service center. We will review 1) an overview of federal costing compliance requirements, and 2) discuss ideal roles and responsibilities of individuals responsible for oversight and management of service centers.

**What is a Service Center?**

For purposes of this article, a *Service Center* can be any business unit within an organization that charges other users for their services. The Office of Management and Budget (OMB) Circular A-21, Section J.47 introduces the term *Specialized Service Facilities* as meaning “highly complex or specialized facilities operated by the institution, such as computers, wind tunnels, and reactors.” OMB Circular A-21 also defines an alternative to specialized service facilities in Section F.6.b.(1) by the use of *Recharge Center*, interpreted to mean a non-specialized service facility such a copy center or glasswashing facility. Section F.6.b. of OMB Circular A-21 is also important to note because it has also been a focus topic on recent DHHS OIG audit work plans, particularly for the consistent treatment of direct-charging of departmental administrative costs. *Research Core Facilities* typically refer to a highly specialized service center providing a technical service such as genomics, imaging, or cell sorting facilities. Core facilities may also be subsidized by a National Institutes of Health (NIH) core

2 OMB Circular A-21, Section J.47, can be found online at: http://www.whitehouse.gov/omb/circulars_a021_2004/

4 Archive of DHHS OIG Audit Work Plans, can be found online at: http://oig.hhs.gov/reports-and-publications/archives/workplan/index.asp
center grant and be advertised by your institution as a competitive strength or focus area of science. Lastly, there are Animal Research Facilities which may fall under one or more of the definitions above. Animal research facilities also follow a special ratesetting guide called: Cost Analysis and Rate Setting Manual for Animal Research Facilities.5

Compliance Requirements
Service Centers have compliance requirements from the federal government in OMB Circular A21, Section J.47 and within your own institution depending on how service centers are defined. Some institutions call all budget or business units that charge out for their services a service center, while others have a dollar threshold (e.g. $5,000 or $25,000) to determine whether a recharge function is a formal operation. Other institutions are only concerned with specialized service facilities that look at operations charging significant, material amounts to federal awards and/or have a revenue amount greater than a specified dollar amount (e.g. $1 million). Many institutions require approval from a central office such as the controller/comptroller, finance, or sponsored programs office to get approval to begin a service center operations. The specifics of your institution’s policy and procedures regarding service centers will dictate how you should proceed.

Here are selected compliance requirements paraphrased from OMB Circular A-21, Section J.47:
(1) Service centers are allowable as a direct-charge as long as you apply credits for portions of the operation the federal government supported;
(2) Charge for actual usage based on a schedule of rates;
(3) Do not discriminate against federally supported activities;
(4) Recover the aggregate costs of the services including direct and indirect costs;
(5) Adjust rates biennially and consider prior period surpluses or deficits;

Applying these compliance requirements and those of your institution, while also managing a service center as an internal business unit, will pose challenges to the many people involved in the process.

Roles and Responsibilities
A service center requires different functions ranging from advertising, order entry, order fulfillment, managing day-to-day operations, to invoicing, collection (if external accounts), performing an annual cost analysis to setting rates for the next fiscal year.

The types of information needed can range from questions about costs, volume, rates, the market, assumptions, and constraints. Typical questions include: how many orders have been delivered and ready to charge or invoice; what supplies are needed to deliver services; how many people will be working in the service center; which

5 The Cost Analysis and Rate Setting Manual for Animal Research Facilities is published by the NIH National Center for Research Resources (NCRR) and can be found online at: http://www.ncrr.nih.gov/publications/comparative_medicine/CARS.pdf
users make up a majority of the volume; what rates will the market pay; are there competing service centers using better technology; and did you document assumptions and consider constraints?

This information can come from different people involved in different aspects of a service center operation. Everyone involved in the process has important compliance and management functions that contribute to the successful operation of the service center. Below is a list of typical roles and responsibilities within an institution:

◆ Central Office—an institution typically has someone in the Finance or Sponsored Programs Office responsible for oversight of service centers. Duties include establishing accounts, setting policies, and establishing biennial review procedures to ensure compliance. Oftentimes the institution’s Cost Analysis/F&A person is responsible for providing federal costing interpretation.

◆ Central or Departmental Sponsored Programs Post-Award—this function ensures costs charged to sponsored awards match the time of the charges, appear reasonably based on the type of award, and follow institutional allowability requirements. They may also be the final approval before a service center charge (via journal entry or feeder system) is charged to a sponsored award.

◆ Internal Audit/Compliance Official—this function is responsible for monitoring the institution’s compliance requirements and efficacy of internal controls in relation to the transaction processing.

◆ School-level Finance, Administrative or Budget Office—may provide limited or expanded oversight depending on the centralization model employed by the institution. Ultimately this office would be concerned with ongoing surpluses or deficits.

◆ Department Administrator—could have a variety of functions to processing journal entries for service center charges, adjusting payroll allocations for service center staff, to mediating budget or rate-setting issues between the service center and oversight offices.

◆ Scientific Director—the scientific faculty member in charge of the service center, who determines the scope of services offered and advertises the center within the department, school, university, or larger market.

◆ Service Center Administrator—the financial and administrative manager of the service center responsible for ordering supplies and billing out for services rendered as well as rate setting. This role may be combined with a Lab Manager.

◆ Lab Manager—person managing the order fulfillment of the service center and managing the technicians performing the work in the service center. This is the person likely responsible for conveying to the financial administrator that the technical work has been completed or other billing milestones. This person has a very important role because without them, the administrators have no way of knowing (without a vendor-offered solution) that services have been rendered.
◆ Service Center Technical Staff—the individuals doing the technical work of the service center.

◆ Senior leadership—any senior role supporting the strategic direction of service centers, ranging from a dean, provost, controller, and others.

As this list demonstrates, there are numerous individuals in an institution responsible for service centers where there does not appear to be one person with complete responsibility. This separation of duties is good for internal controls; however, poses more challenging when compliance requirements and cost analysis requires input from all of them. Ultimate accountability is on the institution. Coordination and communication between them is essential for success. My experience at the University of Pennsylvania worked so well because we had support from senior leadership and cooperation throughout all of the roles and responsibilities outlined here. When underperforming services centers are faced with the equivalent of bankruptcy, it requires input from the scientific side to know whether the service centers were worth saving. Determining whether departmental recharge centers are compliant with OMB Circular A-21 requires justifications from the department administrator, guidance from the compliance office, and a final determination from the cost analysis official. Internal audit including service centers in its work plan is also beneficial in testing the efficacy of your institution’s service center policies and procedures.

**Conclusion**

My favorite motto is “working in a University, you cannot achieve anything by yourself.” Managing service centers is a difficult process because of the competing demands to achieve compliance, meet solvency requirements, and providing services to the users of the facility. Reinforcing roles and responsibilities is important to running a compliant, break-even, and solvent service center operation.

He has 10 years of research administration experience primarily in post-award and financial compliance having worked at institutions in the Philadelphia, PA and Washington, DC areas. Martin had service center responsibilities at the University of Pennsylvania School of Medicine and Temple University and is active with Attain clients on the subject.
1720.4 **Genesis and Implications of a Survey on Sharing F&A Cost Recovery**

Kristine M. Kulage, Columbia University School of Nursing

Do research administrators and senior investigators believe policies for sharing facilities and administrative (F&A) cost recovery on sponsored projects between schools, departments, or units would help promote interdisciplinary research initiatives? How many colleges, universities, and academic medical centers actually have such policies in place? What are the most common, effective, and satisfying types of policies? These are the questions that prompted an article I recently first-authored for *Academic Medicine*, “Sharing Facilities and Administrative Cost Recovery to Facilitate Interdisciplinary Research.” Our published findings, which present an emphatic “yes” to the first question and illustrate an important policy gap, in the end point readers to one last open-ended question: What now?

My history with this topic began in early 2004 when I was the grants administrator for one of the 21 exploratory interdisciplinary centers initially funded by the National Center for Research Resources of the National Institutes of Health (NIH) under the NIH Director’s Roadmap Initiative. After four difficult but rewarding years and a large learning curve, in 2008 I presented a case study on this topic at the 50th Annual NCURA Meeting where I discovered that I was not alone in facing the administrative difficulties inherent in interdisciplinary research. A year ago, I detailed my experiences working with this center in an *NCURA Magazine* article which highlights the challenges of setting up multiple financial accounts across departments that would allow for the sharing of F&A cost recovery at an institution where this was not standard practice and a policy did not exist. Fortunately, I was able to develop “backdoor” methods within our archaic accounting systems that allowed us to share this grant’s F&A cost recovery. This caught the attention of the Mailman School of Public Health’s Associate Dean for Interdisciplinary Programs who was struggling with the same issues and led to our eventual collaboration on the *Academic Medicine* original research article.

We began our investigation with several key questions: “What F&A cost recovery sharing policies currently exist?”; “Is there interest in this topic among colleges, universities, and / or medical centers?”; and “Is there a gap in the literature about this topic that we can fill?” As we searched online for general information about the topic, we noted that there was almost nothing in the published literature. In addition, an indepth search failed to reveal any peer-reviewed articles which described and examined, in a systematic way, policies for sharing F&A cost recovery or assessed user satisfaction with any existing policies.

---

1 This article is reprinted from the *NCURA Magazine*, May / June 2011, Volume XLIII, No. 3. It is used with permission of the publisher.

I spent over 100 hours scouring the Internet for universities which currently have policies for sharing F&A cost recovery between schools, departments, or units posted on their web sites. The limited number of policies I found were buried deep within layers and sub layers of convoluted university web sites, and were found across a wide array of home page types (e.g., controller’s office, sponsored projects administration office, post-award office, general policy pages, etc.). A few were available through a single link to the findings of a previously convened task force where the actual policy was stated in one sentence on page 25 of 30 pages. Based on this, I imagine some of these policies are not well-publicized and or well-known even for administrators and researchers at that institution. After using almost 50 distinct search terms in Google searches and investigating any links which looked remotely like they would lead to a policy, I was only able to find 54 policies. Although the policy descriptions and types ranged from very generic and loose to exhaustingly specific percentages of F&A split, we were able to categorize them into 4 major types which then informed our survey that we targeted to both investigators and research administrators.

Our simple, brief survey was designed to capture information about attitudes toward policies for sharing F&A cost recovery, specifically in regard to their impact on interdisciplinary research. It also asked respondents if their institution has such a policy and, if so, what is the overall design of their policy and how satisfied are they with it.

The invitation to participate in the survey was sent to all principal investigators (PIs) of NIH-funded Clinical and Translational Science Awards (CTSA) as well as all members of four NCURA Neighborhood Listservs. The high response rate from the CTSA PIs was especially impressive considering the heavy workload these senior investigators typically have, which attests to their interest in the topic.

In all honesty, we were not surprised to find that the vast majority of respondents, administrators and researchers alike, agreed that a policy for sharing F&A cost recovery between participating schools, departments, or units would improve interdisciplinary research efforts. Logically, it makes sense that receiving a portion of the indirect costs associated with conducting the research would be a huge incentive to collaboration – money talks, and loudly in today’s economy. Even so, the majority of respondents reported that their institution does not have a formal policy in place.

There was a surprising lack of knowledge and awareness among both groups of respondents: over 8% indicated they didn’t know if their institution even has a policy for sharing F&A cost recovery. Considering the experience level of CTSA PIs and active NCURA members, we were surprised that nearly 1 out of 12 couldn’t answer this question. This could be a direct result of how difficult policies are to find on their web sites or that they are simply not publicized internally. Our most important survey finding was the fact that most individuals who indicated their institution had a policy also indicated that they were satisfied with the policy. Statistical analyses showed that, amazingly, this was true regardless of the type of policy they have. This speaks volumes in support of having policies, rules, and regulations in
this area rather than ambiguity or dealing with the issue on a case-by-case basis as it arises.

As a way of saying “thank you,” once our article was available in PubMed, I again contacted all members of the four NCURA listservs which had been invited to participate in the survey. In less than two hours I received 80 responses requesting a copy of the article and to date I have sent copies to over 200 NCURA members (the article will be freely available in PubMed Central, http://www.ncbi.nlm.nih.gov/pmc/, PMCID: PMC3045474, on 3/1/2012). Several respondents added that they are currently working with central administration on developing such a policy, a testament to the article’s timeliness. Very few institutions currently have policies, but recent NCURA responses indicate this trend is changing.

Obviously, interest in this topic remains high, and our Academic Medicine article has great potential to prompt research administrators to promote the adoption of a policy for sharing F&A cost recovery at their institution. Ultimately, it is my hope that the article will also empower them to begin negotiations with central and department administration to develop tasks forces to explore policy options for sharing F&A cost recovery best suited for their institution’s unique needs and dynamics. Since it has become clear that interdisciplinary research is not just a passing fad,4 it’s time for institutions to embrace the reality and set themselves up for success. Our research has shown that one positive step in this direction is to establish a policy that allows collaborating schools, departments, and units to share in the F&A cost recovery of sponsored projects.

1720.5 Strategic Spending to Maximize F&A Return
Carolyn Elliott-Farino, Kennesaw State University

The theme of the magazine this month is Doing More With Less, the mantra of research administrators at most predominantly undergraduate institutions (PUIs). As a public PUI, Kennesaw State University (KSU) does not have the infrastructure or budget of fellow University System of Georgia (USG) institutions UGA (Georgia), Georgia Tech, or Georgia State, let alone private research institutions (and some elite PUIs). KSU was founded as a two-year college 50 years ago; and when it became a four-year university in the 1990s, the focus was still on teaching. Although KSU faculty had been quite successful in obtaining National Science Foundation (NSF) Course, Curriculum, and Laboratory Improvement (CCLI) grants, as well as Department of Education Teacher Quality grants, it was not until the mid-2000s that faculty started having success in receiving research grants from NSF and the National Institutes of Health (NIH). At about this same time, the University started to emphasize the importance of research, while still highly valuing teaching and service.

While research started to become a more important component of the promotion and tenure process, the University had limited resources for release time for faculty or start-up packages for new hires. KSU had always been a place where people did more with less. Whether it was the Board of Regents’ asking KSU to test drive new processes or assume some USG administrative duties with no additional resources, or faculty having to teach seven or eight courses per year and making time for grant proposal writing and intramural research, employees at the university consistently did more with less.

There is a downside to always doing more with less – you are expected to continue doing more and more with no additional resources. As you regularly increase your output, it becomes ever harder to convince those with the purse strings that you actually need more resources. On an individual level, think of the employee who regularly assumes additional tasks. Before long, her job duties have expanded exponentially, and she is starting to run out of steam. How does she tell her boss that she needs help, that she has too much work to do? “What do you mean you need help? You are doing an outstanding job. You get everything done well and on time.” This employee has done such a great job doing more with less that she has shot herself in the foot. She has effectively increased the list of her job duties with no commensurate increase in salary or promotion. Should she have spoken up sooner and declined some of these additional tasks?

For a university, what does it mean to do more with less regularly? On the face of it, one is to be commended for being efficient; but if that efficiency is not rewarded with more resources, is that a hollow commendation? How does it affect a university’s potential to increase its research portfolio when it is administratively efficient, when it does more with less?

One area that is potentially negatively affected is the facilities and administra-
Active (F&A) rate because the rate is calculated on the basis of the institution’s previous year’s expenditures. If the institution had low administrative expenditures in the prior year, this would be reflected in the F&A rate calculation. Since its federal awards do not meet the $10,000,000 threshold that would dictate use of the long form, KSU uses the short form to calculate its rate. The base is total direct costs (TDC) less capital equipment and subaward amounts in excess of $25,000. This is in contrast to the modified total direct costs (MTDC) described in A-21 that the long form yields. The short form TDC rate only excludes the capital equipment and subaward amounts.

The short form is less taxing to prepare (no space survey required) and considerably less expensive than the long form, which makes it more appropriate for PUIs. It is, however, not as precise as the long form and sometimes yields seemingly unjust results. This fact was brought home to us this spring as we finalized our F&A rate proposal—we were surprised and dismayed that the rate had decreased since the previous proposal. Research activity has increased; we have two beautiful new buildings partially devoted to research, so how could our rate have declined?

The simple answer is that the numbers in the denominator are increasing at a faster rate than are their counterparts in the numerator. (Note: The F&A rate is the ratio of indirect costs to direct costs.) The university has increased its expenditures on teaching, research, public service, and student services, and this is good since the university’s primary stakeholders are its students; Georgia taxpayers also have an interest since state resources partially fund the university’s budget. True to its history of doing more with less, KSU increased the number of students it served, increased its public service outreach, and increased its research activity with a minimal increase in administrative expenses. Well done, KSU!

Except . . . like that employee who regularly assumed additional tasks and ended up with a heavier workload but no salary increase or job promotion, has the university shot itself in the foot by being fiscally prudent and administratively efficient? One would hope not, but what is a conscientious PUI to do? It receives (and has always received) modest budget allotments from the state and is unable to increase tuition, and therefore has limited resources available for capital improvements, library expenses, staffing, or start-up packages. Funds are purposed first to meet the instructional needs of a large public undergraduate student population and growing number of graduate students, and secondarily to invest in the facilities and non-instructional personnel. The institution is caught in the proverbial catch 22—it needs to increase its spending on research in order to recoup higher F&A on sponsored research. With limited state resources and no ability to raise tuition, where does an institution find these additional resources to devote to the research enterprise?

While an institution can bemoan the lack of state resources and tuition, most institutions have some latitude in how they spend their funds. Should a PUI that is trying to increase its research activity and has prioritized it for new hires spend more strategically on its library and research facilities? Should it hire departmental staff to help with administrative tasks, thereby freeing up time for faculty that they
can use to conduct intramural research or prepare grant proposals? Should it invest in an electronic grants-management system that would streamline proposal submission and award management?

These are difficult decisions for any institution to make because most have competing interests all vying for the same limited resources. Public institutions in particular have a public service mission, so it is difficult to cut back on public service, even when no or limited F&A costs are provided. Such projects contribute to the denominator, but very little to the numerator. However, were the institution to decline these activities, it could run afoul of its governing body or state legislature. More importantly, institutions of higher education are not driven by the bottom line and don’t base decisions solely on economics. Decisions are made to support the mission.

Student learning is paramount, and while faculty who are engaged in research bring implicit benefits to their students, including opportunities to conduct research, the many interests competing for limited resources can all claim that they are critical for student learning. Global learning is just one area that demands resources and the costs to be a globally engaged institution are not insignificant. How should an institution prioritize its spending?

Research administrators don’t usually have the ability to dictate strategic spending at their institutions, but sponsored programs personnel can raise the issue with senior level administrators and make them aware that how the institution chooses to spend its money can have a profound impact on its ability to increase its research activity. Improving the institution’s research resources will facilitate faculty research, increase faculty competitiveness, and strengthen proposals in the area of institutional environment and resources. Moreover, increased spending on research indirect costs will eventually yield a higher F&A rate, which will allow the institution to continue to devote more resources to research.

Lest one get carried away with the thought of a ballooning F&A rate, the idea is not to increase administrative spending just to spend more money and be less efficient. Rather, because F&A rates are currently determined by documented expenditures (presuming the Office of Management and Budget does not adopt a flat F&A rate for all institutions), if an institution with a relatively low F&A rate but aspirations of increasing research opportunities for its faculty and students wants to maximize its resources for this pursuit, the institution needs to make a strategic investment that considers F&A return.

1720.6 Optimizing Reimbursement: Understanding the UCA
Tony Benigno, Monika Moses, Attain, LLC

The Operations and Maintenance (O&M) cost pool is the largest uncapped cost pool included in the Facilities and Administrative (F&A) cost rate. Utilities (electricity, steam, natural gas, fuel oil and domestic water) are a major component, and often the largest expense, of the O&M cost pool. That’s why understanding the Utility Cost Adjustment (UCA) and its implications are as important as ever when it comes to optimizing your O&M reimbursement and overall F&A recovery.

Uniform Guidance Establishes New UCA Calculation
With the implementation of OMB Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards 2 CFR Part 200, or Uniform Guidance (UG), all Institutions of Higher Education (IHE) are now eligible to receive the UCA rate. While the UG does not change the methodology used to allocate O&M costs—utilities included—to Organized Research (OR), the UG now requires all IHE’s on the long form to calculate and justify the UCA up to a cap of 1.3 points.

Reaction to the new calculation of the UCA rate in the UG is varied. The Council on Government Relations (COGR) indicated in their response to OMB-2015-0001, that the section in the UG related to calculating the UCA “…may be the single most confusing section of Uniform Guidance…”. So let’s clear things up. First, it’s important to understand where the UCA came from and why it’s used at all. Then we’ll examine the calculation and show you how it’s applied through two example cases.

The Past — From UCAS to UCA

Starting in the 1980’s colleges and universities performed Utility Cost Allocation Studies (UCAS) that distributed utility costs on a room by room basis using the results of energy audits. The Utility Cost Adjustment (UCA) was then introduced in 1998 under OMB Circular A-21 to replace the complex UCAS. The UCAS served as the basis for 65 universities included in OMB Circular A-21 Exhibit B to earn the eligibility to claim a flat 1.3 additional points in their F&A cost rate proposal; the 1.3 was added to their calculated F&A rate.

But why have a UCA at all? Within a building there are many different room types, including research labs and office spaces. A typical research lab requires 100% outside air and has four or more times the number of air changes per hour compared to an office. And, since a large percentage of energy goes in to conditioning air, you start to see that there are very large differences in energy density within a building – and that is only one of many variables. The UCA is, in simplest terms, a means of addressing such energy differences without conducting detailed, room level energy audits.

Thus, with the disallowance of the UCAS in OMB Circular A-21, it became more important to identify opportunities to improve the allocation of cost by using exist-

---

1 This article is reprinted from the NCURA Magazine, Vol XLVIII No 4, August 2016. It is used with permission of the publisher.
ing utility meters, and to further optimize cost recovery with additional strategically placed meters. Building level utility meters became the tool to identify and allocate utility costs to a building.

**Calculating UCA — What Is The REUI?**

In a multifunction space where metering can’t isolate utility cost to a single function (which is most common) the UCA justification begins with the calculation of an “effective square footage”. All research laboratory space is multiplied by a Research Energy Use Index (REUI). The REUI established in the UG is 2.0, and the regulations stipulate that the REUI will be adjusted not less often than every five years, nor more frequently than every year.

The REUI weighting factor defined in the UG 2 CFR Appendix III, section B.4.c (2) (ii) B was calculated as follows:

**Figure 1720.6-1**

The average energy usage of buildings with Laboratories – taken from the Lawrence Berkeley Laboratory (LBL) benchmarking tool (http://labs21benchmarking.lbl.gov)

\[
\text{REUI Numerator: } \frac{310 \text{ kBtu/yr}}{155.37 \text{ kBtu/GF} \text{ yr}} = 2.0
\]

Effective square footage is calculated by multiplying the actual research laboratory space by the REUI; utility costs are then reallocated in the same manner, but with the new proportion of areas. The overall result is more utility costs allocated to Organizational Research (OR) within the F&A rate calculation. The difference between the F&A rate calculation with the weighting factor applied and without it (all else being equal) reflects the percentage increase in the F&A rate, or the UCA. The UCA is currently capped at 1.3%.

**Optimizing Utility Cost Allocation**

Since the Uniform Guidance went into effect, we’ve repeatedly heard two very important questions from two predominant groups of institutions. The first group represents institutions eligible for the UCA for the first time asking, “Any UCA is a windfall compared to before so I am done, right?” Whereas the second group is comprised of institutions that previously received the UCA of 1.3 points asking, “How do I maintain my UCA of 1.3 points?”

As consultants and engineers by trade, we have worked closely with the allocation of utility costs since the 1990’s, and we welcome the renewed interest in all things utility related. Keeping in mind that every IHE has its own unique blend of
challenges related to the extent and types of utility metering, space assignment, and service agreements, we present two case studies that emphasize the implementation of the new UCA calculation— for institutions applying the UCA for the first time and those trying to maintain their 1.3 points—and the overall importance of utility metering and cost identification.

**Case Study No. 1 — I Finally Get the UCA, I’ve Calculated It, So Now I Am Done**

IHE No. 1 was not previously eligible for the UCA. The IHE allocated all of the O&M costs equitably at the same cost density across the entire campus. Being new to the UCA, and uncertain as to the calculation, Attain was engaged to calculate the UCA (Column C) and identify utility costs to OR (Line 1 Column A). The IHE was delighted that the UCA was calculated at 1.65 points, though disappointed to learn that there would have to be an adjustment down to the 1.3 point cap. The net result was $832,000 identified to OR using the campus wide allocation, which was based on a claim there were no meters.

Because we speak “Facilities,” we were skeptical about the claims of no building meters. Not surprisingly, there were meters, but they were only being used to track energy usage for operational purposes (internal benchmarking, energy conservation tracking, etc.) rather than to track energy cost by building. So, we rolled up our sleeves, jumped into a few steam tunnels, and closely examined the distribution systems and meter data. A revised cost allocation and UCA calculation was then developed that incorporated the metered data (Line 2).

Although using the metered data resulted in a lower UCA and net loss of $29,000 (Line 3 E) related to the UCA, the combined impact was substantially offset by the gain from using the metered data to allocate utility costs to OR. This resulted in a total of $1.26M identified to OR, which represented a $426,000, or 2.1 point increase (Line 3 F) above the default methodology that the IHE was previously using.

Case Study No. 2 -- We Used to Get 1.3 UCA Points. How Do We Maintain It?

IHE No. 2 was one of the 65 schools permitted to add the UCA of 1.3 percentage points under OMB A-21. The default allocation (Line 1) included some metered data, and the UCA was calculated at 0.84 points, with a cost to OR of $2.2M (Line 1 F). Pulling all of the meter data out of the allocation and resorting to a uniform cost density similar to Case Study No. 1 did result in meeting the 1.3 UCA rate, but it provided the worst combined cost to OR (Line 2 F) of $1.9M. After an analysis of the IHE’s utility distribution systems, it was determined that additional building level meters would improve the overall identification of utility costs to OR (Line 3 A). Similar to Case Study No. 1, the UCA did decrease further, but the overall cost identified to OR increased an additional $351,000, or almost a point a year (Line 3 F). The added metering cost met with the institution’s requirement of a simple payback of approximately one year.

Conclusions

It should be understood that each institution is unique, and there is not a one size fits all approach to improve the identification and recovery of utility costs to Organized Research. The calculation of the UCA presents some challenges in and of itself, and the focus should be to understand the interaction of the UCA and an institution’s allocation of utility costs. The objective should be to maximize the recovery of utility costs from the cumulative results of the prescribed allocation methodology plus the additive UCA.

When it comes to allocation methodology, utility metering is an equally important component of the evaluation because the cost of utilities (as well as costs
Improving Cost Allocation and Recovery

There are a number of metrics that can be defensibly increased significantly over the years to track and manage utilized to improve cost allocation and subsequent recovery through the F&A cost rate. For the typical multifunction building, utility costs should be apportioned to function in the same manner as depreciation: identified at the building level (or for groups of buildings), and then allocated by functional activity within the building(s) based on the assignable square footage. Meters are used to track utility consumption to a building or group of buildings. Although the number of buildings that are individually metered have energy costs and to identify opportunities to reduce energy and water waste, it is not uncommon to find additional opportunities, through additional metering or corrective action, to increase F&A recovery.

While improving cost allocation through use of metered data can improve overall cost recovery, it’s important to understand that it doesn’t always lead to the highest UCA rate. Understanding the interaction between the cost allocation methodology and UCA calculation is key.

that are related to utilities such as mechanical maintenance) normally comprise the largest component of the O&M cost pool. Therefore, it is critically important to understand the institution’s utility metering and distribution systems.

Some of the issues that should be examined might include:

◆ How are utility costs allocated to buildings?
◆ How are the utility related costs (i.e. operator costs, equipment maintenance and repair costs) tracked and assigned to utilities?
◆ How are line losses tracked and assigned to utilities?
◆ What initiatives (new buildings, new plants, or other modifications) are underway that will impact the allocation of costs?
◆ Is metered data defensible?

The appropriate use of existing meters, or developing a plan to implement additional meters where necessary, should be a focus of all institutions. It should be noted that building meters themselves are expensive to install and maintain properly, and so locations that provide meaningful payback should be modeled and selected carefully – do not just put meters everywhere. Finally, always remember that although the use of building level meters may reduce the UCA, the gain by using (and possibly adding) meters will likely far outweigh the benefit of a UCA, even one at the cap of 1.3 percentage points.

About the Authors

Tony Benigno is a Manager with Attain, LLC’s Higher Education Facilities and Administration Services Practice. Tony has more than 20 years of experience in the HVAC industry, ranging from routine assessments and troubleshooting of existing...
meters and collection and reporting systems, to Project Management, Commissioning, and M&V related to the identification and recovery of utility and utility related costs including, but not limited to, F&A rate proposals.

**Monika Moses, PE** is a Manager with Attain, LLC’s Higher Education Facilities and Administration Services Practice. Monika has more than 20 years of engineering experience, including energy benchmarking, energy utilization studies, conceptual design and implementation of metering programs, costing studies for cogeneration systems, and identification of strategies to improve the allocation of costs in the Operation and Maintenance cost pool.
1730  Practical Tools
This section includes practical guidance and tools — flowcharts, checklists, etc. — relating to facilities and administrative (F&A) costs. These materials are culled from a variety of authoritative sources.

1730.1 ‘Best Practices’ Manuals
AIS editors

The Department of Health and Human Services (HHS) Division of Cost Allocation (DCA) released a new version (dated December 2006) of its “Best Practices Manual for Reviewing Long-Form University Facilities and Administrative Cost Proposals” in early 2007. The 149-page manual replaces a 2001 edition and provides guidance to federal negotiators to use when negotiating F&A rates with colleges and universities and reviewing indirect cost rate proposals. Because research administrators may be involved in preparing successful F&A rate proposals, the manual could prove useful also to research administrators.

There are four new sections included in the 2006 edition:
◆ alternate space methodology
◆ affiliated hospital space including Department of Veterans Affairs facilities
◆ Intergovernmental Personnel Act mobility program rates
◆ facility cost projections

Guidance From EPA

The Environmental Protection Agency (EPA) has issued guidance to its grants management and program officers on steps to be taken in performing a cost review of a grant proposal budget. The guidance provides detailed information by cost category on considerations in conducting cost reviews. EPA’s “Cost Review Guidance” is available at http://epa.gov/ogd/grants/award/CostReview.htm.
\subsection{1730.2 Reviewing the Importance of F&A Cost Recovery}

\textbf{AIS editors}

Indirect costs of research — laboratories, utilities, research materials, and administrative and regulatory compliance costs — are real costs that are reflected in the facilities and administrative cost reimbursement rates that are regularly negotiated and audited by the federal government. To limit arbitrarily the ability of universities to recover these costs would impose an undue financial burden on universities, discouraging them from continuing to conduct the research vital to the nation’s future security.\footnote{From the Council on Governmental Relations, working in conjunction with the Association of American Universities and the National Association of State Universities and Land Grant Colleges, “Statement Expressing Opposition to Indirect Cost Cap on Basic Research In House Defense Appropriations Bill,” August 2007. Available at www.cogr.edu.}

In August 2007 the Council on Governmental Relations, working in conjunction with the Association of American Universities and the National Association of State Universities and Land Grant Colleges, created a set of documents to help explain facilities and administrative (F&A) costs and “the serious negative impact” a then-possible Department of Defense F&A cost cap would have on the research enterprise. At that time, appropriations legislation passed by the House would have placed a 20 percent cap on DoD basic research costs. (A cap of 35\% on indirect costs was included in Public Law No. 110-116, signed in November 2007 and effective for fiscal year 2008.)

The following documents were posted to the COGR Web site (www.cogr.edu) and may prove useful to research administrators as a review and background on the importance to the research enterprise of F&A cost reimbursement:

### 1730.3 Determination of Allowable Costs: Critical for Sponsored Projects Success

Jean Cody, The University of Texas at San Antonio

Whether monitoring is done at the department level or in central administration and whether it is done prior to expenditure or after the fact, OMB Circular A-21 needs to be considered. OMB Circular A-21 (2 CFR 220), Cost Principles for Educational Institutions, establishes principles for direct and indirect costs that may be charged to federal research grants and contracts. Most of us are, or should be, familiar with A-21’s criteria for determining allowable costs, direct or indirect. As addressed in C.2., allowable costs must:

- Be reasonable — Reasonable is the prudent person rule. Is the cost necessary?
- Be allocable — Allocable asks if the cost is solely to advance the work under the sponsored agreement and benefits the agreement and the institution.
- Be given consistent treatment — Consistent treatment refers to “like circumstances.”
- Conform to limitations or exclusions of A-21 or the sponsored agreement.

Sounds pretty simple, right? So how do we do this, as a department, central administration or finance department? One of the most important ways to address allowability of costs is written policies and procedures that deal with their interpretation of A-21. Here are some suggestions for what to keep in mind when writing or updating your allowable cost/direct charging policies and procedures and implementing them. Of course these ideas are not all inclusive or exclusive. As part of the process you need to determine what works best for your institution.

Determine who is responsible for monitoring expenditures for allowability. Do you have good departmental support? Do they have the resources? Is the central administration staff in a position to monitor all or some expenditures? Do they have access to what they need in the institution’s purchasing, payroll, disbursements and accounting systems?

- Do you have an after-the-fact financial review at the time of invoicing/financial reporting? Does staff have adequate access to documents?

If you have a negotiated indirect cost rate agreement, meet with staff responsible for the institution’s indirect cost rate proposal.

- Make sure you agree on what are “like circumstances” and “major projects.”

- Determine how you will handle items normally considered indirect costs, such as office supplies and postage.

---

1 This article is reprinted from the NCURA Magazine, Vol. XLII, No. 1, January-February 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Communicate with faculty and staff prior to writing policies, and especially procedures.

◆ Talk with your principal investigators, program directors, and institute/center directors about their needs when working on projects.

◆ Find out what staff needs are to process paperwork and monitor as accurately as possible.

◆ Get feedback on draft policies and procedures from all persons and departments involved.

Application of policies and procedures.

◆ Once policies and procedures are approved, communicate the information and provide training at all levels: principal investigators, project directors, central sponsored projects administrators, departmental research administrators, administrative assistants, financial departments and any other department involved with sponsored project administration.

◆ When monitoring, consider the sponsor’s guidelines and regulations.

◆ Make sure everyone knows if allowability is affected by exceptional circumstances. What are those circumstances?

   Determination of allowable costs can be a complex issue. Just remember to keep in mind the needs of your institution and how you monitor expenditures for allowability. Taking the time to put workable policies and procedures in place — policies and procedures that were written with input from the whole institution — should streamline the monitoring process. It should also improve relationships with faculty, staff and other institutional departments, something that benefits all of us.

About the Author

Jean Cody is the Assistant Director, Post Award, in the Office of Sponsored Programs at The University of Texas as San Antonio. She is a graduate of Texas Christian University and has been at UTSA since August 2008. Prior to working at UTSA, Jean held various post award positions in research administration at institutions including the University of North Texas and Tulsa University. She also worked as the Grants Coordinator for the City of Stillwater, Oklahoma, where she identified and wrote grants in addition to post award administration.
§1730.4  A Primer on F&A and Research Operating Costs

Council on Governmental Relations

Research sponsors, including the federal government, private industry, state and local governments, and nonprofit foundations, provide funding to universities in the form of grants, cooperative agreements, or contracts. Awards generally include funds for the direct costs of research as well as F&A (i.e., “Research Operating Costs”), both of which are real costs incurred by the institution to conduct research. We use the terms “F&A”, “Indirect”, and “Research Operating Costs” interchangeably as a means to reinforce that F&A costs are an absolute necessity for a functional and effective research enterprise.

Direct Costs
Direct research costs are what people generally think of when it comes to federal support of research projects. These costs solely support research that is about to take place and often include laboratory supplies, specific research equipment, salary support for researchers and lab personnel, and travel for conducting research or disseminating research results. This is the core of university research, and it is also where the bulk of the federal investment is spent.

Facilities and Administrative (Research Operating) Costs
In order to perform research on behalf of federal agencies, universities incur a variety of other significant costs both leading up to and during a specific research project that they would otherwise not incur. F&A costs cover the portion of these infrastructure and operational costs related to federally-funded research. Such shared costs include the maintenance of sophisticated, high-tech labs specifically designed for cutting-edge, federally-sponsored research; utilities such as light and heat; telecommunications; hazardous waste disposal; and the infrastructure necessary to comply with various federal, state, and local rules and regulations.¹

Federal policymakers, and the investigators who conduct research projects, generally recognize the necessity of the direct costs of research, including salary support (e.g., investigators, laboratory staff, technicians, graduate students), supplies, and sophisticated equipment. F&A costs, on the other hand, are often devalued for primarily two reasons: (1) due to the way some agencies provide for F&A, some stakeholders view the F&A budget category as diverting funding from direct costs, and (2) the reimbursement mechanism for F&A costs (i.e., the “F&A rate”) is complex and thus difficult to explain and to understand.

However, fair reimbursement of F&A costs is crucial to a stable and viable re-

¹ From the Association of American Universities (AAU) and the Association of Public and Land- grant Universities (APLU). “Understanding the Costs of Federally Sponsored Research at Universities,” October 2013.
Research universities and institutions cannot implement research programs if sponsors do not support the real costs of research infrastructure and compliance activities. Construction and maintenance of state-of-the-art research laboratories and administrative efforts that ensure compliance with federal rules and regulations are necessary investments. A June 2014 COGR paper, *Finances of Research Universities* (see www.cogr.edu, Policy Issues / Financial Management), provides an in-depth look at the financial landscape of research universities, including the importance of the F&A reimbursement process.

The F&A rate is the mechanism used to determine and accomplish F&A cost reimbursement. The Office of Management and Budget (OMB), through 2 CFR Part 200 (Uniform Guidance) and related guidance, defines rules for reimbursement of F&A costs by way of federally-negotiated F&A rates. F&A rates are:

- **Calculated** by the university according to rules defined by OMB and based on audited university financial data;
- **Submitted** to the rate-setting cognizant agency (for research universities and most research institutions, either the Department of Health and Human Services, Cost Allocation Services or the Department of Defense, Office of Naval Research);
- **Reviewed and/or audited**, rigorously, by the rate-setting cognizant agency;
- **Negotiated** between the university and the rate-setting cognizant agency and normally effective for a period of two to five years; and
- **Charged** by multiplying the negotiated F&A rate by a subset of the direct costs of the sponsored research project.

An institution determines F&A costs by applying the negotiated F&A rate to a subset of the direct costs of the research project – this subset is known as the “modified total direct costs”, or MTDC. Through 2 CFR Part 200, OMB specifies those items that are included in MTDC and those that are not included to ensure equitable allocation of F&A costs. The items excluded from MTDC are generally direct costs which are assumed to not require extensive F&A costs/activities (e.g., graduate student tuition, equipment, subaward amounts greater than $25,000) compared to other direct costs (e.g., salaries, benefits, supplies).

The chart below illustrates typical direct cost items in a research budget and application of the F&A rate. The F&A Amount (column 4) is determined by multiplying the negotiated F&A Rate (column 3) by the Direct Amount (column 2) for MTDC cost categories.

**Figure 1730.4-1. Research Budget and Application of F&A**

Source: Congressional Justification of the NIH fiscal year (FY) 2017 budget request; Overview of 2017 President’s Budget.

National Institutes of Health data shows that F&A costs as a percent of total awards has remained constant at less than 28 percent for over a decade. This may or may not represent the “ideal” ratio; however, it does demonstrate that a consistent allocation of funds dedicated to the direct costs of scientific activities is reliable.

At the same time, cutting-edge science requires appropriate infrastructure and other support and institutions incur these real research expenses in the form of facility operations and compliance activities when conducting research on behalf of the federal government and other sponsors. Equitable reimbursement of those F&A costs has a significant impact on the financial health of research institutions, and, consequently, helps to ensure that research activities are supported with the best, state-of-the-art laboratory facilities, as well as the highest quality administrative and compliance support mechanisms.
1760 Statistics and Survey Results

This section includes statistics and survey results and trends data relating to facilities and administrative (F&A) costs. These materials are culled from a variety of authoritative sources.

1760.1 Trends in NIH Cost Reimbursements to Universities

AIS editors

The General Accountability Office (GAO) released a recent report it submitted to Congress on “National Institutes of Health Extramural Research Grants: Oversight of Cost Reimbursement to Universities.” The report analyzed the management and oversight of direct and indirect costs in National Institutes of Health (NIH) grants awarded to universities for fiscal years 2003–2005, and the conclusions drawn in the report may be of interest to research administrators.

GAO found that reimbursement of indirect costs was stable at about 28.5 percent annually, because indirect cost rates were stable during this period. According to GAO, this was true because there was little change in the largest component of the indirect cost rate — the administrative component — and because indirect cost rates generally remain valid for 2 to 4 years once they are negotiated.” However, while the proportion of indirect costs awarded was flat, because the total amount of extramural research funding at NIH increased during the period, the amount NIH awarded to universities for direct and indirect costs associated with the grants also increased (see Figure 1760.1-1).

Figure 1760.1-1: Reimbursement of Direct and Indirect Costs to Universities Receiving NIH Extramural Research Grants, FYs 2003–2005

GAO stated that the “key controls” in place to ensure grantee compliance with federal guidance in claiming costs include the review of information submitted by universities when indirect cost rates are set (see ¶1705) and when grant applications and annual progress reports are submitted. Key controls can also include conducting onsite reviews and examining cost accounting practice disclosure statements. (Each university that receives $25 million or more in federal funds during the previous fiscal year is required to prepare a disclosure statement detailing the cost accounting practices used to develop its proposal.) In carrying out these functions, the Department of Health and Human Services (HHS) Division of Cost Allocation (DCA) focuses much of its effort on universities receiving the most federal funding. (For more about DCA, see ¶1730.1.)

GAO also found that for the 100 universities that received the most NIH funding for FYs 2003–2005 and for which DCA negotiates indirect costs rates, average indirect costs were stable over the three-year period. “For each of these 3 years, indirect costs rates averaged about 51 percent of the modified total direct costs associated with the NIH grants.” Further, the average annual amount of the administrative component of the indirect costs rates, which is capped at 26 percent of modified total direct costs, ranged from 25.6 percent in FY 03 to 25.8 percent in FY 05.

To obtain a copy of the report (GAO-07-294R), go to www.gao.gov/new.items/d07294r.pdf.
¶1790  Knowledge Check
AIS editors

The Q&As at ¶1790.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 1700 has been understood. Note: For the answer key for ¶1790.1, see ¶1790.3, which appears on a separate page (page 1790:5) for testing purposes.

Discussion topics at ¶1790.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶1790.1  Q&As
1. Cost pools are
   (a) Costs associated with buildings and improvements used directly for, or in support of, sponsored research
   (b) Subcategories of facilities and administrative costs
   (c) Costs for offices that provide institutionwide general and administrative support services, school or college administration, department administration, and sponsored programs services
   (d) Costs incurred to support the institution’s mission activities that cannot be readily identifiable or directly assigned to a major project or activity with a high degree of accuracy

2. An F&A rate of 60% (MTDC) for sponsored research means that for every dollar of direct costs the institution spends on its research projects, it spends an average of WHAT on F&A costs?
   (a) $0.60
   (b) 6%
   (c) $6.00
   (d) $0.66

3. Under-recovery is
   (a) The rate calculated based on historical costs — the most recently completed fiscal year, which is known as the base year
   (b) The theoretical level of reimbursement that the institution would receive by applying the negotiated rate to all sponsored projects
   (c) The difference between the recoverable F&A costs and actual F&A recovery
   (d) An approximation of the costs that an institution incurs in support of its major programs
4. Sources of cost sharing could include all of the following EXCEPT:
   (a) Cash
   (b) Audits
   (c) Graduate student tuition
   (d) Materials & supplies

5. Nonfederal sponsors
   (a) Are not bound by the federal rules on F&A rates
   (b) Are bound by the federal rules on F&A rates
   (c) Unlikely to allow F&A rates
   (d) Categorically require F&A rate determinations based on MTDC

6. What amount of a subcontract is subject to F&A?
   (a) The first $50,000
   (b) The last $50,000
   (c) The first $25,000
   (d) The first $100,000

7. All of the following costs on federal awards generally are not subject to F&A
   EXCEPT:
   (a) Equipment purchase
   (b) Salary for a research technician
   (c) Tuition remission
   (d) Subcontract costs over $25,000

8. To be eligible as cost sharing, contributed costs must be all of the following
   EXCEPT:
   (a) Allowable
   (b) Reasonable
   (c) Necessary for the performance of the project
   (d) Approximately 50% of total project costs

9. According to ¶1705, what is RCM?
   (a) Regional consortium of researchers
(b) Resource certification by management
(c) Researchers care more
(d) Responsibility center management

\section*{Discussion Topics}

1. What is the difference between modified total direct costs and total direct costs and why is this difference important?
2. What is a “cognizant” federal agency for purposes of F&A costs? Why is this important?
3. What is the “F&A rate calculation” and why is it important to your institution?
4. How important to your institution is “recovery” of F&A costs and what is your policy with respect to use and distribution of F&A recoveries?
5. How are costs handled that would normally be indirect costs but under certain circumstances could be an “exception”? For example, postage costs on a survey project where the postage could be in the thousands of dollars and are integral to the project.
6. What is your institution’s policy with respect to indirect cost waivers? How often is this policy reviewed for possible revision?
7. Does your indirect costs rate differ between federal and nonfederal sponsored projects?
8. How do you obtain benchmarking data on how F&A costs are treated at institutions of comparable size to yours? How reliable is this data?
9. What is a “cost pool”? How do costs pools function at your institution?
10. What impact could cost sharing have on your F&A rate? Why?
1790.3  **Answer Key**

Following are the correct answers to the questions included at ¶1790.1.

1. (b) Subcategories of facilities and administrative costs

2. (a) $0.60

3. (c) The difference between the recoverable F&A costs and actual F&A recovery

4. (b) Audits

5. (a) Are not bound by the federal rules on F&A rates

6. (c) The first $25,000

7. (b) Salary for a research technician

8. (d) Approximately 50% of total project costs

9. (d) Responsibility center management

Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter covers the closely related topics of data rights and intellectual property, including patents, copyrights, and software, of concern to research administrators.

Mary Ellen Sheridan, now retired from the University of Chicago, provides an exceptionally thorough overview of the topics. Sheridan effectively makes the point that it all starts with data and the rights to that data. She demonstrates that without data there can be no intellectual property. Therefore, the manner in which “data” is defined and the way the rights to that data are assigned to the parties in a research agreement are of critical importance to the future uses to which the data can be put. Whether new to research administration or not, readers will find extensive information on data rights and intellectual property issues that facilitates an improved understanding of highly complex and occasionally arcane issues.

Sheridan describes the revolution in technology transfer and intellectual property that began with the passage of the Bayh-Dole Act in 1980. Since that time, universities and other grantees have had the right to elect to retain title to inventions developed with federal funds. In an area that was highly complex to begin with, Sheridan illustrates some of the factors that continue to make it even more complex, including the application of export control regulations and the increasing use of “proprietary” and “confidential” data. Sheridan wisely points out the benefits of an effective collaboration between the institution’s research administrators, technology transfer staff, and legal counsel.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶1905, as appropriate. Content added to other sections of the chapter will provide readers supplementary discussions of related topics (at ¶1920), practical tools (at ¶1930), case studies (at ¶1940), and trends data and other related statistics (at ¶1960). A “knowledge check” containing Q&As and discussion topics is included at ¶1990.
Data Rights and Intellectual Property

Mary Ellen Sheridan*
Associate Vice President for Research (retired)
University of Chicago

Offices of sponsored programs (OSP) are responsible for assuring that the terms and conditions of awards reflect, protect, and uphold the mission and values of the institution. Research administrators may not always understand the scientific objectives and methodologies (the “guts” of research proposals), but they must know how to assure that any terms and conditions governing a proposal and/or resulting award protect the rights to data generated by investigators and researchers during the course of the sponsored project, protect the use of that data after the award period ends for education and further research purposes, and assure that the rights to intellectual property created during the course of the sponsored project are clearly understood by all parties. Data and intellectual property (IP) concerns must be identified by research administrators and principal investigators (PIs) at the proposal stage.

Open and respectful communications between the sponsored programs office, the technology transfer office (TTO), and the general counsel/legal office assures that faculty and research administrators receive the necessary assistance in a timely and informed manner. Data rights and intellectual property requirements are complex, inconsistent from sponsor to sponsor, and highly dependent on the nature of the agreement. Mentoring systems and cross training between sponsored programs offices and technology transfer offices in these areas is highly recommended.

This chapter describes the concepts of data rights and intellectual property sufficient to evaluate proposed “terms and conditions” for consistency with institutional policy and compliance with federal regulations (and other sponsors’ terms and conditions) and provides advice about what generally acceptable terms and conditions should include to protect investigators and the institution. This chapter also provides OSP personnel an opportunity to become familiar with the federal government’s rights in data, technical data, and intellectual property.

The chapter also advises when the prudent sponsored research administrator should seek the counsel and expert advice of technology transfer and legal offices, as these resources are often critical when confronted with complex data rights and IP provisions. Discussions of data and intellectual property rights on campus must appreciate that rights to data and IP are also important to the federal government or any other sponsor, and an overview of such rights also is included in this chapter.

* The author would like to acknowledge the assistance of Susan Boone, Deputy Director, University Research Administration, and Russell Herron, Associate General Counsel, at the University of Chicago for their assistance in reviewing a draft of this chapter.
¶1905.1 Overview of Data Rights

The definition of what constitutes data may depend on what stage of research is being discussed and includes the following:

◆ **Primary data**: original observations and findings in any format, usually not interpretable without additional information; examples of primary data include “raw” data, notebooks, Western blots, spectral scans, radiologic images, primary video recordings, photographs, clinical records, cell lines, and laboratory strains

◆ **Secondary data**: primary data transformed to make understandable to scientific peers, statistically analyzed data, summary data, charts, and photographic montages

◆ **Published data**: final interpretation and presentation of data

Three important definitions of data from federal requirements are referenced on page 1905:3. However, federal data rules and regulations vary from agency to agency, and within the same agency the appropriate management, retention of rights, and use of data may differ depending upon whether the award is a grant or a contract. In the case of nonfederal sponsors, especially private sector sponsors, it is paramount that data rights be clearly defined in the agreement. It is also very important to make sure that the definition and treatment of “data” does not include forms of intellectual property developed in the course of research. Data are not inherently intellectual property. The two subjects should be treated separately.

More than any other federal agency, the Department of Health and Human Services (HHS)/National Institutes of Health (NIH) has issued guidance and policy pertinent to its expectations of a grantee institution’s and principal investigator’s responsibilities with respect to data generated in the conduct of NIH-funded research (see ¶1905.3). In the following discussions, frequent references to NIH data sharing, data retention, and data accessibility policies and guidelines reflect NIH’s continuing and increasing concerns about the rights and obligations of data management. In general other federal agencies may have similar expectations of researchers, but few have such well-articulated policies and guidelines. Thus it is not unusual that institutional policies refer to NIH’s expectations in their own policies and guidance to investigators.

**Investigator Priorities**

For researchers the dissemination of the research outcomes is of primary importance. The right to disclose and publish research findings is a fundamental tenant of academic freedom. The right to control access to research data, the right to establish productive research relationships and collaborations with various sponsors, and the training and education of students are inextricably intertwined with data rights.

**Data for Research and Educational Purposes**

Any sponsored research agreement should contain a clear understanding that the university has reserved the right to use data generated in the course of the research or sponsored project for continuing research and educational purposes. This is important for clinical study agreements in which the sponsoring company often asserts a right of ownership of the data generated in the course of the study. If the institution is unable to
secure joint ownership or limit sponsor rights to the delivered case report forms, it is important to protect the right to use the data for education and research purposes. Protection of the right to use research data goes hand in glove with publication rights.

Key Terms

The following are key terms relating to data and intellectual property rights.

Background intellectual property: This is intellectual property developed before or independent of performance of the particular agreement that is generally legally necessary for performance of the award work.

Bayh-Dole Act: The act provides universities, nonprofit organizations, and small businesses the right to elect to retain title to the inventions created in whole or in part with federal support. Regulations issued under the act are codified at 37 CFR 401. Federal agencies are required to reference 37 CFR 401 in most grants, contracts, and cooperative agreements with universities, nonprofits, and small businesses.\(^1\)

Data: (1) OMB Circular A-110 defines data as “the recorded factual material commonly accepted in the scientific community as necessary to validate research findings, but not any of the following: preliminary analysis, drafts of scientific papers, plans for future research, peer reviews, or communications with colleagues.” A-110 excludes from the definition physical objects (lab samples); trade secrets, commercial information, and materials necessary to be held confidential; and personnel and medical information and similar information.\(^2\)

(2) The NIH Grants Policy Statement (December 2003), “Part II: Terms and Conditions of NIH Grant Awards,” Subpart A: General Access to Research Data defines data as “recorded information regardless of the form or medium on which it is recorded, and includes writings, film, sound recordings, pictorial reproductions, drawings, designs, or other graphic representations; procedures, manuals, forms, diagrams, flow charts, equipment descriptions, data files, data processing or computer programs (software), statistical records, and other research data.”\(^3\)

(3) FAR 27-401 and 52.227-14(a) of the Federal Acquisition Regulations (the FAR) define data as “recorded information, regardless of form or the media on which it may be recorded” (“FAR Data”).\(^4\)

---

\(^1\) The Bayh-Dole Act was passed in 1980 as P.L. 96-517 and amended in 1984 by P.L. 98-620. Regulations issued under the act are codified at 37 CFR 401. Title 37 covers “Patents, Trademarks, and Copyrights” and Part 401 pertains to “Rights to Inventions Made by Nonprofit Organizations and Small Business Firms under Government Grants, Contracts and Cooperative Agreements.” The Department of Commerce is responsible for maintaining the regulations.

\(^2\) OMB Circular A-110 is entitled Uniform Administrative Requirements for Grants and Cooperative Agreements with Institutions of Higher Education, Hospitals, and Other Non-Profit Institutions. A-110 was revised in 1999 and is now codified at 2 CFR 215. The OMB circulars can be found at www.whitehouse.gov/omb/circulars.

\(^4\) The FAR Web site is www.acqnet.gov/far.
**Fundamental research exclusion/exemption**: Export control regulations have the potential to undermine academic freedom. This possibility has been acknowledged and provided for in National Security Decision Directive (NSDD) 189, which exempts fundamental research from export control. The directive defines "fundamental research" as "basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production, and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons."

**Intellectual property (IP)**: This term generally refers to creations of the intellect that have commercial value and are protectable under the law, including inventions, processes, literary and artistic works, and the like. Although each type of IP is a separate area of law, governed by different federal, state, and common laws concerning ownership and protection, all these mechanisms are designed to provide some protection from someone misappropriating the products and ownership of intellectual creativity. Common forms of IP include patents, copyrights, trademarks, and trade secrets.

**License**: A license is a legal agreement or contract that permits one party to use intellectual property belonging to another under mutually agreed upon terms. In other words, a license is a grant of a right to use IP.

**Material transfer agreement (MTA)**: An MTA is a form of protection for intellectual property that governs the transfer of material and related information from one entity to another. These agreements set forth the terms of use and obligations of the recipient when exchanging materials. Typically these materials are cell lines, DNA, or chemical compounds. However, MTAs may be used for the transfer of any kind of physical material.

**Patent**: A patent is a document granted by the federal government in accordance with 35 USC 154 that provides the recipient of the patent the right to exclude others from making, using, or selling his or her invention throughout the United States. 6

**Royalty**: A royalty is consideration or compensation paid to the licensor in exchange for certain rights in technology that the licensor is providing to the licensee. (Royalties may be based on many factors — e.g., sales, up-front fees, performance benchmarks.) Licenses also may be royalty free, meaning that they make no provision for royalties.

**Work for hire**: This refers to a copyrighted work prepared by an employee within the scope of his or her employment or a copyrighted work specially ordered or commissioned that falls into one of nine categories in the Copyright Act (contribution to a collective work; part of a movie or other audiovisual work; a translation; a supplementary work; a compilation; an instructional text; a test; answer material for a test; or an atlas).

6 35 USC 154, "Contents and Term of Patent; Provisional Rights." The code can be found at www.law.cornell.edu/uscode/.
§1905.3 Institutional Concerns over Data Rights

The concepts of data ownership, retention, access, and sharing are often intertwined under the general category of data “rights and responsibilities” or “obligations.” For some public institutions, state law may govern or dictate data policies. More frequently institutional policies and practices and sponsor terms and conditions contain more explicit requirements or guidelines governing treatment of research data.

A clear and unambiguous delineation of data rights and obligations in sponsored agreements is fundamental for institutions and investigators. Without clarity surrounding ownership of data or at a minimum the right to use the data generated in the course of the research, the right to public dissemination of research outcomes may be impeded and rights to intellectual property arising from the sponsored research may be compromised. It is impossible to talk about intellectual property without first talking about data rights.

Institutional Policies

Policies governing data rights and responsibilities take many forms. Some institutions have formal written data ownership policies; other institutions’ policies are more informal, perhaps only spelling out data retention obligations for researchers. For those institutions unfortunately lacking both formal or informal written policies and guidance, data ownership and retention default to rather more intuitive practices. That is, it is just good common sense for PIs to retain their original or raw data, consent forms, notebooks, recordings, etc., for as long as possible.

Institutions and PIs are well advised to develop a reliable and organized data/document management system. Written policies or guidance documents that describe the institution’s expectations and minimal data retention requirements for PIs are invaluable. In the absence of written guidance, well-intentioned researchers may assume they have minimal or no responsibilities for data management. Institutions may assume their PIs are keeping all source data safely and sharing appropriately. The sponsored programs offices may find lack of clear and unambiguous communication leads to unintended consequences and poor sponsor relations. Written institutional policies governing data ownership, retention, and sharing also provide a responsible framework for faculty as they mentor students and postdoctoral researchers.

Generally a university should own data resulting from university-conducted research. This assures that investigators

◆ retain the right to interpret data,
◆ control the content of presentations,
◆ can permit students to use data for dissertations,
◆ can use data for ongoing research activities, and
◆ preserve rights to use their data for other educational and research purposes.

Figure 1 contains four sample institutional data ownership/data retention policies.
Data Ownership

Ownership of research data often determines the future use of the data created during the project, unless use rights have been separately negotiated. Institutional ownership of data protects the researcher’s ability to publish. Ownership of the data assures that IP arising from the research can be further developed for commercialization through means of “technology transfer.” The institution is generally deemed to own data generated under federal assistance agreements.

The NIH Grants Policy Statement states that “grantees own the data generated by or resulting from a grant-supported project.” Contractual agreements from federal sponsors as well as other sponsors should be carefully examined prior to execution to assure that data ownership reflects the PI’s and institution’s interests.

---

Footnote 3: See footnote 3.
Data Retention

Data retention generally refers not only to the means by which data are stored but also the explanation of who is responsible for retaining data. PIs typically retain their research data to support publications and to share data with collaborators and colleagues. In general institutions charge the PI with the overall responsibility to retain raw data generated in the course of the research in a manner appropriate to the discipline. There are other important regulatory reasons why original/raw data must be protected. With some exceptions, Office of Management and Budget (OMB) Circular A-110, Section 53 generally requires that “financial records, supporting documents, statistical records and all other records shall be retained for a period of three years” from the date of submission of the final expenditures report. Thus some tracking system is recommended to locate, identify, or document records destruction.

Institutions are also required to retain data that may be subject to a data access Freedom of Information Act (FOIA) request. Under OMB A-110, Section 36, a grantee institution must provide source data that was produced with federal funds and that are cited publicly and officially by a federal agency in support of an action that has the force and effect of law, i.e., has been used by the government in making policy or regulation.8

Digital Data Storage. Section 53 of OMB A-110 states: “Copies of original records may be substituted for the original records authorized by the federal awarding agency.” The HHS Office of Grants and Acquisition Management authorized the use of electronic-imaged records as substitutes for paper records in 1999.9 The institution is responsible for putting procedures in place to provide adequate security for digital records and a process to validate the authenticity of the electronic records.

Data Involving Misconduct Allegations. Timely mechanisms to obtain and protect original raw data are a critical component of an institution’s “research misconduct” policy. Many institutions have developed policies that define how the data in question will be sequestered and protected during the inquiry and investigation. As noted in its model policy and guidance documents, the Public Health Service (PHS) expects that the documentation supporting treatment of the allegation will address sequestration of data.

The obligation to assure access to data in the event of an allegation of scientific misconduct is a reason why an institution must assure that in any sponsored research agreement it has the ability to retain a copy of the research data. In conjunction with the regulations, institutional policies should be designed to protect both institutions and responsible researchers in the event of an allegation of scientific misconduct. Further the PHS “Policies on Research Misconduct” require that an investigation’s report and

---

8 This A-110 language originated in the FY1999 Omnibus Appropriations Act (P.L. 105-277, Div. A, Sec. 101(h)), commonly referred to as the Data Access Law or Shelby Amendment, recognizing the source of the language as Sen. Richard Shelby (R-Ala.).

9 See www.hhs.gov/grantsnet/gps/at.htm. The policy was issued Aug. 9, 1999.
all records used to support the report must be maintained in a secure manner by the institution for seven years after completion of the proceeding or the completion of any PHS proceeding involving the research misconduct allegation.10

Data Sharing

Increasingly NIH requests for applications (RFAs) and requests for proposals (RFPs) either require or encourage a statement pertaining to the sharing of research resources or to intellectual property. NIH looks for specific plans for sharing data, materials, and software generated with NIH funds. Such resources should be freely available to the entire research community, consistent with the terms of the Bayh-Dole Act. The NIH policy statement on this subject, entitled “Principles and Guidelines for Recipients of NIH Research Grants and Contracts on Obtaining and Disseminating Biomedical Research Resources,” notes “data should be made as widely and freely available as possible while safeguarding the privacy of participants, and protecting confidential and proprietary data.”11 NIH wants to ensure that research tools and resources developed with NIH funds are readily available to the research community.

A statement on data sharing is required by NIH of applicants seeking $500,000 or more in direct costs in any year of the project period (see “Final NIH Statement on Sharing Research Data”).12 Data sharing is particularly important in those NIH-funded programs where databases are being developed or libraries of methodologies, sequences, single nucleotide polymorphisms (SNPs), etc., are a funding objective. Investigators should describe clearly and directly how data will be shared, e.g., through open-source code, posting of data to an open Web site, and publications/presentations to the research community. Reasonable time delays for protection of rights are permissible under Bayh-Dole and should be mentioned, if appropriate.

In accordance with the “NIH Policy on Sharing of Model Organisms for Biomedical Research,” investigators who develop such model organisms (animal or biologics) must include a sharing policy or explain why the research tools cannot be shared. A sample model statement is included in Figure 2 that can be used in applications to demonstrate an institution’s commitment to the open dissemination of research tools.13

---

10 42 CFR Parts 50 and 93. See also Office of Research Integrity at HHS, www.ori.dhhs.gov.

Figure 2: Example of Institutional NIH Data Sharing/IP Plan

At the University of Chicago, the following guidance and sample language is posted on the “Resources” section of the University Research Administration’s Web site for investigators preparing proposals (http://researchadmin.uchicago.edu):

The following sample texts are provided to assist you with the preparation of grant applications. Should the sponsor require a Data Sharing/Intellectual Property Plan or a Plan for Sharing of Model Organisms/Animal Models, you may adapt this language to suit the specific needs and circumstance of your proposal.

Your proposal may be adversely affected if you do not document that you understand and agree to abide by applicable NIH and University of Chicago policies and procedures. To assist you in fulfilling your obligations as a recipient of federal funding and as a member of the faculty, we have prepared some sample language that you should adapt to reflect the types of research tools involved or that you expect to be created if your application is funded. Your signature on the proposal confirms to NIH that you understand and accept these important responsibilities.

Sample Language:

The University of Chicago is committed to the open and timely dissemination of research outcomes. Investigators in the proposed activity recognize that promising new methods, technologies, strategies, and computer software [revise as applicable to the nature of the research program] may arise during the course of the research. The investigators are aware of and agree to abide by the principles for sharing research resources as described by NIH in “Principles and Guidelines for Recipients of NIH Research Grants and Contracts on Obtaining and Disseminating Biomedical Research Resources.”

While the investigators expect that research tools will be freely shared with the research community, opportunities for technology transfer through commercialization will be explored as appropriate. Working with the university community, the University of Chicago’s Office of Technology and Intellectual Property (UCTech) manages intellectual property at the University of Chicago. UCTech serves faculty, staff, and students by commercializing inventions, ideas, and software developed at the university to ensure that new knowledge benefits society.

UCTech works with researchers to assess the commercial potential of new ideas. UCTech’s goals are to disseminate new ideas so the public can benefit from discoveries and to generate revenues for research and education. When the best means of disseminating discoveries and new intellectual property is collaboration between the university and commercial entities, UCTech has a special role to play. It protects the rights of the inventors and the university — and then typically works with industry, granting licenses so that a company will develop the discovery and bring it to the market. Revenues from licenses secured by UCTech are shared with the inventor, the inventor’s laboratory, and the inventor’s academic division. Where opportunities arise for corporate sponsored research related to the NIH-funded research programs, the university expects any agreements to conform to the principles described by NIH in the 1994 policy “Developing Sponsored Research Agreements: Consideration for Recipients of NIH Research Grants and Contracts.”

Sample Language for Sharing of Model Organism (Animals or Biologics):

Under the NIH “Policy on Sharing of Model Organisms for Biomedical Research,” published May 7, 2004 (NOT-OD-04-042), investigators who develop such model organisms (animal or biologics) must include a model organism sharing plan or explain why the research tools cannot be shared. A
Sample “Model Organism Sharing Plan” follows that can be used in applications to demonstrate the university’s commitment to the open dissemination of research tools. We also recommend you look at the FAQs and examples of plans NIH has developed to assist investigators at http://grants.nih.gov/grants/policy/model_organism/index.htm.

Note that grant applicants responding to a Request for Applications (RFA) or a Request for Proposals (RFP) may find additional requirements to those listed below, related to resource or data sharing for the specific announcement or solicitation. It is the responsibility of the investigator to address any such additional requirements in the “Sharing Plan.”

Sample Model Organism Sharing Plan

I. UNIVERSITY STATEMENT

The University of Chicago is committed to the open dissemination of research results, information and research tools that facilitate research and further scientific progress. It is the expectation and goal of the University that all “model organisms” (as defined by the NIH at www.nih.gov/science/models/) that are created during the course of NIH funded research grant projects, are shared with the research community. In accordance with these efforts the University of Chicago will use as guidance the NIH Policy on Sharing of Model Organisms for Biomedical Research, published May 7, 2004.

II. GUIDING PRINCIPLES

The guiding principles that the University will follow to achieve the above stated goal are outlined below:

1. The University will work with and encourage its faculty to disclose newly created model organisms on a timely basis.

2. The University will facilitate the transfer of model organisms to researchers requesting access through its material transfer agreements or the UBMTA Implementing Letter. Alternatively, the University may, when appropriate, make the material available through the use of a repository or a commercial distributor. In all cases, arrangements will be made to ensure that the materials are made widely available to the nonprofit research community.

3. If the University decides to patent the model organism, it will take steps to ensure that the protection of rights shall not interfere with the distribution of the organism to the scientific community.

4. If the University decides to patent and license the model organism, it will negotiate terms with licensees that promote widespread distribution of the organism. With respect to exclusive licenses, the agreements will include provisions for the return of rights to the University should the licensor fail to commercialize the technology and offer it for public sale in a timely manner. The University will also make every effort to reserve rights to the licensed material to the University and other nonprofit institutions.

5. The University will draw upon the expertise within University Research Administration, UCTech, the office of General Counsel and other appropriate offices within the institution when developing individual model organism sharing plans with its principal investigators.

6. If third-party patents or contract obligations exist, the University will seek to minimize any possible restrictions affecting the availability of model organisms.
III. MODEL ORGANISM SHARING PLAN SPECIFICATIONS
(to be completed prior to submission)

A. HOW THE NOVEL STRAINS WILL BE MADE AVAILABLE TO THE SCIENTIFIC COMMUNITY

1. Describe the organism(s) to be made available:

2. Indicate the form in which the organism will be provided (e.g., adults, embryos, sperm):

3. List any related research resources or data that you plan to provide:

4. Include a time frame for the periodic disposition of material and associated data:
   (materials should be made available at least upon publication of the primary results
   announcing the development of any genetically modified organisms)

5. Will a repository be used? ___ yes ____ no
   (Note: Examples of available resources are posted on the NIH Model Organism for
   Biomedical Research Web site and are updated periodically)

6. If relevant, describe how risks of infection or contamination will be minimized:

B. HOW TECHNOLOGY TRANSFER ISSUES WILL BE HANDLED

The University will facilitate the transfer of model organisms to researchers requesting access
through its material transfer agreements or the UBMTA Implementing Letter. Alternatively, the
University may, when appropriate, make the material available through the use of a repository or a
commercial distributor. In all cases, arrangements will be made to ensure that the materials are
made widely available to the nonprofit research community.

If the University decides to patent the model organism, it will take steps to ensure that the
protection of rights shall not interfere with the distribution of the organism to the scientific
community.

If third-party patents or contract obligations exist, the University will seek to minimize any possible
restrictions affecting the availability of model organisms.

__________________________________ ______________________________
Principal Investigator Date Institutional Officer Date
**Data Rights and Publication Rights**

Data rights and publication rights are closely aligned in most sponsored research agreements. The important messages reflecting this interrelationship can be summarized as follows:

- Free, unrestricted right of researchers to publicly share research results must be preserved.
- Determination of authorship and acknowledgements — whose intellectual or scientific contribution merits recognition as co-author versus acknowledgement as resource person — must be made clear.
- Compromising publication autonomy lends an appearance of the control of research by third parties and may jeopardize the fundamental research exclusion and raise export control issues. (Researchers and their institutions generally hold that a basic tenet of academic freedom is unfettered freedom to disclose research outcomes. A publication restriction by a sponsor (a “third party”), usually framed in language such as “review and approval” of proposed publications or presentations is thus a breach of academic freedom.)

**1905.4 Data Rights in Federal Awards**

Federal policies and regulations governing data rights are complex, inconsistent, and difficult to understand. Different policies apply to assistance agreements and procurements, and different federal agencies may have different regulations and policies. The recommended practice, therefore, is that research administrators should read each program solicitation, funding opportunity, RFA, broad agency announcement (BAA), RFP, or call for proposal to identify how data rights are defined and what obligations the government is requiring of the awardee.

It is incumbent on the institution to identify at the time the proposal is submitted whether data rights or any other terms of award are problematic and would require further negotiation if an award were to be considered. Even when the negotiation process concludes with modifications of award conditions that are acceptable to the institution, experienced administrators know to read again in detail the terms of the final proposed agreement prior to execution by the institution to confirm that all modifications agreed to during the negotiation have been incorporated into the final document.

Although there is no flow-down requirement for data rights, prime grantees and contractors typically seek a license from subawardees to use the data generated by the subawardee to fulfill requirements of the grant or contract. (For a full discussion of managing subawards, see Chapter 3700.)

**Federal Grants and Cooperative Agreements**

The government’s rights in data under assistance agreements (grants and cooperative agreements) are spelled out in OMB Circular A-110. The circular stipulates the federal government has the right to obtain, reproduce, publish, or otherwise use the data first produced under an award, and the government has the right to authorize others to
As noted above, in response to a FOIA request for research data relating to published research findings produced under a federally funded award and used by the federal government in developing an agency action that has the force and effect of law, the federal awarding agency will request, and the recipient should provide within a reasonable time, the research data so that it can be made available to the public through the procedures established by FOIA.

**Example**

Suppose the president were to issue an executive order (EO) banning cigarette advertising, and the EO cites research data in support of its position. If federally funded research grants developed that data, the source data must be turned over to the federal government to allow it to respond to a FOIA request. Note that the government agency not the institution responds to the FOIA request. A private institution is not subject to FOIA, even though some of its research work is “FOIA-able” through the sponsoring government agency. Public institutions may be liable under a state’s FOIA or so-called “sunshine act” (relating to transparency in government) to turn over or share information.

**Federal Contracts**

In federal contracts, ownership of data is determined by the terms of the contract agreement. Rights in technical data and computer software are prescribed within the Federal Acquisition Regulation (the FAR). There is no consistent treatment of data rights, however, under agency-specific FAR provisions. The government’s rights vary depending on the agency, the scope of work, or source of funds. Normally the government receives a royalty-free, nonexclusive, irrevocable, worldwide license to use, disclose, reproduce, prepare derivative works, distribute copies to the public, and perform and display publicly the copyrighted data for data “first produced.”

Certain FAR clauses (as discussed in Figure 3) are objectionable to most academic institutions because they infringe on rights to data created by the institution in the conduct of the research, limit or restrict the Bayh-Dole rights to the intellectual property arising from the research, or involve publication restrictions. Objections to FAR clauses are most persuasively argued by universities when the institution’s academic freedom and data/IP policies are clearly stated and uniformly applied. Ultimately institutions determine which FAR clauses they can live with in the interests of performing the research and which clauses infringe institutional principles to such an extent that it is preferable to turn down the proposed award. Knowing that an institution can and will decline the award can be a powerful negotiating tool, but the institution must be prepared to honor its claim.

OSP staff should read the FAR clauses pertaining to data rights carefully to assure that the rights of the institution and researcher are fully protected or, when appropriate, to assure that a detailed examination informs any determination of whether an exception to university policy may be warranted for the specific contract. There are several
frequently used FAR clauses that deal with technical data; some of these are described in detail in Figure 3 because they are of special relevance for university OSP staff. (For a full discussion of administering research contracts, see Chapter 2700.)

**Figure 3: Some FAR Clauses of Relevance to University Sponsored Research Agreements**

**FAR 52.227-14, Alternate IV**

For most agencies other than the U.S. Department of Defense (DoD), U.S. Department of Energy (DOE), and the National Aeronautics and Space Administration (NASA), FAR 52.227-14 applies. There are several alternatives offered under this FAR clause. Alternate IV is required to be used in contracts for basic or applied research to be performed solely by universities and colleges. Alternate IV states that title to all data and software belongs to the institution. If government and third-party funding is used, the government usually receives government purpose rights. For data, Alternate IV enables the government to reproduce, prepare derivative works, distribute copies to the public, and perform publicly and display publicly, by or on behalf of the government. For software, under Alternate IV the government does not receive the right to distribute copies to the public.

Research administrators should carefully review the full text of FAR 52.227-14(d)(3). This clause contains publication restrictions.

**FAR 52.227-17, Rights in Data – Special Works**

This clause is required to be inserted in contracts primarily intended for the production/compilation of data for government internal use or where there is a need for limited distribution. The government acquires unlimited rights to data, including technical data and computer software. The contractor may not establish copyright or release distribution. Publication of delivered data is restricted.

This clause is virtually insurmountable trouble for universities, as it requires written approval of the federal contracting officer to establish copyright in all other data. Contractor may not establish, without prior approval from the government, copyright in scientific and technical articles if these contain data first produced in the performance of the contract and published in academic, technical, or professional journals and symposia proceedings or similar works. Of course the inclusion of a “Special Works” clause destroys the so-called “fundamental research exemption” thereby inviting all the restrictions and requirements relating to export controls and export regulations and licensing requirements.

**Department of Defense Acquisition Regulations (DFARS)**

Two separate regulations govern computer software and other types of technical data in Department of Defense (DoD) sponsored contracts. The DFARS (DoD’s supplemental regulations to the FAR) do not make a distinction between commercial organizations and nonprofit educational institutions. Standard license rights granted to the government under DFARS may be modified through negotiation with DoD. (DFARS are available online at www.acq.osd.mil/dpap/dars/dfars/index.htm.)
Typically DoD’s allocation of rights in technical data recognizes the source of funds for the work as follows:

- Developed exclusively with government funds (unlimited rights)
- Developed with mixed funding (government purpose rights)
- Developed exclusively at private expense (limited rights)

(a) DFAR 242-204-7000, Disclosure of Information (Dec. 1991)

This clause restricts the contractor from public dissemination of any unclassified information without the prior written approval of the federal contracting officer. The contractor is further required to include this restriction in any subcontract under the prime contract. Any request from a subcontractor for authorization to release information must be forwarded from the prime contractor to the contracting officer.

In almost all cases, a university will not accept a “7000” clause as it contradicts most institutions’ policies on open and unrestricted dissemination of research results, but also because (as with the “Special Works” clause discussed above) the 7000 clause destroys the fundamental research exemption of NSDD 189 and opens the project to application of export control restrictions and export regulations and licensing requirements.

(b) DFAR 242-204-7000, Release of Information (Dec. 1991) Deviation

Under this deviation language, the contractor is free to publish, permit to be published, or distribute for public consumption, any information — oral or written — concerning the results or conclusions made pursuant to performance of the contract as long as the contracting office receives a copy of the intended release at least 30 days prior to such release for review and comment.

NASA Contracts

NASA data rights provisions are stated in NASA FAR Supplement, Part 1827.404. NASA generally follows the FAR data rights provisions described above. However NASA also typically adds a requirement that the contractor must have the permission of NASA to copyright, publish, or release software first produced in performance of a NASA-funded contract (NFS 1852.227-14). NASA believes this permission is necessary to assure that the dissemination of computer software developed by NASA or its contractor is most efficiently accomplished. (The NASA Far Supplement link page is www.hq.nasa.gov/office/procurement/regs/.)

For the benefit of the academic community, the NASA FAR Supplement states that the addition of the requirement (a (d)(3) provision) should not be used in contracts for basic or applied research with universities or colleges. FAR Alternate I for delivery of limited rights data may be appropriate for such contracts. (This reference is to FAR 52.227-14, Rights in Data – Alternate 1, which provides limited data rights for the government for data (other than computer software) developed at private expense that embody trade secrets or are commercial or financial and confidential or privileged.) Special permissions from NASA may be required to assure that university publication rights are preserved in NASA contracts.
**1905.5 ‘Work for Hire’**

A university should be extremely leery of agreeing to undertake research described as a “work for hire,” as in such agreements the third party (the sponsor) owns all data/outcomes. Invariably this precludes the investigator’s use of the research data for publication or public presentation without the explicit permission of the sponsor. In such cases, data would be owned by the sponsor as would any resulting intellectual property.

Research administrators may see “work-for-hire” language in a corporate sponsored research agreement, as the company may propose to treat university research as a procurement. For projects involving the conduct of corporate sponsored research using university facilities, work-for-hire language would be unacceptable as this would be viewed as transferring ownership of valuable property for less-than-arm’s-length consideration. For tax-exempt entities, the Internal Revenue Service (IRS) may look at this as providing a private benefit to a commercial entity, which is inconsistent with the Section 501(c)(3) nonprofit status of most universities.

The facts involved in a specific situation ultimately will guide what is appropriate for a PI and consistent with the institutional mission. If an institution determines that an agreement with work-for-hire language is acceptable, the institution would want to restrict involvement of students in such projects as the students’ rights to use the research results for dissertation or other educational advancement might be compromised.
Example

A faculty member may be commissioned by the National Academy of Sciences (NAS) to write a particular paper. An NAS agreement requires it to treat the commission as a “work for hire” whereby NAS owns the paper. Should an institution accept this restriction? Some institutions will not accept any publication restriction on a sponsored project and would require the faculty member to do this work through a “consulting agreement” with NAS. Other institutions may make an exception for an NAS-commissioned study once there is assurance that the work involves solely the PI and no student dissertation work.

¶1905.6 Joint Ownership of Data

Joint ownership of data allows both parties equal rights to use data generated in the course of the sponsored project. Agreeing to joint ownership of research data is a reasonable way to satisfy some sponsors’ requirements for ownership. For example, state agencies often are required to own the data funded with state funds. Joint ownership protects the university researcher’s use of data generated in the course of the research for education, publication, and future research purposes.

¶1905.7 Protection of Proprietary and Confidential Data

When a sponsor or third party believes that certain information and/or data are necessary for the institution to carry out its research, language protecting the proprietary property of the sponsor is necessary. Whether the sponsor is the federal government or a private corporation, the obligation of the receiving institution is to protect the information from public disclosure. Generally a prepublication review by the sponsor is adequate to assure that no confidential or proprietary data is inadvertently disclosed in the publication.

OSP staff should be diligent in reviewing the definition of “confidential” to ascertain that this definition is narrowly applied to information/data provided by the sponsor. Occasionally a sponsor will define the data arising during the course of the research within its definition of company “confidential information.” Left uncorrected, this creates an implicit publication bar at best; at worst, it gives the company automatic rights to research data. Also OSP staff should be on the lookout for a definition of “confidential information” that includes ideas, inventions, and other forms of IP, as this would conflict with the negotiation of IP provisions of the contract as well as Bayh-Dole obligations and most institutions’ IP policies.

Frequently today, companies that want to disclose company-proprietary (confidential) information will require the likely PI and the institution to sign a nondisclosure agreement (NDA) or confidentiality agreement (CDA). Some institutions take a hard line and argue that such agreements should only involve the PI who is receiving the information and the company. A company may insist that the agreement must be between the organizations that would ultimately be the binding parties to the research or clinical trial agreement.
As more institutions are agreeing to sign these agreements, the following are tips to consider when an institution is first presented with such an agreement:

◆ Be careful about the period of confidentiality. Accepting a long period of confidentiality at this stage will tie the institution’s hands in downstream negotiation of the research or trial agreement.

◆ Be careful about “scope creep.” The agreement may propose limitations on what the institution as a whole can do or with whom it can talk in the same or related areas of research. Always limit the field as narrowly as possible, and only to the PI directly involved.

◆ Be leery of indemnification language in CDAs.

◆ Watch for language that binds the institutions for all future agreements. At this stage the institution doesn’t know if the research relationship will proceed and under what conditions.

¶1905.8 ‘Sensitive but Unclassified’ Information

Although the terminology — “sensitive but unclassified” — is not new, federal agencies have become more concerned about certain types of data and information that is or could be perceived to be a national security concern; these concerns may be related to terrorism, biosecurity, computer security, or other areas that the government has determined would benefit from tighter oversight or security, but that fall short of being governed through formal classification procedures.

In March 2003 the Association of American Universities prepared a helpful summary and analysis entitled Definitions and Regulations Involved in the Classified-Sensitive Information-Unclassified Debate. Several “sensitive information” definitions cited in the document provide useful background for this discussion and are included in Figure 4.

Institutional Concerns

The absence of clarity in situations where “sensitive but unclassified” data or information may be involved places institutions in a precarious position. It is important for the OSP to assure that “sensitive but unclassified” information is defined in the work agreement, and that the PI and the institution know the consequences of having such information and the particular obligations they will incur concerning such data. The terminology is appearing in certain government contracts, but it is possible it could also find its way into grant agreements. No matter what the nature of the agreement, the ambiguity of the terminology and the potential impact on the conduct of research merit careful review by the PI and the OSP.

When the government “classifies” data or information or a project work scope there are clear and unambiguous regulatory requirements defining the impact of classification. If the government classifies the project, the institution may have to decide if it wants to participate in the project. Many institutions have drawn a “bright line” at participation in government-sponsored classified research projects and simply will not do classified research.
Wording about "special conditions" for "confidential treatment of sensitive information" has appeared in several NIH solicitations and awards dealing with bioterrorist agents. Institutions should be extremely diligent in reviewing these requests for applications and award documents for special conditions involving sensitive but unclassified information as they impose publication restrictions on any disclosure of sensitive information/data.

It is worth noting that institutions have been able to negotiate a clarification with NIH whereby the contract stipulates that in general the government may not designate

---

**Figure 4: Background on Definition of ‘Sensitive’ Information**

The Association of American Universities publication, *Definitions and Regulations Involved in the Classified-Sensitive Information-Unclassified Debate*, contains several definitions of “sensitive information” as follows:

1. **Sensitive information**: The Computer Security Act of 1987 (P.L. 100-235) established requirements for the protection of certain information on federal government information systems. This information is referred to as “sensitive information,” defined in the act as: “Any information the loss, misuse, or unauthorized access to or modification of which could adversely affect the national interest or the conduct of federal programs or the privacy to which individuals are entitled under [the Privacy Act] but which has not been specifically authorized under criteria established by an Executive Order or an Act of Congress to be kept secret in the interest of national defense or foreign policy.”

2. **Sensitive, but unclassified information**: The Department of State describes “sensitive but unclassified information” as “…information which warrants a degree of protection and administrative control that meets the criteria for exemption from public disclosure set forth under … the Privacy Act.” This is a document designation comparable to “For Official Use Only.” DoD uses a similar mechanism for some categories of information called “controlled but unclassified.”

3. **Sensitive, but unclassified technical information**: The Department of Energy’s use of “sensitive, but unclassified” is described as: “Information for which disclosure, misuse, alteration or destruction could adversely affect national security or government interests. National security interests are those unclassified matters that are related to the national defense or foreign relations of the Federal Government. Governmental interests are those related, but not limited to, the wide range of government or government-derived economic, human, financial, industrial, agricultural, technological, and law enforcement information, as well as the privacy or confidentiality of personal information provided to the Federal Government by its citizens.”

4. **Sensitive homeland security information**: In an October 10, 2002, appearance before the House Science Committee, Director Jack Marburger of the Office of Science and Technology Policy defined sensitive homeland security information as “not a new category of information; rather it is the type of information that the government holds today which is not routinely available to the general public, such as law enforcement data and critical computer security threats and vulnerabilities.”

as “sensitive” information/data the results of the research conducted by the contractor during the performance of the contract. It is also helpful to ensure that the contract recognizes that sensitive data shall not include data already published or otherwise publicly available.

The government must formally and officially designate as “sensitive” information/data provided under the contract by the government or third parties and provide written notice to the institution in advance of transmission of such information to the contractor. The identification of such information must be done at the time it is provided so that it may be properly treated. For those institutions with a very strict policy on the protection of publication rights, a mandatory condition for institutional acceptance of the agreement should be that the government may not designate data or information arising from the conduct of the research as “sensitive but unclassified.”

1905.9 Material Transfer Agreements

In some universities, OSPs are responsible for material transfer agreements (MTAs). In other universities, the technology transfer office oversees MTAs. An MTA is an agreement that governs the rights and obligations between the “provider” of the material and the “recipient” of the material. MTAs often cover

◆ data rights,
◆ protection for intellectual property existing and yet to be developed using the provider’s material,
◆ a description of the material that is being transferred,
◆ the research use of the material by the recipient,
◆ prepublication reviews,
◆ acknowledgement of source of material,
◆ liabilities,
◆ penalties for breach of the MTA, and
◆ indemnification.

OSP staff should be on the lookout for restrictive language pertaining to data rights and intellectual property, especially if the “provider” is from the private sector or from a foreign source.

The following are some typical MTA trouble spots:

◆ Definition of the material
◆ Rights to modifications and derivatives
◆ Restrictions on the use of materials, including limiting the period of time during which the material may be used
◆ Publication or confidentiality clauses
◆ Licensing or ownership rights
Impact on future collaborations and research

Indemnification provisions

Penalties for breach of the MTA

The “NIH Policy on Sharing Biomedical Research Resources: Principles and Guidelines for Recipients of NIH Research Grants and Contracts on Obtaining and Disseminating Biomedical Research Resources” (64 Fed. Reg. 72090, Dec. 23, 1999, available at http://ott.od.nih.gov/policy/rt_guide_final.html) describes appropriate terms for disseminating and acquiring research tools developed with NIH funding. OSPs (and technology transfer offices) that are responsible for managing MTAs should ensure that NIH-funded investigators are fully informed of NIH’s expectations and requirements for sharing biological research tools. This policy describes when NIH funding may not be used for research involving materials if the provider places excessive restrictions on the sharing.

‘Nonnegotiable’ MTAs

Sometimes providers will label their MTAs (including the restrictive clauses) as “non-negotiable.” Never assume that this means that the provider will never be willing to negotiate. If the material is critically important to an investigator but the MTA’s terms are unacceptable to the institution, it is certainly worth approaching the provider to explain why certain provisions are problematic. Sometimes the provider will negotiate; sometimes it won’t. Accepting restrictive language in a material transfer agreement can impede commercialization of research discoveries downstream. If the MTA granted IP rights to the provider, an institution’s TTO must take these binding conditions into consideration when it evaluates the licensing potential for research discoveries that derived in some manner from the material governed by the MTA.

1905.10 Protecting Intellectual Property

The research mission of universities and colleges is embodied in the creation and dissemination of new knowledge. Traditionally that knowledge is shared with the public and the scientific community through scholarly publications and presentations. Since the 1980s an increasing vehicle for sharing discoveries and new technology is through the licensing of technologies and inventions to private corporations (“technology transfer”). Many states credit their universities’ technology transfer initiatives to the success of their regional economic development. Successful technology transfer also generates revenue for investigators and the university. The terms of a sponsored research agreement may also reflect that technology transfer is a legal obligation to the sponsor, whether the research is federally or privately funded.

The term “intellectual property (IP)” is the general descriptor for creations of the intellect that have commercial value and are protectable under the law, such as patents, copyrights, trademarks, or trade secrets. Why is protection of IP important? Legal protection establishes ownership in the IP and facilitates the use of the protected IP by others who have been granted licenses to use it. A gateway criterion for assessing the potential commercial value of an invention, discovery, or technology is whether it is
“protectable” under law. The U.S. Constitution authorizes the protection of patents and copyrights in the United States.\(^\text{14}\)

**Institutional Policies on IP**

Does the university own faculty inventions? Always? Sometimes? Under what circumstances? Does it matter if the inventor used university financial and/or physical resources? In the case of a public institution, does state law dictate ownership of inventions and discoveries? Do the institution’s policies provide for an appeal process if an inventor believes that the discovery is outside institutional ownership? What about student inventions/discoveries? OSP staff must be familiar with its own institutional patent policy to answer these, and many other, questions. (For resources for obtaining sample intellectual property policies and agreements, see Figure 6, page 1905:36, and ¶1930.)

In general most universities’ patent policies claim ownership of their employees’ (including faculty) inventions and discoveries. Some policies recognize the traditional rights to copyrightable works authored by faculty outright, while other policies acknowledge that the institution will assert its ownership of copyrightable faculty works only when substantial use of university resources has been involved.

Whether the sponsor is federal or nonfederal, all executed sponsored research agreements invariably contain legal and regulatory obligations to sponsors pertaining to data and IP rights. The training for any new OSP staff, therefore, should include the following:

- The fundamentals of intellectual property
- The institution’s policies regarding data rights, patents, and other intellectual property
- Most importantly, how to read proposed sponsored agreements to ascertain that the sponsor’s data and IP expectations are consistent with university policies

\[\text{¶1905.11 \hspace{1em} Patent Protection}\]

A patent is intended to provide an incentive to invention and discovery. In return for openly sharing information, the patent permits the owner to have a period of time (generally 20 years under current U.S. law) during which the owner has exclusive right to use the property covered under the patent.

Key points of the U.S. patent system include the following:

- Anything that is (1) useful, (2) novel, and (3) unobvious may be patented.
- Subject matter must be within “patentable” subject matter, as defined by the patent statutes.
- There are three types of patents: utility, design, and plant.

\(^{14}\)U. S. Constitution, Article 1, Section 8, Clause 8 states, “The Congress shall have the power…to promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.” U.S. patent law is under the jurisdiction of the U.S. Patent and Trademark Office, www.uspto.gov. U.S. copyright law is under the jurisdiction of the U.S. Copyright Office, www.copyright.gov.
Definition of an invention is made up of only two parts: “conception” and “reduction to practice.”

U.S. patent law defines what may be patented and what is not patentable. For example, mathematical formulae, laws of nature, and “anything repugnant to morals or public policy” are not patentable by statute.

For purposes of patent law, “utility” means that the invention has some practical, useful purpose. Design patents are more restricted: A design patent protects only the ornamental appearance of an article, and not its structure or utilitarian features. If a design is utilitarian in nature as well as ornamental (such as a computer mouse design that is very comfortable to use), a design patent will not protect the design. Such combination inventions (both ornamental and utilitarian) can only be protected by a utility patent. A design patent has a term of 14 years from the date of issuance. Special patent laws apply to plants, hybrids, seeds, and agricultural plant products.

Patent Process

Understanding patent law is best left to the experts; however, some background on patents will be helpful to research administrators. In and of itself, a patent does not constitute technology transfer. The commercialization of intellectual property is dependent on many nuances, not the least of which is the prospect of a market for the technology and whether the technology can be protected — through patent, copyright, or other legal mechanisms.

Timing is often a key factor for patent eligibility: Has the technology been publicly disclosed? If so, when? Has the technology been in public use or for sale? In the United States, a patent application must be filed no later than one year after a public disclosure. In most of the rest of the world, the patent must be filed prior to public disclosure. In the United States, the patent system is built around the assumption that the “first to invent” has claim to patent protection. In most of the rest of the world, the patent protection goes to the “first to file.” These are crucial distinctions in global patent law. OSP staff should generally refer patent questions to the TTO where expertise in current patent law is available. Patent law does change from time to time; indeed currently there are substantial modifications to U.S. patent law under consideration by Congress.

Application. The patent application must describe the invention, the inventor must sign an oath that he/she believes that he/she is the first inventor, and the process of making and using the technology must be disclosed

◆ in full, clear, concise, and exact terms; and
to enable any person skilled in the art to make and use the invention without undue experimentation. (Applications must contain specifications, claims, and drawings, if required.)

Provisional Application. One mechanism to fast-track patent protection in the face of impending public disclosure is through the filing of a “provisional” patent application. There are minimal requirements for filing a “provisional application” (PA), but a regular full patent application must be filed within one year of filing a PA. While the PA assures an earlier filing date, the coverage is limited to only the part of the invention that is disclosed in the provisional application.

Inventorship
The simplest and clearest way to address “inventorship” in sponsored agreements is for the institution to reach agreement with the sponsor that inventorship is determined by U.S. patent law. Authorship is not a valid test of inventorship. An inventor is anyone who contributes to the conception or reduction to practice but not someone who was following orders. For example, inventors may be the scientific collaborators who came up with the method to make a new chemical compound but not the technician who assisted in the laboratory work. (In a scientific publication there may be a number of authors who made contributions to the science, such as in the creation and understanding of a new compound the person who carried out the crystallography that helped understand the structure of the new compound would be an author, but the crystallographer wouldn’t typically be an inventor.)

Additionally revenue-sharing plans at many institutions are not limited strictly to inventors, but may permit inventors to share IP revenue with other collaborators and contributors. Research administrators should work with the TTO to become familiar with the institution’s patent policy and IP revenue-sharing policies.

1905.12 The Bayh-Dole Act
The Bayh-Dole Act was enacted in 1980 and stands as the watershed for today’s technology transfer in American colleges and universities. The act was amended and amplified by various executive and Congressional actions, and it now collectively describes federal law governing rights to inventions conceived or first reduced to practice during research under a federally funded grant, contract, or cooperative agreement at colleges/universities and small businesses. The Department of Commerce is designated as the federal agency to promote commercialization and has responsibility for implementing the regulations issued under the act.

The purpose of Bayh-Dole is to
◆ promote collaboration between commercial concerns and nonprofit organizations including universities;
◆ promote use of inventions arising from federally sponsored research or development; and
◆ ensure that inventions are used to promote free competition and enterprise.
Prior to enactment of Bayh-Dole, title to inventions under federal funding vested in
the funding agency unless the individual institution and agency had entered into an
agreement regarding rights to inventions. There was very little patenting by federal
agencies; agencies only wanted to do nonexclusive licenses. Consequently very little
federally funded research found its way to public benefit. Industry was hesitant to fund
projects at universities because a PI’s program of research invariably involved federal
funding, and that meant uncertainty of rights to inventions.

Under the provisions of the Bayh Dole Act
◆ The university has the right to elect to retain title to inventions developed with
  federal funding.
◆ The university must file patents on inventions they elect to own. (NIH has created an
  exception to this provision for biological materials.)
◆ The university must make disclosure of the invention to the federal government
  within two months after receipt of disclosure from the investigator.
◆ The university must make written election of title within two years of the disclosure.
◆ If title is elected, the university must file a patent prior to any statutory bar.
◆ The government retains certain rights in the invention.
◆ Government rights include a royalty-free, nonexclusive license for governmental
  purposes including use by subcontractors.
◆ The university may not assign its rights, except to a patent management entity,
  without the agency’s permission.
◆ The government may exercise march-in rights. (“March-in” rights allow the
  government to order the university to grant certain licenses, if necessary, for such
  things as ensuring public use or health and safety.)
◆ Royalty sharing with inventors is required.
◆ The balance of royalties must be used for the support of scientific research or
  education.
◆ A written agreement with all persons working on the research except clerical or
  nontechnical staff is required.
◆ A reasonable attempt to license to small business must be made.
◆ Substantial manufacture of product in the United States should occur if exclusively
  licensed.

Bayh-Dole Exclusions
Exceptions under Bayh-Dole are allowed in three circumstances as follows.
(1) An agency may decide that title to inventions is better vested with the federal
  agency. Such a decision — termed a “Determination of Exceptional Circumstances”
  (DEC) — must be made prior to the award of federal support and becomes a part
  of the sponsored project agreement. Under Section 401.3(a)(2) of the Bayh-Dole Act, an
  agency may determine that restriction or elimination of the right to retain title to any
subject invention will better promote the policy and objectives of 35 USC 18. The agency must file an “exception circumstance” determination with the Department of Commerce, which will then rule on its validity. Reasons for a DEC may involve issues of sensitive research or national security.

If the institution is responding to an RFA that includes a DEC, the institution should examine the DEC to assure that it is as narrowly constrained as required by Section 401.3(b), for example restricting the DEC to a particular field of use, and in compliance with Section 401.3(e) to fully justify and support the use of the DEC.

(2) Congress has authorized certain programs that specifically override Bayh-Dole rights to intellectual property for universities. One program is the Department of Defense’s (DoD) Advanced Technology Program (ATP). Prime applicants must be private sector entities and IP rights are specifically provided to the company, even if a university is a subawardee on the prime. Some institutions do not permit ATP funding as it contradicts their IP and patent policies. Other institutions participate in ATP research in order to have the benefit of participation in the research project. Some institutions have been able to negotiate with the prime awardee a “grant back” of rights to use university-generated IP for internal research and education purposes.

(3) No scholarship, fellowship, training grant, or other funding agreement made by a federal agency primarily to an awardee for educational purposes will contain any provision giving the federal agency any rights to inventions made by the awardee.

Rights for Subawardees
When a university is a subawardee under a prime award made to another organization, the subawardee retains the same rights provided for the prime grantee/contractor by the sponsor. The prime awardee is not entitled to claim, as a part of the consideration for awarding the subaward, any rights in the subcontractor’s subject inventions. The prime may legitimately require the subawardee to provide access to such invention, copyright information, and data as may be necessary to meet the reporting requirements of the prime to the sponsor.

Title to Patentable Biological Materials
NIH issued a policy that outlines the conditions under which biological materials on which the contractor elects not to file a patent application may be licensed. This policy is intended to encourage the dissemination of biological materials through licensing without patent protection. The NIH contractor/grantee electing title to patentable biological materials and requesting to distribute them through licensing as “unpatent-

---

15 35 USC 18 “Patent Rights in Inventions Made with Federal Assistance.”
16 15 USC 278n, “Advanced Technology Program.”
able tangible research materials” must agree to a set of sharing conditions specified by NIH. The terms of the license must be no more restrictive than they would have been if the material had been patented.

1905.13 IP Rights in Nongovernmental Agreements

Intellectual property language in agreements from nongovernmental sponsors requires diligent review and consideration. Negotiation of mutually acceptable data and patent rights language can consume legendary amounts of time. This can be true whether the agreement is an MTA where no funds are involved or a multimillion-dollar sponsored research agreement funded by a private company.

Corporate Sponsors

The number of corporate sponsored research agreements is on the rise, reflecting an increasing desire by university researchers to collaborate with industry, and vice versa. The research is interesting and the opportunities for alternative funding when competition for federal funds is tight are attractive to researchers. The issues in negotiating mutually acceptable IP terms in corporate sponsored research agreements reflect the cultural gaps and differing expectations between the academic researcher (and his or her institution) and the private sector. Not infrequently companies assert that funding the research is sufficient to entitle them to any IP generated in the conduct of the project and it should be assigned or licensed at no additional cost to the company.

Elements of a good corporate sponsored research agreement governing rights to intellectual property would address the following:

◆ Clear and reasonable definitions of terms
◆ Ownership (sole, joint, and third-party rights)
◆ Oversight of IP disclosure
◆ Management of IP
◆ Reporting, filing, and election of title
◆ Payment of patent costs
◆ Reservation of rights for research tools
◆ Options and licenses for commercialization of IP arising from research project’s scope of work
◆ Dispute resolution relating to IP

NIH Guidance. In the early 1990s, NIH observed that universities were entering into multimillion-dollar research agreements with companies whereby the sponsoring company was granted an exclusive right to intellectual property arising from the university laboratories being supported. What NIH further observed was that these laboratories were also receiving NIH funds and often considerably more than the company was providing. In effect, then, the company was getting the IP benefits of taxpayer dollars. In 1994 NIH issued a policy guidance document for NIH grantees,
“Developing Sponsored Research Agreements: Considerations for Recipients of NIH Research Grants and Contracts.”18

In brief this guidance reminded an institution of its obligations under Bayh-Dole and that it should refrain from engaging in activities that undermine its abilities to fulfill its responsibilities and obligations to the federal government. Research administrators will find the NIH guidance an invaluable resource when negotiating corporate sponsored research agreements, especially if the researchers involved have NIH funding in their laboratories.

Under the guidance, NIH’s “Points for Consideration” (for all sponsored research agreements) include the following:

◆ Academic freedom
◆ Dissemination of research results
◆ How research results will be used (“utilization”)
◆ Requirements for U.S. manufacture
◆ Notification requirements and record keeping

NIH reminds institutions to give agreements heightened scrutiny when the
◆ amount of financial support from the company exceeds $5 million/year or $50 million in total;
◆ proportion of funding by sponsor exceeds 20 percent of a grantee’s research funding;
◆ sponsor’s prospective licensing rights cover all technologies developed by a major component of a grantee organization; and
◆ duration of the agreement is five years or more.

Nonprofit Sponsors

Just as IP policies vary from company to company, nonprofit sponsors have different expectations regarding intellectual property arising in whole or in part from their funding. Increasingly nonprofit organizations have been modifying their patent policies and IP terms to require their grantees to involve them more actively in the technology transfer process. While most nongovernmental organizations (NGOs) will honor the patent policy of the university grantee organization, it is absolutely necessary to read the terms and conditions of these funders carefully prior to submitting a proposal or accepting an award. (For example, large sponsors such as the Susan B. Komen Foundation, the American Heart Association, and the American Cancer Society have changed their IP terms in recent years.)

Some NGOs do not routinely share their IP policies in proposal guidelines; the “terms and conditions” are included as a part of the award acceptance packet. These

---

must be read carefully. It is highly recommended that the sponsored programs office coordinate review of these conditions with the TTO. Some of the conditions may place excessive reporting and coordination burdens on the TTO.

Technology transfer and the prospect of related new revenues are receiving increasing attention in the 21st century from the NGO community. Many sponsors require sharing the revenue arising from commercialization of IP that their funds helped support. Some are clear about proportional relationships to total funding, some have thresholds of revenue above which they would expect sharing. Some recognize that institutions may have Bayh-Dole rights and federal obligations in the IP; others do not.

The following are areas of possible concern when accepting awards from NGOs:

◆ Sharing of royalties
◆ Pre-approval of any licensing for commercialization
◆ March-in rights if licensing partner(s) fails to produce on commercialization benchmarks
◆ Return of IP rights to sponsor if university decides not to elect to patent invention or discovery

Few, if any, NGOs reimburse the university’s overhead costs. For some institutions, the reimbursement of overhead costs factors into agreements with NGOs regarding revenue sharing. For example, a university may require a written royalty sharing agreement that stipulates that royalties accruing to the NGO first reimburse the grantee’s unrecovered indirect costs on the NGO direct research support, before any proportional sharing of royalties is paid to the NGO. In addition universities cite the accumulated investment by the university and any prior sponsors in supporting the lab, personnel, and prior research as considerations in negotiating what is a reasonable proportional share of NGO royalties.

If the NGO’s IP conditions are troublesome to the institution, the institution should take exception to the terms of the award at the time the proposal is submitted. Sponsored programs administrators should be proactive in providing guidance to researchers about problematic terms and conditions proposed by NGOs. If certain conditions are known to be unacceptable to an institution, researchers should know that before they expend considerable effort preparing a proposal.

**Licensing Terms**

OSP staff should be leery of license terms spelled out in research agreements. A “license” is a legal agreement or contract that permits one party to use intellectual property belonging to another under mutually agreed upon terms. In other words, a license is a grant of a right to use IP. Research is unpredictable. Neither the researcher nor the sponsor can predict what potential IP may arise from the project.

Sponsored research agreements establish royalty rates that have the effect of setting the commercial value of unknowns. A “royalty” is a consideration or compensation paid to the licensor in exchange for certain rights in technology that the licensor is providing to the licensee. (Royalties may be based on many factors including sales, up-front fees, and performance benchmarks.) An exclusive license gives the licensee the sole author-
ity to exercise its rights contained in the license agreement. If another party exercises these rights, including the owner, the exclusive licensee can obtain protection and relief in court to prevent the party from infringing on its exclusive rights. Exclusive rights may be limited to a period of time, a country, a field of use, etc.

Cooperation between the OSP and the institution’s TTO to restrict the license terms in a corporate sponsored agreement to the extent possible is invaluable. Sometimes companies need the reassurance of a scale of royalties within which they may expect to negotiate. But it is most prudent to avoid any licensing conditions or royalty rates, other than the option to negotiate in good faith for a limited period of time.

What is the risk of committing to license IP in a corporate sponsored research agreement? There are two potential risks for the typical college or university:

1. Agreeing to assign, license, or otherwise provide the IP from research projects to the corporate sponsor may be inconsistent with the institution’s Section 501(c)(3) nonprofit status and its mission of education, research, and public service. An obligation to license IP on a royalty-free basis or at pre-established rates could be seen as providing a direct benefit to the private sector at less than fair market value, which is inconsistent with an institution’s charitable status and obligation to support the public (not private commercial) good.

2. Use of facilities funded by tax-exempt bonds for private benefit may jeopardize the tax-exempt status of the bonds. IRS Revenue Procedure (Rev. Proc.) 97-14 regarding “Guidelines for Research Agreements” is applicable when sponsored research is conducted in facilities constructed in whole or in part with tax-exempt bond proceeds, and it describes the conditions under which a research agreement does not result in private benefit use. Basic research, for purposes of Section 141 of the 1986 Internal Revenue Code, means any original investigation for the advancement of scientific knowledge not having a specific commercial objective. For example, product testing supporting the trade or business of a specific nongovernmental person is not treated as basic research.

Under the “Guidelines for Research Agreements,” Section 5 establishes the definition and restrictions that pertain to corporate-sponsored research at Section 5.02. The guidance stipulates that any license or other use of resulting technology by the sponsor is permitted only on the same terms as the recipient would permit that use by any unrelated, nonsponsoring party (that is, the sponsor must pay a competitive price for its use) with the price paid for that use determined at the time the license or other resulting technology is available for use. This clearly is intended to preclude establishing licensing terms at the time the research agreement is executed. Although the institution receiving the corporate support need not permit persons other than the sponsor to use any license or other resulting technology, the price paid by the sponsor must be no less than the price that would be paid by any nonsponsoring party for those same rights.

1926 USC 141, “Private Activity Bond; Qualified Bond.” The “Guidelines for Research Agreements” were issued Jan. 10, 1997.
Section 5.03 of this same IRS guidance stipulates the conditions that apply to research agreements relating to property used pursuant to a joint industry-governmental cooperative research agreement. Under cooperative research agreements, corporate sponsors are entitled to no more than a nonexclusive, royalty-free license to use the product of any of that research.

**Nonexclusive IP Rights**

Companies frequently seek nonexclusive, royalty-free, perpetual, worldwide, for any purpose, sublicense rights to IP arising from company sponsored research. What’s the problem with a nonexclusive, royalty-free license? Read the language carefully. Is the nonexclusive license limited to internal research purposes? If so, this license is probably not a problem. If the purpose of the license is not restricted to research, it may present a problem.

Issues for an institution to consider before accepting agreements granting a company nonexclusive IP rights include the following:

- Is the nonexclusive right limited to the field of interest for the sponsor?
- Is the research in an area already dominated by the sponsor (there may be nothing for an institution to protect)?
- Is the institution getting fair compensation — such as full facilities and administrative costs recovery and funding that would benefit the institution?

Research administrators have to recognize and respect what corporate sponsors’ priorities are and be prepared to negotiate a fair and reasonable business relationship.

**Preferred Language.** Preferred language in a sponsored research agreement grants a royalty-free license to the sponsoring company limited to its internal research purposes. Any license for commercial uses whether for exclusive or nonexclusive rights should be written as “an option to negotiate” with appropriate time limits. Royalty-free sublicense rights should be limited to allowing use of the IP for the company’s internal purposes only, avoiding the company’s right to sublicense to a third party the IP for the company’s financial benefit.

**1905.14 Copyrightable Technology**

OSP staff should know the application of its institutional policy regarding and understand the protections the policy gives to the traditional rights of faculty in textbooks, publications, and the transfer of rights to journals. OSPs should be aware of the new NIH recommendation for posting online publications arising from NIH-funded research within one year of publication. This is not a requirement at this time but could become one in the future.

**Software**

Rights in software can be complicated. Some software is protectable through patent but most software applications are protected through copyright. Many computer scientists regard their research-developed software as “open-source” software. An OSP should
know what the developers of the software mean when they say “open source” in the event the sponsor questions the term in an agreement. For example, do they intend to post source code on publicly accessible sites?

§1905.15 **IP Concerns in Small Business Awards**

Universities often participate as subawardees to small businesses in phase I and phase II Small Business Innovative Research (SBIR) programs and under the Small Business Technology Transfer (STTR) program.²⁰ The STTR program additionally mandates a subaward with a collaborating academic institution and an IP plan as part of the award.

Two areas of concern often arise with SBIR/STTR projects:

1. The small business and the institution should have clear and mutually acceptable data and intellectual property rights and obligations. (The institution’s TTO already may be licensing university technology to the small business.)

2. If the small business is already dealing with the institution’s TTO, issues of financial conflicts of interest may arise.

Depending on the institution’s policy, these SBIR/STTR relationships may require special oversight. If the research project involves clinical research, even greater scrutiny is warranted because the research requires the participation of human volunteers. Sometimes the small business may not have the resources to provide appropriate indemnification; it may not be familiar with Bayh-Dole rights for subrecipients; and it may lack legal sophistication in agreement language. There also are often financial conflicts of interest between the institution’s faculty (perhaps even the institution has an equity share) and the small business. Because relationships with small businesses are often high-risk relationships, they deserve special scrutiny.

As with all agreements, the OSP should read the prime SBIR/STTR application carefully. The institution should require that the small business share the funding agency’s notification of grant award. And, ultimately, of course, an OSP should read the subaward document very carefully to assure that all terms and conditions pertaining to data and IP rights are consistent with institutional policy.

§1905.16 **CREATE Act**

The patent laws have recently been modified to implement the Cooperative Research and Technology Enhancement Act (CREATE Act), although it is still unclear what application the CREATE Act has for university research collaborations.²¹ This act is intended to foster collaborative research between different organizations. The act creates an exemption (“safe harbor”) from the “prior art” invalidation rules for confi-

²⁰ See the Small Business Administration page for these programs at www.sba.gov/sbir/indexesbir-strr.html.

²¹ CREATE Act is P.L. 108-453. See 70 Fed. Reg. 7 (Jan. 11, 2005), for the interim rule implementing the CREATE Act for patent statutes.
dential disclosures among collaborators. (“Prior art” is information such as publications, patents, or general knowledge that is in the public domain. Prior art cannot be patented — a patent is for something “novel,” i.e., something not previously known. Thus “prior art” is currently considered invalid (for new patents) under patent law.)

For the CREATE act to apply, a joint research agreement, defined as a “written contract, grant, or cooperative agreement entered into by two or more persons or entities for the performance of experimental, developmental, or research work in the field of the claimed invention,” must be in place. Three conditions must be met for an invention to be recognized under the act:

1. The claimed invention was made by or on behalf of parties to a joint research agreement that was in effect on or before the date the claimed invention was made.
2. The claimed invention was made as a result of activities undertaken within the scope of the joint research agreement.
3. The application for patent for the claimed invention discloses or is amended to disclose the names of the parties to the joint research agreement.

The requirement for a written joint research agreement may be problematic for universities. The typical inter-institutional agreement used between TTOs may be adequate to address the issues raised by the CREATE Act; however, these agreements are more often executed after the date of the claimed invention. To take advantage of the CREATE Act, the collaborative research agreement should be written to describe the broadest work scope for the project.

1905.17 Intellectual Property Plans

As noted above in the discussion of data sharing plans, institutions may be required by a federal sponsor, especially NIH, to include a detailed plan for the treatment of intellectual property that will govern the research outcomes from the proposed research. Special conditions may apply when the deliverable on a contract is software/data-bases. NIH expects the contractor to prepare a plan for resolving IP rights and legal issues concerning rights to data that may be included in databases delivered to the government, which includes obtaining “know-how” or otherwise acquiring rights from other sources for constructing the database. NIH may expect a contractor to provide a full disclosure of intent to patent or copyright the work supported under the contract. These conditions are situational to the contract and should be carefully evaluated and fully understood by the institution and the PI before the contract is executed. (See Figure 2 on page 1905.9 for a sample data sharing/IP plan.)

Elements of a typical IP plan include coverage of:

◆ inventorship by all involved parties and ownership of IP (sole inventions solely owned by each party and joint inventions, jointly owned);
◆ reservation of rights (e.g., ability to practice inventions and discoveries for continuing research and educational purposes); and
◆ use of inter-institutional agreements if multiple institutions are involved in the research project.
¶1905.18 Special Issues for Small Institutions

At a small institution, the sponsored research and technology transfer functions may be housed in the same office and may also be performed by the same staff. The general counsel or legal office may or may not be an available resource for advice about data rights and IP protection. Attendance at a workshop presented by professional organizations such as Association of University Technology Managers (AUTM), National Council of University Research Administrators (NCURA), or Society of Research Administrators (SRA) can offer invaluable means to learn the basics in this area, to network and find contacts with expertise that a smaller office may not have access to, and to identify specific terms and conditions in agreements that can be problematic.22 (For a discussion of “Establishing Technology Transfer Operations at PUIs,” see ¶2320.1.)

It is often difficult to assure PIs at all sizes of institutions that institutional policies and priorities are the standard in the field and not peculiar to the institution. No matter the size of the institution, there may be pressure to get the money, driving the PI to expect the institution to compromise its policies to comply with a sponsor’s expectations. All institutions must guard against this.

¶1905.19 Conclusion

A research administrator should know and understand the basics of the institution’s data and IP policies, including the following: How are the policies generally interpreted? Under what conditions are exceptions to policy considered? Who has the authority to approve an exception? Most importantly he or she needs to know when and to whom to refer investigators, students, and research staff when questions of ownership and rights to data and intellectual property arise. To this end, OSP staff will work closely with the institution’s technology transfer office and the general counsel/legal office. Figure 5 includes an overview of some key considerations involving data rights and IP that OSP personnel should keep in mind when negotiating awards.

Data rights and intellectual property are complex subjects embodied in institutional policy and federal, state, and sponsor language in the legally binding research agreement. OSPs set the course for clear understandable data rights and downstream IP opportunities, rights, and obligations through the conditions agreed to in the research agreement.

---

Figure 5: Protecting Data Rights and Intellectual Property: Factors for Success

To protect its data rights and intellectual property in sponsored agreements, an institution should consider the following:

- Read the terms and conditions of all program announcements, RFPs, RFAs, and solicitations carefully and, preferably, repeatedly.
- Take exception to any and all problematic provisions at the time the proposal is submitted.
- Read award agreements and terms and conditions (which may not have been provided with the funding opportunity) carefully and repeatedly, prior to executing the award agreement.
- Data rights, intellectual property, and publication restrictions can be found in multiple sections of proposed agreements, including those not labeled IP or “data rights.”
- Discuss data rights and intellectual property definitions, rights, obligations, and provisions with the PI.
- Excellent communications and working relationships between the institution’s technology transfer office and office of sponsored programs go a long way toward properly understanding and protecting data rights, intellectual property, and potential commercialization of research outcomes.
- The institution may have special concerns when IP rights are or may be perceived to be related to individual and/or institutional financial conflicts of interest.
- What is anticipated, negotiated, or accepted today builds the foundation for what can be done in the future. (The same is true for compromise.)

To assure that faculty research endeavors are adequately protected, data and IP language in an agreement must recognize that data and potentially IP are created in the conduct of research and that technology transfer through protection of IP and licensing opportunities must be accomplished in accordance with institutional policy and federal and state laws and regulations. Thoughtful long-range planning at the proposal, negotiation, and award stages accomplishes the merger of an institution’s research goals, data and IP protection, and ultimately technology transfer. Suggested resources for additional assistance are included as Figure 6, page 1905:36.
**Figure 6: Suggested Resources**

- Originally developed by the National Institutes of Health, the Interagency EDISON (iEDISON) system is an online information management system for invention reporting that is used by the majority of the federal granting agencies. See www.iedison.gov.

- The *NIH Guide for Grants and Contracts* is the official publication for NIH medical and behavioral research grant policies, guidelines, and funding opportunities. It is also used by NIH contracting offices (dealing with corporate sponsored research agreements). Available at http://grants.nih.gov/grants/policy/notices.htm.

- Stanford University’s library copyright pages are helpful and are located at http://fairuse.stanford.edu.

- University of Texas’s intellectual property pages are a good resource and are located at www.utsystem.edu/ogc/intellectualproperty/INDEX.HTM.
Practical Tools

This section includes practical guidance and tools relating to data rights and intellectual property. These materials are culled from a variety of authoritative sources.

Resources for Sample Intellectual Property Policies, Agreements

AIS editors

The Association of University Technology Managers (AUTM) has compiled a collection of links to college and university sites for sample policies relating to intellectual property, animal care, conflict of interest, scientific misconduct, human resources, and other topics. Also included are links to sample agreements, such as those for copyright assignment, confidentiality, licensing, material transfer, research, software development and distribution, and others. Access the links at www.autm.net/aboutTT/aboutTT_policies.cfm.

NIH’s Office of Technology Transfer (at www.ott.nih.gov) also provides a variety of sample forms and model agreements including the following:
- Employee Invention Report (EIR)
- Confidential Disclosure Agreement (CDA)
- Inter-Institutional Agreements
- License Application
- Model Cooperative Research and Development Agreements (CRADAs)
- Model License Agreements
- Material Transfer Agreement (MTA)
- Royalties — W-9 Form

Guidelines for Technology Licensing

The Association of American Medical Colleges and eleven of the nation’s top research universities have released a white paper, “In the Public Interest: Nine Points to Consider in Licensing University Technology.” According to the authors, the reason for issuing the paper is “to encourage” institutions when undertaking academic technology transfer “to analyze each licensing opportunity individually in a manner that reflects the business needs and values of their institution, but at the same time, to the extent appropriate, also to bear in the mind the concepts articulated herein when crafting agreements with industry.” Further, the authors wish “to foster thoughtful approaches and encourage creative solutions to complex problems that may arise when universities license technologies in the public interest.”

Although acknowledging that each licensing opportunity must be analyzed individually, the paper does suggest that there are core values to consider, including the following:
(1) Universities should reserve the right to practice licensed inventions and to allow other nonprofit and governmental organizations to do so.

(2) Exclusive licenses should be structured in a manner that encourages technology development and use.

(3) Strive to minimize the licensing of “future improvements.”

(4) Anticipate and help to manage technology transfer-related conflicts of interest.

(5) Ensure broad access to research tools.

(6) Enforcement action should be carefully considered.

(7) Be mindful of export regulations.

(8) Be mindful of the implications of working with patent aggregators.

(9) Consider including provisions that address unmet needs, such as those of neglected patient populations or geographic areas, giving particular attention to improved therapeutics, diagnostics, and agricultural technologies for the developing world.

In addition to containing discussions of these nine points for consideration in licensing, useful commentary on each of the points, examples, and sample contract language are also included as appendices to the paper.

**University-Industry Collaborations**

The University-Industry Demonstration Partnership (UIDP) was formed “to enhance the value of collaborative partnerships between university and industry in the United States.” Among its activities, the UIDP

◆ Fosters dialogue between universities and industry on issues such as technology transfer, licensing, sponsored research, and the broader aspects of university-industry partnering.

◆ Develops/beta tests tools and approaches that “unify and streamline” university-industry agreements. (A current project is TurboNegotiator, an approach and software tool designed to minimize time-to-agreement in sponsored research.)

◆ Seeks out best practices in university-industry partnering around the globe; disseminates these to its members through presentations, publications, and town hall discussions.

UIDP has published a set of “Guiding Principles” and “Living Studies” or case studies most of which “focus on challenges at the beginning of research partnerships, when sponsored research agreements are negotiated.” The organization also has gathered together some “Tools & Tips,” where members share practical information including the following sample agreements:

◆ Materials Transfer Agreement – Company Drug to University Researcher

◆ Applied Sciences and Engineering Solutions Research Program
◆ Open Collaboration Principles
◆ Agreement for Testing Services

The UIDP Web site is www.uidp.org.
1930.2 **Resources for Ethics in Data Management**

AIS editors

A video-based resource for ethics in data management is available from the Office of Research Integrity (ORI) at the Department of Health and Human Services. The product consists of 10 “video vignettes” addressing issues surrounding data sharing, technology transfer, data storage, data falsification, data ownership, sharing of resources, and collaboration. The product was created by Syracuse University, with funding from ORI. The videos are available at [http://ori.hhs.gov/education/products/syracuse/index.shtml](http://ori.hhs.gov/education/products/syracuse/index.shtml).

Specific videos include the following:

- Resource Request
- Technology Transfer
- Data Sharing
- Protocol Sharing
- Data Storage
- Misrepresentation of Data
- Collaboration
- Data Falsification
- Data Ownership
- Sharing Resources
1930.3 Ideas for Increasing Technology Transfer

AIS editors

According to the Government Accountability Office (GAO),\(^1\) officials at the Department of Energy laboratories have taken a number of steps to further technology transfer, such as the following, which might also prove helpful for university research tech transfer practices:

- Officials regularly evaluate their laboratories’ pending research publications for evidence of inventions or technologies that have not been disclosed for commercial opportunities that may have been overlooked.
- Officials at one lab expanded the office’s reach by working with their laboratory’s public relations office to promote selected technologies, which proved successful in attracting licensees for those technologies.
- Several laboratories brought in entrepreneurs-in-residence, representing venture capital firms, with strong backgrounds in business and science to help identify and commercialize promising technologies.
- Several laboratories said they invest a portion of the laboratories’ licensing income in other technologies in need of further research and development to help make them more attractive to outside investors.
- Some laboratories have taken steps to simplify the negotiation of technology transfer agreements, such as creating templates or standard terms and agreements that have been pre-approved. At least one laboratory has taken this approach a step further by creating standardized agreements that apply to specific entities with which the laboratories expect to have a longer-term partnership.

To better measure, and improve, the effectiveness of technology transfer efforts, GAO recommends considering the following approaches:

- explicitly articulate priorities for such efforts;
- develop clear goals, objectives, and performance measures in line with these priorities;
- clarify which activities qualify as technology transfer;
- collect reliable performance data and further consider ways to use the data to monitor the progress and effectiveness of tech transfer efforts;
- ensure sufficient access to both technical and business development expertise;
- develop a systematic approach to identify technologies with commercial promise; and
- develop a comprehensive means of sharing information, such as a Web-based clearinghouse for technologies ready for further development or commercialization.

1930.4 **Tips for Ethical Writing**
Miguel Roig, PhD, St. Johns University

The following guidelines are taken from “Avoiding Plagiarism, Self-Plagiarism, and Other Questionable Writing Practices: A Guide to Ethical Writing” by Miguel Roig of St. Johns University with funding from ORI. The guide is available at http://ori.dhhs.gov/education/products/plagiarism.

**Guideline 1:** An ethical writer ALWAYS acknowledges the contributions of others and the source of his/her ideas.

**Guideline 2:** Any verbatim text taken from another author must be enclosed in quotation marks.

**Guideline 3:** We must always acknowledge every source that we use in our writing; whether we paraphrase it, summarize it, or enclose it quotations.

**Guideline 4:** When we summarize, we condense, in our own words, a substantial amount of material into a short paragraph or perhaps even into a sentence.

**Guideline 5:** Whether we are paraphrasing or summarizing we must always identify the source of your information.

**Guideline 6:** When paraphrasing and/or summarizing others’ work we must reproduce the exact meaning of the other author’s ideas or facts using our words and sentence structure.

**Guideline 7:** In order to make substantial modifications to the original text that result in a proper paraphrase, the author must have a thorough understanding of the ideas and terminology being used.

**Guideline 8:** A responsible writer has an ethical responsibility to readers, and to the author/s from whom s/he is borrowing, to respect others’ ideas and words, to credit those from whom we borrow, and whenever possible, to use one’s own words when paraphrasing.

**Guideline 9:** When in doubt as to whether a concept or fact is common knowledge, provide a citation.

**Guideline 10:** Authors who submit a manuscript for publication containing data, reviews, conclusions, etc., that have already been disseminated in some significant manner (e.g., published as an article in another journal, presented at a conference, posted on the internet) must clearly indicate to the editors and readers the nature of the previous dissemination.

**Guideline 11:** Authors of complex studies should heed the advice previously put forth by Angell & Relman (1989). If the results of a single complex study are best presented as a ‘cohesive’ single whole, they should not be partitioned into individual papers. Furthermore, if there is any doubt as to whether a paper submitted for publication represents fragmented data, authors should enclose other papers (published or unpublished) that might be part of the paper under consideration (Kassirer & Angell, 1995). Similarly, old data that have been merely augmented with additional data points and that are subsequently presented as a new study can be an
equally serious ethical breach.

**Guideline 12:** Because some instances of plagiarism, self-plagiarism, and even some writing practices that might otherwise be acceptable (e.g., extensive paraphrasing or quoting of key elements of a book) can constitute copyright infringement, authors are strongly encouraged to become familiar with basic elements of copyright law.

**Guideline 13:** While there are some situations where text recycling is an acceptable practice, it may not be so in other situations. Authors are urged to adhere to the spirit of ethical writing and avoid reusing their own previously published text, unless it is done in a manner consistent with standard scholarly conventions (e.g., by using of quotations and proper paraphrasing).

**Guideline 14:** Authors are strongly urged to double-check their citations. Specifically, authors should always ensure that each reference notation appearing in the body of the manuscript corresponds to the correct citation listed in the reference section and vice versa and that each source listed in the reference section has been cited at some point in the manuscript. In addition, authors should also ensure that all elements of a citation (e.g., spelling of authors’ names, volume number of journal, pagination) are derived directly from the original paper, rather than from a citation that appears on a secondary source. Finally, authors should ensure that credit is given to those authors who first reported the phenomenon being studied.

**Guideline 15:** The references used in a paper should only be those that are directly related to its contents. The intentional inclusion of references of questionable relevance for purposes of manipulating a journal’s or a paper’s impact factor or a paper’s chances of acceptance is an unacceptable practice.

**Guideline 16:** Authors should follow a simple rule: Strive to obtain the actual published paper. When the published paper cannot be obtained, cite the specific version of the material being used, whether it is conference presentation, abstract, or an unpublished manuscript.

**Guideline 17:** Generally, when describing others’ work, do not rely on a secondary summary of that work. It is a deceptive practice, reflects poor scholarly standards, and can lead to a flawed description of the work described. Always consult the primary literature.

**Guideline 18:** If an author must rely on a secondary source (e.g., textbook) to describe the contents of a primary source (e.g., an empirical journal article), s/he should consult writing manuals used in her discipline to follow the proper convention to do so. Above all, always indicate the actual source of the information being reported.

**Guideline 19:** When borrowing heavily from a source, authors should always craft their writing in a way that makes clear to readers, which ideas are their own and which are derived from the source being consulted.

**Guideline 20:** When appropriate, authors have an ethical responsibility to report evidence that runs contrary to their point of view. In addition, evidence that we use in support of our position must be methodologically sound. When citing supporting
studies that suffer from methodological, statistical, or other types of shortcomings, such flaws must be pointed out to the reader.

**Guideline 21:** Authors have an ethical obligation to report all aspects of the study that may impact the independent replicability of their research.

**Guideline 22:** Researchers have an ethical responsibility to report the results of their studies according to their a priori plans. Any post hoc manipulations that may alter the results initially obtained, such as the elimination of outliers or the use of alternative statistical techniques, must be clearly described along with an acceptable rationale for using such techniques.

**Guideline 23:** Authorship determination should be discussed prior to commencing a research collaboration and should be based on established guidelines, such as those of the International Committee of Medical Journal Editors [www.icmje.org].

**Guideline 24:** Only those individuals who have made substantive contributions to a project merit authorship in a paper.

**Guideline 25:** Faculty-student collaborations should follow the same criteria to establish authorship. Mentors must exercise great care to neither award authorship to students whose contributions do not merit it, nor to deny authorship and due credit to the work of students.

**Guideline 26:** Academic or professional ghost authorship in the sciences is ethically unacceptable.
1930.5 Exploring the Alphabet Soup of Non-Monetary Agreements

Marjorie Forster, University of Maryland Baltimore, and Amanda Miller, University of Texas at Dallas

Historically when we, as Research Administrators, think about our chosen profession and all that it incorporates we mainly think about proposals, awards, and agreements that fund research projects. We think about submission deadlines, budget preparation, administrative forms and sponsored research agreements. Research is expensive. A university typically judges its success on the dollars its faculty brings in each year, and we work really hard helping our faculty seeking ways to fund their research. This is very logical. After all, the more money an institution brings in the more research they can perform.

However, it is also important to recognize the significance of non-monetary agreements and their role in supporting and protecting the research enterprise. We will demonstrate that failure to treat non-monetary agreements with the same degree of care may result in problems associated with obtaining and performing funded projects.

There are many different types of non-monetary agreements all of which support important functions of academic institutions. While this list certainly is not all-inclusive, these agreements may include:

◆ Confidential Disclosure Agreements (CDA)
◆ Consortium Agreements (CA)
◆ Data Use Agreements (DUA)
◆ Memorandum of Understanding (MOU)
◆ Material Transfer Agreements (MTA)
◆ Teaming Agreements (TA) and
◆ Visiting Scientist/Scholar Agreement (VSA)

The focus of this article is to outline the different types of non-monetary agreements and highlight the importance of each. We will discuss how non-monetary agreements facilitate the transfer of research materials between institutions and corporations; protect the exchange of confidential and proprietary information that allows for open discussion between researchers and potential collaborators and/or sponsors; allows the licensing of software or other tools needed for research; protects a party’s intellectual property, clearly maps out each party’s expectations prior to starting a project, and keeps each party aware of the type of entity with which they are working.

To put the drafting and negotiating of non-monetary agreements into perspective we should always keep in mind the mission of academic institutions which is to educate students, conduct unbiased research and investigations, and focus on freely creating, developing and disseminating new knowledge for the public good.
Confidential Disclosure Agreements

Confidential Disclosure Agreements (CDA) can also be referred to as Confidentiality Agreements (CA), Non-Disclosure Agreements (NDA), Proprietary Information Agreements (PIA), or Proprietary Disclosure Agreements (PDA). While these contracts have different names and acronyms, their function is largely the same: to allow for the exchange and protection of proprietary and/or confidential information (CI).

CDAs are legally binding agreements between at least two parties that outline the information they wish to share with each other, the boundaries imposed by both parties on the purpose and use of the exchange of information and/or materials, and also how to restrict from wider use and dissemination to third parties. CDAs are commonly executed when two parties are considering pursuing a relationship together and need to understand the other’s processes, methods, or technology solely for the purpose of evaluating the potential for a future relationship. For clinical trials, sponsors use CDA’s in order to provide the sponsor’s proprietary and confidential information. Another circumstance in which a CDA is used is when a corporation wants to evaluate a material when considering entering into a license agreement. If the parties decide to work with each other on a project, additional terms (such as a statement of work, ownership of intellectual property and licensing options, payment, etc.) will be outlined in a separate agreement, such as a Sponsored Research Agreement, a Collaborative Research Agreement, a Clinical Trial Agreement, or a License Agreement. CDAs also protect the ability of the owning party to patent an invention; something that can be compromised if a disclosure of the invention becomes public knowledge.

Important to keep in mind when reviewing a CDA:

◆ As with all agreements, it is important to clearly identify the parties entering into the contract, using proper legal names for each entity involved.
◆ It should be clear whether the CI will be exchanged mutually (two-way), or whether only your institution will be receiving or disclosing the CI (one-way).
◆ Ensure the date the CDA goes into effect (the “Effective Date”) is clearly defined and pre-dates any exchange of CI. Any information disclosed prior to the Effective Date of the CDA is not protected.
◆ It is important that the purpose of the CDA is clearly identified. Why are the parties exchanging information (i.e., to evaluate a possible research collaboration)? When the Purpose is clearly defined it can be used throughout the CDA terms to limit how the Receiving Party uses the CI. Examples of language using a clearly defined Purpose:
  ◆ The Receiving Party shall only use CI for the Purpose;
  ◆ Receiving Party shall restrict disclosure of the CI of the Owning Party solely to those employees of Receiving Party having a need to know such CI in order to accomplish the Purpose stated above;
  ◆ The definition of “Confidential Information” (CI) – should be explicit and should
not be overly broad so as to prevent discussion of an investigator’s research (e.g., “anything related to semiconductors”). It is important to have the CI disclosed in writing or summarized and reduced to writing and clearly marked as “Confidential”. This assures the Receiving Party is aware when items he/she receives need to be maintained per the terms of the CDA and prevents unintentional disclosures of CI to third parties. Avoid including in the definition anything obtained through observations while on the Disclosing Party’s property or in meetings with the Disclosing Party, as it is hard to quantify what someone else observes.

◆ Terms should outline who at the Receiving Party can access the CI. This typically is given on a need-to-know basis.

◆ The term of the agreement should be clearly defined and limited to only the time period the parties will be actively exchanging or evaluating CI. Typically, this will be a short period of time (1 – 3 years) depending on the Purpose for the exchange of information. For instance, a CDA for a research collaboration may have a term anywhere between 1-3 years, whereas for a CDA for a license agreement (simple evaluation of a material) is usually less than one year.

◆ The term for which the obligations of confidentiality remain (can be for longer than the term of the CDA, depending on the purpose of the sharing of the CI) should be clearly outlined. A party’s obligations should not be “indefinite.” No guarantees can be made that the CI disclosed will match the Receiving Party’s expectations or needs.

◆ No rights in the CI are granted to the Receiving party. The CI disclosed remains the sole property of the Disclosing Party.

If a CDA contains a defined statement of work or terms addressing generation of intellectual property, payment, publication rights, etc. talk to your faculty member to assess his/her needs. Another agreement may be more appropriate.

Consequences of not using a CDA:

◆ The Receiving Party can claim the Disclosing Party’s CI as its own.

◆ The Receiving Party can pass CI on to a third party.

◆ The Receiving Party can use CI for commercial purposes – especially problematic for a non-profit, public institution of higher education.

◆ The disclosure of information is considered a “public disclosure”, which can jeopardize potential patent rights.

In summary, CDAs protect information considered confidential or proprietary and give parties the freedom to evaluate possible collaborations. It is important to ensure the Effective Date of the contract predates any disclosure that needs to be protected.

For your convenience a sample CDA is provided.
Figure 1930.5-1. Confidential Disclosure Agreement

This non-disclosure agreement ("Agreement") entered into as of __________, 20___ (the "Effective Date") between The University of _________ located at [ADDRESS], ("University") and_____________ ("Company"), a corporation having a business address at_____________________ . University and Company may each be referred to as "Party" or collectively as the "Parties".

RECITALS

A. Company and University wish to exchange certain Confidential Information pertaining to___________. This exchange includes all communication of information between the parties in any form whatsoever, including oral, written and machine readable form, pertaining to the above.

B. University and Company wish to exchange the Confidential Information for the sole purpose of ___________ (the "Purpose") and each party regards certain parts of the Confidential Information it possesses to be secret and desires to protect those parts from unauthorized disclosure or use (such secret parts being hereafter collectively referred to as “Confidential Information”).

C. University and Company are willing to disclose Confidential Information (as “Owning Party”) and receive Confidential Information (as “Receiving Party”) on the terms and conditions set forth herein.

AGREEMENTS

Therefore, University and Company agree, as follows:

1. "Confidential Information" is proprietary and/or secret information owned or controlled by the Owning Party and which is discussed or disclosed during any meeting or discussions regarding the Purpose or otherwise disclosed in connection with the Purpose. Confidential Information includes, but is not limited to, all communications by Owning Party with the Receiving Party in any form whatsoever including oral, written and machine-readable form, video, audio, phonorecord, recorded media, drawings, schematics, samples, devices, software, formulas, biological materials, applications for intellectual property protection, services, processes, procedures, trade secrets, intellectual property, pricing, costs, business or strategic plans, and marketing or advertising strategies.

2. The Receiving Party shall only use Confidential Information for the Purpose. Specifically, but without limitation, the Receiving Party will not use any of the Confidential Information for any commercial purpose or development of any products or technology and shall not use or attempt to practice any invention arising from or disclosed in the Confidential Information, or any part thereof, without first entering into an agreement with the University permitting such use or practice.

3. The Confidential Information shall remain the sole property of the Disclosing Party.

4. Since the disclosure of Confidential Information by Disclosing Party is in strictest confidence, the Receiving Party covenants and agrees to:
   a. Not disclose to any other person the Confidential Information of Owning Party, and use at least the same degree of care and discretion to maintain the Confidential Information secret as the Receiving Party uses in maintaining as secret its own Confidential Information, but always at least a reasonable degree of care and discretion;
   b. Not disclose such Confidential Information to any third parties or use, duplicate, reproduce, copy, distribute, or otherwise disseminate such Confidential Information,
except as permitted pursuant to this Agreement;

c. Restrict disclosure of the Confidential Information of the Owning Party solely
to those employees of Receiving Party having a need to know such Confidential
Information in order to accomplish the Purpose stated above;

d. Advise each such employee, before he or she receives access to the Confidential
Information, of the obligations of Receiving Party under this Agreement, and require each
such employee to agree in writing to be bound by the terms of this Agreement, unless
such employee is automatically bound thereby as an employee of Receiving Party;

e. Within thirty (30) days following request of Owning Party, return to Owning Party
all documentation, copies, notes, diagrams, computer memory media and other
materials containing any portion of the Confidential Information, or confirm to
Owning Party, in writing, the destruction of such materials.

5. Nothing in this Agreement shall be interpreted as placing any obligation or expectation
of confidentiality or non-use on the part of the Receiving Party with respect to any
portion of the Confidential Information received from Owning Party that:

(a) can be demonstrated to have been in the public domain as of the date of this
Agreement, or comes into the public domain during the term of this Agreement
through no fault of the Receiving Party;

(b) can be demonstrated by tangible evidence to have been known to Receiving Party
prior to disclosure by Owning Party and as to which the Receiving Party has no
obligation not to disclose or use it;

(c) is lawfully obtained by Receiving Party from a third party under no obligation of
confidentiality, and who did not acquire it, directly or indirectly, from the Owning
Party under a continuing obligation of confidentiality;

(d) can be demonstrated by tangible evidence to have been independently developed
by Receiving Party without a violation of this Agreement and without use of or
reference to the Owning Party’s Confidential Information;

(e) is generally disclosed by Owning Party to third parties without a duty of
confidentiality on the third parties; or

(f) is disclosed as required by law.

In the event any Confidential Information is required to be disclosed pursuant to governmental
law, regulation, or judicial or administrative proceeding, Receiving Party shall provide prompt notice
of such request to the Owning Party and shall cooperate fully in seeking a protective order or other
assurance that confidential treatment will be accorded to the Confidential Information required to be
disclosed, should Owning Party seek such order or assurance. In the event that such protective order or
other remedy is not obtained, or that the Owning Party waives compliance with the provisions hereof,
Receiving Party and its employees and agents agree to furnish only that portion of the Confidential
Information of Owning Party which is legally required to be furnished. Furthermore, such Confidential
Information shall continue to be considered and treated by the Receiving Party as Confidential
Information for all other purposes. Confidential Information required to be so disclosed shall not be
deemed part of the public domain by virtue of such disclosure.
6. This Agreement imposes no obligation on Receiving Party with respect to any portion of the Confidential Information disclosed by the Owning Party, unless such portion is:

(a) disclosed in a written document or machine readable media marked “CONFIDENTIAL” at the time of disclosure, or

(b) disclosed in any other manner and summarized in a memorandum mailed to Receiving Party within thirty (30) days of the disclosure.

Confidential Information disclosed by Owning Party in a written document or machine readable media and marked “CONFIDENTIAL” includes, but is not limited to, the items, if any, set forth in Schedules A and B attached hereto. Schedules A and B are incorporated herein by reference. Receiving Party hereby acknowledges receipt of the items listed in Schedules A and B, if any.

7. NEITHER OWNING PARTY MAKES ANY REPRESENTATION WITH RESPECT TO AND DOES NOT WARRANT ANY INFORMATION PROVIDED UNDER THIS AGREEMENT, BUT SHALL FURNISH SUCH IN GOOD FAITH. WITHOUT restricting the generality of the foregoing, NEITHER OWNING PARTY MAKES ANY REPRESENTATIONS OR WARRANTIES, WHETHER WRITTEN OR ORAL, STATUTORY, EXPRESS OR IMPLIED WITH RESPECT TO THE INFORMATION WHICH MAY BE PROVIDED HEREUNDER, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE. NEITHER OWNING PARTY SHALL BE LIABLE FOR ANY SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES OF ANY NATURE WHATSOEVER RESULTING FROM RECEIPT OR USE OF THE INFORMATION BY THE RECEIVING PARTY.

8. The Receiving Party shall comply with all applicable federal, state and local laws and regulations in connection with its activities pursuant to this Agreement, including United States laws and regulations controlling the export of materials and information including technical data, drawings, know-how, computer software, laboratory prototypes and other items.

9. In the event of a breach or threatened breach or intended breach of this Agreement by either Party, the other Party, in addition to any other rights and remedies available to it at law or in equity, shall be entitled to seek preliminary and final injunctions, enjoining and restraining such breach or threatened breach or intended breach, or requiring specific performance of the Party’s obligations hereunder, even if monetary damages are available and readily quantifiable and without proof of actual damage.

10. The validity, construction, and performance of this Agreement are governed by the laws of the State of _______, and the Parties hereby consent to jurisdiction in such courts.

11. If any mediation, litigation or other legal proceeding relating to this Agreement occurs, the prevailing party shall be entitled to recover from the other party (in addition to any other relief awarded or granted) its reasonable costs and expenses, including attorney’s fees, incurred in the proceeding.

12. The rights and obligations of the Parties under this Agreement may not be sold, assigned or otherwise transferred. This Agreement shall not be amended or modified
without mutual consent of the Parties to such amendment or modification.

13. Neither Party may use the other Party’s name without prior written consent.

14. Either Party may terminate this Agreement at any time without cause upon thirty (30) days written notice to the other Party, or for cause effective upon written notice to the other Party.

15. LIMITATIONS. COMPANY AND UNIVERSITY AGREE THAT THERE ARE CONSTITUTIONAL AND STATUTORY LIMITATIONS ON THE AUTHORITY OF UNIVERSITY (A ______ STATE AGENCY) TO ENTER INTO CERTAIN TERMS AND CONDITIONS THAT MAY BE A PART OF THIS AGREEMENT. ACCORDINGLY, THE TERMS AND CONDITIONS OF THIS AGREEMENT ARE ONLY BINDING ON UNIVERSITY TO THE EXTENT AUTHORIZED BY THE LAWS OF THE STATE OF ______. Company and University specifically agree that (i) neither the execution of this Agreement by University nor any other conduct, action or inaction of any representative of University relating to this Agreement constitutes or is intended to constitute a waiver of University’s or the state’s sovereign immunity to suit and (ii) University has not waived its right to seek redress in the courts.

16. This Agreement is binding upon both Company and University and upon the directors, officers, employees and agents of each. This Agreement is effective as of the Effective Date and will continue for a period of three (3) years, unless earlier terminated as provided herein. However, Receiving Party’s obligations of confidentiality and restrictions on use of the Confidential Information disclosed by Owning Party, and all related remedies for breach thereof, shall survive expiration or termination of this Agreement.

17. This Agreement constitutes the entire and only agreement between the Parties for the confidentiality of Confidential Information related to the Purpose. Nothing herein requires either Party to proceed with any proposed transaction or relationship in connection with which the Confidential Information may be disclosed.

IN WITNESS WHEREOF, the Parties have caused this Agreement to be executed by their duly authorized representatives.

Consortium Agreements
A consortium is essentially a partnership – one or more institutions joining forces to accomplish a common goal. Universities can pool their scientific, organizational, and educational resources to build collaborative research centers, educational programs for students, or community outreach programs. A Consortium Agreement is the contractual vehicle that establishes the fundamental rules of the partnership and ensures all parties have a common understanding of the structure, purpose and goals of their union. Consortium collaborations may involve various types of institutions including academic institutions, foundations, government, and for-profit entities. Depending upon the type of project and the composition of the consortium members will determine which terms are appropriate for the project. There are several types of consortium collaborations: 1) a corporate sponsored and funded membership consortium that attracts academic institutions with an area of expertise in which corporate/industrial sponsors are interested. The academic institutions focus on the consolidation and pooling of its resources including non-financial (faculty expertise, graduate students, entrepreneurial skills, etc.) to build a research center to conduct different research projects focused on a particular field of concentration; and 2) a consortium collaboration that is developed in response to a funding opportunity that requires the consortium agreement be put in place in order to outline the terms of engagement of all the participating entities.

When reviewing Consortium Agreement it is important to keep in mind the following:
◆ While multiple institutions are involved, one university will serve as the lead institution to manage the administrative or organizational aspects of the partnership.
◆ The agreement should clearly define the purpose of the collaboration and outline the following basic issues:
  ◆ Governance – how will decisions related to the consortium be made? Typically this is through creation of an advisory board made up of representatives of each of the university partners, who vote on issues. It is important that each university is represented and has the ability to weigh in on issues and decisions.
  ◆ Dispute resolution – as with any collaboration, there is the possibility of disputes arising. It is important to have a plan clearly in place for how the parties will proceed should issues arise.
  ◆ Funding – how will the consortium be funded? Is this internal support from the partnering institutions – each institution covering its own expenses – or does the partnership need outside sponsors to fund the program? If outside funding is involved, how will the monies be divided among the university partners?
  ◆ Intellectual Property (IP) – If generation of IP is anticipated, it is important to define IP and outline how rights in IP will be managed. Each university
partner should have the right to use Consortium IP generated for its own internal research and training use but not for commercial purposes.

◆ Publication rights should be addressed when research projects are involved. It is important to allow all collaborating universities to have prior review of publications, however this prior review should be limited to not unnecessarily delaying or preventing publication. This is especially important if students are involved who may need to publish results to complete their degree programs.

◆ Term – the term of the partnership should be clearly defined and should be appropriate for the nature of the partnership.

◆ Termination rights should be clearly outlined as well as how/when the partnership will end. Consideration should be given to how to add a new consortium member or drop an existing member.

In summary, a Consortium Agreement allows two or more institutions to accomplish programs and partnerships that individually they may not have the resources to effectively achieve on their own. The Consortium Agreement maps out the rules and terms of the partnership for the universities to work together to build educational and exploratory opportunities to benefit students and society at large.

For your convenience a sample Consortium Agreement is provided.

---

**Figure 1930.5-2. Consortium Agreement**

Consortium Agreement Between

____________________ and __________________

This Consortium Agreement ("Agreement") is effective this ___ day of __________ (the "Effective Date"), by and between ________________ (hereinafter referred to as "_____") and ______________ (hereinafter referred to as "_____") and such other non-profit universities as may have executed the Instrument of Adherence attached hereto as Schedule A upon mutual agreement of the parties, to be known collectively hereinafter as "Institutions" or individually as an "Institution."

Whereas, the parties to this Agreement have each received or will be receiving funding to support the National Science Foundation Industry/University Cooperative Research Center for ______________ (hereinafter referred to as "Center") in its efforts to perform research to _____________________________ _______.

Whereas, the activities of Center are funded by (i) the National Science Foundation (hereinafter referred to as "NSF"), (ii) members from industry (hereinafter referred to as "Members"), (iii) direct budgetary support from the Institutions and (iv) other funds that may be received from time to time.

Whereas, Institutions are desirous of formalizing certain agreements between them with respect to the subject matter contained herein.

Now therefore, for and in consideration of the mutual promises and covenants herein contained Institutions hereto agree as follows:

1. Center Governance.
   a. The Center will have a common Institutional Advisory Board ("IAB") composed of a
representative of each Member and each Institution; an Academic Advisory Committee and a Research Advisory Committee. Each Institution shall use a common format for its membership agreement, which shall be substantially in the form of the Membership Agreement as set forth in Schedule B (“Membership Agreement”). Institution may make changes to the Membership Agreement insomuch as said changes do not affect Members’ rights as provided in Schedule B. Changes made to the Membership Agreement must be submitted in writing and agreed upon by the Institutions and NSF. No response by recipient Institution(s) within a 30-day period from receipt of suggested changes will indicate automatic approval by the recipient Institution(s).

b. In accordance with the NSF award, the Center Director will be from ______________________. Each Institution shall select a Site Director in accordance with the policies and procedures of each Institution.

2. Center Funding.

a. During the first five-year period of the Center, each Institution will receive its own funds directly from NSF, will be responsible for recruiting its own Members, and will retain membership fees collected from its Members. Institution may be directed by the IAB to allocate a portion of the membership fees collected to inter-institutional collaborative research between the Institutions. The expectation is that inter-institutional collaborative research projects will constitute approximately __% of Center funds on average, annually.

b. Institutions shall jointly pay (in equal shares) for major promotional Center materials, such as brochures, provided however, that each Institution’s obligation hereunder shall only apply to promotional materials that have been produced with the advance written approval of all participating Institutions.

c. Within each Institution, a separate internal account shall be set up for the operation of the Center. The Director and each Site Director must provide an annual budget based on expected income from all sources to the respective Institution. These budgets should be made available to the Center Director, the Site Director of the Center and the responsible university officials of such Institution by _____ of each year.

3. Ownership and Administration of Intellectual Property. “Invention” means any invention or discovery which is or may be patentable or otherwise protectable under Title 35 of the United States Code or which may be copyright protected under Title 17 of the United States Code) that results from work sponsored by Center funds developed by the Institution or Institutions (collectively “Intellectual Property”). Institutions shall maintain records of all Center-funded work, including project titles, primary Institution, and primary investigators. Subject to the rights of Members contained in Schedule B, all right, title, and interest in and to all Intellectual Property shall be allocated as follows:

a. Solely Owned Institution Intellectual Property. All Intellectual Property developed or invented by inventors solely at one Institution shall belong solely to that Institution (“Institution Intellectual Property”).

b. Jointly Owned Institution Intellectual Property. All Inventions invented jointly by personnel of two or more Institutions will belong jointly to each Institution whose employees are named inventors (“Joint Institution Intellectual Property”). In each such case, the technology transfer offices of the Institutions jointly owning the Intellectual Property shall agree which Institution shall be the lead Institution for commercialization purposes. After identifying the Institution that will administer the Joint Institution Intellectual Property, the relevant Institutions shall negotiate in good faith an Intellectual Property Agreement, which agreement shall contain, inter alia, terms and conditions concerning the sharing of royalties and costs associated with the Joint Institution Intellectual Property, and providing
for sharing information related to the Intellectual Property and commercialization efforts. Regarding any such information received by either Institution with regards to the Intellectual Property, the receiving Institution shall use reasonable efforts to limit dissemination pending the determination and/or filing of intellectual property protections.

c. Disclosure and Intellectual Property Protections. Each Institution shall be responsible for the identification and evaluation of its sole Institution Intellectual Property and for informing all Members regarding Institution Intellectual Property as outlined in the Membership Agreement. If Members and the inventing Institution(s) agree that patent protection should be sought and if Members are interested in securing such protection, the Members will follow the process outlined in Schedule B. If Members do not notify the Institution in writing that the Members are not interested in procuring protection for the Intellectual Property within sixty (60) days from the date of disclosure, the inventing Institution(s) may determine on its/their own whether protection will be sought, and such Institution(s) may dispose of the Intellectual Property.

d. Institutions having an ownership interest in Joint Institution Intellectual Property shall jointly review any Joint Institution Intellectual Property, evaluate its commercial potential and inform Members regarding the Joint Institution Intellectual Property as outlined in Schedule B. If Members and Institutions agree that patent protection should be sought and if Members are interested in procuring protection for such Joint Institution Intellectual Property, Institutions will manage the Joint Institution Intellectual Property according to the terms of the applicable Intellectual Property Agreement agreed to by the Institution.

4. License to Use Intellectual Property for Internal Use. With respect to Institution generated Intellectual Property belonging solely to an Institution, such Institution agrees to and does hereby grant to the other Institution, subject to the terms of this Agreement, a nonexclusive, nontransferable, irrevocable, royalty free license for internal, educational and noncommercial research purposes only (without the right to sublicense). This license shall include the right to utilize any information and materials published by Center. Institutions acknowledge that a separate license agreement may be required by the licensing Institution in order to convey the rights granted by this paragraph.

5. Publication of Joint Institution Intellectual Property. Each Institution with an ownership interest in Joint Institution Intellectual Property shall have the right to publish research resulting from development of such Intellectual Property. The Institution desiring to publish such research results shall submit a draft of any such proposed publication to the other Institution holding ownership interests at least twenty (20) days prior to the submission of the research results for publication. The non-publishing Institution shall have the right to delay any publication involving its Joint Institution Intellectual Property for a period of not more than sixty (60) days for the purposes of obtaining patent protection by giving the publishing Institution written notice before the end of twenty (20) days notice period provided herein. For the purposes of this Agreement, cataloging and placing reports of research results in the library of any Institution where such results are available to third parties shall be deemed to be a “publication.”

   a. This Agreement may not be amended or modified except by the execution of a written instrument executed by the parties hereto.
   b. In the event that any of the terms, provisions, or covenants contained in this Agreement are held to be partially or wholly invalid or unenforceable for any reason whatsoever, such holding shall not affect, alter, modify, or impair in any manner whatsoever any of the other terms, provisions, or covenants not held to be partially or wholly invalid or unenforceable.
7. Term. The term of this Agreement will be from Effective Date and shall continue for the duration of the Center contract with NSF.

8. Counterparts. This Agreement, Schedule A and Schedule B hereto may be executed in any number of counterparts and by any party on separate counterpart, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

9. Entire Agreement. The Agreement is the entire agreement between the parties regarding the subject matter of this Agreement and it supersedes any prior agreements, understanding or discussions with respect to such subject matter.

In witness whereof, Institutions hereto have caused this Agreement to be duly executed by their duly authorized officers as of the day and year set forth next to each signature.

SCHEDULE B

Industry/University Cooperative Research Center for ____________________

Membership Agreement

This Membership Agreement (“Agreement”) is made this __________ day of ______, 20____ (the “Effective Date”) by and between ___________________, (hereinafter called “UNIVERSITY”) and _______________________ (hereinafter called “COMPANY”), for the Center comprising and acting through the Center for ___________________, which is defined as all _________ Research Sites funded by the Industry/University Cooperative Research Center Program of the National Science Foundation.

WHEREAS, _______________________ (_____) and University (hereinafter collectively called the “Collaborating Universities”) have entered into a Consortium Agreement (“CA”), a copy of which is attached hereto as Exhibit A, in a cooperative effort to establish and support an Industry/University Cooperative Research Center for ___________________ (hereinafter called “Center”). The parties to this Agreement intend to join together in a cooperative effort to support the Center at the Collaborating Universities to maintain a mechanism whereby the Collaborating Universities environment can be used to perform research to enhance the national excellence in ________________________________________.

The parties hereby agree to the following terms and conditions:

A. Center will be operated by certain faculty, staff and students at the Collaborating Universities. For the first five years, the Center will be supported jointly by industrial firms, Federal laboratories, the National Science Foundation (NSF), the State, and the Collaborating Universities. It is possible that the
Collaborating Universities may receive support from NSF for an additional ten (10) years.

B. Any company may become a sponsor of the Center, consistent with applicable state and federal laws and statutes. Any Federal Research and Development organization or any Government-owned Contractor Operated laboratory may become a sponsor of the Center.

C. Company agrees to the following level of membership and shall contribute: (check one)
   ___ Full Member: $_______ annual fee
   ___ Small Business Associate Member (“SBA Member”): $_______ annual fee

“Member” or “Members” means one or more of any of the Full Members or SBA Member. For Company to qualify for the reduced SBA Member fee, Company must qualify as a small business by the current definitions issued by the U.S. Small Business Administration.

Payment of these annual membership fees shall be made as a lump sum effective May 1 of each annual period; or in four (4) equal quarterly installments on May 1, August 1, November 1, and February 1, of each year of sponsorship. These membership fees will be increased by __%, beginning in _______, and every third year thereafter. Checks from Company should be mailed to:

Name:
Address:

and made payable to ________________________. Since research of the type to be performed by the Center takes time, and research results may not be obvious immediately, Company should join Center with the intention of remaining a fee paying member for at least two (2) years. However, Company may terminate this Agreement by giving University ninety (90) days prior written notice. Termination or cancellation of this Agreement shall not affect the rights and obligations of the parties accrued prior to termination. Fees paid by Company as a Member are not refundable.

D. There will be an Industrial Advisory Board (IAB) composed of one (1) representative from each Member. This board votes and makes recommendations on (a) the research projects to be carried out by Center (b) the apportionment of resources to these research projects, and (c) changes in the bylaws. Each Industrial Member will count as eight (8) votes and each SBA Member will count as three (3) votes. The organization and operation of the Center will be specified by Center bylaws that will be adopted during the first year of Center operation. The bylaws, when adopted, will become part of this agreement and will be located at the following website: www.uml.edu/windstar.

E. University reserves the right to publish in scientific or engineering journals the results of any research performed by Center. Company, however, shall have the opportunity to review any paper or presentation containing results of the research program of Center prior to publication of the paper, and shall have the right to request a delay in publication for a period not to exceed ninety (90) days from the date of submission to Company, provided that Company makes a written request and justification for such delay within thirty (30) days from the date the proposed publication is submitted by certified mail or electronic mail with notification receipt to Company.

F. All patents, inventions, discoveries, technology, software and tangible materials conceived or first actually reduced to practice in the course of research conducted by the Center (“Intellectual Property”) shall be owned by Collaborating Universities in accordance with the CA. University, pursuant to chapter 18 of title 35 of the United States Code, commonly called the Bayh-Dole Act (“Act”), will have ownership of all inventions developed from this work conducted in accordance with the CA.

G. University agrees that each Member is entitled to a non-exclusive, royalty-free license to use Intellectual Property arising during such Member’s participation in the Center. While designated as a Member, Company will have the right to sublicense such use to its subsidiaries and affiliates.
Members that wish to exercise rights to a non-exclusive royalty-free license shall pay associated patent expenses and/or other reasonable costs of protecting licensed Intellectual Property. Such patent or other reasonable costs shall be shared equally by all Members electing a nonexclusive license.

H. If Company is the sole Member seeking a license, Company may negotiate an exclusive fee-bearing license from University. The terms of such license shall be commercially reasonable and shall provide for diligent development of the Intellectual Property towards commercialization by Member. Such Member shall have the right to sublicense to its subsidiaries and affiliates.

I. Copyright registration shall be obtained for software developed by Center. Each Member shall be entitled to a nonexclusive, royalty-free license to all software developed by Center during such Member’s membership to the Center. Members will have the right to enhance and to re-market enhanced software with royalties due to Center to be negotiated, based on the worth of the initial software, but not to exceed __% of a fair sale price of the software product sold or licensed by such Member.

J. Any royalties and fees received by University under this Agreement, over and above expenses incurred, will be distributed according to University policy.

K. Neither party is assuming any liability for the actions or omissions of the other party. To the extent allowed by law, each party will hold the other party harmless against all claims, liability, injury, damage or cost based upon injury or death to persons, or loss of, damage to, or loss of use of property that arises out of the performance of this agreement to the extent that such claims, liability, damage, cost or expense results from the negligence of a party’s agents or employees.

L. Limitation of Remedies. The obligations of University are set forth in this agreement and are in substitution for all other warranties, obligations and liabilities. There are no warranties, expressed or implied, arising by law or otherwise, including but not limited to, any implied warranty arising from course of performance, course of dealing or usage of trade. In no event shall University be liable for any indirect, incidental or consequential damages.

M. Non-Waiver. University is an agency of the State of _____ and nothing in this Agreement waives or relinquishes the right of University to claim any exemptions, privileges, and immunities as may be provided by law.

IN WITNESS WHEREOF, the University and Company have caused this Membership Agreement to be executed by their respective duly authorized officers:

Data Use Agreements

Sharing data is essential when conducting research. Not only does it encourage collaboration and diverse thinking, but it also enables researchers to re-create a certain study and validate its results. Typically data are shared through public disclosure such as journal publications or conference presentations. However, there are certain types of data sets that are not accessible or part of the public domain - for example a hospital’s identifiable patient records, state health department data sets, for-profit entity clinical trial data sets, or institution’s confidential or proprietary data sets. In order to gain access to these data, such exchanges are authorized by entering into a Data Use Agreement (DUA).

A DUA is a formal agreement between two or more institutions that clearly outlines the type of data exchanged and defines how the data can be accessed, stored, and used. The DUA protects the Disclosing Party and restricts the Receiving Party from unauthorized release of the data to third parties and provides a clear understanding of the terms of data use.

While a Confidential Disclosure Agreement (CDA) also allows for the exchange of confidential or proprietary information, it is important to keep in mind the key difference: a CDA allows for parties to evaluate a possible collaboration while the DUA allows for the use of data in active research projects.

Important items to keep in mind while reviewing a DUA:

◆ The parties entering into the Agreement need to be clearly defined, using their full legal names. It is important to confirm the party releasing data is the owner of the data and is authorized to provide the access outlined in the terms of the Agreement. A statement to this effect is often included in the Agreement’s terms.

◆ The term of the Agreement and period under which the data are authorized for use should be defined. It is important to know what happens to the data once the terms of the Agreement expires, whether the data need to be returned to the Disclosing Party or whether the data should be destroyed. Some entities may request written certification of destruction if they do not wish the data be returned.

◆ Definitions for “research project”, “data set”, and “recipient” may be considered.

◆ The authorized use of the data should be clearly outlined and specific. For universities, on both incoming and outgoing DUAs, use should be restricted to research and/or education purposes only.

◆ Personnel authorized to use the data should be identified and included in the DUA. This can include specific names of individuals or can be limited to a need-to-know basis. Do all individuals allowed access to the data have the same level of access?

◆ How will the information need to be stored? It is important to verify the data’s security can be maintained in compliance with applicable laws and regulations. For instance, a non-medical institution may not have the infrastructure to comply with HIPAA regulations. It is always good to check with your Information Security Office to verify your institution has the capabilities to keep the data
secure and comply with the terms of the Agreement. If your institution cannot securely store identifiable information, can the provider de-identify the data prior to release? If you do not need identifiable information, do not request it.

◆ How will the data be transferred from the provider to the user? Will it be transferred electronically or will a hard copy be provided? If there are expenses related to the transfer of data, which party is responsible for these costs?

◆ The DUA is not transferable. For example, any major changes to the original purpose or change in Principal Investigator would require the execution of a new DUA. The data will not be used in any research that is not disclosed and approved as part of the original Research Project.

◆ If an unintended breach of security occurs, the owning party should be notified as soon as possible upon the Receiving Party’s discovery of the breach. A clear course of action should be outlined to resolve such unintended breach.

◆ If the authorized use of the data results in a paper or report, ownership of the research results will vest in the Receiving Party of the data set. However, ownership of the original data set itself will always vest with the Disclosing Party.

◆ Publication: should be authorized subject to the provider’s prior review. This review is simply to verify none of their confidential information is included to prevent public disclosure. The prior review time period needs to be limited to prevent unnecessary delays in publication, especially if students are involved in the research project.

◆ Verify the person signing on behalf of each institution is authorized to do so and bind their institution to the terms of the Agreement. A Principal Investigator should never sign an agreement on behalf of his/her institution unless they have been delegated this authority by the proper institutional officials.

For access to special data sets, for example Medicaid data, special terms and conditions in these types of agreements may be requested to ensure the protection of personal and medical information and data.

◆ Provide a copy of IRB approval

◆ Provide periodic reports if any changes are made to the original scope of work

◆ For all publications acknowledge the contribution and provision of the data set received from the agency

◆ For any publication, report, article, written or oral presentation, written analysis, or similar document that makes reference to the data, the agency providing the data set should be provided with a copy prior to submission.

◆ Without express written authorization the recipient agrees not to attempt to link records included in the file(s) to any other individual-specific source of information

◆ Should there be an inadvertent disclosure of the material it is important to immediately notify the provider.
In summary, a DUA allows a faculty member at an institution to access data he/she may not otherwise have access to, such as patient data or a company’s proprietary information. It is essential to understand the security requirements required and verify you are capable of meeting those requirements to ensure the data remains secure.

A sample DUA is provided for your convenience.

Figure 1930.5-3. Data Use Agreement

This Data Use Agreement ("Agreement"), effective as of the __ day of ____, 2015 ("Effective Date"), is by and between The University of ____________ Center, with an address at ____________ ("Covered Entity") and The University of ____________, with an address at ____________ ("Recipient") (collectively, the "Parties"; each, a "Party") for purposes of complying with the federal Standards for Privacy of Individually Identifiable Health Information set forth at 45 C.F.R. Parts 160 and 164 (the "Privacy Standards").

RECITALS

Recipient would like to use certain health information maintained by Covered Entity as described on Exhibit “A” attached to this Agreement and incorporated herein by reference ("Data") for purposes of _______________ ("Purpose").

Recipient recognizes that Covered Entity is a covered entity under the Administrative Simplification provisions of the Health Insurance Portability and Accountability Act of 1996 ("HIPAA") and that Covered Entity is required by the Privacy Standards adopted pursuant to HIPAA to protect the privacy of the individually identifiable health information maintained by Covered Entity.

45 C.F.R. § 164.514(e) of the Privacy Standards permits Covered Entity to disclose a “Limited Data Set” of health information to Recipient for purposes of health care operations, research, or public health if Recipient enters into a “Data Use Agreement” with Covered Entity, containing adequate assurances from Recipient that Recipient shall comply with certain obligations with respect to such Limited Data Set.

This Agreement constitutes a Data Use Agreement under 45 C.F.R. § 164.514(e) and is intended to comply with the Privacy Standards as may be amended from time to time.

In consideration of the mutual promises and covenants herein, and for other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the Parties agree as follows:

A. Definitions.

1. **Breach.** "Breach" means the unauthorized acquisition, access, use, or disclosure of Unsecured Protected Health Information ("PHI") in a manner not permitted under the Privacy Standards that poses more than a low probability that the PHI has been compromised. The Covered Entity determines whether a Breach has occurred.

2. **Covered Entity.** "Covered Entity" means The University of ____________.

3. **Health Care Operations.** "Health Care Operations" means any of the activities specified at 42 C.F.R. § 164.501 under the definition of "health care operations", to the extent that such activities are performed by the Recipient.

4. **Individual.** "Individual" means the person who is the subject of the Protected Health Information.
5. **Limited Data Set.** “Limited Data Set” means PHI that excludes the following direct identifiers of the individuals or of the relatives, employers, or household members of individual: (i) names; (ii) postal address information, other than town or city, state and zip code; (iii) telephone numbers; (iv) fax numbers; (v) electronic mail addresses; (vi) social security numbers; (vii) medical record numbers; (viii) health plan beneficiary numbers; (ix) account numbers; (x) certificate/license numbers; (xi) vehicle identifiers and serial numbers, including license plate numbers; (xii) device identifiers and serial numbers; (xiii) web universal resource locators (URLs); (xiv) Internet Protocol (IP) address numbers; (xv) biometric identifiers, including finger and voice prints; (xvi) full face photographic images and any comparable images.

7. **Protected Health Information or PHI.** “Protected Health Information” or “PHI” means individually identifiable health information regardless of the form in which it is maintained or transmitted.

8. **Public Health.** “Public Health” refers to the activities specified in 42 C.F.R. § 164.512(b).

9. **Recipient.** “Recipient means The University of _____________.

10. **Required by Law.** “Required by Law” means a mandate contained in law that compels a use or disclosure of PHI and that is enforceable in a court of law.

11. **Research.** “Research” means a systematic investigation, including research development, testing, and evaluation, designed to develop or contribute to generalizable knowledge.

**B. Creation and Disclosure of Limited Data Set.** Covered Entity may use PHI to create a Limited Data Set and may disclose the Limited Data Set to Recipient solely for the Purpose.

**C. Recipient Obligations Regarding the Limited Data Set.** As a condition of receiving the Limited Data Set, Recipient agrees to comply with all applicable federal and state privacy and security laws. Recipient further agrees:

1. not to use or disclose the Limited Data Set except as necessary to fulfill the Purpose;
2. not to use or further disclose the Limited Data Set in a manner that would violate the Privacy Standards if done by Covered Entity;
3. not to use or further disclose the Limited Data Set other than as permitted by this Agreement or otherwise Required by Law;
4. to use appropriate safeguards to prevent use or disclosure of the Limited Data Set other than as permitted by this Agreement;
5. to immediately report to Covered Entity any use or disclosure of the Limited Data Set not permitted by this Agreement of which Recipient becomes aware, including any unauthorized acquisition of computerized data that compromises the security, confidentiality, or integrity of information in the Limited Data Set. If any unanticipated
use or disclosure of the Limited Data Set occurs, Recipient shall cooperate and assist
Covered Entity in determining, in an expedited manner, the date, nature, content, and
extent of such unanticipated use or disclosure. In the event that the Covered Entity
determines that the unanticipated use or disclosure of the Limited Data Set constitutes
a Breach, Recipient shall cooperate and assist Covered Entity with the breach reporting
process in the manner requested by the Covered Entity;

6. to ensure that any agents to whom it provides the Limited Data Set agree to the same
restrictions and conditions that apply to the Recipient with respect to the Limited Data
Set; and

7. not to identify any Individuals or contact such Individuals.

D. Term and Termination.

1. Term. This Agreement shall be effective as of the Effective Date and shall remain
effective for one (1) year. The Parties may extend the Agreement term upon written
amendment, and either Party may terminate this Agreement with or without cause
upon thirty (30) days’ written notice to the other Party.

2. Termination for Breach. If Recipient breaches any provision in this Agreement, Covered
Entity may, at its option, access and audit the records of Recipient related to its use
and disclosure of the Limited Data Set, require Recipient to submit to monitoring and
reporting, and such other conditions as Covered Entity may determine is necessary
to ensure compliance with this Agreement, or Covered Entity may terminate this
Agreement as of any date specified by Covered Entity.

3. Continued Confidentiality of Information. After the termination of this Agreement,
Recipient shall return or destroy the Limited Data Set, if it is feasible to do so. If it is not
feasible to do so, Recipient agrees to maintain the confidentiality of the Limited Data
Set as set forth in this Agreement and the HIPAA Privacy Standards.

E. Miscellaneous.

1. Indemnification. To the extent authorized under the Constitution and laws of the State
________, each Party shall indemnify, defend and hold harmless the other Party and its
employees, directors, officers, subcontractors, agents or other members of its workforce,
each of the foregoing an “Indemnified Party,” against all actual and direct losses
suffered by the Indemnified Party and all liability to third parties arising from or in
connection with such Party’s: (a) breach of this Agreement; (b) breach of any warranty
hereunder; or (c) negligence or wrongful acts or omissions, including failure to perform
its obligations under the Privacy Rule.

The indemnities set forth in this Section E(1) shall survive termination of this Agreement.
Covered Entity reserves the right, at its option and expense, to participate in the
defense of any suit or proceeding with respect to this Agreement through counsel of its
own choosing.

2. Rights of Proprietary Information. Covered Entity retains any and all rights to the
Limited Data Set and any other confidential or proprietary information that Covered
3. **Notices.** Any notices pertaining to this Agreement shall be given in writing and shall be deemed duly given when personally delivered to a Party or a Party’s authorized representative as listed below or sent by means of a reputable overnight carrier, or sent by means of certified mail, return receipt requested, postage prepaid. A notice sent by certified mail shall be deemed given on the date of receipt or refusal of receipt. All notices shall be addressed to the appropriate Party as follows:

If to Covered Entity:

**Notice should be given to:**

Name:
Address:
Attn:
Phone:

If to Recipient:

Name:
Address:
Attn:
Phone:

4. **Amendments.** This Agreement may not be changed or modified in any manner except by an instrument in writing signed by a duly authorized officer or representative of each of the Parties hereto. The Parties, however, agree to amend this Agreement from time to time as needed to assure compliance with the Privacy Standards.

5. **Choice of Law.** This Agreement and the rights and the obligations of the Parties hereunder shall be governed by and construed under the laws of the State of______, without regard to applicable conflict of laws principles. Covered Entity, as an agency of the State of______, is subject to the Constitution and laws of the State of______, and nothing in this Agreement shall constitute or be construed as a waiver of the sovereign immunity of the State of______ or a waiver, limitation, or restriction of any right of the State of______.

6. **Assignment of Rights and Delegation of Duties.** This Agreement is binding upon and inures to the benefit of the Parties hereto and their respective successors and permitted assigns. However, neither Party may assign any of its rights or delegate any of its obligations under this Agreement without the prior written consent of the other Party, which consent shall not be unreasonably withheld or delayed. Notwithstanding any provisions to the contrary, however, Covered Entity retains the right to assign or delegate any of its rights or obligations hereunder to any of its wholly owned subsidiaries, affiliates or successor companies. Assignments made in violation of this provision are null and void.

7. **Nature of Agreement.** Nothing in this Agreement shall be construed to create: (i) a
partnership, joint venture, or other joint business relationship between the Parties or any of their affiliates; (ii) any fiduciary duty owed by one Party to another Party or any of its affiliates; or (iii) an agency or employment relationship between the Parties or any of their affiliates.

8. **No Waiver.** Failure or delay on the part of either Party to exercise any right, power, privilege or remedy hereunder shall not constitute a waiver thereof. No provision of this Agreement may be waived by either Party except by a writing signed by an authorized representative of the Party making the waiver.

9. **Equitable Relief.** Any disclosure or misappropriation of the Limited Data Set by Recipient in violation of this Agreement shall cause Covered Entity irreparable harm, the amount of which may be difficult to ascertain. Recipient, therefore, agrees that Covered Entity shall have the right to apply to a court of competent jurisdiction for specific performance and/or an order restraining and enjoining Recipient from any such further disclosure or breach and for such other relief as Covered Entity shall deem appropriate. Such rights are in addition to any other remedies available to Covered Entity at law or in equity. Recipient expressly waives the defense that a remedy in damages would be adequate, and further waives any requirement in an action for specific performance or injunction for the posting of a bond by Covered Entity.

10. **Severability.** The provisions of this Agreement shall be severable and, if any provision of this Agreement shall be held or declared to be illegal, invalid or unenforceable, the remainder of this Agreement shall continue in full force and effect as though such illegal, invalid or unenforceable provision had not been contained herein.

11. **No Third Party Beneficiaries.** Nothing in this Agreement is intended to confer on any person, other than the Parties to this Agreement or their respective successors and permitted assigns, any rights, remedies, obligations or liabilities under or by reason of this Agreement. Nothing in this Agreement shall be considered or construed as conferring any right or benefit on a person not a party to this Agreement nor imposing any obligations on either Party hereto to any person not a party to this Agreement.

12. **Headings.** The descriptive headings of the articles, sections, subsections, exhibits and schedules of this Agreement are inserted for convenience only, do not constitute a part of this Agreement, and shall not affect in any way the meaning or interpretation of this Agreement.

13. **Entire Agreement.** This Agreement, together with any applicable exhibits, schedules, riders, and amendments which are fully completed and signed by authorized persons on behalf of both Parties from time to time while this Agreement is in effect, constitute the entire Agreement between the Parties hereto with respect to the subject matter hereof and supersede all previous written or oral understandings, agreements, negotiations, commitments, and any other writing and communication by or between the Parties with respect to the subject matter hereof. In the event of any inconsistencies between any provisions of this Agreement in any provisions of any exhibit, schedule, or rider, the provisions of this Agreement shall control.
14. Regulatory References. A citation in this Agreement to the Code of Federal Regulations ("C.F.R.") shall mean the cited section as that section may be amended from time to time.

Memorandum of Understanding

As part of the University mission, developing collaborations with faculty from other institutions both domestic and international has been part of the academic fabric for decades. The collaborations may involve training, research, service and exchange programs involving both faculty and students. In some instances, international collaborations, in addition to involving academic institutions and corporations, may also involve ministries of Health or Finance or Education.

When these collaborations are proposed, a Memorandum of Understanding (MOU) is the mechanism usually used as a way in which to formalize a newly proposed program or an already existing relationship. An MOU also formalizes access to systems that are critical to your faculty member’s project work or providing students with domestic and international education and training exchange experiences. For international projects, traditionally before many international academic institutions and government agencies will entertain working with your institution, they may first require having an MOU in place.

Historically, a Memorandum of Understanding (MOU) tends to be an umbrella agreement, broad in scope and without funding. The expectation is that under the umbrella agreement other agreements with specific scope of work and appropriate budgets will be implemented. MOU’s are inclined to be short term between three to five years with the option for renewal. Usually the scope of the MOU is broad in nature with limited specificity although for student exchange MOU’s increased specificity may be required.
As you are considering drafting an MOU the common clauses to be considered are as follows:

◆ Legal identification of both parties

◆ Preamble that describes the purpose of the MOU that may also include a description of the strengths of both parties

◆ Identification of the scope of the MOU and the responsibilities of both parties that may be divided into three sections by listing:
  ◆ What your institution will bring to the collaboration
  ◆ What the other entity will contribute to the collaboration
  ◆ What both parties may jointly work on together

◆ A section that describes that the scope of the collaboration and MOU is contingent upon the application and receipt of third party funding.

◆ Language that requires that the policies of the respective institutions will apply to their respective personnel and students, and to all activities undertaken under the MOU.

◆ From each institution the name and contact information of the individual who is responsible for the success of the program should be provided.

◆ For those collaborations where the expectation of intellectual property will result from the collaboration, language describing the management of intellectual property should be included

◆ Dispute Resolution – while arbitration language may be proposed it is recommended that mediation language is more universally accepted

◆ Term and termination – important to ensure that language is included to ensure that the term of the MOU is for a finite period of time.

When drafting an international MOU the following are additional clauses that should be considered:

◆ Export control language that indicates that American institution are required to comply with US Export Control laws

◆ Non-discrimination language that is typically required and included in US negotiated agreements

◆ Language that describes that the MOU is not a treaty

◆ That the parties to the MOU are independent contractors and neither party is authorized to make representation on behalf of the other party

For MOU’s that involve international ministries of Health or Finance or Education the following are clauses for consideration:

◆ Assistance with obtaining visa/work permits for Expatriate personnel based in country

◆ Where licenses, authorizations and permits for employment and medical practice
(if applicable) are required for Expatriates, that the international agency will assist in the processing and receipt of them.

◆ To facilitate the importation and receipt of equipment, vehicles, personal household goods, assistance from the international agency in obtaining the waiver of customs duty and value added tax exemption should be requested.

◆ For American Expatriates assistance in obtaining income tax exemption.

When drafting your MOU there are clauses that are not appropriate for inclusion, and for the purpose of an MOU should be avoided and excluded. As discussed earlier, an MOU tends to be a broadly focused agreement with limited specificity and the following clauses are more appropriate to agreements that involve a specific scope of work and an appropriate budget in support of the project:

◆ Confidentiality language – since the MOU has a broadly stated purpose you want to avoid providing access to the body of work undertaken by faculty, students and the institution.

◆ Indemnification. You may encounter the request to provide indemnification. Given the nature of MOU’s, indemnification would not be appropriate, especially for those institutions precluded from agreeing to indemnification.

◆ Given the universal mission of academic institutions to generate and disseminate new knowledge for the public good, any form of publication restrictions would be in conflict with mission, but also other policies of your institution. As a tax-exempt organization, under the IRS code there is also the requirement to have the freedom to disseminate the results of the work undertaken by your institution.

◆ Any request of ownership of intellectual property should be avoided in order to comply with your institutions policies as well as US federal regulations, for example the Bayh Dole Act.

◆ Budget/Payment/Invoicing are terms that should be avoided in an MOU. These are more appropriately addressed in other types of agreements.

In conclusion, it is important to remember that MOU’s are not binding, are not enforceable, have no legal responsibilities or obligations and there is no joint venture or partnership established.

For your use a Memorandum of Understanding template is provided.
Figure 1930.5-4. Memorandum of Understanding

THIS MEMORANDUM OF UNDERSTANDING ("MOU") is made BETWEEN the __________________________located in ___________________________ with an address AND ________________________ located in _________________________ with an address ___________________ is a public university devoted to professional and graduate education, research, patient care, and public service. ___________ educates health professionals and conducts internationally recognized research, including research in ___________. __________’s mission is to serve as a fountain of high quality multi-disciplinary knowledge and promote effective research, skills training and community service for national competitiveness and sustainable socio-economic development in ________. ___________ and _____________ have as mutual objectives developing, directly or in collaboration with other institutions, advanced clinical education programs and clinical research opportunities in the field of infectious diseases with particular emphasis on HIV, tuberculosis, and malaria education and research plus other global health issues that impact health outcomes.

2. _____________ and _____________ agree to explore collaborations related to research, prevention and treatment of infectious diseases and strengthening of health care systems in_______, in the following general areas:

a) Encouraging their scientific faculty to conduct joint research activities;

b) Exchange of faculty and postgraduate scholars on terms and durations to be agreed;

c) Participation in conferences, symposia and seminars at each party’s campus;

d) When appropriate and as agreed among faculty, submitting joint proposals for solicitation of funding from sponsors;

e) Collaboration in joint research and joint publications when appropriate and in accordance with generally accepted academic standards and principles and applicable United States and Rwandan law.

f) Capacity building through exchange programs and short courses related to subjects of mutual interest;

h) Joint organization of scientific meetings such as seminars, conferences and colloquia; and

h) Postgraduate infectious diseases training at ______________

Specific collaborations may be undertaken pursuant to separate agreements identifying the parties’ respective responsibilities, project funding sources, and other issues as appropriate to the individual activities. In general, and subject to funding being obtained from third party sources, each party will bear its own expenses in connection with collaborations identified in this MOU.

3. Each party will designate a member of its faculty to act as its representative in the implementation and performance of this MOU.

a. The initial designee of ______________ is _______________________

b. The initial designee of ______________ is _______________________

4. a. Intellectual Property ("IP") means inventions, improvements and/or discoveries patentable or unpatentable, copyrightable or uncopyrightable -including but not limited
to software and biological materials. The parties anticipate that their mutual undertakings may result in development of IP.

b. Background Intellectual Property ("BIP") means all IP developed before or independent of performance of this MOU or activities pursuant to collaborations developed after execution of this MOU. Ownership of BIP used jointly by the parties shall reside with the party that created it or is the owner of the BIP pursuant to law, policy or the party’s agreements with inventors.

c. IP that is conceived and reduced to practice in performance of work undertaken pursuant to this MOU, and further collaborations as envisioned in this MOU, is subject to the terms of this MOU unless otherwise agreed in a subsequent document executed by the parties. ____________ IP means such IP is made solely by one or more personnel of ____________ and owned by _______________ under its policies. ____________ IP means such IP is made solely by one or more personnel of ____________ and owned by _______________ under its policies. Joint Intellectual Property ("JIP") means such IP that is made jointly by one or more personnel of each party to this MOU. JIP is jointly owned, each party having an undivided interest in the JIP.

d. Each party that has sole ownership of IP subject to this MOU will be solely responsible for determining upon what patent applications it will file concerning such IP, and will be responsible for prosecuting and maintaining at its cost those applications and any resulting patents, whether in the United States or in other countries. Promptly following disclosure of JIP to one or both parties, the parties will discuss and designate one party to be responsible for patent filings with respect to inventions included in the JIP. The parties will share patenting and marketing expenses pursuant to a more specific agreement that will be executed with respect to the HP. Neither party will abandon the prosecution of any patent application for HP or the maintenance of any patent for TIP without giving at least 30 days written notice to the other party so that it may determine whether to assume patent management responsibilities and expenses.

e. Subject to applicable law and the terms of funding agreements for work that results in IP subject to this MOU, ____________ and ____________ each will grant royalty-free licenses to the other party to use inventions, software and copyrighted work as described in ____________ IP and ____________ IP, respectively, for purposes of education, research and public services, but not for any commercial purpose.

5. Research materials and other materials shall be exchanged by the parties subject to execution of appropriate material transfer agreements.

6. All ____________ activities contemplated by this MOU are contingent upon the receipt by ____________ of funding from external sources to support specific activities. Terms of grants and contracts resulting in such funding will take precedence over the terms of this MOU. ____________ will not obligate ____________ with regard to performance of agreements made by ____________ without first securing ____________’s consent for such obligations.

7. The design, methodology, manner, timetable, and budget for implementation of all
collaborations resulting from this MOU shall be developed jointly by the parties. Once specific agreements are entered into as to projects and activities contemplated by this MOU, the specific agreements will take precedence over this MOU as to the matters described in the agreements. This MOU creates no obligation to enter into any subsequent agreement.

8. If a dispute between the parties related to this MOU arises, the parties will negotiate to resolve the dispute. In case of failure to reach agreement, the parties will confer in good faith with respect to the possibility of resolving the matter through mediation with a mutually acceptable third party. The parties agree that they will participate in any mediation session in good faith in an effort to resolve the dispute in an informal and inexpensive manner. All expenses of the mediator will be shared equally by the parties.

9. This MOU may be amended by the parties at any time after it is in force. An amendment must be in written form and executed by the undersigned officers or their successors.

10. This MOU will be in effect for five (5) years after the date of last signature, and may be extended only by a properly executed amendment. Either party may terminate this MOU upon three (3) months written notice, given to the undersigned signatory of the other party.

By: ________________________________ Date: ________________

By: ________________________________ Date: ________________
Figure 1930.5-5. Memorandum of Understanding for Academic Cooperation

This Memorandum of Understanding (“MOU”) concerns academic cooperation between the PRIME (Prime), _______________, and ________________(xxx), ___________________.

This MOU is established effective November 1, 2014 (“Effective Date”) to facilitate cooperation in education and research in the areas of ________________.

Article 1
To the extent practicable, PRIME and xxx each agree:

(a) To propose faculty who are willing to share and exchange their own teaching experiences (courses, seminars, etc.) in the area of bioethics and biomedical research. Both PRIME and xxx faculty need the prior approval of their respective Authorities and Dean (and any other institutional official whose approval is required by policy) before an exchange program can take place.

(b) To encourage faculty to exchange documents and publications representing the outcome of the exchange program.

(c) To inform the other party about courses, conferences and seminars pertinent to ____________.

(d) To promote the participation of its faculty in courses, conferences and seminars organized by the other party.

(e) To promote the exchange of faculty members for limited periods of time to perform collaborative academic and/or research projects.

(f) This MOU does not apply to individuals who wish to partake in clinical rotations or actively participate in human subjects research, as such activities would raise liability issues.

Article 2
Each party agrees to the following:

(a) To collaborate with the other party on the offering of courses in research methodology and ethics using both face-to-face instruction and distance education.

(b) To collaborate on the development of workshops in research methodology and research ethics.

(c) To deliver a standard curriculum prepared and agreed between parties, in the workshops, courses, etc. to allow them to include the logos of both parties on the certificates, and to have these logos on the handouts.

Article 3
Any joint activity of the parties that might involve fees, reimbursements, or the awarding of degrees shall require execution of a separate agreement.

Article 4
Xxx will work with PRIME to apply for and implement relevant and mutually agreed research, health education, and public health proposals as announced by different funding agencies. Xxx and
PRIME will reach agreement on the terms and conditions under which joint funding is sought and individual scopes of work for such collaborations. Any agreement for a specific collaborative project will supersede the terms of this MOU as to that collaborative project.

**Article 5**

(a) Before any specific activity can be implemented, the parties shall discuss the issues involved to the satisfaction of each party and enter into a specific activity agreement based on the mutually agreed objectives and outcomes of the relationship. Each party’s policy for review and approval of funding applications and agreements for project implementation will be followed.

(b) Each party agrees to carry out its activities under this MOU in accordance with the laws and regulations of its country and the state or local governments that may have authority over the party’s activities.

(c) The parties acknowledge that the evaluation, selection and funding of projects under this MOU must take into account and may be affected by the restrictions imposed upon PRIME by the export control laws and regulations of the United States.

(d) The parties agree that visits by faculty and students from one institution to the other shall be subject to the entry and visa regulations of the United States and Egypt, as applicable, and also shall comply with the regulations and policies of PRIME and xxx.

(e) This MOU is not intended to create legal or financial relationships between the parties. Rather, it is designed to facilitate and develop a genuine and mutually beneficial exchange process and research relationship.

**Article 6**

This MOU shall be effective for a term of five (5) years from the Effective Date (the “Term”). This MOU may be terminated by PRIME or xxx with a minimum of 90 days written notice. If feasible, activities in progress at the time of termination of this MOU shall be permitted to conclude as planned unless otherwise agreed.

**Article 7**

PRIME and xxx subscribe to the principle of equal opportunity and do not discriminate on the basis of race, color, religion, age, ancestry, national origin, sex, sexual orientation or gender identity, nondisqualifying physical or mental disability, marital status or veteran’s status. PRIME and xxx shall abide by these principles in the administration and implementation of this MOU and individual undertakings, and shall not impose criteria that violate principles of nondiscrimination on the selection of scholars or students.

**Article 8**

All notices, demands and communications between the parties shall be in writing and shall be sent by email with a confirmation of receipt requested and by recognized overnight delivery service with confirmation of receipt to the addresses of the applicable representatives below or substitute addresses a party provides by proper notice:
Article 9
This MOU may be amended by written consent of the parties.

Article 10
The representatives of the institutions will communicate on at least an annual basis to evaluate past and ongoing activities, and to work out detailed plans for the succeeding year. The institutions will review this MOU in the last year of the Term to evaluate the progress and the quality of the activities under the MOU. This MOU may be extended for additional periods upon written consent of the parties.

The parties have caused this MOU to be executed by their duly authorized representatives on the dates indicated below.

Material Transfer Agreements
The management of Material Transfer Agreements (MTA) may fall within the purview of the research administrator’s portfolio but also may be handled by the Technology Transfer Office (TTO). However, for research administrators it is important to understand the role that MTA’s play in the conduct of research within academic institutions and in sponsored research agreements.

Historically faculty within academic institutions as well as within the for-profit sector develop various types of tangible materials that may be used as research tools to enhance the results and outcomes of research projects. Examples of materials include any tangible research material of scientific and/or potential commercial value and may include, but not be limited to the following substances: cell lines, viruses, organisms, and monoclonal antibodies to name just a few. The following are examples of the types of organizations that are likely to request and also generate materials: government agencies, universities, non-profit organizations and for-profit organizations.

What does the transfer of tangible materials allow the various parties to do? The exchange of materials makes research tools available for scientific use, serves as a
resource to explore new avenues of research, and may be used to facilitate or expedite research.

Why is it important to use an MTA when exchanging tangible materials? The use of an MTA will safeguard the proprietary and intellectual property rights of the provider, and allows the provider to maintain control over the use of their materials. For the Provider the use of an MTA allows the Provider to maintain ownership and control of the materials.

What can happen if an MTA is not used when exchanging tangible materials? There is the potential to sacrifice the protection of potential inventions, patents, and the ability to market and license the patented technology. Lack of an MTA also may create a breach of an existing contract, grant, or licensing agreement. There may be the potential of creating a liability for the institution if biohazard or other “risk-associated” material is being exchanged.

When you or the TTO receives an MTA what are the reasons and purpose for reviewing the MTA? Some of the steps to be undertaken in the review of an MTA is to identify in which project the material will be used and the source of funding, e.g. federal or from a for-profit sponsor. Depending on the terms of the funding agreement, in reviewing the MTA ensure that the MTA terms do not conflict with any already existing agreement terms and conditions. Will the material be used in a research project for which there already exists: a disclosed invention, filed patent, or licensed technology? If any of these exist it will be critical to ensure that the terms of the MTA do not conflict with the terms of existing agreements and in this instance, consultation with the TTO would be in order.

Key issues for consideration include ensuring that:

◆ the agreement is in compliance with University policy, and for State supported institutions, the agreement complies with state regulations and laws;
◆ the rights to publish and to own the research results are protected
◆ potential “liability issues” are identified and properly handled, addressed, and/or deleted;
◆ the faculty receiving the material and other faculty are not restricted now or in the future regarding their research efforts and program, and
◆ existing agreements are not breached and future funding agreements are not restricted nor compromised.

What are the most common issues and problems encountered in negotiating MTA’s primarily those received from the for-profit section, but also from other academic institutions?

◆ Definition of Material – acceptable definition includes the original material, progeny, and unmodified derivations. Unacceptable definition would be one that includes derivatives, modification of material, improvements, and/or any material that could not have been made without the use of the provided material. All of these terms describe new intellectual property created by the recipient of the material that did not exist prior to the receipt of the material and none
of these derivatives, modifications, and improvements were transferred by the provider to the recipient. Ownership of modifications, and new and improved tangible materials should be established in accordance with the U.S. Patent laws.

◆ **Purpose** – a section that clearly and narrowly defines the use of the material

◆ **Publication** – limit the length of time for review of publications for determining the existence of the provider’s confidential information. Avoid accepting language that allows the provider to approve publications or be granted the right to remove the recipient’s results from a publication because the provider considers them detrimental to its organization.

◆ **Intellectual Property** – if your institution creates new intellectual property what rights may be granted to the provider of the material? It would be acceptable to include a clause that would provide to the provider a non-exclusive license to new uses for or improvement to the provider’s material for internal research purposes only. What would not be acceptable are the following:

◆ granting a non-exclusive license to new uses for or improvements to the material for any purpose, including the manufacture, use or sale of the material. Why would this be problematic to your TTO? This clause would make it difficult for the TTO to find a licensee for any inventions that resulted from the use of the material.

◆ granting a non-exclusive right to license any invention resulting from the use of the material would result in giving up rights to intellectual property that did not exist at the time of the receipt of the provider’s material. Doing so would make it difficult to find a licensee for any invention if you have already granted a non-exclusive license to the provider.

◆ avoid granting a first right of refusal to inventions that result from the use of the provider’s material because this would restrict TTO’s ability to find a licensee. TTO would be required always to go back to the provider to offer them the option to license the technology. If you are unable to avoid such a term, then you should place a time-limit on the option for first right of refusal, e.g. six months from the time of disclosure and that a decision by the provider has to be made within a thirty day period from notice of a third party offer.

◆ avoid granting an exclusive license to provider.

◆ **Research Data and Results** – all research results and data created in the direct performance of research defined in the scope of work. Any request for unrestricted use of recipient’s research data and results and also request for research report should also be avoided

◆ **Confidential Information** – is defined as any information, know-how, and/or documentation related to the material that is provided by the provider to recipient in writing and is marked as “confidential” by provider.

◆ **Confidentiality** – providers confidential information received will be treated with the same degree of care as institution’s own confidential information. In order to
comply, the provider should be required to provide such information in written form and marked as such.

◆ **Indemnification** – avoid agreeing to indemnification language, especially for State supported institutions.

What are other expectations of the Provider of material? Provider should be willing to make their materials available to non-profits while not placing restrictions on the funding sources used in support of the research in which the materials will be used. For the Provider of the material there should not be the automatic rights to inventions made by the Recipient of the materials.

For the Recipient of the materials what are the expectations of how they may use the materials? The use should be restricted to what is agreed to by the Provider. The Recipient should not transfer materials to third parties. The Recipient understands that it does not automatically receive any commercial rights to the materials. And as stated previously, the recipient’s research results should not be treated as confidential.

When your institution exchanges materials what types of agreements are available for you to use? There is one MTA that has been around for many years that was developed between the National Institutes of Health (NIH) in conjunction with the Association of University Patent Administrators (AUTM) for use by academic institutions. Initially a master Uniform Biological Material Transfer Agreement was developed to simplify the transfer of materials, and many institutions signed onto the Master Agreement. For signers of the Master UBMTA the transfer of materials was achieved by the use of an Implementing Letter. Access to information about the UBMTA can be found at:

http://www.autm.net/Content/NavigationMenu/Members/MaterialTransfer-Agreements/default.htm

However, if your institution would prefer to develop its own unique MTA, AUTM has developed a new set of freestanding MTA templates that are available for institutions that are not signatories to the UBMTA master. The reason AUTM created this set of templates was for those materials that do not easily fit within the UBMTA’s definition of materials. These templates are designed so that each institution may customize to include clauses that are appropriate and pertinent to the material to be transferred. Information and access to the AUTM MTA templates may be found at:

http://www.autm.net/AUTM_MTA_Templates/12639.htm

In conclusion, with regard to the management and review of MTA’s it is important for a research administrator to understand the context in which an MTA will be used, identify who is responsible for the review and negotiation of such agreements, and have an understanding of what MTA terms are and are not acceptable.

For your information an example of the AUTM MTA template for Biological Materials as discussed above is shown below.
Figure 1930.5-6. Standard Material Transfer Agreement For the Transfer of Biological Materials Between Non-profit Organizations

The Provider and Recipient identified below hereby agree to be bound by the terms set forth in the attached Exhibit A, and Exhibit B if applicable, to govern the transfer of the Original Material described herein. Each party represents that it has made no changes to the attached Exhibit A or Exhibit B as published by the Association of University Technology Managers and available on their website, except as modified by the checked boxes in Exhibit B.

[ ] If checked, this Agreement is also subject to additional terms and conditions set forth on the attached Exhibit B. In the event of a conflict between any specific terms or conditions in Exhibit A and Exhibit B, Exhibit B shall govern.

Original Material (description of the material being transferred) | Shipping Address

| Name: | Address: |

Exhibit A

Standard Terms

I. DEFINITIONS:

1. Provider: Organization providing the Original Material. The name and address of this party is specified on page 1 of this Agreement.

2. Provider Scientist: The name and address of this party is specified on page 1 of this Agreement.

3. Recipient: Organization receiving the Original Material. The name and address of this party is specified on page 1 of this Agreement.

4. Recipient Scientist: The name and address of this party is specified on page 1 of this Agreement.

5. Original Material: The description of the Material being transferred is specified on page 1 of this Agreement.

6. Material: Original Material, Progeny, and Unmodified Derivatives. The Material shall not include: (a) Modifications, or (b) other substances created by the Recipient through the use of the Material which are not Modifications, Progeny, or Unmodified Derivatives.

7. Progeny: Unmodified descendant from the Material, such as virus from virus, cell from cell, or organism from organism.

8. Unmodified Derivatives: Substances created by the Recipient which constitute an unmodified functional subunit or product expressed by the Original Material. Some
examples include: subclones of unmodified cell lines, purified or fractionated subsets of the Original Material, proteins expressed by DNA/RNA supplied by the Provider, or monoclonal antibodies secreted by a hybridoma cell line.

9. Modifications: Substances created by the Recipient which contain/incorporate the Material.

10. Commercial Purposes: The sale, lease, license, or other transfer of the Material or Modifications to a for-profit organization. Commercial Purposes shall also include uses of the Material or Modifications by any organization, including Recipient, to perform contract research, to produce or manufacture products for general sale, or to conduct research activities that result in any sale, lease, license, or transfer of the Material or Modifications to a for-profit organization. However, industrially sponsored academic research shall not be considered a use of the Material or Modifications for Commercial Purposes per se, unless any of the above conditions of this definition are met.

11. Nonprofit Organization(s): A university or other institution of higher education or a non-profit organization officially recognized or qualified under the laws of the country in which it is organized or located, or any nonprofit scientific or educational organization qualified under a federal, state or local jurisdiction’s nonprofit organization statute. As used herein, the term also includes national, state or local government agencies.

II. TERMS AND CONDITIONS OF THIS AGREEMENT:

1. The Provider retains ownership of the Material, including any Material contained or incorporated in Modifications.

2. The Recipient retains ownership of: (a) Modifications (except that, the Provider retains ownership rights to the Material included therein), and (b) those substances created through the use of the Material or Modifications, but which are not Progeny, Unmodified Derivatives or Modifications (i.e., do not contain the Original Material, Progeny, Unmodified Derivatives). If either 2 (a) or 2 (b) results from the collaborative efforts of the Provider and the Recipient, joint ownership may be negotiated.

3. The Recipient and the Recipient Scientist agree that the Material:
   (a) is to be used solely for teaching and academic research purposes;
   (b) will not be used in human subjects, in clinical trials, or for diagnostic purposes involving human subjects without the written consent of the Provider;
   (c) is to be used only at the Recipient organization and only in the Recipient Scientist laboratory under the direction of the Recipient Scientist or others working under his/her direct supervision; and
   (d) will not be transferred to anyone else within the Recipient organization without the prior written consent of the Provider.

4. The Recipient and the Recipient Scientist agree to refer to the Provider any request for the Material from anyone other than those persons working under the Recipient Scientist’s direct supervision. To the extent supplies are available, the Provider or the Provider Scientist agrees to make the Material available, under an agreement having terms
consistent with the terms of this Agreement, to other scientists (at least those at Nonprofit Organization(s)) who wish to replicate the Recipient Scientist’s research; provided that such other scientists reimburse the Provider for any costs relating to the preparation and distribution of the Material.

5. (a) The Recipient and/or the Recipient Scientist shall have the right, without restriction, to distribute substances created by the Recipient through the use of the Original Material only if those substances are not Progeny, Unmodified Derivatives, or Modifications.

(b) Under an agreement at least as protective of the Provider’s rights as this Agreement, the Recipient may distribute Modifications to Nonprofit Organization(s) for research and teaching purposes only.

(c) Without written consent from the Provider, the Recipient and/or the Recipient Scientist may NOT provide Modifications for Commercial Purposes. It is recognized by the Recipient that such Commercial Purposes may require a commercial license from the Provider and the Provider has no obligation to grant a commercial license to its ownership interest in the Material incorporated in the Modifications. Nothing in this paragraph, however, shall prevent the Recipient from granting commercial licenses under the Recipient’s intellectual property rights claiming such Modifications, or methods of their manufacture or their use.

6. The Recipient acknowledges that the Material is or may be the subject of a patent application. Except as provided in this Agreement, no express or implied licenses or other rights are provided to the Recipient under any patents, patent applications, trade secrets or other proprietary rights of the Provider, including any altered forms of the Material made by the Provider. In particular, no express or implied licenses or other rights are provided to use the Material, Modifications, or any related patents of the Provider for Commercial Purposes.

7. If the Recipient desires to use or license the Material or Modifications for Commercial Purposes, the Recipient agrees, in advance of such use, to negotiate in good faith with the Provider to establish the terms of a commercial license. It is understood by the Recipient that the Provider shall have no obligation to grant such a license to the Recipient, and may grant exclusive or non-exclusive commercial licenses to others, or sell or assign all or part of the rights in the Material to any third party(ies), subject to any pre-existing rights held by others.

8. The Recipient is free to file patent application(s) claiming inventions made by the Recipient through the use of the Material but agrees to notify the Provider upon filing a patent application claiming Modifications or method(s) of manufacture or use(s) of the Material.

9. Any Material delivered pursuant to this Agreement is understood to be experimental in nature and may have hazardous properties. THE PROVIDER MAKES NO REPRESENTATIONS AND EXTENDS NO WARRANTIES OF ANY KIND, EITHER EXPRESSED OR IMPLIED. THERE ARE NO EXPRESS OR IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR THAT THE USE OF THE MATERIAL WILL NOT INFRINGE ANY PATENT, COPYRIGHT, TRADEMARK, OR OTHER PROPRIETARY RIGHTS.

10. Except to the extent prohibited by law, the Recipient assumes all liability for damages
which may arise from its use, storage or disposal of the Material. The Provider will not
be liable to the Recipient for any loss, claim or demand made by the Recipient, or made
against the Recipient by any other party, due to or arising from the use of the Material by
the Recipient, except to the extent permitted by law when caused by the gross negligence
or willful misconduct of the Provider.

11. This Agreement shall not be interpreted to prevent or delay publication of research findings
resulting from the use of the Material or the Modifications. The Recipient Scientist agrees to
provide appropriate acknowledgement of the source of the Material in all publications.

12. The Recipient agrees to use the Material in compliance with all applicable statutes and
governmental regulations and guidelines such as, for example, those relating to research
involving the use of animals or recombinant DNA.

13. This Agreement will terminate on the earliest of the following dates: (a) on completion of
the Recipient’s current research with the Material, or (b) on thirty (30) days written notice
by either party to the other, or (c) on the date specified in Exhibit B, provided that:

(i) if termination should occur under 13(a) or (c) above, the Recipient will discontinue its use
of the Material and will, upon direction of the Provider, return or destroy any remaining
Material. The Recipient, at its discretion, will also either destroy the Modifications or
remain bound by the terms of this agreement as they apply to Modifications;

and

(ii) in the event the Provider terminates this Agreement under 13(b) other than for breach
of this Agreement or for cause such as an imminent health risk or patent infringement,
the Provider will defer the effective date of termination for a period of up to one year,
upon request from the Recipient, to permit completion of research in progress. Upon the
effective date of termination, or if requested, the deferred effective date of termination,
Recipient will discontinue its use of the Material and will, upon direction of the Provider,
return or destroy any remaining Material. The Recipient, at its discretion, will also either
destroy the Modifications or remain bound by the terms of this agreement as they apply
to Modifications.

14. Paragraphs 6, 9, and 10 shall survive termination.

**Exhibit B**

**Optional Terms**

If checked, the following terms apply to this Agreement:

[ ] This Agreement shall terminate on . Upon termination, the Recipient will either
destroy any remaining Material or return it to the Provider, as directed by the Provider.

[ ] A transmittal fee of shall be paid by Recipient to Provider, for preparation and
distribution costs.

[ ] The Recipient intends to use the Material for purposes including but not limited to those
described below:

[ ] To the extent permitted by law, Recipient agrees to treat in confidence, for a period of three
(3) years from the date of its disclosure, any of Provider’s written information about the Material that is stamped “Confidential” (“Confidential Information”). Any oral disclosures from Provider to Recipient shall be identified as being Confidential Information by notice delivered to Recipient within ten (10) days after the date of the oral disclosure. Confidential Information does not include information that:

a. has been published or is otherwise publicly available at the time of disclosure to the Recipient;

b. was in the possession of or was readily available to the Recipient without being subject to a confidentiality obligation from another source prior to the disclosure;

c. has become publicly known, by publication or otherwise, not due to any unauthorized act of the Recipient;

d. Recipient can demonstrate it developed independently, or acquired without reference to or reliance upon Confidential Information; or

e. is required to be disclosed by law, regulation, or court order.

[ ] Additional binding terms:

**Teaming Agreements**

Traditionally Teaming Agreements are used when two or more organizations have agreed that they wish to collaborate on a project (research, training or technical assistance) that will be funded through a federal agency specific funding announcement, for example, Funding Opportunity Announcement (FOA), Request for Application (RFA) or Request for Proposal (RFP). The types of organizations involved may include academic institutions, not for profit organizations and /or foundations, and for profit organizations both domestic and international.

As part of the proposal development, preparation and submission it is critical to have drafted, negotiated and executed the Teaming Agreement prior to the submission of the proposal. The first decision to be made among the participants is who will take the lead and serve as the prime applicant on the proposal and which institution(s) will be identified as sub-recipients. In those circumstances when there are three or more participants, individual teaming agreements will be executed between the Prime and each individual sub-recipient and in the body of each Teaming Agreement reference will be made to the other partners involved.

The purpose of the Teaming Agreement is to clearly establish the guidelines for the preparation of the application, and should also delineate the roles and responsibilities of all the parties involved.

The prime applicant takes the lead for preparing and submitting the proposal, and sub-recipients are responsible for preparing those technical portions of the proposal related to their tasks and deliverables along with associated cost proposals.

As you are drafting and negotiating a Teaming Agreement the following are common clauses that should be considered for inclusion:
◆ Legal identification of the parties

◆ Purpose of the Agreement – outlines guidelines and the rights and obligations of all parties involved.

◆ Language should be included limiting the Agreement only to the specific FOA, RFA or RFP and any resultant award, and not to any other work undertaken by your institutions and your partner(s) that falls outside the purpose of the FOA, RFA or RFP

◆ Acknowledgement that should an award be made, the prime shall negotiate a subcontract agreement that will include the provisions of the Award

◆ Exclusivity – critical to include language that requires both the prime and the sub-recipient(s) not to collaborate or join with any other party for submission of another proposal in response to the specific FOA or RFA or RFP

◆ Confidential and Proprietary Information (CPI) - each party will contribute its CPI, and in order to protect the ownership of these contributions, a clause that restricts the use of each party’s CPI to the development and inclusion in this proposal only and may not be used beyond the expiration of the Teaming Agreement

◆ Ownership of Intellectual Property – a clause that clearly delineates ownership and management of intellectual property including rights in data, copyrights and patents should be included

◆ Term – duration and termination of the agreement is contingent upon the receipt of an award or notification that an award will not be made; in either instance the Teaming Agreement would be terminated. Recognition of how to manage the situation should the sub-recipient’s portion of the proposal not be approved

◆ Dispute resolution – language that describes mediation is recommended

◆ Joint venture – a clause that describes that the Teaming Agreement does not constitute or establish a formal joint venture, partnership, or formal business organization of any kind between the parties.

◆ Authorized Representatives – include a clause that identifies the individuals who are responsible for programmatic/technical issues and/or contractual terms and conditions

When drafting a Teaming Agreement with international partners there are one or two clauses your partner may request:

◆ Force Majeure – a clause that describes force majeure circumstances

◆ Non-compete - international partners may request a non-compete clause related to the recruitment of personnel. It is recommended that you avoid the inclusion of such language. However, should you find that your international partner insists upon such language, be sure to put a non-compete time limit of six months but no more than one year. Also include language that allows personnel to independently respond to job announcements.
In conclusion, Teaming Agreements serve the purpose of clearly delineating the roles and responsibilities of the prime and sub-recipients in the preparation, drafting and submission of a proposal in response to a specific FOA, RFA, or RFP, and is time limited to either the receipt of an award or notification that the proposal was not successful.

For your use here are several examples of Teaming Agreements.

---

**Figure 1930.5-7. Simplified Teaming Agreement**

This Agreement is made and entered into by and among __________, having offices at __________ and the ________________, having offices at ____________.

WHEREAS the parties intend to collaborate to submit a proposal for [include funding agency name, RFA name and title],

WHEREAS the parties intend by this agreement to clarify their roles and responsibilities in the event an award is made as a result of the proposal,

NOW THEREFORE, the Parties hereby agree as follows:

1. _________________ will be the prime applicant. In the event that an award is made by (insert acronym for agency), the parties are prepared to enter into negotiated subaward agreements for research to be performed under the award; such agreements will ensure compliance with the prime award and all pertinent Federal regulations.

2. _______________ will take principal charge of preparing and submitting the proposal. The parties will collaborate to ensure that information and documentation necessary to meet the proposal requirements is provided in a timely manner.

3. If an award is made to __________ based upon the proposal, __________ will promptly provide a copy of such funding agreement to each subrecipient and will issue a subaward agreement in accordance with the funding agreement, the proposal, and this Agreement. If the terms of such funding agreement appear to be inconsistent with the provisions of this Agreement, the parties will attempt in good faith to resolve any such inconsistencies. The order of precedence of agreement documents will be: the funding agreement from the sponsor to the prime applicant; the subaward from the prime applicant to the subcontractor; and this Agreement.

4. Role and Responsibilities of _________ (Prime)

5. Role and Responsibilities of ___ [for each proposed subrecipient]

6. Liability. The parties are not (and nothing in this Agreement may be construed to constitute them as) partners, joint venturers, agents, representatives or employees of the other, nor is there any status or relationship between them other than that of independent contractors. No Party has any responsibility or liability for the actions of another Party except as specifically provided in this Agreement. No Party has any right or authority to bind or obligate another Party in any manner or make any representation or warranty on behalf of another Party.

7. Term and Termination. This Agreement is effective as of __________ (Effective Date)
and remains in full force and effect for the period of any award made as a result of
the proposal to ____________. This Agreement will terminate as to all parties upon
determination that the proposal will not be funded.

8. Modifications. Modifications to this Agreement may be made only in writing signed by
authorized representatives by all parties.

9. Assignment. This Agreement may not be assigned or otherwise transferred by either
Party, in whole or in party, without the express prior written consent of this other Party.

10. Counterparts. This Agreement may be executed in counterparts, each having the legal
effect of an original.

The undersigned parties have caused this Agreement to be executed by their authorized
representatives as of the Effective Date.

PARTIES TO THE TEAMING AGREEMENT

<table>
<thead>
<tr>
<th>PRIME</th>
<th>Subrecipient</th>
</tr>
</thead>
</table>

AGREEMENT BETWEEN THE PARTIES

PRIME Institution___________ (hereinafter referred to as “_______”) with offices located at________________________, and xxx (hereinafter referred to as ‘the partner’) with offices at xxx have discussed mutual interests in bidding for Agency/Sponsor RFA/RFP number, titled RFA/RFP Title (hereinafter referred to as “the RFA”), and as a result have agreed to execute this Teaming Agreement (hereinafter referred to as “agreement”).

Whereas PRIME and xxx intend to collaborate to submit a proposal for funding for a project in the Location, both partners have concluded that because of their complimentary capabilities, they would mutually benefit from a teaming arrangement in order to develop the best management and technical approach for the response to the RFA and any award made by the Agency/Sponsor pursuant to the RFA (hereinafter the “Award”). The preparation of this proposal will involve sharing of proprietary information by each party.

NOW, THEREFORE, the Parties hereby agree as follows:

ARTICLE 1.0 PURPOSE OF AGREEMENT

1.1 The purpose of this Agreement is to establish guidelines and define the mutual rights and obligations of the Parties during the preparation of the application in connection with the RFA, and, should an award be made to PRIME and its partners as a result of the application, PRIME will proceed to negotiate a subcontract with the partner. It is, further, the intent of this Teaming Agreement to foster the development of a successful application by combining the strength that the partner brings.

1.2 The Application will be based on PRIME being the prime recipient for the Award.

1.3 Each Party shall be responsible for its own expenses related to application development, unless otherwise agreed to in writing by the Parties.

1.4 The Statement of Work of the partner is set forth in article 3.0 and 4.0 of this agreement.

ARTICLE 2.0 RELATIONSHIP

2.1 PRIME and the partner based on their complementary expertise agree to collaborate to submit an Application for the RFA that is consistent with their goals and respective methodologies and expertise.

2.2 This Agreement shall relate only to the Application and any resultant Project and to no other effort currently being undertaken by PRIME or the partner, jointly or separately.

2.3 PRIME shall recognize and identify the partner in the Application and, if awarded the Cooperative Agreement. Each of the parties will give full recognition and consideration to the role and contribution of the other Party in all information releases concerning the Application that directly pertains to the other Party’s area(s) of responsibility.

ARTICLE 3.0 STATEMENT OF WORK – PREPARATION OF APPLICATION

3.1 The Parties agree to work in a mutually supportive manner during the process of developing the application.
3.2 PRIME shall bear the responsibility for the preparation and delivery of the application documents. The partner shall provide technical assistance and information as may be required by PRIME.

3.3 The partner shall prepare in a format acceptable to PRIME, the following sections:

- Strategic and technical approach related to: xxx
- Intermediate result(s) xxx
- Corporate capability statement, tailored to the responsibilities of the partner in the application.
- Illustrative technical assistance plan for the following: quality assurance / quality improvement.
- Budget (cost) component related to the partner’s proposed activities in an agreed format, and in accordance with the requirements set forth in the RFA.
- Business information and other relevant information in accordance with the requirements set forth in the RFA.
- Other information necessary to enhance the competitiveness of the application.

3.4 The partner agrees to adhere to the requirements for submission including deadlines set by PRIME, and shall make personnel available, at times and locations requested by the PRIME, to contribute towards preparation of the application.

3.5 Considering that the other partner in this application, xxx, will play a key complementary role in the design of the strategic and technical approach for intermediate result xxx, the partner will work in close collaboration with xxx, under the direction of PRIME and/or consultant(s) hired by PRIME, to ensure a high quality design.

ARTICLE 4.0 INTENT TO NEGOTIATE A SUBCONTRACT

4.1 Should an award be made to PRIME pursuant to this RFA, PRIME and the partner shall negotiate in good faith and in a timely manner to conclude a mutually acceptable sub-contract pursuant to the provisions of the Award between PRIME and Agency/Sponsor.

4.2 It is agreed that while PRIME will be responsible for the management of the resultant project, the partner shall take responsibility for the areas outlined in the project proposal and in line with the provisions of the prime Award.

4.3 Considering that the other partner in this application, xxx, will play a key complementary role in the implementation of actions contributing to intermediate result, should an award be made to PRIME, the partner will work in close collaboration with xxx, under the direction of PRIME, to ensure high quality and timely implementation of planned actions.

ARTICLE 5.0 EXCLUSIVITY

For purpose of the Agreement, the partner agrees that in consideration of being included in PRIME’s application for the project entitled “Title” (Agency/Sponsor RFA/RFP number in Location), it will not collaborate or join with any other party(ies) in any additional application submitted in response to this RFA.

ARTICLE 6.0 CONFIDENTIAL INFORMATION

6.1 The partner agrees not to share any information regarding this Agreement, nor any discussions
or activities in the execution thereof, beyond the corresponding staff members or hired consultants of PRIME and formal consortium. Either party may disclose the existence of the Agreement.

6.2 Both Parties anticipate that it may be necessary to provide access to information of a proprietary nature to the other - including, without limitation, computer programs, code, algorithms, know-how, formulas, processes, ideas, inventions, and other technical, business, financial and product development plans, forecasts, strategies and information. Each Party agrees that proprietary information provided to the other Party and marked as confidential shall be treated as fully confidential and the exclusive property of the disclosing Party.

6.3 The receiving Party shall use such information solely for the purpose for which it is supplied, and shall not disclose it to anyone other than the employees and consultants who participate in the activities contemplated herein, without the prior written consent of the disclosing Party. The Parties further agree to advise their subsidiaries, affiliates, employees and agents having access to the proprietary information of the obligation to ensure its protection.

6.4 All proprietary information shall be promptly returned, together with all copies thereof, to the disclosing Party or destroyed after receiving Party’s need for it has expired, or upon written request of the disclosing Party.

6.5 The obligations of non-use and non-disclosure of information shall survive any Agreement termination for three (3) years from the date of disclosure of the proprietary Information.

ARTICLE 7.0 RIGHTS IN DATA, COPYRIGHTS AND PATENTS

Both parties agree that this Agreement does not grant or confer any right, title or interest in the other’s products or services. If, during the life of this Agreement, patentable inventions or copyrighted works result, the following shall apply:

A. Subject to the rights of Agency/Sponsor under any ensuing Award, no license, express or implied, shall inure to the benefit of other participating parties as a result of a patent being granted to one of the parties for inventions made exclusively by its employees or as a result of a copyrighted work that originated exclusively from its employees.

B. PRIME and partner shall jointly hold title to any inventions made, and copyrighted works originated, jointly by PRIME and partner.

C. Each party shall cooperate with the other to enable it to perfect its patent rights.

ARTICLE 8.0 DURATION OF AGREEMENT

8.1 This Agreement shall become effective upon the Effective Date shown at the beginning of this document, and shall conclude upon the occurrence of any of the following events or conditions:

◆ Receipt by PRIME of written notice from Agency/Sponsor that it will not make an Award under the RFA.

◆ Receipt by PRIME of written notice of Agency/Sponsor’s rejection of the Application, or Award to an awardee other than PRIME.

◆ Receipt by PRIME of written notice from Agency/Sponsor stating Agency/Sponsor’s disapproval of PRIME’s use of the partner as a participant. PRIME will provide Agency/Sponsor’s written notification to the Subcontractor. PRIME will use reasonable efforts to secure Agency/Sponsor’s approval of the use of the partner’s technical
services and proposed personnel for the award.

◆ Any significant change in the financial capability of either Party that, in the opinion of either Party, seriously affects a Party’s ability to perform its responsibilities.

◆ Upon execution of a Subcontract by the Parties after receipt of the Award by PRIME pursuant to this RFA.

◆ The Parties terminate this Agreement by mutual consent.

◆ Failure by either Party to comply with any of the material provisions of this Agreement.

8.2 Upon termination of this Agreement, all obligations hereunder shall terminate, except those that expressly survive such termination.

ARTICLE 9.0 NONSOLICITATION
During the period of performance of this Agreement and for one (1) year thereafter, neither Party, directly or indirectly, shall hire or attempt to hire any employee of the other Party without the express written permission of such other Party. This provision shall not be construed to prevent either Party from hiring a person who responds to an advertisement or job posting, or who is contacted by placement personnel not specifically targeting the employees of either Party.

ARTICLE 10.0 DISPUTE RESOLUTION AND SEVERABILITY
10.1 The Parties shall exhaust all attempts to resolve all disputes through informal means. This may include mediation or any other procedures upon which the Parties agree. Each Party agrees that, prior to resorting to litigation to resolve any dispute, it shall confer with the other Party to determine whether alternative dispute procedures that are less expensive or less time-consuming can be adopted to resolve the dispute.

10.2 If any of the provisions of this Agreement is found by an arbitrator, court or other competent authority to be void or unenforceable, such provision shall be deemed to be deleted from this Agreement and the remaining provisions of this Agreement shall continue in full force and effect. Notwithstanding the foregoing, the Parties shall thereupon negotiate in good faith in order to agree the terms of a mutually satisfactory provision to be substituted for the provision so found to be void or unenforceable.

ARTICLE 11.0 MODIFICATION
This Agreement and any of its provisions may be amended, waived or modified only in writing, signed by an authorized representative of each Party.

ARTICLE 12.0 LIABILITY
PRIME and partner are not (and nothing in this Agreement may be construed to constitute them as) partners, joint venturers, agents, representatives or employees of the other, nor is there any status or relationship between them other than that of independent contractors. Neither Party has any responsibility or liability for the actions of the other Party except as specifically provided in this Agreement. Neither Party has any right or authority to bind or obligate the other Party in any manner or make any representation or warranty on behalf of the other Party.

ARTICLE 13.0 FORCE MAJEURE
Any delays in or failure of performance of either Party shall not constitute default or give rise to any claim for damages if and to the extent caused by or resulting from acts of God, earthquake, fire,
explosion, flood, the elements, strikes, boycotts, labor disturbances or differences with workmen, acts of the public enemy, war, rebellion, riots, acts of the government, or any cause whatsoever beyond the control of the Party in default, but performance hereunder shall be resumed as soon as the cause preventing performance has been removed.

**ARTICLE 14.0 AUTHORIZED REPRESENTATIVES**

All communications relating to this Agreement shall be directed to the specific persons, identified on the next page, designated to represent PRIME and the partner. Communications that are not properly directed to the persons designated in accordance with this section shall not be binding upon the Parties.

---

**Visiting Scientist / Scholar Agreements**

One of the traditions among faculty researchers and teachers who have special areas of knowledge, expertise and experience is to provide to others opportunities to learn about new areas of research and techniques, or new innovative areas of education. Institutions support faculty in these endeavors and facilitate opportunities for them to interact with other scientists, colleagues and students who will have access to University research resources, facilities and faculty, not otherwise available to the public.

When faculty receive requests from individuals to spend time on campus for extended periods of time, if not already in place, the first step to manage this type of campus visit, is to adopt a Visiting Scientists and Scholars Policy. The purpose of the policy may be twofold:

1. A policy that permits faculty to:
   - engage in on-campus, hands-on open research collaboration with professionals who are working in the academic, public, industrial and international communities;
   - interchange/exchange information, and
   - provide training and educational opportunities to students

2. A policy that protects the University’s
   - existing or potential intellectual property rights, and
   - contractual obligation to sponsors

3. The purpose of the policy is to provide faculty with mechanisms and safeguards:
   - for hands-on instruction and/or research collaboration using institution faculty, resources and laboratory facilities, to individuals who are not University employees;
   - to ensure compliance with institution policies and procedures
   - to ensure compliance with institution contractual obligations to federal and industrial sponsors;
   - for institution to retain original copies of laboratory notebooks;
◆ for the institution to require visiting scientists to submit any reports or other outstanding documents prior to leaving the institution to the appropriate designated institution official.

Prior to arrival of visitor on campus, the faculty sponsor must require and have in place either a fully executed Visiting Scientist Agreement or Visiting Scholars Agreement.

When you begin to draft your Visiting Scientist/Scholars agreements what issues should be covered and what clauses should be included? The Visiting Scientist/Scholar Agreement should:

◆ identify the visiting scientist/scholar by name, identify name of home institution, state period of time requested, identify name of faculty sponsor and faculty sponsor’s department, and include a brief description of planned activities
◆ clearly define the scope of the visitor’s work, training, and/or observation
◆ identify the visitor’s status as a non-employee who is not entitled to compensation or benefits
◆ indicate that the visitor is supported either by home institution or personally
◆ assert that the visitor is subject to institutional policies, including intellectual property policies
◆ require that the visitor agrees to maintain confidentiality of information observed outside the visitor’s work scope
◆ require the visitor to take any necessary training
◆ oblige the visitor and/or home institution to assume liability for “injuries to people or property resulting from my acts”
◆ require signatures by the visitor and home organization
◆ require the home organization to acknowledge the visit of its faculty and/or student by signing the VSA, and acknowledge the necessity of their faculty/student to comply with institution’s intellectual property terms

What are the different requirements for a Visiting Scientist versus a Visiting Scholar? In most instances a Visiting Scientist will gain access to an institution’s laboratory and may participate in third party funded research, e.g. from the federal government or supported by a for profit sponsor award. For the Visiting Scientist the Agreement has two parts – Part A includes language that describes how the Visiting Scientist is required to comply with all of the institution’s policies and acquire training when required. Part B is focused solely on the requirements and management of intellectual property that may result during the time the Visiting Scientist is on campus. Part B requires that all data, results, reports and intellectual property developed during the Visiting Scientist’s time on campus will be the owned and property of the institution.

For a Visiting Scholar whose sole purpose is to receive specific training or be involved in an observation-based training program only Part A of the VSA is required.
For International Visiting Scientists/Scholars before finalizing the VSA there are additional reviews and evaluations that are required that include:

◆ Export Control review especially for visiting scientists/scholars travelling from embargoed or sanctioned countries
◆ Immigration status and whether it is appropriate for the proposed activities
◆ Determination that the visitor has the appropriate visa that allows entry into the United States

What are the areas of main concern for an institution when visitors are allowed to spend time on campus? Obviously the potential of institution liability as well as the inability to discipline visiting scientists or scholars may be of concern.

In summary, having a Visiting Scientist/Scholars policy, procedure and agreement in place will provide institutions with more control over individuals who are on campus for an extended period of time, will allow institutions to be aware of who is a visitor on campus, where the individual is located, length of the visitor’s stay, and also puts the visitor on notice of the requirement to comply with the institution’s policies, and in particular with the management and ownership of intellectual property.

This section is based on the University of Maryland Baltimore (UMB) Visiting Scientist Policy and Agreements. Information about UMB’s Visiting Scientist/Scholar Policy and Agreement templates may be found at the following link:

1960 Statistics and Survey Results

This section includes statistics and survey results from authoritative sources relating to data rights and intellectual property.

1960.1 Trends in University Patenting Activities

AIS editors

The National Science Board’s Science and Engineering Indicators provides “a broad base of quantitative information on the U.S. and international science and engineering enterprise.” One set of data pertains to university patenting trends and could prove of interest to research administrators and technology licensing professionals alike.

According to U.S. Patent and Trademark Office (USPTO) data, patent grants to universities and colleges increased sharply from 1988 to about 1999, when they peaked at just under 3,700 patents, and then fell to about 3,000 in 2008 (see Figure 1960.1-1). Three technology areas have dominated these patent awards (chemistry, biotechnology, and pharmaceuticals), accounting for 45% of the total patents awarded to U.S. universities in 2008 (see Figure 1960.1-2).

According to the Association of University Technology Managers, “Despite continuing difficult economic conditions, … [s]tartup formation and the number of licenses and options executed to startups showed healthy increases over FY 2009, as did the number of startups that remained active at the end of the fiscal year. FY 2010 also saw a significant increase in total research expenditures and the highest increase in patents issued since AUTM began collecting this data 17 years ago.” Data from the AUTM U.S. Licensing Activity Survey: FY2010 found the following types of activity at respondents to its survey including 155 universities, 27 hospitals and research institutes, and one third-party technology investment firm:

- 657 new commercial products introduced
- 5,362 total license and options executed, 4,284 of which were licenses
- 651 new companies formed
- 3,657 startup companies still operating as of the end of FY 2010
- $59.1 billion total sponsored research expenditures
- 20,642 disclosures
- $2.4 billion total licensing income

Patents

- 18,712 total U.S. patent applications
- 12,281 new U.S. patent applications
- 1,116 non-U.S. patent applications
- 4,469 issued U.S. patents
AUTM is a nonprofit association of academic technology transfer professionals. For more about the AUTM licensing survey, go to www.autm.org (see also Figure 1960.1-3 and Figure 1960.1-4).

Notes: Data include institutions affiliated with academic institutions, such as university and alumni organizations, foundations, and university associations. Fewer than 200 institutions shown because data for certain institutions are for entire university system and incorporate data from various campuses. Patents assigned to Naval Postgraduate School and Air Force Academy not shown here. Top 200 R&D institutions ranked by sum of their patents from 1998 through 2010. Unlike some previous versions of this table, data include all assignees on patent, not just first; therefore, patent counts in this table are slightly higher than reported in some previous years. Patents on whole-count basis, that is, each assignee on patent credited one count.

Notes: Data include institutions affiliated with academic institutions, such as university and alumni organizations, foundations, and university associations. Universities vary in how patents are assigned, e.g., to boards of regents, individual campuses, or entities with or without affiliation with university. The Patent BoardTM technology areas constitute an application-oriented classification system that maps the thousands of International Patent Classes (IPCs) at main group level into 1 of 35 technology areas. If patent has more than one IPC, only primary IPC is considered in mapping. Data in table not comparable to previous versions due to changes in classification system.

Assessing Technology Transfer Performance
Richard Kordal and Leslie K. Guice, Louisiana Tech University

Abstract
This paper presents an analysis of the Association of University Technology Managers (AUTM) annual U.S. Licensing Activity Survey data for 2007. Before performing the analysis, the institutions were first categorized into three “peer” groups (large, medium, or small) based on size of research expenditures so that more appropriate comparisons could be made. To assist in the interpretation of the results, we suggest some factors that may affect institutional performance in certain areas.

Introduction
Each year when the Association of University Technology Managers (AUTM) annual survey results are published, invariably the statistic that generates the most interest is the level of royalty income generated by universities. Despite mission statements that may not place royalty income at the top of the list (e.g., instead, open innovation may be a primary goal) many university administrators, state officials, and policy makers nonetheless often use that statistic as the key measure of an institution’s technology transfer performance. For the reasons elaborated below (as do many practitioners) believe it is difficult to use royalty income alone as the sole measure of technology transfer performance.

Nearly two decades of AUTM survey data have shown that a large money-making license is a relatively rare event: only about 0.5% of active license agreements generate over $1 million in royalty income (endnote #1), and most generate much less. Income is more a function of “hitting the grand slam,” i.e., being in the fortunate position of having licensed a technology that is a huge commercial success or negotiating an equity deal to a company whose stock greatly appreciates. Although skill in negotiating the deal is critically important (to be in a position to capture the value from the intellectual property [IP]), what is also important is having as many high-quality “technologies” as possible in play. This “portfolio approach” helps to increase the odds of “winning the lottery.” For example, the average ratio of license + option agreements executed in a given year to invention disclosures is about 1:5 (actual median percentage was 18.9% for all U.S. academic institutions responding to the 2007 AUTM survey). This implies that an institution receiving 100 disclosures per year should expect on average to negotiate about 20 licenses and option agreements per year. (This does not necessarily mean that 20% of all disclosures received will eventually get licensed because some, perhaps many, of the licenses executed in a given year may be based on technologies disclosed in previous years.) As mentioned above, only about 0.5% of all license agreements are “home runs” (million dollar royalty generators), and fewer still are “grand slams.” Therefore, for every 200

---

1 This article is reprinted from Research Management Review, Vol. 16, No. 1, Fall/Winter 2008, published by the National Council of University Research Administrators. It is used with permission of the publisher.
active license agreements the expectation is that one will be a “home run.” Assuming half of the 20 agreements executed above were license agreements and the volume of disclosures (100/year) and deal flow remain constant (10 licenses/year), the expectation is that this hypothetical institution will have a “grand slam” roughly once every 10–20 years (1 home run = 0.005 x 10 license/yr. x 20 yrs.).

Based on the above analysis of the infrequent nature of “grand slam” licenses, it stands to reason that there should be a correlation between total number of active royalty-yielding licenses and options that an institution holds and royalty income. One would expect that the higher the number of active options and licenses, the greater the royalty income because the more active agreements in play, the greater the odds that one will be a home run. Indeed, there is a correlation, albeit not a very strong one (see Figures 1 and 2). Figures 1 and 2 are identical except that Figure 1 includes New York University’s exceptional income of $791,210,587 for 2007 and Figure 2 does not.

**Figure 1. Income vs. Number Active Licenses/Options (with outlier)**
A similar correlation is seen if one compares aggregate income over the previous five years versus the number of active licenses/options. See Figures 3 and 4, which are identical except that Figure 3 includes two outliers and Figure 4 does not.
This rough correlation may just be reflective of the unpredictable nature of the marketplace and stock market, which is beyond the control of the technology transfer office. To some extent, due to external factors (e.g., advent of a disruptive technology, shift in trade policy, availability of risk capital), marketplace success is even beyond the control of company managers (no one can guarantee success — at best, all one can do is estimate the probability for R&D, regulatory, and commercial success).

If royalty income or ROI alone is not a good measure of assessing technology transfer performance, what is? We do not believe any one measure is sufficient; rather, it is our opinion that a number of metrics need to be assessed, such as volume of disclosures (cultural measure), evaluation of commercial potential, patent/legal expense management, marketing effectiveness, number of industry partners/contracts, etc., in order to develop a more complete picture of performance. Only by looking at all the aspects of technology transfer can one draw any meaningful conclusions. (Most important is how well the public is benefiting from the new innovations being developed at the country’s academic and non-profit institutions. This is not something that can be easily quantified, although AUTM is attempting to do so in a qualitative manner through their excellent series of Better World Reports.)

Using the most recent 2007 AUTM survey data (AUTM, 2007) (for the purpose of this analysis it was not important which survey year’s data were used), we dug a little deeper. At the risk of being compared to a paleontologist who, using just fragmentary fossil remains, makes big leaps or deductions about the lives and habits of dinosaurs, we attempted to see what conclusions we could tease out of the data. Before conducting the analysis, the academic institutions being surveyed were first grouped into three categories (large >$250 million R&D expenditures, medium >$75 million <$250 million, or small >$10 million <$75 million) based on size of research.
enterprise. It may be inappropriate to compare institutions with widely varying sizes of their research enterprise (e.g., Johns Hopkins University, which had $1.1 billion in R&D expenditures in 2007, to Duquesne University, which had $11 million in R&D expenditures). In our opinion it is more appropriate to compare institutions among their peers.

While it is difficult to make firm conclusions based on the analysis of just one year’s compilation of technology transfer performance statistics (arguably 5 year cumulative data might be more instructive), some interesting observations were made. Some of the observations raise additional questions that may require collecting additional information not found in the current survey. Getting answers to these questions will also require an honest appraisal of the technology transfer offices themselves as well as external factors affecting the offices’ performance.

It is hoped that this analysis will aid others (in particular VP Research, policy makers, etc.) in assessing their institution’s technology transfer operations and prompt them to delve deeper into what might be the cause of any major deviations from the norm. For example, an institution may have a high reimbursement rate for patent/legal expenses that ordinarily would be viewed as a positive. However, it could also mean that the institution has an aversion to risking its own money on patent applications and may only file if they have a licensee or optionee willing to foot the bill. While this cautious approach may make sense for some institutions and appear on the surface that the office is managing their patent/legal budget wisely, it will undoubtedly limit the portfolio of patent protected technologies available for licensing, and hence the opportunity for future royalty income.

**Analysis of 2007 AUTM Data by Institution Size**

Table 1 shows the median, maximum, and minimum values calculated for a variety of technology transfer metrics. Median rather than average values were determined because we did not want any outliers to skew the results and give a false picture of typical performance. According to the table, most institutions average approximately four new invention disclosures per $10 million in R&D expenditures. The rate is slightly greater for the smaller institutions. Disclosure rate is indicative of an institution’s innovation productivity or culture. A low disclosure rate may mean that more educational and outreach activity is needed to encourage researchers to seek opportunities for patentable innovations in their research. Or it may simply mean that the type of research being conducted is not conducive to inventions — e.g., more behavioral or clinical research rather than scientific or engineering research. It may also mean that the faculty do not hold the view that participation in technology transfer helps advance their careers (reappointment, tenure, and promotion). To get a better understanding of the reason for “atypical” results, either positive or negative, one would have to investigate the cause of either the lower or higher than norm productivity. Top performers in FY 2007 are shown in Table 2.

One area in which the larger, more prestigious universities seem to out-perform the medium and smaller universities is in Return on Investment (ROI) or royalty income as a percentage of R&D expenditures. There could be a number of explanations for this. First, larger institutions have typically put more technologies “in play” over the years and are now reaping the benefits of this increased activity. They were the first to get heavily involved in technology transfer after the passage of the Bayh-Dole...
legislation and due to their large R&D expenditures have received more disclosures and executed a greater number of license agreements.

Alternatively, larger institutions may have more entrepreneurial-minded and/or inventive faculty who disclose higher-quality or more valuable inventions (e.g., Eminent Scholars, Nobel Laureates, National Academy of Science members, large grant recipients, etc.) than the smaller and medium institutions. These faculty members are sometimes referred to as “star” faculty and are in high demand and heavily recruited. It would be interesting to see if there is a correlation between the number of star faculty at an institution and the royalty income or scientific impact (citation rate) of an institution’s inventor’s publications (patents and related journal articles) and royalty income.

The performance of more prestigious universities could be due to the “halo” effect of the institution. Sine et al. (2003) have found that after controlling for other factors, a one-unit increase in an institution’s *U.S. News and World Report* ranking increased the rate of licensing by 1.5%. (This is not to imply that the less well-known universities cannot be successful at technology transfer. To the contrary, a recent report funded by the National Science Foundation showed that some small and medium-sized institutions can excel at technology transfer [Palmintera et al., 2007].)

The success of larger institutions could also be attributed to having received more technologies that could be the basis of a start-up company. If they take equity in these start-up companies, then they may be benefiting from these equity positions disproportionately (Bray & Lee, 1988). It is well known that only a small percentage (on the order of 2–3%) of disclosures are broad, wide, and deep enough to be the basis of a venture-backed start-up company. An institution receiving 20–30 disclosures each year may only see one platform technology occasionally, whereas an institution that receives hundreds per year may see several suitable candidates each year.

But most probably there is no one single reason for their high performance; rather, it is probably due to a variety of factors. Differences in university technology transfer performance have been the subject of several scholarly articles (Siegel et al., 2007; Thursby & Kemp, 2002). Among others, some of the top contributing factors include: presence or absence of a medical school, private or public institution, and cultural and faculty incentive structure. Top performers in this category are shown in Table 3.

External factors that could affect the ROI metric is the university’s position or philosophy in terms of IP rights in research grants and contracts and/or material transfer agreements (MTAs). If an institution has a high number of active license and option agreements in place (in particular, industry agreements) but is yielding low royalty income from them, one might want to check the IP provisions in the underlying research agreements and MTAs (if there are many) to see how much opportunity is available to benefit from the university’s inventions. For example, there has been a recent trend among charitable foundations to require that a royalty-sharing provision be included in their contracts as a condition of receiving their grant. While this may be understandable from the standpoint of the foundation, the net effect is to reduce the amount of income that would otherwise come to the university. Some institu-
tions have made the value judgment that research dollars today are more important than royalty income they might receive from hypothetical IP tomorrow. High royalty income and generous IP rights to sponsors usually do not go hand in hand.

The important role played by universities in economic development is well recognized by most state government leaders, policy makers and the general public. One easily quantifiable measure is the number of new start-up companies spun out of the universities annually. Table 4 shows some of the top performers in this category in 2007, normalized for R&D expenditures. Start-up activity is not only a measure of an institution’s innovation productivity but also the whole entrepreneurial ecosystem that has been developed in the area in which it is located. This ecosystem makes it possible for the innovations to be translated into new business and the nascent companies to be nurtured until they can stand on their own. In addition to new technology, start-ups require capital, experienced business professionals, skilled workers, and other resources often in short supply. The technology is only one component in the chain.

Over the years we have seen a steady increase in the percentage of disclosures that are drafted into patent applications. Today, it appears that most universities (large, medium and small) are filing patent applications on roughly half of their incoming disclosures. Interestingly, the small and medium institutions are filing a slightly larger percentage of patents than the larger universities (~60% for small and medium vs. 50% for large institutions) — see Table 1. This increase may be due to in part to the ability to file inexpensive provisional applications. There seems to be a growing tendency to file first and then see what interest the technology generates from the market and/or assess it for patentability and commercial potential. At one extreme, Cal Tech files a provisional application on virtually every new disclosure (endnote #2). While there may be merits to this approach it still requires the expenditure of some funds for legal services and it may delay the often difficult regular patent filing decision. Sometimes it can be more difficult to abandon a pending patent than not to file one in the first place. On the other hand, this strategy can pay off if a licensee is found that is willing to pay for the conversion.

As Table 1 indicated, the large and medium institutions have better success at getting their inventions licensed or optioned (23.6% and 17.8%, respectively) than the smaller universities (13.7%). This trend is consistent with the %issued patents/disclosure ratio — 18.8%, 16.9%, and 13.3%, respectively. It may reflect the fact that companies prefer to license patented technologies rather than unpatented or patent pending technologies.

Interestingly the larger institutions have a greater percentage of their patent/legal expenses reimbursed by their licensees (46.6%) than the medium and smaller institutions
(27.9% and 10.6%, respectively) — see Table 5.

One explanation might be that the larger institutions license a relatively greater percentage of their technologies (see above). This is not too surprising since it is very common for the licensor to ask an exclusive licensee to reimburse them for their patent expenses. Alternatively, smaller institutions may be doing more non-exclusive licenses which generally do not bring full reimbursements.

To get a rough estimate of how much institutions are paying for patent filings, we divided the total amount of money the institution spent on patent/legal expenses by the number of new U.S. patents filed. Granted, not all the money is spent only on the preparation and prosecution of a new patent. Some is spent on maintenance fees for issued patents, foreign filings, continued prosecution of previously filed patents, etc. Nevertheless, it does provide a first approximation of what institutions are paying for a patent application. Worthy of note is that the larger institutions are paying more than the smaller institutions. This is true even if one subtracts for reimbursements. The amount spent per new application is still higher for the large institutions compared to the smaller institutions. While a high number may signal that an institution is paying top dollar for patent/legal services in an effort to get high-quality IP protection, it could also just mean that they incurred some extraordinary expenses that year — e.g., expenses related to a patent infringement lawsuit. Ordinarily, one would think that a low number is better. If it is too low, however, it may be a sign that the institution is filing a high percentage of inexpensive provisional patents. It could also mean that they have hired in-house counsel and are having their staff attorneys write and prosecute the applications.

Two additional metrics not tracked by the AUTM survey but nonetheless useful in our estimation in assessing technology transfer performance are: 1) percentage of patented or patent pending technologies licensed, and 2) degree to which marketing solicitations generate follow-up requests for more information under a non-disclosure agreement (NDA). A high percentage for the first metric tells you whether you are placing your bets on the right technologies (risking your money on the most commercializable technologies). The second metric tells you whether you are marketing your technologies to the right targets. For example, a high response would
indicate that you are hitting the mark and doing a good job at market research. (One caveat, however, is that in general it is less difficult to market and license major discoveries made by pre-eminent scientists. Often industry technology scouts come looking for these types of discoveries and little marketing effort is needed. But if conducted, the marketing of these high profile cases will generally result in a high response rate. In some respects, then, it is more impressive to see an office that is successful in marketing and out-licensing a significant but yet non-revolutionary innovation, by a novice researcher without a strong track record. Finding a home for these types of technologies can often be more challenging.)

As the author Fletcher Knebel once said, “smoking is one of the leading causes of statistics.” A corollary might be “technology transfer is one of the leading causes of statistics.” To draw any meaningful conclusions about technology transfer performance, one must take care in interpreting the data. Many parameters can be used to assess the performance of a technology transfer operation. Each parameter provides a measure of a different facet of the office and institution. However, unless one delves beneath the surface to understand the factors that may be affecting these parameters, they will be left with a superficial understanding of the office’s operation. Obviously, it takes more than one year’s worth of data to make a fair assessment of an office, particularly for new offices just getting started in technology transfer (endnote #3). In performing this analysis we did not attempt to account for differences in staffing (level or experience) or budget (e.g., patent/legal budget) which naturally will affect overall performance.

In conclusion, it is our opinion that comparisons between institutions should be done in relation to their peer groups (as Frederick Douglas once said, “You are not judged on the height you have risen but from the depth which you have climbed”). Furthermore, top-line statistical data can sometimes be misleading and lead to erroneous conclusions unless analyses are conducted in view of performance factors. Ultimately, technology transfer offices should be evaluated in terms of the overriding mission of the university and the primary goal that it is trying to achieve through technology transfer, which can differ from institution to institution (e.g., attract corporate research dollars, generate discretionary income, promote regional economic development, benefit the public, etc.). So while comparisons can be made, each office inevitably must function as best suits the institution in which it is housed.

Endnotes

1. Association of University Technology Managers. (2003). AUTM Licensing Survey. Figure US-28 (151/25,979 = 0.6%).

2. Statement by Lawrence Gilbert, J.D., M.B.A., Senior Director, California Institute of Technology, Office of Technology Transfer, during a presentation at AUTM Advanced Topics Course, December 6, 2008, New Orleans, LA.

3. Generally speaking, significant royalty income only comes after the licensed product has reached the market and grabbed market share. It may take offices new to the game 5–10 years before their licensed technology gets to this point. So it is expected that they will lag in royalty income for a while.

He previously served as Dean of the College of Engineering and Science at Louisiana Tech. At LTU, he oversees several engineering and science research centers as well as the intellectual property and commercialization activities at the University. His research activities have included studies in structures and materials. He has also led several National Science Foundation projects focused on technology commercialization. He is Chair of the State-wide Louisiana Optical Network Initiative (LONI) Management Council.

Richard Kordal is Director, Office of Intellectual Property and Commercialization, Louisiana Tech University. He earned a Ph.D. in Chemistry (biochemistry emphasis) from the University of California, Santa Barbara. He has 18 years’ experience in the in vitro diagnostics industry with Dade/Baxter, Boehringer Mannheim, Instrumentation Laboratory and Bionostics in various technical, supervisory and managerial positions, including industrial technology assessment. During his employment in industry he has taken more than 10 products through R&D into the market. Prior to joining Louisiana Tech University he was Director, Intellectual Property Office and University Patent Officer, University of Cincinnati. He is active in professional technology transfer organizations and currently serves as AUTM’s Assistant Vice President for Metrics and Survey (U.S.). He co-founded an Internet-based brokerage service, Techquisition.com, to make the marketing and acquisition of technology easier for both buyers (licensees) and sellers (licensors) of technology.
Knowledge Check

The Q&As at ¶1990.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 1900 has been understood. Note: For the answer key for ¶1990.1, see ¶1990.3, which appears on a separate page (page 1990:5) for testing purposes.

Discussion topics at ¶1990.2 are designed to engender dialogue among staff on general issues of importance in the field.

§1990.1 Q&As

1. Perhaps more than any other federal agency, which of the following has issued guidance and policy with respect to data generated in the conduct of funded research:
   (a) National Science Foundation
   (b) Department of Health and Human Services/National Institutes of Health
   (c) Office of Science and Technology Policy
   (d) Department of Health and Human Services/Office of Laboratory Animal Welfare

2. The Bayh-Dole Act is concerned principally with
   (a) Protection of human subjects in research
   (b) Ownership of intellectual property
   (c) Export controls
   (d) Data processing in federally funded research

3. A material transfer agreement typically covers all of the following EXCEPT:
   (a) Data rights
   (b) Research use of the material by the recipient
   (c) Liabilities and indemnification issues
   (d) Cost principles and cost transfers

4. All of the following are some typical material transfer agreement trouble spots EXCEPT:
   (a) Definition of the material
   (b) Rights to modifications and derivatives
   (c) Publication or confidentiality clauses
   (d) Name of principal investigator(s)
5. You typically would consult the DFARS if you had a contract with which of the following?
(a) Department of Education
(b) Defense Department
(c) NASA
(d) Veterans Affairs

6. Technology transfer as covered by an MTA is
(a) The commercial licensing of technologies and inventions
(b) Exporting controlled technology with an appropriate license
(c) Publishing proprietary and nonproprietary research results
(d) A license to conduct research on and send defense-related technology abroad

7. As used in Chapter 1900, what does NDA stand for?
(a) Negotiable data agreement
(b) Notice to desist agreement
(c) Negotiable data access
(d) Nondisclosure agreement

8. IRS Revenue Procedure 97-14 (“Guidelines for Research Agreements”) is applicable
(a) When sponsored research is conducted in facilities constructed in whole or in part with tax-exempt bond proceeds
(b) When sponsored research is conducted in facilities constructed in whole or in part with federal contract dollars
(c) When sponsored research is conducted in facilities constructed in whole or in part with federal award dollars
(d) When sponsored research is conducted in facilities outside the continental United States

9. As used in ¶1905, a license is basically
(a) A consideration or compensation paid to the licensor in exchange for certain rights in technology that the licensor is providing to the licensee
(b) Usually entered into as a subaward with a collaborating academic institution
(c) A grant of a right to use IP
(d) Any original investigation for the advancement of scientific knowledge not having a specific commercial objective
\section{Discussion Topics}

1. What, if any, special policies does your institution have for sharing research data and resources? Do the policies cover ownership, access, and retention? If yes, why? If no, why not?

2. What intellectual property issues might arise when negotiating and accepting research agreements from foundations and other private nonprofits that might differ from agreements involving federal and industry sponsors?

3. Sponsors often attempt to impose intellectual property terms in agreements that are generally unacceptable to institutions of higher education. Discuss what terms your institution might find objectionable and ways of dealing with them.

4. Where would you go for guidance on how to craft and implement effective institutional policies regarding inventions created at least in part with federal funds?

5. Briefly, what is meant by the following terms: patent, copyright, trademark, and trade secret?

6. Does your institution have an intellectual property policy, or are issues relating to intellectual property covered by various policies? If the latter, how do you coordinate protections afforded intellectual policies?

7. What is the relationship between conflict of interest and intellectual property?

8. What is technology transfer and how is it handled at your institution? What role, if any, does the research administration office policy?

9. How is intellectual property protected in the case of departing (transferring, retiring, etc.) principal investigators?

10. What is your policy with respect to data safety monitoring boards? That is, who can sit on them and are members compensated?

11. Does your institution have a research integrity office or official? If yes, what role does this person play in protecting data and intellectual property rights?
§1990.3  **Answer Key**

Following are the correct answers to the questions included at §1990.1.

1. (b) Department of Health and Human Services/National Institutes of Health
2. (b) Ownership of intellectual property
3. (d) Cost principles and cost transfers
4. (d) Name of principal investigator(s)
5. (b) Defense Department
6. (a) The commercial licensing of technologies and inventions
7. (d) Nondisclosure agreement
8. (a) When sponsored research is conducted in facilities constructed in whole or in part with tax-exempt bond proceeds
9. (c) A grant of a right to use IP

¶2101 Introduction

This chapter addresses the special considerations for academic medical centers (AMCs) and their clinical research activities. It also provides insight into ways sponsored research administrators can handle these unique challenges.

Gunta Liders and Anthony Beckman of the University of Rochester introduce this topic by setting forth the mission of academic medical centers: patient care, research, and education. This unique tripartite mission makes the academic medical center different both from the other sectors of the typical university and from other hospitals and clinics that don’t have the teaching and research missions. The world of biomedical research has experienced unprecedented growth in recent years. This has created a series of both challenges and opportunities for medical schools and academic medical centers. In this chapter, the authors clearly and carefully outline the issues and problems that are unique to the academic medical center environment and discuss in detail the implications of each of these circumstances for the research administrator.

Liders and Beckman also provide illustrations of research administration challenges, e.g., use of human subjects, conflict of interest, and effort reporting, that are not limited to the academic medical centers. However, they effectively show how each of these challenges takes on new dimensions in this environment. Their review of this topic also includes information on some of the specific issues facing academic medical centers: human embryonic stem cell research, the Health Insurance Portability and Accountability Act (HIPAA), and the roles and responsibilities of affiliated hospitals. Liders and Beckman have provided an excellent diagnosis of the major research administration issues afflicting academic medical centers and also have offered a comprehensive list of resources, which, if properly implemented, will contribute to a full recovery.

This chapter will continue to respond to the information needs of research administrators at academic medical centers through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶2105, as appropriate. Content added to other sections of the chapter will provide readers supplementary discussions of related topics (at ¶2120), practical tools (at ¶2130), case studies (at ¶2140), and funding trends data and other related statistics (at ¶2160). A “knowledge check” containing Q&As and discussion topics is included at ¶2190.
Special Issues for Academic Medical Centers

Gunta J. Liders
Associate Vice President for Research Administration
University of Rochester

Anthony Beckman
Senior Research Administrator
Office of Research and Project Administration
University of Rochester

This chapter addresses special research administration issues for academic medical centers. Academic medical centers (AMC) have a traditional tripartite mission — patient care, research, and education. This distinguishes AMCs from other hospitals and clinics that are not as concerned with the latter two missions.

The very nature of biomedical research — which includes activities involving human subjects, industry-funded clinical trials, and other high-risk research — broadens, enhances, and complicates the issues for sponsored research administration in the AMC environment. In addition institutions that own their hospitals, or that are “covered entities” as defined under the Health Insurance Portability and Accountability Act (HIPAA), face additional requirements with which sponsored programs offices must be familiar.

This chapter discusses some critical issues for the AMC sponsored program office and provides some resources that could assist in helping to improve the administration of the institution’s sponsored programs. This chapter also provides an overview of organization, staffing, communication, and resource topics.

Note: A list of resources is included at the end of the chapter (see Figure 5).

Overview of Special Issues

The following are several unique issues that an office of sponsored programs (OSP) located in, or responsible for, a medical center may need to deal with

1. **Clinical faculty appointments and clinical practice compensation issues**: Medical centers must grapple with the concept of a clinical faculty appointment, or a faculty member that devotes his or her time to clinical, research, educational, and administrative duties. Because clinical compensation plans and administration of these plans can vary widely among medical centers, each institution must understand how its compensation plan “fits” within the existing regulations and how compliance is achieved.

2. **Clinical research**: The clinical research environment presents unique administrative, regulatory, and ethical challenges. Clinical research is defined by the National Institutes of Health (NIH) as “research conducted with human subjects (or on material of human origin such as tissues, specimens, or cognitive phenomena) for which an investigator directly interacts with human subjects. This area of patient-oriented research includes: i. development of new
technologies; ii. human disease mechanisms; iii. therapeutic interventions; and iv. clinical trials. Clinical research also includes epidemiological and behavioral studies and outcomes research and health services research.”

“Human subject” means a living individual about whom an investigator (whether professional or student) conducting research obtains (1) data through intervention or interaction with the individual, or (2) identifiable private information.

Clinical research also raises potential risks relating to clinical service billing. Billing for procedures, items or tests furnished to clinical research subjects is a complex task because (in addition to many other issues) of the need to determine whether a clinical service might qualify for insurance reimbursement and, if so, which costs are reimbursable by insurance and what approvals/dокументation/other requirements might be prerequisites to such billing. Potential fines and penalties for noncompliance with applicable policies may be substantial.

Clinical trials: Clinical trials are a subset of clinical research that involves the testing of drugs, devices, biologics, and behavioral or other interpersonal interventions in humans in order to determine their feasibility, efficacy, and side effects. Biomedical clinical trials of experimental drug, treatment, device, biologics or behavioral intervention may proceed through four phases. NIH defines these phases in the following manner:

◆ **Phase I** clinical trials test a new biomedical intervention in a small group of people (e.g., 20–80) for the first time to evaluate safety (e.g., to determine a safe dosage range and to identify side effects).

◆ **Phase II** clinical trials study the biomedical or behavioral intervention in a larger group of people (several hundred) to determine efficacy and to further evaluate its safety.

◆ **Phase III** studies investigate the efficacy of the biomedical or behavioral intervention in large groups of human subjects (from several hundred to several thousand) by comparing the intervention to other standard or experimental interventions as well as to monitor adverse effects, and to collect information that will allow the intervention to be used safely.

◆ **Phase IV** studies are conducted after the intervention has been marketed. These studies are designed to monitor effectiveness of the approved intervention in the general population and to collect information about any adverse effects associated with widespread use.

Typically academic medical centers are involved in phase II or phase III clinical trials; however, AMCs are increasingly engaged in early-stage clinical trials (pre-clinical and phase I) or even post-approval studies (phase IV).

(3) **HIPAA**: The regulations of the Health Insurance Portability and Accountability Act (HIPAA) govern the privacy and security of health information. HIPAA applies only to a medical center that is a “covered entity” or “a health care provider who transmits any protected health information in electronic form.”
Sponsored programs offices become involved with HIPAA when health care information is likely to be transmitted in the course of conducting sponsored programs.

(4) **Select agents and other high-risk biomedical research:** AMCs are more likely to engage in research with select agents than other types of universities. Select agents are a group of microorganisms and toxins that the Centers for Disease Control considers to have potential to pose substantial harm to human health. A parallel group of agents has been identified by the U.S. Department of Agriculture (USDA) as “High Consequence Livestock Pathogens and Toxins.” This is a group of microorganisms and toxins considered to have the potential to pose a severe threat to animals or to animal products. A list of these select agents can be found here:

There are other types of research that a sponsored programs office in a medical center may encounter, which may necessitate the creation of additional safeguards for review and tracking or additional oversight committees. This research could include human embryonic stem cell research or gene transfer research, or so-called dual use research.

(5) **Predominance of NIH funding:** The very high predominance of funding from one particular research sponsor creates a unique environment for a sponsored programs office at an AMC.

(6) **Relationships to affiliated hospitals:** The sponsored programs office’s relationship to its affiliated (but not owned) hospitals may be one that needs repeated clarification. Affiliated Veterans Affairs (VA) hospitals fall into this category and require the AMC to manage practical aspects of the relationship, such as the VA’s particular position on intellectual property conceived or reduced to practice in VA facilities.

Along with these unique issues, biomedical research accentuates some of the management challenges associated with conflict of interest, international partnerships, and subcontractors, and the management of multisite clinical studies. The liability associated with medical school activities and clinical trials research is significant, thus sponsored programs offices must engage in the proper processes that ensure appropriate legal review and risk management.

Finally the sense of urgency that sometimes accompanies biomedical research, such as clinical studies when critically ill subjects meeting the enrollment criteria may be waiting to receive an investigational drug or device, begs for a clear sense of office priorities.

Understanding key principles, practices, and external requirements is an essential component of effectively overseeing sponsored programs at an AMC. Separate discussions of key issues confronting OSPs at academic medical centers are included below.

---

1 See [http://www.selectagents.gov/SelectAgentsandToxins.html](http://www.selectagents.gov/SelectAgentsandToxins.html)
¶2105.2 Organizational, Staffing, and Communication Issues

As noted, academic medical centers face unique issues which require attention from the office of sponsored programs. The diversity of organizational structures among academic medical centers only adds to this complexity. For instance, some universities have established separate sponsored programs offices for their medical centers that may have different reporting structures from the rest of the campus (e.g., such offices may report to the dean of the medical school or associate dean for research). This in and of itself may create organizational, staffing, and communication issues among two or more sponsored programs offices and for the institution at large.

Other universities choose to keep their sponsored programs offices centralized under one leadership (with dotted-line reporting or accountability to the university’s academic leaders), but retain at least two physical office locations to provide facilitated service to the various schools/colleges. For those institutions that do not have the ability to maintain two physical locations, or locate the central office directly within the medical center, it is imperative to find other methods for efficient service delivery between the sponsored programs office and medical center (e.g., swing space, courier service, frequent meetings or training sessions at other locations).

Accommodating NIH Funding

The predominance of National Institute of Health (NIH) funding also may impact a sponsored programs office, and how it is structured in order to accommodate and facilitate the heavy workloads that exist around standard proposal deadlines. Some offices been successful creating NIH “specialists” to be able to effectively address questions and problems related to NIH guidelines; others choose to cross-train all professional staff in order to enlist the greatest amount of human resource during these deadlines and ensure coverage during staff absences.

Communication with Other Groups

An OSP at an academic medical center will interact with a variety of institutional offices and personnel.

Regulatory Committees. Because of the emphasis on human and animal research issues, medical centers are required to create regulatory committees and offices to oversee the various regulatory aspects of biomedical research that are distinct from the OSP. While many of these committees and/or offices are critical to universities without medical schools, the regulatory requirements of biomedical research may require the following additional committees within an institutional setting: human use of radioisotopes committee, gene transfer oversight committee, and embryonic stem cell research oversight committee. The OSP needs to have an understanding of these committees, their missions, and the interface between and among offices.

Clinical Trial Offices. Many AMCs have established separate clinical trial offices to facilitate and increase clinical study activity. The organizational link to the sponsored programs office is critical, and a clear sense of the individual office roles and responsibilities must be fostered. Clinical trial offices may assume various roles,
whether it is to promote and facilitate clinical trial activity, to conduct oversight
or audit reviews to ensure that clinical studies are conducted and/or billed in a
compliant manner, to assist with the development of budgets, to negotiate the
terms and conditions of clinical trial agreements, or to monitor ongoing studies
with respect to recruitment and billing. Research compliance has become an
important focus of any clinical trial office and at some academic medical centers this
compliance monitoring role has been transitioned into its own office. (See: http://
medschool.duke.edu/compliance)

**Other Institutional Offices.** The AMC sponsored programs office must also have
clear organizational and communication links to the
◆ office of legal counsel (having one or two specified liaisons within this office is
  recommended),
◆ conflict of interest committee(s),
◆ hospital compliance office (if applicable),
◆ foundation relations/development,
◆ office of technology transfer,
◆ office of corporate alliances,
◆ public relations department, and
◆ medical library for the purposes of coordinating support for the faculty for
certain NIH policies, such as its public access policy, data sharing plans and
processes, etc.

It is not unusual for sponsored programs at an AMC to generate the second-larg-
est source of revenue after patient care revenue. Thus research activities play a ma-
jor role within the institution, and the sponsored programs office must be connected
to all the key players.

**Research Community.** Communication from the sponsored programs office to its
constituency (e.g., deans, faculty, administrators, study coordinators) is critical; this
basic principle does not differ from that of sponsored programs offices that are not
located in medical schools. Communication can be accomplished by the traditional
means, such as via listservs, newsletters, formal presentations, and workshops. This
communication does get more complicated when there are two or more sponsored
programs offices within the university, and the need for information is cross-divi-
sional.

Some medical centers have established intranets, or other dedicated communi-
cation vehicles. These could be extremely helpful to ensure control or security over
the information, but also prove to be somewhat limiting in transmitting communi-
cation that is vital to the entire university enterprise. Thus OSPs utilizing an intranet
or other electronic means for information dissemination should consider the scope
of the intended audience and use more traditional means of communication when
necessary. (For a full discussion of communications, see Chapter 500.)
Resources Required

Resources critical to the AMC sponsored programs office are largely identical to those needed by sponsored programs offices that are not located at medical centers — adequate staff (discussed above), technology, and expertise.

Technology

Because of the volume of research conducted with human and animal subjects, access in some form to limited portions of the databases of the regulatory committees is critical. For example, the Institutional Review Board (IRB) must maintain records of who has completed the educational requirement required by NIH in order to conduct human subjects research. It is imperative that sponsored programs office personnel maintain or have access to this information, preferably electronically. In other words, the institution could benefit from shared data or co-located databases that allow information exchange between both IRBs and OSPs.

The OSP database needs to accommodate data relating to many aspects of research and be able to produce reports on the use of certain materials, biohazards, etc. The OSP will need to complete periodic survey data, and it is not unusual for it to produce frequent reports for the following offices:

◆ Dean
◆ Budget
◆ Property accounting
◆ Development
◆ Hospital (if owned by the institution)
◆ Institutional Biosafety Committee
◆ Human Embryonic Stem Cell Oversight Committee
◆ Environmental Health and Safety Committee
◆ Radiation Safety Committee

In addition databases need to accommodate the types of research that would be conducted at medical centers, including fixed-price, per-subject clinical trials, and track the specific award mechanisms used by NIH (e.g., program project grants, training grants). It is critical that the data be exported to a central database or warehouse where academic units can generate their own reports.

Expertise

OSPs should ensure that they are signed up to receive notifications from the NIH Guide for Grants and Contracts, NIH NEXUS, American Association of Medical Colleges (AAMC) and other resources that provide timely information on changes in regulations and requirements that would impact the medical center environment (see Figure 5).

Educational programs offered by the OSP need to address the robustness and
complexities of the clinical regulatory environment and recognize the fact that departmental administrators may move from clinical to research responsibilities and not be familiar with the compliance requirements associated with research. Similarly OSP’s should ensure that they possess appropriate levels of expertise regarding the clinical enterprise and its operation to better facilitate clinical research endeavors.

OSP’s should anticipate that their staffing needs will be quite complex and require individuals with broad knowledge of sponsored programs and experience dealing with various sponsors and award mechanisms. Regardless of the scope of the OSP (in relation to the other offices noted above) staff will need to have a diverse skill set that includes the ability to develop budgets, negotiate legal terms, and build effective relationships with principal investigators.

‡2105.4 Human Subjects Research

Because the medical center environment focuses on biomedical and clinical research (much of it of greater than minimal risk), sponsored programs offices must ensure that roles and responsibilities of the IRB and the OSP itself are clearly understood by both parties. Included below are sample mission statements for the two offices.

Example

OSP: The Office of Sponsored Programs serves and guides the university on all aspects of sponsored programs administration by

- providing pre- and post-award services;
- providing stewardship of external sponsored funding;
- providing training and education; and
- maintaining information systems pertinent to research administration and funding.

IRB: The mission of the Institutional Review Board is to protect the rights and welfare of human research subjects at the university. To accomplish this, it reviews and approves the initiation of and reviews periodically research involving human subjects.

The roles of the IRB and OSP offices intersect, and the key points of human subjects research must be understood by the sponsored programs staff in order to properly respond to questions, negotiate agreements, and review synopses of proposed human subjects research in proposals and applications.

Working with the IRB

Periodic meetings between the sponsored programs and IRB staff are especially useful to educate the IRB staff on the grant proposal and award processes and to enlighten the sponsored programs staff on nuances of the regulations governing human subjects research. Universities’ IRBs are guided by the ethical principles described in The Belmont Report and by the regulations of the Food and Drug Administration (FDA) (21 CFR 50 and 56) and the Department of Health and Human Services (HHS) (45 CFR 46). (For information on where to find these and other
resources, see Figure 5.) Sponsored programs staff should be aware of these requirements. At the least, it is advisable that all professional sponsored programs staff in the mandatory and voluntary educational programs offered by the IRB. For an overview of the compliance requirements of human subjects research, see Figure 1.

**Figure 1: Identifying Human Subject Research**

The following was excerpted from the Investigator Handbook prepared by the University of Rochester (see [https://www.rochester.edu/ohsp/documents/ohsp/pdf/policiesAndGuidance/Policy_901_Investigator_Responsibilities.pdf](https://www.rochester.edu/ohsp/documents/ohsp/pdf/policiesAndGuidance/Policy_901_Investigator_Responsibilities.pdf). It is provided here as background on the Belmont Report and the basic ethical principles guiding human subject research. (Note: RSRB refers to the university’s Research Subjects Review Board.)

Human subject research is any activity that either:

- Meets the DHHS definition of research and involves human subjects as defined in the DHHS regulations; OR
- Meets the FDA definition of research and involves human subjects as defined in FDA regulations.
- Research as defined by DHHS regulations: A systematic investigation, including research development, testing and evaluation, designed to develop or contribute to generalizable knowledge. A “systematic investigation” generally means that there is a study plan/protocol that is followed. Contributing to “generalizable knowledge” means that there is or will be a report, publication, poster, communication, etc. that provides the results and conclusions of the research to other people/clinicians/researchers.
- Research as defined by FDA regulations: Any experiment that involves a test article and one or more human subjects, and that either must meet the requirements for prior submission to the FDA under section 505(i) or 520(g) of the act, or need not meet the requirements for prior submission to the FDA under these sections of the Food, Drug and Cosmetics Act, but the results of which are intended to be later submitted to, or held for inspection by, the FDA as part of an application for a research or marketing permit. For research involving drugs, an experiment is any use of a drug except for the use of a marketed drug in the course of medical practice.

As a means of highlighting some of the areas where both offices must work closely together, a series of scenarios is presented below.

**Examples**

#1 The grant administrator has received a proposal that indicates that the human subject research proposed is exempt from 45 CFR 46. There is no documentation that the IRB has reviewed this proposal. Is the certification from the investigator adequate?

#2 An investigator has submitted a protocol to the IRB that will be included in an NIH grant, and the application indicates that the inves-
tigator has a financial interest that could affect the proposed protocol. What should the IRB administrator do?

#3 The grants administrator is negotiating a subcontract that involves human subject research in a foreign country. This foreign entity’s negotiator will not accept governance by the regulations of the U.S. Department of Health and Human Services (45 CFR 46), but indicates that the regulations of the foreign country will prevail. What should the grants administrator do?

#4 The IRB has, unfortunately, discovered a serious lapse in an investigator’s conduct of a clinical study and has temporarily suspended the IRB approval of this investigator. What communication should take place between the IRB and the sponsored programs office?

While each academic medical center may have differing processes and practices to address the preceding scenarios, it is evident that a good working relationship between offices will help to ensure compliance with the applicable regulations and requirements, as well as facilitation of the issue at hand.

There are other, more informal ways that offices work together, such as referencing each other’s Web sites, providing reciprocal links to each office’s educational requirements and offerings, and assisting in the tracking of clinical research within the institution (as not all clinical research is sponsored by an external party). Both offices need to educate the community on “just-in-time” processes (e.g., sponsor requests for additional documentation and regulatory approvals are deferred until the proposal receives a fundable score) and when IRB review is expected and when it should occur. For instance, even though a sponsor may not require IRB approval at the time of the proposal, the institution may have determined that it will still review certain protocols prior to proposal submission, such as for gene transfer studies or if a principal investigator (PI) is not in good standing. Both the IRB and the OSP should be aware of and enforce institution-specific requirements.

Finally the importance of a strong relationship between the IRB and the OSP becomes apparent when an institution is applying for accreditation under the Association for the Accreditation of Human Research Protection Programs (AAHRPP) (see Figure 5). This exercise highlights how institutional policies and processes must work in concert to ensure full compliance with the regulations governing protection of human subject volunteers.

\(\texttt{2105.5 \hspace{1cm} Clinical Trials}\)

Clinical trials present additional challenges to the sponsored programs office. As noted above, some medical centers have clinical trial offices, and some of the responsibilities normally undertaken by the sponsored programs office may be placed in the clinical trials office. For purposes of this section, it is assumed that the sponsored programs office is responsible for negotiating the key terms and conditions of

\(^2\) See for example http://www.rochester.edu/ohsp/policies/guidanceDocuments.html
clinical trial agreements. These key negotiation provisions include payment (including noncancelable start-up costs, a per-patient fee, and other pass thorough costs), F&A costs, termination, publication, intellectual property, liability and indemnification, subject injury, confidentiality, and choice of law.

AMC negotiating positions on some of these provisions may differ depending on whether the clinical trial protocol is industry sponsored and industry initiated, or PI initiated. Sponsor-initiated studies are generally conducted by the AMC on behalf of the industry sponsor as a requirement of obtaining FDA approval for drugs or devices. Under this scenario, AMCs are generally reluctant to deviate from standard policies as the commercial sponsor will obtain in the full benefit of any work done by the AMC.

Investigator-initiated protocols are written and developed by an AMC faculty member, typically because the faculty member would like to investigate a hypothesis on an expanded or new use of an FDA-approved drug. In this case, the faculty member and AMC will file for the new drug or device application directly with the FDA, designating the AMC as study sponsor, and may need to consider absorbing additional risks by the institution. Oftentimes industry partners will participate in the investigator-initiated protocols by providing drug or supplies – but are unwilling to provide indemnification beyond the minimal manufacturing risk. Therefore the AMC will need to have a process in place for review and risk mitigation for the potential adverse event concerns.

**Contract Negotiations**

Clinical trials are an area where close communication between the OSP and other institutional offices continues to be vital and may become even more complex. For instance, many AMC’s have strict indemnification policies for industry-supported trials, and these policies may be dependent upon whether or not clinical studies present greater than minimal risk. Therefore there must be a communication mechanism in place with the IRB in order for the sponsored programs office to know what necessary provisions must be negotiated based upon risk determination. The AMC’s legal counsel also becomes a critical resource for the sponsored programs office when negotiating clinical trials.

While there are no universally “standard” positions with respect to negotiation of key policy and management areas among AMCs, there are basic recommended principles that are normally embraced by institutions. These principles are discussed in the AAMC publication entitled “Clinical Trial Contracts: A Discussion of Four Selected Provisions.”

The key policy and management areas that must be addressed by sponsored programs offices with respect to contract negotiation are the following:

- **Publication**: Does the institution ever accept a publication restriction for a clinical study? Does it ever accept a delay longer than 90 days? What is the length of delay that an institution will accept if it is participating in a multisite study and the institution wishes to publish its own results? Is this ever longer than a year?

---

3 See [https://members.aamc.org/eweb/upload/Clinical%20Trial%20Contracts.pdf](https://members.aamc.org/eweb/upload/Clinical%20Trial%20Contracts.pdf)
Who within the institution makes these determinations?

◆ **Intellectual property:** Will the institution be willing to give up title to intellectual property in a sponsor-initiated clinical trial? Will it give up all intellectual property or only that intellectual property that results from the stated activities of the protocol? Does this policy differ if it is a PI-initiated trial? Who within the institution makes the decision on intellectual property issues in clinical trials? If the institution finances building construction with the issuance of tax-exempt bonds, then it may also be necessary for bond counsel to render an opinion on assigning title on intellectual property and whether there are any constraints imposed by Revenue Procedure (Rev. Proc.) 2007-47.

◆ **Indemnification:** Does the institution always insist upon full indemnification for damages sustained as a result of conducting the protocol? Under what situations will this requirement be reduced or waived by the institution? Will the institution require full indemnification for PI-initiated studies? What types of indemnification is required on PI-initiated studies? Does the institution have a formal policy whereby a risk assessment is done to determine the amount of risk the institution is willing to undertake?

◆ **Subject injury:** Does the institution always require the sponsor to pay for a subject’s injuries that are sustained as a direct result of participating in a trial? Are there any exceptions? What about PI-initiated studies? Who makes the exceptions? How does the institution assure that the language in the clinical trial agreement mirrors the language in the human subject’s informed consent form?

These questions illustrate the need for clear institutional policy and clear authority for deviations from standard policy. At some medical centers, authority for determinations and deviations on these issues may rest with different individuals. Or it may be that the institution will never accept deviations (which may ultimately result in failed attempts at negotiation). For some negotiation issues, questions concerning academic freedom may arise. For others issues the decision is based on the institution’s overall aversion to risk. And for still other issues, it is a question of what the IRB requires with respect to human subjects protections. There are many resources that can assist an institution and the OSP in molding its policies and management strategies around these issues (see the resources included in Figure 5).

**Example**

The University of Rochester does make an exception for indemnification and provision for subject injury when the protocol is PI initiated. However, there is a definitive process for doing this, and the IRB, the sponsored programs office, office of counsel, and the Senior Associate Dean for Clinical Research all have a role in the process. The policy was approved by the highest levels of the university, thus there is a clear expectation of what needs to take place. The institution also has a clear policy for the provision of full indemnification and payment for subject injury when the protocol is sponsor initiated. The need for both policies to be clearly articulated is critical in the proper negotiation and...
facilitation of clinical studies.

**F&A Reimbursement.** Another issue that may be assigned to an institutional decision maker is that of facilities and administrative (F&A) reimbursement. F&A rates for industry-sponsored clinical trials will normally be based on an institution’s Other Sponsored Programs (OSP) rate. One of the rationales for charging less than the institution’s federally approved research rate is that sponsor-initiated trials typically do not have a basic research component. Often, the protocol is administered at an off-site location. Some industry sponsors will have caps on what they will reimburse, and thus institutions will need to develop their own policies with respect to waivers on F&A rates, or whether this issue is negotiable. It is recommended that the AMC have a documented policy regarding indirect cost rates for clinical trials to help ensure consistency across all trials. It is important to keep in mind that a rate applied to industry sponsored clinical trial may be influenced by broader market forces as well.

**Mission of the Institution**

Clinical trial research raises two issues which highlight the importance of confirming that the work being undertaken is consistent with the AMC’s mission.

*Intellectual Property:* As noted earlier, it may be necessary to engage tax counsel in issues surrounding title to intellectual property arising from clinical studies.

*Unrelated Business Income:* Related to this issue, AMC’s need to be aware that clinical trials, because they are often focused on testing rather than basic research, could be construed as “regular activity that is not substantially related to its tax exempt purpose or function.” As such the activity could be subject to unrelated business tax (UBIT). AMC’s can avoid this classification by ensuring that any trials conducted are fundamentally related to education and research. Additionally AMC’s can avoid UBIT by documenting how the activity being undertaken relates to the AMC’s mission.

At one medical school, a simple questionnaire is appended to the institution’s routing form that asks several questions, as included in Figure 2. By virtue of analysis of the answers to these questions, the institution can be assured that the clinical trial activity falls within the stated mission of the institution.

AMC’s should also be concerned about industry sponsored clinical trial activities resulting in “private business use.” Within Rev. Proc. 2007-47 the section labeled “Guidelines for Research Agreements” is applicable when sponsored research is conducted in facilities constructed in whole or in part with tax-exempt bond proceeds, and it describes the conditions under which a research agreement does not result in private benefit use.\(^4\) (For a full discussion of these issues, see Chapters 2900 and 1900.) Documentation, though a checklist similar to that noted above, as well as retention of publication rights within the negotiated clinical trial agreement, will help minimize the risk from these concerns.

---

\(^4\) See 26 USC 141, “Private Activity Bond; Qualified Bond.” The “Guidelines for Research Agreements” were issued Jan. 10, 1997.
Figure 2: Research Profile for Industry-Sponsored Clinical Trials

In order to evaluate and document the proposed industry-sponsored clinical trial’s relationship to the stated missions of the “Medical Center;” the “University” requires that all principal investigators complete this “Research Profile.” It is not necessary to answer yes to every question in order to demonstrate that the study contributes to our exempt purposes. It will be the responsibility of the chair or unit chief to review the profile; any questions concerning the nature of a study must be discussed with the dean.

Has the PI or other university-designated individual had input or involvement in the study design and/or been designated manager of data-coordination activities?

________________________________________________________________________

Is the study a systematic investigation aimed at the discovery, interpretation, or verification of facts? If yes, please describe briefly or attach summary of the scientific intent of the study:

________________________________________________________________________

Is the project furthering an educational purpose? If yes, please indicate how residents, fellows, or students are involved in the study:

________________________________________________________________________

Is there therapeutic intent (i.e., potential of some benefit) to improve the research subjects’ condition?

________________________________________________________________________

Is the study concerned with new application of products or drugs in order to improve the ability to treat various diseases and conditions?

________________________________________________________________________

Does the project qualify as scientific research involving testing to validate a scientific hypothesis, rather than routine testing to determine if the item meets certain specifications?
Billing Issues

Sponsored programs administrators will need to be aware of the potentially problematic billing issues that may surface during the period of the clinical trials. As it is illegal to bill Medicare/Medicaid or other third-party payers for expenses billed to clinical trial sponsors (so called double billing), it is important that the sponsored programs office is aware of institutional policies with respect to the billing of medical treatments and procedures.

Hospital Compliance Offices. How OSPs interface with hospital compliance offices is very important, and both offices should work together to ensure compliance and effective communication in this area. Often, these offices will work together to establish not only billing practices, but appropriate budgeting and budget review for clinical trials that identifies those items and services that should be billed to the sponsor versus procedures that are routine and allowable costs to Medicare/Medicaid under the regulations. These offices, working cooperatively, can also be instrumental in pulling together training programs on the budgeting and billing aspects of clinical trials. Once such education program has been developed by the University of Chicago.5

Conflict of Commitment and Interest

Research conflicts of commitment and interest are another critical area related to clinical trials and important within research administration more broadly. Sponsored programs administrators should be extremely cognizant of the conflict of interest policies that have been established within their AMC. In particular how these policies treat the disclosure and management of financial interests if they relate to clinical studies. Even before the recent implementation of the Department of Health and Human Services Conflict of Interest policy (42 C.F.R. Part 50, Subpart F) most AMCs had established a “zero threshold” for investigators when disclosing financial interests that could affect, or appear to affect, the outcome of a clinical trial, or their research more broadly. Some AMC’s have adopted the guidelines developed by the AAMC on the management or elimination of conflicts associated with clinical trials, whereby a faculty member may not conduct a clinical trial if he or she has a significant financial interest associated with that clinical trial unless he or she can show a compelling reason to do so.

The “compelling reason” argument is interpreted slightly differently among AMCs, and, in order to provide guidance to medical center faculty, sponsored programs staff should have some understanding of the threshold and/or types of financial interest the institution deems to be significant whereby the individual either has to divest herself or himself from the financial interest or forego participation in the trial.

Others require management or divestiture only when the significant financial interest is deemed to be related to the clinical trial, and more importantly that the significant financial interest could directly and significantly affect the research.

Typically the director of the sponsored programs office will sit on the institution’s conflict of interest committee in order to provide guidance to both the com-

mittee and the sponsored programs staff in this area. It is critical that the conflict of interest committee be apprised not only of the investigator’s financial interests, but also of his or her funding portfolio. Thus sponsored programs office representation on the conflict of interest committee is extremely valuable.

**Registering Clinical Trials**

Federal law requires public registration of most clinical trials (See US PL 110-85). In fact most informed consent forms now state the following, “A description of this clinical trial will be available on http://www.clinicaltrials.gov, as required by US Law.” Additionally, the International Committee of Medical Journal Editors (ICMJE) now requires, as a consideration for manuscript publication, that the clinical trial be registered in a public registry. Registration will typically be the responsibility of the pharmaceutical company as study sponsor; however, it may be an individual investigator’s responsibility when conducting PI-initiated trials. (For a discussion of the clinical trial registration requirements under Federal Law, see ¶2120.1.)

**Institutional Administrator:** There is a requirement for an institutional representative to serves as the official contact with ClinicalTrials.gov. This person will assign user IDs for staff members who are eligible to release clinical trials data or register in ClinicalTrials.gov, the recommended public registry. This institutional role may be delegated to the sponsored programs office, or the responsibility may be placed elsewhere within the organization. The institution should ensure that the instructions for registering are readily available for researchers and administrators. (see: http://www.urmc.rochester.edu/ctsi/regulatory-support/clinical-trials-registration.cfm)

**Process Facilitation**

With all the complexities of clinical studies, it may seem almost impossible to facilitate this type of transaction. Nonetheless the sponsored research office must recognize the importance of these studies and be responsive to the time sensitivity of ensuring that they are negotiated in the most expedient manner. Informing PIs of potential issues early in the process, enlisting their help on occasion to explain university issues to industry colleagues, and understanding the implications of competitive enrollment are all important factors when facilitating clinical trials. Research administrators can also provide insight into the financial risks associated with conducting clinical trials and assist their departmental counterparts in mitigating these risks to the extent possible. Offering complete explanations of university policies, even in an annotated clinical trial agreement, will be helpful in expediting negotiations.

Many AMC’s continuously strive to improve efficiency by streamlining the routing form for industry-supported clinical trials, among other tactics. Along with facilitation, faculty must be educated on the consequences of initiating a trial without a signed contract in place or IRB approval, as well as the institutional and individual ramifications for acts of negligence. When the research administrator has the tools and knowledge they need to negotiate complex agreements with savvy industry sponsors – successful studies are the result.
HIPAA Compliance

With the passage of the Health Insurance Portability and Accountability Act (HIPAA) of 1996, which contains the national standards to protect the privacy of personally identifiable health care information (or PHI, protected health information), the conduct of clinical research by “covered entities” has been further complicated. A “covered entity” is “a health care provider who transmits any protected health information in electronic form.” For resources relating to HIPAA compliance, see Figure 5. (Additional HIPAA compliance materials are located in ¶2130.)

In order for the covered entity to conduct research using patient information, one of the following conditions must be met:

1. Permission is granted by the patient, through a written authorization form.
2. The information is completely de-identified and no longer governed by HIPAA.
3. The information is compiled in a “limited data set” and a data use agreement is executed. (See, http://www.hopkinsmedicine.org/institutional_review_board/hipaa_research/limited_data_set.html).
4. The activity qualifies as “preparatory for research.”
5. A waiver of individual authorization is obtained from an IRB or privacy board.
6. The researcher is accessing information solely on decedents.

Most IRBs have undertaken the role of the privacy board and append the individual authorization to release PHI to the subject consent form. Thus HIPAA has affected how IRBs operate and has required additional expertise from existing committees.

However, the sponsored programs office may also become involved with HIPAA requirements when negotiating clinical trial agreements covering projects that transmit PHI, in working with data use agreements (e.g., an agreement that establishes the ways that a limited data set may be used and how it is protected) that convey PHI, and in fielding questions from investigators and sponsors. Therefore it is important that the sponsored programs office have at least a basic understanding of the rules (sponsored programs personnel at covered entities are likely to be required to take at least part of the mandatory HIPAA training). The office must also understand

1. the roles of the privacy board or IRB;
2. the role of the institution’s privacy officer, and
3. the role of the OSP when negotiating agreements.

Note that the covered entity may have relationships with “business associates” or persons/entities that provide certain functions, activities, or services whereby disclosure of PHI may be necessary (such as a billing service). It is typically not the sponsored programs office that negotiates these agreements; legal counsel and/or the privacy officer normally have responsibility for such agreements.
Most research administration offices in covered entities will, as a matter of practice, include a standard HIPAA provision in their clinical trial agreements. An example of such a provision is included below.

**Example**

COMPLIANCE WITH HIPAA. “It is understood and agreed that Institution, as a covered entity under the Health Insurance Portability and Accountability Act of 1996 (“HIPAA”), may not use or disclose protected health information (“PHI”), as defined in HIPAA and its implementing regulations, for purposes other than treatment, payment, or health care operations without first obtaining authorization from the individual concerned. Institution agrees to obtain authorization from individuals enrolled in the Study which permits disclosure to and use of PHI by Sponsor for purposes of conducting and overseeing the trial. Sponsor agrees that it shall not disclose PHI to any person or entity except as permitted by the HIPAA authorization.”

**Data Use Agreements**

The transmission of limited data sets and data use agreements involve additional complex requirements for the institution. Transmission of data resulting from human subject research is particularly sensitive and should be reviewed thoroughly. Limited data sets (see above) may be used only for the purposes of research, public health, or health care operations. It may be the OSP’s responsibility to review and negotiate data use agreements if they pertain to activities for a funded, or even unfunded, research project. These agreements are normally negotiated against a standard template that has been developed by the institution.

Typically the IRB, in partnership with the OSP will inform an investigator of the procedures for a data use agreement, and it may even be necessary for the IRB to retain a copy of the data use agreement in the study file. Data use agreements outside the research arena are usually the responsibility of the HIPPA security officer. While this is a standard scenario for such agreements, institutional practices vary, and the OSP should be familiar with the process and procedures of its own medical center.

**Human Embryonic Stem Cell Research**

This type of research is primarily done within academic medical centers and research institutes; however, some institutions do not conduct research with nonregistered hESC due to state regulations. In 2009 the landscape of Human Embryonic Stem Cell (hESC) Research changed dramatically when Executive Order 13505, “Removing Barriers to Responsible Scientific Research Involving Human Stem Cells” was issued. Following this order, the National Institutes of Health released guidelines for use of hESC in research. These policy changes have reinvigorated research utilizing hESC’s and AMC’s should expect their faculty to become involved. How do sponsored programs offices interface with these regulations and what are the practices that these offices need to initiate to assist with compliance?
Research Identification

The sponsored programs office is an important component in assisting to identify hESC research within the institution. Not all hESC research will be externally funded, but a simple question on the institution’s routing form (e.g., will the research use hESC?) and notification to the appropriate individual (notably a dean or the chair of the Embryonic Stem Cell Research Oversight (ESCRO) Committee) is extremely important. Once a project using hESC is identified, the OSP or other office should find out specific information about the project including the following:

◆ Is the project using nonregistered lines? (http://grants.nih.gov/stem_cells/registry/current.htm)

◆ Where will the project be physically located?

◆ What equipment will be used?

◆ What personnel will be working with nonregistered hESC?

Approval of the project by the AMC’s ESCRO committee will likely be required by the sponsor. See here for an example of the information required to apply for this approval. http://www.urmc.rochester.edu/stem-cell/escro.cfm.

12105.8 Subaward/Subcontract Administration

Although the issues surrounding subawards to collaborating institutions are covered in a separate chapter of the Guide, there are specific issues that the AMC OSP needs to take into account when organizing for success in this area. The AMC sponsored programs office will see many industry and federally sponsored contracts in addition to traditional assistance grants – and these contracts will require additional management when establishing the sub-agreement (See Chapter 3700 for a full discussion of subawards.)

Multisite Industry Studies

AMC sponsored programs offices often have to assist in the development, issuance, and negotiation of multisite clinical trials funded by industry. The standard Federal Demonstration Project (FDP) Model Subaward Agreement template was not intended for situations as complex as this. The FDP Model Agreement does not accommodate the necessary flow downs imposed by industry, the fixed-price/per-subject method of payment based on case report forms, or the fact that typically an investigator’s written assurance on the clinical trial agreement is required prior to study initiation. Thus OSPs will need to consider how best to develop practices and expertise in this area and how to ensure that resources are adequate to accommodate the large number of subcontracts that may need to be issued for one study (e.g., if the medical center houses one or more clinical coordinating centers, it is not unusual to have more than 50 sites for one funded study).

Policy Development

In addition to the staffing needs that may be required to handle the workload involved in multi-site clinical trial management, OSPs should consider additional
Figure 3: University Medical Center Human Stem Cell Research Tracking Form

If your proposal/project involves the use of human stem cells or embryos, please complete this form and forward it to the Dean's Office, Box 706.

policies in this area such as the following:

◆ Subagreements should typically be issued for the full length of the anticipated project period in order for sites to continue enrollment and treatment.

◆ OSPs should consider the collaborating site’s institutional policies in areas of publication, intellectual property, indemnification, and subject injury. It is imperative to get studies up and running quickly, and sponsors should be aware of the consequences of the inclusion in study agreements of terms that other institutions may have difficulty accepting.

◆ Subagreements may be issued without a ceiling amount, due to the fact that it is sometimes impossible to predict how many subjects will be enrolled; however, it may be preferable to indicate a “not-to-exceed” amount. It is advisable to include a provision that alerts the subcontractor that authorization to release funds is contingent upon payment from the industry sponsor for subrecipient costs. The prime recipient should avoid becoming liable for payment exceeding reimbursement and/or budget approval by the industry sponsor. It will be important for the AMC to review the regulations associated with the Federal Funding Accountability and Transparency Act (FFATA). The AMC is required to report, within a Federal database, on funds allocated to sites under a clinical trial subaward. This becomes complex when the award is issued without a ceiling amount. (See Chapter 3700 for more details.)

◆ If the AMC hosts a clinical trials coordinating center, it is essential for there to be open and effective communication between the center and the OSP. These offices need to work as a team, and the OSP should collaborate with the center to develop agreement terms that fit the coordinating centers’ business practices. The OSP should encourage the coordination center to ensure that collaborating sites agree up front on the proposed per-subject fee and appropriate F&A cost. This will facilitate smooth subcontract negotiations. When issuing subcontracts, it is often advisable to specify a due date for return of the contracts given the time sensitivity of this work. And, while payment is normally made on the receipt of case report forms, the coordinating center may choose to implement more sophisticated processes, such as the generation of invoices by the coordinating centers that are based on electronic case report data and verified by the site. Subcontracts should reflect these practices.

◆ The institutional policies with respect to waiver of indirect costs on multicenter studies should be clearly articulated. NIH reaffirmed several years ago the applicability of academic institutions’ negotiated F&A rates on subawards, i.e., on federally supported studies each site should be reimbursed at its full rate. There has been a recent trend from Federal Sponsors issuing total cost funding caps on clinical trials awards. These caps could put downward pressure on the assessment of Indirect costs across a multi-site trial. Additionally, foundation-led cooperative clinical trials continue to cap the reimbursement of the full rate in order to fund additional sites. The OSP should be aware of the limitations of F&A assessment in multisite studies with Federal award caps or funded by
foundations and by industry, and it will need to develop a position on the issue of waivers in conjunction with its dean’s office and budget officials. (See a full discussion of F&A waivers in Chapter 1700.)

◆ AMC’s should be concerned about IRB approval across the sites of a multi-site clinical trial. The coordinating center, OSP and IRB should discuss these issues during the proposal development stage to ensure there is harmonization around subcontracts, protocol, and informed consent documentation among the many sites. There is growing pressure for AMC’s to engage a central/Independent IRB when planning and executing multi-site clinical trials. This is an area of increased interest – several institutions have initiated pilot programs and/or established policies regarding the use of a central/independent IRB. (See here: http://research.unc.edu/offices/human-research-ethics/)

International Collaborations
Subcontracting with foreign and developing countries is not unique to medical centers. However, given that a significant portion of foreign collaborations are funded by HHS or the Agency for International Development (AID) for the purposes of biomedical research, health care delivery, or health care education and intervention, medical center OSPs should be aware of the unique issues that arise when subcontracting to foreign institutions.

The FDP has developed a template to be used by universities when subcontracting to a foreign site from NIH grant funding. This should prove useful for OSPs at medical centers, as it provides a road map for developing institutional positions associated with issues such as additional risk, method of payment, currency, public policy requirements, financial conflict of interest, additional costs that may be required in the work (e.g., translators, shipping costs), any additional taxes imposed by the foreign country, varying accounting practices, subaward monitoring, and audits. (For a full discussion of international collaborations, see Chapter 3500.)

This discussion does not provide a comprehensive overview of all the possible considerations involving foreign collaborators; at a minimum OSPs should consider working with legal counsel on these issues, as well as with risk management. Before entering into subawards with foreign organizations, a medical center OSP should consider the following:

1. Conduct a pre-award audit by an external audit firm if the subaward is significant and to a developing country; this cost may be covered by the award. However, even if it is not a covered cost, it is a prudent approach that may mitigate risk and potential disallowances.

2. Use a fixed-price award, rather than a cost reimbursement mechanism. While the up-front analysis may be more intensive, this mechanism has the advantages that the subawardee has greater incentives for compliance, there is less flow-down risk, and cost reimbursable payment may not be practical given the accounting principles of the foreign country.

The additional time that is required to complete and negotiate foreign sub-
awards is considerable and should be taken into account when planning such actions. In addition OSPs should recognize that NIH must obtain State Department approval for any non-U.S. site that is proposed as a participant in an NIH-funded study. This approval may take up to two months. This delay must be communicated to the medical center’s PI in order to provide accurate information on when work can actually begin.

\section*{2105.9 Effort Reporting}

Effort reporting within a medical center environment is complicated by clinical practice compensation and the treatment of clinical appointments either inside or outside the institution. It is imperative for the sponsored programs office to be very familiar with how clinical compensation is treated by the medical center.

\textbf{Compensation Issues}

Questions concerning the medical center’s institutional base salary (IBS) often arise, such as the following: Are clinical salaries part of the center’s IBS, and are clinical duties considered part of the person’s institutional responsibilities? Is clinical compensation shown on the institution’s payroll and is it paid at the direction of the medical center? Or is clinical compensation under the control of another “paymaster” or separately organized clinical practice plan, and are clinical duties not considered part of the faculty member’s institutional requirements?

NIH has issued guidelines on this subject in its Grants Policy Statement section 7.9.1 (https://grants.nih.gov/grants/policy/nihgps/HTML5/section_7/7.9_allowability_of_costs_activities.htm). Because of the complexities of clinical salaries, there may need to be additional resources — such as training on how to represent salaries in grant applications and how to ensure accurate effort reporting — within the OSP to ensure compliance in this area.

The guidance by NIH elucidates one more important point for OSPs in medical centers: “[T]hat the IBS not vary based on the specific clinical services provided by the investigator within the periods for which total IBS is certified by the grantee institution.” Most clinical salaries controlled by medical centers can vary depending upon the time spent performing clinical duties, number of patients seen, etc. It is not uncommon for medical centers to have two or three levels of clinical compensation. These levels will vary among institutions, but could be represented by a “guaranteed” or minimal amount of compensation, plus an “approved” level or the expected compensation based on performance metrics, or perhaps a “targeted” level whereby a clinician can accrue a higher salary based upon enhanced clinical performance.

The NIH guidance suggests that the approved level be utilized in grant applications and in effort reporting; however, it is not always entirely understood by faculty which salary level should be utilized for which purposes. With respect to this aspect of representing the IBS, OSPs should be in close communication with the dean’s office and with the office that authored the institution’s “clinical compensation plan.” Best practices would dictate that the clinical compensation plan include a section on representation of salary to potential sponsors and for purposes of compli-
ance with payroll certification or effort reporting.

Finally OSPs should recognize that the percentage of effort that clinical investigators can devote to research is under constant pressure due to the aggregated demands of patient care, educational programs, and administrative duties. In addition there are various measures of clinical faculty “time.” This includes the cost reporting or “time and effort” study that is done by hospitals to indicate hours spent on various activities, including research, to ensure proper billing to Medicare/Medicaid. This report generally represents an estimate, as it measures effort (by hours) during selected weeks during the year; these weeks may not be representative of how the person normally spends his or her time. In addition faculty may have problems completing the study as requested categories of effort can be confusing and sometimes overlap.

Others measure of effort include the level of clinical activity as represented by RVU’s or clinical billings or revenue. Also productivity statistics based on comparison benchmarks established by a group of AMCs on “imputed clinical FTE” (full-time equivalent) might be utilized.

How all these measures compare to payroll certification or effort reporting is very important. For those institutions that include clinical compensation in the IBS, OSPs should be in close communication with the AMC’s compliance office (if applicable) and with the office that requests that faculty complete the time and effort studies. This is especially important when the clinical faculty member has received an award that mandates a significant commitment to research, such as the NIH K award series. These awards are even further complicated as they can establish salary caps that do not match the faculty’s current IBS, thus requiring cost sharing by the AMC. The following practices in this area are recommended:

♦ Issue effort reports or plan confirmation reports around the same time that the hospital time and effort studies are conducted, and insert a reminder on each type of report that faculty should consider the information portrayed on both reports to ensure consistency.

♦ Issue an introductory letter from the OSP, or in conjunction with the dean’s office, to all new K award recipients (or other faculty that have received awards that require minimum effort levels committed to research) that reminds faculty members, mentors, and chairs of the obligations that the institution has undertaken to protect dedicated effort to research pursuits.

♦ Issue an additional certification on a periodic basis to K award recipients that requires attestation that the faculty member has committed the required percentage of effort to research and that any salary supplementation (e.g., cost sharing) did not impose any constraints on how this effort was spent.

♦ In concert with the compliance office, issue a notification to the chair and mentor of any measures of time or effort that indicate that there may be a deviation from the commitment to research. No measure of effort is perfect, and typically these deviations can be easily explained. But, given the complexities of clinical appointments, it is extremely helpful to provide a baseline measurement and the

opportunity to correct any apparent discrepancies in a timely manner.

Clinical Trial Effort

One final topic that may warrant additional education and guidance in the area of time and effort for clinical trials administration is the faculty effort provided in the conduct of the trial. This may be a difficult issue, as a number of factors will influence the amount of effort that an investigator will devote to a trial. These factors can include the
◆ phase of the trial,
◆ amount of interaction that the faculty member will have with subjects,
◆ roles of other study personnel such as nurse/study coordinators, and
◆ amount of overlap between the study and clinical intervention, routine services, or standard of care practices.

These issues become very complex when a physician is using his or her own patients as subject volunteers, as the lines between clinical care and research may become blurred. It is important for an OSP to work with the dean’s office, administrators engaged in clinical trials, and the compliance office to set forth some guidance and instruction on the matter.

This instruction should highlight that investigators are required to list their active industry-funded clinical trials on current and pending support information. Referencing NIH policy could be helpful; however, it is not entirely clear at what level NIH expects that clinical trial effort will be reported. NIH has suggested that it is appropriate to list an aggregate level of effort on an individual’s industry-supported clinical trials, provided that the aggregated effort is no greater than 10 percent. However, OSPs at medical centers should consider their internal policies and gauge what is appropriate for the institution. This is an area that continues to evolve and OSPs at medical centers should continue to keep alert for any new guidance.

12105.10 Other NIH-Specific Issues

As noted above, the predominance of NIH funding at AMCs will influence the OSP’s practices, policies, and organization. While many of the NIH-specific issues have already been discussed, the OSP should consider the following additional items in order to optimize the administration of NIH proposals and awards:
◆ Establish continuing and regularly scheduled hands-on training for faculty and administrators for the development of NIH applications, budgets (including modular), and navigation of the NIH’s electronic grants management systems (Grants.gov, eRA Commons, Public Access).
◆ Provide specific support for NIH training grant applications, such as workshops on proposal development and grants administration. An OSP should consider working with the graduate student and postdoctoral dean’s offices to provide standardized and updated information for the tables required in the training grant applications.
◆ Interface with the medical school’s library to offer clear instruction on how to register final peer-reviewed publications in the National Library of Medicine’s PubMed in accordance with NIH’s “Public Access Policy.” (See Figure 5 for the Web site for NIH’s “Public Access Policy” and other helpful resources.)

◆ Assist the dean’s office in writing the regulatory research compliance and support sections now required by many of the larger applications solicited by NIH.

◆ Post the various policy requirements required by NIH in proposal submission and award administration, along with medical center implementations of policy. This may include providing examples of proposal language for the NIH data-sharing and unique resources-sharing requirements and clear instruction and policies with respect to the institutional treatment of any salary costs over the NIH salary cap.8

◆ Currently a significantly reduced pay line may account for increased proposal activity within the AMC. OSPs should ensure adequate staffing for NIH deadlines and establish clear-cut policies with respect to internal deadlines in order to meet heavy NIH deadlines.

2105.11 Interface with Technology Transfer and Corporate Alliances Offices

An AMC sponsored programs office, often in cooperation with the institution’s corresponding office of technology transfer (OTT), will need to be prepared for (1) the numerous MTAs that will need to be negotiated and adequate staffing for this function; and

(2) the possibly conflicting terms within the material transfer agreements and the use of the materials in projects that have project-specific intellectual property obligations.

Other issues that are likely to involve the OSP and the OTT concern:

◆ the NIH requirements regarding the sharing of research data, unique biological resources, and model organisms;

◆ the requirements under the Bayh-Dole Act (regulating ownership of federally funded inventions) and use of a “Determination of Exceptional Circumstances,” that can sometimes occur with NIH funding when the agency is partnering with corporate manufacturers and developers of therapeutic compounds (A federal agency may decide that title to inventions is better vested with the federal agency than the grantee. Such a decision — termed a “Determination of Exceptional Circumstances” (DEC) — must be made prior to the award of federal support and becomes a part of the sponsored project agreement.); and

◆ problematic intellectual property terms that can be found in private foundation

7 See one example of such instruction at http://www.urmc.rochester.edu/libraries/miner/publishing/NIHPublicAccessPolicyMinerLibrary.cfm
agreements and in grants from voluntary health associations.

These issues are fully discussed in separate chapters of the Guide (see Chapters 1900 and 2900).

**Corporate Alliances Offices**

With the uncertain future of NIH funding, it is not uncommon for medical centers to establish offices of “corporate alliances” or “corporate relations” in order to attract and facilitate the interaction between university researchers and corporate scientists and attract more corporate research funding. These offices could be outgrowths of the office of technology transfer or development office. Sponsored programs offices, again, will want to establish close communication with this office, and ensure that each office understands its role in the negotiation and finalization of corporate agreements. In fact it is advisable that representatives from the offices of technology transfer and sponsored programs sit on the administrative advisory committees of the office of corporate relations.

**¶2105.12 Collaborative/Cross-Disciplinary Projects**

Because medical centers are often decentralized and physically removed from the rest of the university campus, OSPs may need to consider (along with deans’ offices) practices that will assist with the facilitation of cross-campus and collaborative research. Certainly there are academic departments and centers that play a huge role in cross-disciplinary research, such as biomedical engineering. OSPs will need to work with a dean’s office on issues such as

◆ attribution of F&A “credit,”
◆ utilization of space, and
◆ recognition of investigator contributions in cross-campus activities.

The resolution of these issues needs to be made readily available to department chairs and faculty in order to establish clear expectations for collaborative projects. It is in the best interest of the OSP to make this process as transparent as possible, as institutions and federal agencies encourage, and in some cases prioritize, collaborative ventures.

The OSP may want to devise a form for the identification of F&A “credit” among several schools. An example of such a form is included as Figure 4.

**¶2105.13 Affiliated Hospital Issues**

A final issue that an OSP in a medical center needs to have familiarity with is its relationship with the patient care organizations that are within the same organizational structure, within the same medical network, or that are loosely affiliated organizations. Even when an AMC owns its hospital, the academic arm and the patient care arm may operate quite independently. Thus an OSP needs sufficient processes, controls, and communications in place to

◆ ensure that any “sponsored research” or “organized research” that is awarded to
the hospital is accounted for and managed appropriately (There may be programs that hospitals are awarded that support purely patient care programs. But if these awards are subject to audit, and the hospital is covered by the institution’s single audit, they must be appropriately administered through the OSP);

◆ receive timely information on the research patient care rate that the hospital negotiates, to ensure that the organization is treating in- and outpatient costs consistently in proposals (especially when budgeting clinical trials), awards, and expenditures; and

◆ work cooperatively on research issues that span both the hospital and the academic school, such as effort reporting and clinical trials administration (as noted above).

Various ‘Arrangements’
The same principles hold true when the medical center or university has incorporated its physician practice groups. In this context, OSPs should be sensitive to clinical trial negotiations and understand that physician practice groups located outside the medical center will need education and assistance in understanding university practices and policies.

There may be hospitals that are within the same health network as the medical center, and faculty within these hospitals may have university appointments that would be subject to university policies and procedures, but the entity would not be subject to the same single audit. An OSP should work with the administration of these entities and with legal counsel to determine how university faculty will be apprised of the AMC rules and regulations (as they are physically removed from the rest of the institution), and how the OSP office can assist in the management of sponsored awards. Practices will vary from institution to institution, but it may be necessary to do an “inventory” to ascertain what research would be subject to the medical center policies. In these cases, as with any other regulatory committee, input from legal counsel is critical to determine the level of compliance oversight that should be put in place within these entities.

There are affiliated entities where there is no common management, but that still interact with the medical center. An OSP should be familiar with the content of existing affiliated agreements and the duties and obligations spelled out in those agreements with respect to research collaborations (if any). When full-time medical center faculty is housed within these entities, it is critical that the expectations of all parties are known when sponsored research is involved.

Working with VA Hospitals
Perhaps one of the most complicated relationships a medical center can have is its association with Department of Veterans Affairs (VA)-owned hospitals and facilities. Because these are government entities, faculty can accept “Intergovernmental Personnel Act” appointments and spend a period of time at these hospitals; the VA will reimburse the medical center for the faculty member’s effort at the VA facility (either full time or part time). More likely, faculty will split their appointments
### Figure 4: Sharing of Indirect Cost Recovery Form

**Purpose:** Please note that this form is to be used when sharing of indirect cost (F&A) recovery is proposed for collaborative interschool/college extramurally funded programs. The completed form must accompany the completed University Proposal Routing Form.

between the VA hospital and the medical center, or consult with the VA through a “without compensation appointment” (WOC).

Going back to the days of World War II, there is a long tradition of cooperation and collaboration between VA medical centers and medical schools. An OSP should be aware, however, that the affiliation with the VA might be extremely complex, particularly when government-funded research (by agencies other than the VA) is involved.

The VA and the medical center may choose to enter into an inter-institutional agreement called a Cooperative Technology Administration Agreement (CTAA). These agreements are not necessary, but may be advisable if there will be an ongoing association with the VA, as CTAs operate like a master agreement for planned collaborations. Alternatively, the medical center can enter into a VA-WOC “Appointee Intellectual Property Agreement” on a one-time basis to cover a faculty member’s work at the VA. With respect to overall administration of jointly conducted sponsored programs, institutions may choose to enter into subawards or other memoranda of understanding (MOU) to establish the responsibilities of conduct and administration.

Some medical centers may find both agreements problematic in terms of the intellectual property terms, and legal counsel or the office of technology transfer should assist the OSP in these matters. These agreements will oftentimes address clinical study IRB review and may add additional complexity to the review process when faculty members with joint appointments are involved. The Council on Governmental Relations Web site is a good resource for accessing information on the relationships — and the issues — between VA hospitals and universities.

This section provides a simplistic summary of the complexities that the medical center OSP administrator can encounter. Organizational structures, health networks, and affiliated entity structures are complex and vary from institution to institution and region to region. Research administrators should seek explanation of these relationships and their responsibilities to the university faculty in each situation. (For resources in this area, see Figure 5.)

¶2105.14 Conclusion

The risks of inadequate administration of sponsored programs in an academic medical center are great. These risks primarily result from the use of human subjects in research, as well as the use of potentially harmful toxins and materials. The liability associated with human subjects research, primarily research that is greater than minimal risk, is the predominant issue that sponsored programs offices will need to consider.

Other areas of risk — such as noncompliance with regulations surrounding conflicts of interest, HIPAA, effort reporting and representation of institutional base salaries, inappropriate billing to Medicare/Medicaid and other third-party payers, or lack of proper controls when subcontracting to foreign entities — also should be examined closely to ensure that sponsored programs offices have adequate policies, practices, and procedures in place as appropriate.

---

9 See www.cogr.edu.
Various scenarios and tools have been suggested to medical center sponsored programs offices to assist in the proper oversight and stewardship of research and research funds. Periodic systematic review and analysis of existing policies and procedures in each high-risk area are a suggested exercise to ensure that the office stays responsive to an ever changing landscape of regulation and risk.

Providing appropriate resources is critical to success. Not only does the sponsored programs staff have to maintain a high degree of familiarity with the rules and regulations surrounding biomedical research, this knowledge is also essential for counsel that assist the OSP.

Sponsored programs offices at medical centers must, on some level, institute institutional training on the key aspects of biomedical research and specifically, research sponsored by NIH. Without a level of expertise at the local level, such as among faculty, departmental administrators, or study coordinators, the institution’s level of risk will remain unnecessarily high. NCURA offers many training opportunities to sponsored programs administrators at all levels working at medical centers, as do programs offered by AAMC, NIH, and other professional organizations. Knowledge is the key to success.

Suggested resources for additional assistance are included as Figure 5.

Implementing the New Clinical Trial Registration Requirements

AIS editors

Public registration of some clinical trials has been required by federal law since 1997, but the Food and Drug Administration Amendments Act of 2007 (P.L. 110-85), signed into law by President Bush on Sept. 27, 2007, contains an expansion of the elements and the types of trials to be reported and requires submission of results data. And for the first time, there is an enforcement mechanism for compliance, so it is particularly important to be vigilant about compliance. According to www.clinicaltrials.gov, penalties for failure to register applicable clinical trials are significant and may include civil monetary penalties and, for federally funded trials, the withholding or recovery of grant funds.

The new law requires registration of trials on www.clinicaltrials.gov, which was created in 2000 and is operated by the National Institutes of Health (NIH). In discussing the new requirements, NIH said that “more data elements are required than under prior U.S. law, and these new requirements include primary and secondary outcome measures, start date, and target number of subjects.” Four additional data elements that have not been part of the registration are now required, and 12 data elements that were considered “optional” are now “mandatory” (for a rundown of these elements, see http://prsinfo.clinicaltrials.gov/interventional_summary_rqmts.pdf).

Many of the new required data elements mimic those required by some magazine editors before a paper is accepted for possible publication. The Association of American Medical Colleges has expressed support for reporting, in the interest of greater disclosure.

Types of Trials Requiring Registration. The new law states that registration is required for “applicable clinical trials,” which are defined as follows:

- Trials of Drugs and Biologics: Controlled clinical investigations, other than Phase 1 investigations, of a product subject to FDA regulation.
- Trials of Devices: Controlled trials with health outcomes of devices subject to Food and Drug Administration regulation, other than small feasibility studies, and pediatric post-market surveillance.

Responsibility for registration rests with the trial sponsor or the principal investigator “if so designated by a sponsor, grantee, contractor, or awardee, so long as the PI is responsible for conducting the trial and has sufficient data rights.

Key Dates. In general, the party responsible for registration for an applicable clinical trial must submit required information by the later of Dec. 26, 2007, or 21 days after the first patient is enrolled. There are two general exceptions:
(1) Data for trials “ongoing” as of Sept. 27, 2007, that do not involve a “serious or life-threatening disease or condition” must be submitted by Sept. 27, 2008.

(3) Trials that were ongoing as of Sept. 27, 2007, but were completed as of Dec. 26, 2007, and do involve a “serious or life threatening disease or condition,” are not subject to these requirements. However, “they may be subject to pre-existing registering requirements.”

Also, as of Dec. 26, 2007, any application or report submitted to the FDA “under sections 505, 510(k), 515, or 520(m) of the Federal Food, Drug, and Cosmetic Act or under section 351 of the Public Health Service Act will need to include certification of compliance with applicable provisions” of the law relating to mandatory registration.

2120.2 Tips for Creating Portable Device and Media Controls to Protect PHI*

Chris Apgar

Note: Although this article specifically addresses the management of media and devices used to store protected health information (PHI), the advice outlined could prove useful to research administrators who oversee data that should be protected whether or not the information is PHI.

— AIS editors

Technology continues to advance at a fast pace, and that can create headaches for privacy and security officers everywhere. As devices used to store confidential information get smaller and smaller, and the tiniest of storage devices can store up to several gigabytes of information, the risk for loss of confidential information continues to increase seemingly exponentially.

The HIPAA security rule specifically addresses management of media and devices used to store protected health information (PHI). Also, the Centers for Medicare and Medicaid Services (CMS) issued remote access guidelines at the beginning of 2007 that include an outline of needed safeguards when managing devices and media that will be used outside of the walls of the organization. It is clear that this is not only an area of concern from a security and privacy perspective, but also from a regulatory and legal risk perspective.

Many have heard of the loss of over a million veterans’ medical records when a Department of Veterans Affairs laptop

---

Worth Noting: NIH’s ‘Commitment’ to Protecting Sensitive Data

In a posting dated April 14, 2008, that came in response to the recent theft of an NIH employee’s laptop containing patient data, the agency reports that it has

“...refocused its efforts on the protection of all information systems (electronic and hard copy) which contain sensitive personal information. Steps are currently underway at NIH to ensure that all computers, laptops and portable electronic devices are encrypted and that NIH employees are educated in the proper handling of sensitive data.

In addition, the NIH encourages grantee institutions and individuals not to use portable electronic devices to store identifiable, sensitive, and confidential information about NIH-supported research or research participants. If they must be used, they should be encrypted to safeguard data and information. These devices include laptops, CDs, disc drives, flash drives, etc. Researchers and institutions should limit access to personally identifiable information through a means of access controls such as password protection.”

*This article was written by privacy and security consultant Chris Apgar, CISSP, president of Apgar & Associates, LLC (www.apgarandassoc.com).
was stolen, and now comes the theft of the NIH laptop containing data on some 2,500 patients enrolled in a cardiac study. There also have been a number of other headlines related to the loss or theft of PHI. This doesn’t mean, though, that the headlines have prompted organizations to implement appropriate safeguards related to the use of portable devices and media.

The purpose of this article is to provide an easy-to-understand look at what is required when establishing portable device and media controls.

The protection of PHI stored on portable devices and media requires an organization to address at least the following areas:

◆ Establish and enforce device and media controls.
◆ Develop and implement appropriate workforce training.
◆ Implement and enforce encryption of data stored and transmitted.

It is important to remember that the most significant risk associated with the use of portable devices and media is directly related to people. Misuse, device/media theft, etc. are generally a people, not a technical, issue. Encryption of stored and transmitted data is important, but if the workforce member using, say, a smart phone, does not take advantage of secure means of transmission, the best encryption tools on the market are in essence useless.

**Establish and Enforce Device/Media Controls**

Establishing appropriate controls is a HIPAA security rule requirement (physical safeguards). From a practical point of view, this means, from a regulatory and legal risk perspective, strong device and media controls are in order. The regulatory requirement stretches way beyond controlling access to and the use of devices and media found in an office setting (like a desktop or a hard drive).

Establishing controls requires defining what devices and media will be used to store and transmit PHI, how the devices and media will be backed up, how they will be protected against loss or theft, how the data stored will be protected in the event of loss or theft, rules for device and media use, appropriate destruction and reuse requirements, policy and procedure development, and staff training/policy enforcement.

A good place to start would be to develop an inventory of portable devices used to transport, transmit, and store PHI (this includes personally owned devices such as smart phones, laptops, and PDAs) and the places within the organization where portable media are used (and what type of media it is). It is difficult to establish controls if the organization is unaware of what devices are in use, the type of media used, and who is responsible for their care (organization owned versus workforce member owned). It is also difficult to establish sound usage policies and procedures if the organization does not know how the devices are being used.

After compiling an inventory of devices, media, and usage, the next step is to develop a policy and procedure that defines how mobile devices and media can and cannot be used as well as the consequences for violation of the policy and procedure. Also, it is important to document the steps to be taken to protect the devices and media
and the data stored or transmitted from a mobile device. This would include addressing questions such as the following:

◆ What devices can be used to store, transmit, and transport PHI (e.g., type of device, devices owned by the organization, only laptops, etc.)?
◆ What protections need to be used with portable devices and media (e.g., encrypting data at rest and when transmitted, not leaving portable devices in open sight in a vehicle, not allowing workforce members to take portable media outside the organization unless encrypted, etc.)?
◆ What are the data backup and recovery requirements and user responsibilities?
◆ What are the data destruction and media reuse requirements and user responsibilities?
◆ What security incident response procedures will be followed if the media and/or device is lost or stolen?
◆ How will portable media and devices be stored when not in use (e.g., locking docking stations for laptops, cable locks, locked media transport, etc.)?
◆ How will compliance with the organization’s portable media and device policies, procedures, and practices be audited and enforced?
◆ How will portable media be tracked?

Appropriate controls include more than just sending a quick message to members of the workforce who use portable media and devices. It requires establishment of a structured program that addresses acquisition through end-of-life disposal and everything in between. It’s also important to note that, as with most security measures, the greatest risk is from the workforce and not from the devices used or documented destruction requirements. This is especially true with the continued rapidly expanded use of smart phones. A smart phone alone represents the risk of transmission of unencrypted PHI, the storage of unencrypted PHI, the loss or theft of the smart phone, etc. And what increases the risk even further is that smart phones generally are not owned by the organization, limiting the organization’s control over use and data/device protection.

Develop and Implement Appropriate Training

Any controls established, any policies and procedures developed, and any new device configuration requirements (e.g., encryption of all media, blocking the ability to download Internet files, etc.) will not provide any real protection until workforce members who use portable devices and media are properly trained. At least some level of training will be required for almost all workforce members. Many workforce members may not have access to a laptop used remotely, but they likely do have access to portable media used throughout the organization (e.g., CD ROMs, DVD ROMs, jump drives, SD
cards, etc.). All it takes to take the network down is using portable media to upload personal files brought from home that are infected with a virus.

As with any aspect of the security rule, the lack of appropriate staff training followed by the necessary enforcement and imposition of sanctions represents one of the most significant security risks to an organization. As an example, if a physician is not aware she should not be texting patient information regarding, say, an upcoming medical procedure to a colleague assisting with the procedure, she will continue to use the text feature of her mobile phone to transmit PHI “in the clear” or unencrypted where it could be intercepted.

Training should be thorough, cover all organizational requirements regarding portable media and device use, should specifically reference sanctions, and should not be a one-time-only event.

**Encrypt Data That Are Stored and Transmitted**

The HIPAA security rule identifies the use of encryption for stored and transmitted PHI as an addressable implementation specification. Addressable, though, does not mean optional. It means covered entities need to implement the safeguard as stated in the rule, implement a safeguard that provides equal protections, or document the heck out of why the covered entity does not intend to implement the implementation specification (keeping in mind that cost cannot be the most significant reason for not adopting the implementation specification).

The security rule was published in April 2003, allowing for the two-year compliance window for all new HIPAA Administrative Simplification rules. At the time, encryption applications were not considered completely mature, and implementation of encryption solutions could be costly from a financial and a staffing standpoint. Much has changed since April 2003. The technology has matured, and solutions exist on the market that will not break the proverbial bank for small covered entities. In fact, a number of newer portable devices on the market come with encryption functionality. Also, Windows XP Professional and Vista include the functionality to encrypt folders containing confidential information and stored on the hard drive of a laptop. There are also reasonably priced utilities on the market that can be used to encrypt portable media.

The technology and the price point today are such that a covered entity would be hard pressed to reasonably document that implementation of portable media and device encryption is not necessary or is administratively burdensome. This represents a potential regulatory problem, especially with the passage of identity theft protection laws at the state level that include provisions requiring appropriate security. Note also that CMS in its security compliance reviews will be looking at the use of encryption (see Figure 2120.2-1). The lack of encryption also represents a legal risk, not to mention the damage to an organization’s reputation, if a portable device or media is stolen, patient information is inappropriately disclosed, and the local (and sometimes national) media broadcasts the story of the theft and disclosure of sensitive patient information because the data were not protected.
Figure 2120.2-1: Security Compliance Checklist

The following items were taken from “Sample — Interview and Document Request for HIPAA Security Onsite Investigations and Compliance Reviews.” You can view the entire list at www.cms.hhs.gov/Enforcement/Downloads/InformationRequestforComplianceReviews.pdf.

◆ Policies and procedures and other evidence that address the following:
  • Prevention, detection, containment, and correction of security violations
  • Employee background checks and confidentiality agreements
  • Establishing user access for new and existing employees
  • List of authentication methods used to identify users authorized to access EPHI
  • List of individuals and contractors with access to EPHI to include copies pertinent business associate agreements
  • List of software used to manage and control access to the Internet
  • Detecting, reporting, and responding to security incidents (if not in the security plan)
  • Physical security
  • Encryption and decryption of EPHI
  • Mechanisms to ensure integrity of data during transmission - including portable media transmission (i.e. laptops, cell phones, blackberries, thumb drives)
  • Monitoring systems use — authorized and unauthorized
  • Use of wireless networks
  • Granting, approving, and monitoring systems access (for example, by level, role, and job function)
  • Sanctions for workforce members in violation of policies and procedures governing EPHI access or use
  • Termination of systems access
  • Session termination policies and procedures for inactive computer systems
  • Policies and procedures for emergency access to electronic information systems
  • Password management policies and procedures
  • Secure workstation use (documentation of specific guidelines for each class of workstation (i.e., on site, laptop, and home system usage)
  • Disposal of media and devices containing EPHI

◆ Other Documents
  • Entity-wide Security Plan
  • Risk Analysis (most recent)
  • Risk Management Plan (addressing risks identified in the Risk Analysis)
  • Security violation monitoring reports
  • Vulnerability scanning plans
    ◆ Results from most recent vulnerability scan

continued
Figure 2120.2-1: Security Compliance Checklist (continued)

- Network penetration testing policy and procedure
  - Results from most recent network penetration test
- List of all user accounts with access to systems which store, transmit, or access EPHI (for active and terminated employees)
- Configuration standards to include patch management for systems which store, transmit, or access EPHI (including workstations)
- Encryption or equivalent measures implemented on systems that store, transmit, or access EPHI
- Organization chart to include staff members responsible for general HIPAA compliance to include the protection of EPHI
- Examples of training courses or communications delivered to staff members to ensure awareness and understanding of EPHI policies and procedures (security awareness training)
- Policies and procedures governing the use of virus protection software
- Data backup procedures
- Disaster recovery plan
- Disaster recovery test plans and results
- Analysis of information systems, applications, and data groups according to their criticality and sensitivity
- Inventory of all information systems to include network diagrams listing hardware and software used to store, transmit or maintain EPHI
- List of all Primary Domain Controllers (PDC) and servers
- Inventory log recording the owner and movement media and devices that contain EPHI
\[\text{2120.3} \quad \text{Tax Reporting Obligations for Payments to Clinical Research Subjects} \]

AIS editors

Many institutions make payments to individuals who voluntarily participate in clinical research studies or trials. Whether these payments represent taxable income to these individuals has often been asked. Further, if the payments are taxable to the recipient, what then are the institution's withholding and reporting obligations?

The Internal Revenue Service (IRS) in Industry Management Resolution System (IMRS) Document No. 0700000417 addresses where to report such payments on the Form 1099-MISC, so it would seem that the form is required for such individuals (see Figure 2130.3-1). (IMRS responds to issues identified by tax professionals as requiring resolution.) The question before the IRS was where on the 1099 the payments should be reported: — Box 7 ("Non-employee Compensation") or Box 3 ("Other Income").

According to the IRS, if the individual is engaged in a trade or business as an independent contractor, the institution should report the payment in Box 7; the payment will likely be subject to self-employment tax. If, however, the individual is not an independent contractor, the payment is reported in Box 3. The IRS, apparently assuming that most individuals receiving clinical research payments will not be treated as independent contractors, recommends that the payments be reported in Box 3 of the Form 1099-MISC “to avoid creating the presumption that these payments are, in fact, subject to the [self-employment] tax.”

Thus, it would appear that a payment made to an individual clinical research subject who is not engaged in the trade or business of being a research subject (1) would represent taxable income to the individual research subject but is not subject to FICA or self-employment tax; (2) would not require an institution to withhold tax from the payment made to the individual; and (3) should be reported by an institution if the payment is $600 or more in Box 3 of Form 1099-MISC. (The general threshold for issuing a 1099 is $600.)

(For additional background on the topic, see also a 1990 private letter ruling, PLR 9106004.)

Statement in Form 1099-MISC. This IMRS memorandum is a relatively obscure document on which some institutions may have been hesitant to rely. But the IRS now has resolved possible ambiguity on this reporting issue by stating in the instructions to the 2009 Form 1099-MISC that Box 3 should be used to report “[a] payment or series of payments to individuals for participating in a medical research study or studies.” The Form1099-MISC instructions are posted on the IRS Web site (www.irs.gov) under “Forms.”
Figure 2120.3-1: IMRS 0700000417 – Proper Reporting of Payments to Participants in Medical Research Studies

Issue: Practitioners report that some payors to participants in medical research studies report the payments on Form 1099 MISC Miscellaneous Income in Box 7, Non-employee Compensation, rather than Box 3, Other Income. This may result in the recipients incorrectly reporting the income on their returns.

Response: In some cases, fees paid to a participant in a medical research study may be subject to Self Employment Contributions Act (SECA) tax because the participant is engaged in a trade or business of participating in medical research studies. However, in many cases, the payor will not know whether the participant is engaged in the trade or business of participating in medical research studies. Therefore, to avoid creating the presumption that these payments are, in fact, subject to the SECA tax, the payments should be reported in Box 3 of Form 1099 MISC. As always, a taxpayer with amounts reported in Box 3 of a Form 1099-MISC must determine whether such amounts are subject to SECA tax based on his or her own circumstances. We will recommend adding this information to the Form 1099 MISC instructions.

(This document is posted on the IRS Web site at www.irs.gov/businesses/small/article/0,,id=177228,00.html.)
Observations on ORI Clinical Research Misconduct Cases*

Office of Research Integrity

Over a 16-year period (1993–2008), there have been on average 3.5 Public Health Service (PHS) findings of research misconduct per year on clinical cases handled by the Office of Research Integrity (ORI). Overall, the 63 clinical cases represent one third of all PHS ORI misconduct findings (63/195).

Clinical research involves studies with people to learn about the disease process and how to treat diseases. In order to determine efficacy of a treatment, these studies are often designed to include people without the disease as control subjects. Clinical research can also be aimed at disease prevention, studying physiological parameters, or examining specimens from people.

Clinical cases with a finding of research misconduct have an unusual difference from other ORI misconduct cases. The allegations of misconduct in clinical cases are proportionately more likely to be determined to be misconduct by ORI. Specifically, 72% of clinical allegations resulted in a misconduct finding compared with 29% for all other types of research misconduct. What would account for this difference?

Clinical trials, a type of clinical case, generally involve more people who can see the research records and underlying source documents. Since there are requirements on how to keep proper records, such as the Food and Drug Administration’s good clinical practice (GCP) or the trials’ protocol specifications, team members are more likely to know the established rules for records. Dr. Peter Abbrecht, Medical Expert, Division of Investigative Oversight (DIO), points out that although staff have different roles to perform on a clinical trial, they have opportunities to observe others actually breaking the protocol rules. In one case, a technician was unable to draw a blood sample in the presence of another team member, yet a sample was submitted for analysis and later determined to be the technician’s own blood. The team member who observed this act was alerted to the falsification and reported it. In another case, the research assistant who had been asked to generate a report on subjects in the study noted that new patients had suddenly been entered into the study by the investigator. The research assistant examined source data and determined that the cases had been fabricated. Audits also are more commonly done in clinical research; there are internal and external auditors who have defined roles to examine the source data for omissions, irregularities, deviations, non-compliance with protocol, etc.

Audits are such a powerful determinant that ORI advises institutions that an audit report in a clinical study may obviate the need for an inquiry, when the audit has uncovered evidence of possible research misconduct.

Dr. Linda Youngman, DIO Scientist-Investigator, believes that: “The high proportion of allegations that are determined to be misconduct is a testament to the fact that emphasis on regular audits in clinical trials, which help to detect problems early, is a key ingredient to preventing research misconduct.”

Prosecuting clinical cases also differs from other types of misconduct. Clinical trials are easier to show “intent” to fabricate or falsify because there are numerous and obvious ways that the data can be manipulated to lead to desired goals. Dr. Nancy Davidian, DIO, Deputy Director, reports that: “While research misconduct occurs at all stages of clinical trials (eligibility, treatment, post-treatment, and follow-up), the most commonplace misconduct is at the time of enrollment.” DIO speculates that falsification and fabrication of eligibility occur because there is often enormous pressure to enroll subjects and there may be per capita rewards attached to each study subject’s enrollment. This in part explains further why clinical trial cases are different from bench science cases.

John Dahlberg, Director of DIO, points out that: “We know that audits in clinical trials make a difference and that if institutions required audits, they would be more likely to find correctable problems, as well as research misconduct. When they require more monitoring and auditing of research records, then ORI will have more confidence that research misconduct is appropriately being detected.”

It is unfortunate that bench research does not have markers comparable to clinical research which can be more easily audited. This may evolve as institutions or groups routinely learn to use electronic lab notebook systems that will allow more people to have the opportunity to review and evaluate the records of others in the group. In the meantime, we must rely on the lab director to create an atmosphere that limits opportunities to cheat and that requires ongoing participation with an advisor, particularly concerning the examination of source data and establishing and enforcing standards.
Figure 2120.4-1: ‘Observations’ on Research Misconduct

The following data is taken from a 2008 report of a survey undertaken by The Gallup Organization for the Office of Research Integrity. The study looked at scientists’ reports on suspected research misconduct. In 2005, an anonymous survey “was mailed to 4,298 randomly selected principal investigators of NIH-funded research grants (R01) who worked in 4,298 unique departments at 605 universities, institutes, hospitals and other organizations. 2,226 scientists returned completed surveys. For more on the results of the survey, see Final Report: Observing and Reporting Suspected Misconduct in Biomedical Research, http://ori.hhs.gov.

Examples of Misconduct

The following are among the instances that respondents to the survey cited that analysts involved in the study said met the federal definition of “research misconduct.” They show that misconduct is being conducted by all levels of researchers — from students and lab techs to postdocs and senior faculty. No type of research appears immune, as reports concern basic science, clinical trials, as well as animal research studies.

◆ Colleague omitted data points that nullified hypothesis.
◆ Colleague downloaded files from junior faculty’s grant into his to edit and modify.
◆ Colleague duplicated results between three different papers but differently labeled data in each paper.
◆ Colleague appropriated unpublished data from another lab without permission.
◆ Student plagiarized extensively in a senior research paper.
◆ Colleague used “Photoshop” to eliminate background bands on Western blot to make the data look more specific than what they were.
◆ Colleague dropped subjects from a study in order to obtain significant group differences; these data were published.
◆ Lab technician was stealing subject fees and then fabricated data so the number of subjects would match the subject payments.
◆ Research assistant entered values for a test without conducting the test.
◆ Postdoc altered data in notebook; this changed the interpretation of the experiments.
◆ Implanted surgical materials and inflammatory responses were misrepresented in reporting animal study outcomes.

continued
Steps Researchers Can Take to Prevent or Reduce Misconduct

The respondents to the survey suggested the following, when asked to recommend ways to thwart misconduct in their own group. (The wording is how it appears in the survey report.)

1. Review/audits/examine
2. Discuss/communication/meeting/ask questions
3. Supervision/monitoring/close contact
4. Good model/ethical model/honesty
5. Training/education/emphasize seriousness
6. Be involved/informed/knowledgeable/familiar
7. Reproduce study
8. Value quality/negative results/no blame
9. Good environment/low pressure
10. Vigilance/watchful/aware/skeptical

Other strategies cited: work in teams; enforce penalties and have zero tolerance for misconduct; and investigate before you hire staff.

Top 10 Strategies to Increase Chances of Misconduct Reporting

1. Protected, anonymous reporting
2. Training/education/emphasize seriousness
3. System for reporting/someone to report to
4. Clear policy and procedures/guidelines
5. Discuss/open communication/meeting/ask questions
6. Review/audits/look for things that don’t fit
7. [Emphasize] responsibility [with] staff/require, encourage reporting
8. Character/ethical model/honesty
9. Good environment/low pressure
10. [Emphasize] scientific/research integrity/threat to science

Top 10 Ways to Detect Research Misconduct

1. Supervision/Observation/Oversight/Responsibility of PI

Research Strategies for Academic Medical Centers: A Framework for Advancements toward Translational Excellence

Rand Haley, ECG Management Consultants, and Thomas J. Champagne, Jr., Rush University Medical Center

Abstract

This review article presents a simplified framework for thinking about research strategy priorities for academic medical centers (AMCs). The framework can serve as a precursor to future advancements in translational medicine and as a set of planning guideposts toward ultimate translational excellence. While market pressures, reform uncertainties, institutional economics, and the move to a value-based environment have firmly pushed clinical strategy to the forefront of AMC planning, research strategic planning remains vitally important, especially for AMCs with significant research enterprises.

A “research strategy DNA” framework can help leadership and faculty toward a shared understanding of their current position and help inform their future strategic priorities in light of rapidly changing environments. Six common strategic elements are outlined in the framework: (1) research faculty, (2) research infrastructure and space, (3) research organizations, (4) research focus areas, (5) research teams, and (6) research partnerships. AMC thinking along these elements is guided by two strands: (1) pursuit of excellence, and (2) strategic stewardship.

Building on this framework, three areas of emerging strategic attention (yet underrepresented in current AMC research strategies) are introduced: research business models, translational organizational structures, and philanthropic agility.

Introduction

While healthcare market competitive pressures and reform uncertainties—and the move to a value-based environment—have firmly pushed clinical strategy to the forefront of academic health planning, research strategic planning remains vitally important, especially for academic medical centers (AMCs) with significant research enterprises. The intertwined scientific, organizational, and financial intricacies of clinical and research enterprises are complex, and their combined strategies will play important roles in AMC sustainability and differentiation. Increasingly, the effectiveness of research strategic planning is having an impact on patient choice, outcomes, and translational excellence.

This review article presents a simplified framework for organizing and focusing AMC research enterprise priorities—a framework that can be thought of as the “research strategy DNA” of AMCs. While a number of articles have been written about AMC research enterprise management (Mallon, 2007), overbuilding (Alberts, 2010), right-sizing (Lee, 2013), and related topics, this framework offers a means of organizing the many elements that AMC leadership and faculty should consider as they chart their future research enterprise trajectories. Increasingly, these trajectories must

1 This article is reprinted from Research Management Review, Volume 22, Number 1. It is used with permission of the publisher.
demonstrate progress along translational medicine fronts to ensure continued institutional investment in research enterprise development, align with persistent patient care priorities, and prevent a decoupling of clinical and research enterprise finances.

**Research Strategy DNA Framework**

The introduced framework combines the authors’ AMC research strategy experience with review of selected strategic plans from AMCs with major research enterprises. The common, central strategic elements found across these and other plans have been extracted into a simplified framework along which research investments have been focused. However, with significant mission and economic pressures bearing down on research enterprises, these central elements, while still required, will not be sufficient as AMC leadership and faculty develop future research strategies. In particular, three additional areas for future strategic attention are identified alongside the framework—areas that are underrepresented in current plans: research business models, translational organization structures, and the importance of philanthropy.

Six common strategic elements are outlined in the framework (Figure 2120.5-1), with these elements forming the “base pairs” of research strategy DNA. The base pairs are structurally supported by two “strands” that guide AMCs’ research thinking: the pursuit of excellence and strategic stewardship. Pursuit of translational research excellence is a fundamental tenet of AMCs and one that continues to promise the opportunity to differentiate AMCs relative to other healthcare providers in the market. Strategic stewardship refers to the increasing emphasis on research effectiveness and efficiency alongside the realization that while research is an inherently nonlinear, inefficient activity, there are limited resources for investment in the enterprise—investments that are made in an environment of numerous competing interests.

1. **Research Faculty**

Support for faculty over the duration of their careers—from recruitment and start-up to junior faculty development to funding gap challenges—is a central element across AMC research strategies and deserves this pole position. AMCs recognize the importance of recruiting and retaining high-performing research faculty, and faculty with strong team-building capabilities are increasingly valued. The competitive external research funding environment, and the lack of clear, sustainable solutions to address prolonged research funding gaps, is a challenge driving AMCs to emphasize faculty return on investment and ability to compete for larger-scale, complex, and team-based funding opportunities.

   Successful AMCs are devoting attention to coordinating faculty recruitment, and their strategic plans characterize junior faculty as investments and describe programs designed to support junior faculty development. Examples include linking junior faculty with experienced faculty possessing strong National Institutes of Health (NIH) funding histories, offering competitive internal seed grants, and establishing clinical scholar awards that provide release time for junior clinical faculty with demonstrated research abilities.

   A limited number of AMCs are also exploring the extension of perfor-
mance-based faculty metrics and compensation approaches from the clinical realm to research. Elements include developing metrics to measure faculty research performance (at the individual investigator and academic unit levels), connecting these metrics to commonly-used clinical RVUs (Relative Value Units), integrating tracked research metrics into performance evaluation, and revising faculty compensation plans to reward research performance across the basic, translational, and clinical sciences.

Other increasingly strategic elements for faculty success are comprehensive faculty mentoring programs—programs that intend to help recognize early strengths and research interests that can be complementary to an AMC’s research strategy. Also, faculty committee service models, tenure designs, instruction/teaching modalities, and other forms of faculty citizenship are gaining strategic importance as AMCs continue to maneuver among the challenges of a demanding landscape.

2. Research Infrastructure and Space

Shared research infrastructure and core research facilities are a strategic focus of many AMCs. Plans reveal emphasis on enhanced research infrastructure investment in concert with improved management of cores along organizational, governance, and financial dimensions. The following description from one plan highlights some of the challenges and opportunities (University of North Carolina, 2012):
While this infrastructure has enabled our faculty to engage in cutting-edge and innovative research, the proliferation of cores and lack of central oversight have led to resource duplication, unnecessary administrative burden and an environment in which cores are often only evaluated in a reactive manner (e.g., efforts to save a core which has run continued annual deficits) rather than proactively. In order to streamline core facilities and platforms and shift institutional attention from putting out fires to evaluating core investments strategically, a process of centralization and consolidation of research core facilities will be initiated.

Investment areas span the basic, translational, and clinical research domains and include biomedical research cores, enhanced imaging cores, tissue procurement capabilities, clinical and laboratory repositories (including biobanks or biorepositories), animal models, and clinical trials infrastructure.

Extending from infrastructure to research space, plans are increasingly attentive to more data-driven research space allocation, re-allocation, and utilization approaches. While a number of AMCs have overbuilt their research enterprises, others have ambitious plans to construct additional research space. Institutions have also begun to evaluate the merits of co-owning/developing research spaces, along with the economic viability of continuing research “incubators” and other scaling facilities. Despite these differences, a constant focus remains: the need for more strategic understanding and decision-making related to available research space and its contribution to impactful, economic, and productive research.

3. Research Organizations

The organization of some AMC research activities into centers, institutes, or other organizational structures represents another key element observed across strategic plans, with a focus on how well-designed organizational structures can enhance research productivity, effectiveness, and efficiency.

Multiple plans identify centers and institutes as important to linking basic and clinical research and to improving the translation of research into improved clinical care. Plans call for establishing or enhancing organizational structures to target these and other research goals. Successful plans are also increasingly focused on objective, transparent, and formal review of research centers and institutes as well as traditional academic departments. As summarized in one plan (University of Pennsylvania, 2013):

Sustained success requires ongoing realignment of priorities and flexibility to invest in developing areas of scientific inquiry and clinical medicine. To this end, we will undertake a rigorous and metric based review of the current center and institutes’ activities, impact, and governance to ensure continued alignment with the institution’s strategic priorities and objectives.

4. Research Focus Areas
Almost universally, leading AMC strategic plans identify a select number of research focus areas for institutional investment and development. Efforts typically focus on strengthening existing competitive research niches, areas of critical faculty mass, and areas of emerging research opportunity in the funding landscape that simply cannot be ignored.

Specific areas identified in the sampled plans range from the basic sciences to population health research (Figure 2120.5-2). Cutting across research domains, a number of AMC plans focus on areas such as establishing leadership positions in bioinformatics or biomedical informatics. Other cross-cutting research areas receiving attention include data-intensive science and personalized or individualized medicine. Per the sampled plans, selected research focus areas include those listed in the table below:

<table>
<thead>
<tr>
<th>Basic Sciences</th>
<th>Translational</th>
<th>Clinical</th>
<th>Population Health</th>
</tr>
</thead>
<tbody>
<tr>
<td>Genomics</td>
<td>Biostatistics</td>
<td>Personalized diagnostics</td>
<td>Outcomes research</td>
</tr>
<tr>
<td>Stem cells</td>
<td>Computational sciences in support of</td>
<td>Degenerative and regenerative medicine</td>
<td>Comparative effectiveness research</td>
</tr>
<tr>
<td>Bioengineering</td>
<td>translational research</td>
<td>Clinical decision-making research</td>
<td>Research related to the delivery and financing of</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>healthcare</td>
</tr>
</tbody>
</table>

All of these research areas of concentration tend to impact research strategic planning within AMCs. Additionally, fiscal realities, clinical priorities, and the previously mentioned limited resource availability all have undeniable influences on the strategic priorities and planning processes for AMCs.

5. Research Teams

Proactive investment in supporting research teams is an institutional priority across a number of AMC plans. These plans often call for developing and improving research development offices and functions. Within these offices, support is provided to help identify and bring together teams of complementary investigators (from the
basic, clinical, and/or population health research domains) and help the teams more effectively identify, plan, and compete for complex, large-scale, and often multidisciplinary funding opportunities. Mentoring programs, young investigator forums, grantsmanship training, and incentive programs that reward teams (over individual investigator-initiated activities) are all additional strategic opportunities that widen and deepen the corpus of research excellence at institutions.

6. Research Partnerships

Research partnerships are positioned in strategic plans as ways to both strengthen research capabilities and attract external funding from sources beyond the NIH and other federal funding streams. Partners include state and local organizations, industry, and international collaborators (Figure 2120.5-3). At the state and local levels, identified partnership opportunities include other schools in the university, other academic institutions in the area, AMC-affiliated hospitals and health systems, and independent research institutes. On the industry side, stated partnership goals include support for clinical research and assistance with the translation of research discoveries into technologies that will benefit future patient care. Whether their clinical operations are globally engaged or not, some AMC plans call for research-focused international partnerships, ranging from basic research collaborations to partnerships focused on clinical research and/or public health.

**Conclusion and Areas for Future Strategic Attention**

The research strategy DNA framework presented here can help leadership and faculty toward a shared understanding of their current position and help inform their future investments in light of rapidly-changing research, clinical, and academic environments. As AMCs continue their research strategy explorations, there are three areas that are of great importance yet underrepresented in current research strategic plans: research business models, translational organizational structures, and philanthropic agility (including the important role philanthropic efforts can play in plan design, flexibility, and ultimate achievement). Introduced below, these areas are expected to be key considerations for AMCs over the next several years.
1. Research Business Models

The traditional business models of AMC research enterprises, characterized by significant support from clinical revenue-sharing, are simply not sustainable. AMCs are facing increasing demands for institutional resources to support research enterprises struggling in a period of extremely competitive external funding. These demands include resources to support faculty and other researchers who have lost grant support, shared research infrastructure, and other elements. At the same time, AMCs are experiencing or expecting significant pressures on resources from the clinical operations on which they have historically relied on to support their research missions.

While improved strategic stewardship of research (for example, efficiencies gained from consolidating overlapping core research facilities) can be helpful, major changes will be needed to craft innovative, new research business models within AMCs (e.g., shared services). Research incentives, including enhanced funds-flow / change-in-net-asset models for research budgeting, creative release-time models, and an increased institutional appetite for loss-leading exploratory research, will all have to be considered. Finally, while financial pressures are particularly challenging for the basic sciences, the new business models must span research domains. The blueprints for these changes are at best in their infancy; a combination of creativity and strong leadership will be needed to reshape academic healthcare research business models in truly productive, sustainable ways.

2. Translational Organizational Structures

More rapid translation of research discoveries into improved patient care has the potential to become a valuable differentiator for AMCs’ clinical enterprises. Translational medicine can allow AMC research enterprises to demonstrate their key institutional importance to both mission and financial contribution. This said, the pace and success of translation have not yet achieved their potential: discoveries are slow to market, patent persecution is complex, and innovation pipelines are continuously pressured by time and expectations for returns on investment. Future attention must be dedicated to experimenting with more innovative organizational structures and incentive systems for linking researchers and clinicians and improving translational medicine. AMCs are particularly well-positioned for these efforts (Brenner, 2012):

Translational medicine is an opportunity that we cannot miss. This is truly a unique niche for academic medical centers and clinician scientists. It requires the intensive analysis and treatment of well-pheno-typed patients, which is something that neither freestanding research institutions nor community hospitals can do.

There are promising glimpses of this at a number of AMCs, including centers and institutes supported by NIH-funded Clinical and Translational Science Awards. However, greater creativity and willingness to experiment with novel organizational structures—even if some of these attempts fail—will be required to make measurable impacts on AMC research and clinical distinction.
3. Philanthropic Agility

Increasingly, the role of philanthropy is being prioritized in the strategic planning requirements of AMCs. Today’s strategic plans assuredly include derived financial plans to support the intended efforts; increasingly, financial plans provide a key role for philanthropy and fundraising. Successful research strategic plans place a portion of the strategic priorities “at risk” and subject to the institution’s ability to raise unrestricted (or limited restriction) funding. This serves to enhance plan agility and allow higher risk (and more rewarding) components to be developed within research strategic plans.

Philanthropic efforts can be valuable to all AMC entities and research missions. For example, grateful patients can seed clinical research efforts with bequests, industry investments can fiscally support new devices closer to market launch, and other forms of industry partnership can bring needed laboratory equipment in-house. Successful philanthropic roles in the strategic planning process can also infuse flexibility into research efforts, relax expectations to make room for creativity, and provide a fiscal backstop for managing unexpected, sometimes expensive research program contingencies.

Endnote

1. Methodology: A qualitative review of strategic plans from AMCs with leading research enterprises was conducted. Publicly available strategic plans from seven AMCs and/or schools of medicine (SOMs) were accessed from universities whose SOMs ranked in the top 15 in fiscal year 2014 research expenditures. While the explored plans varied in format and level of detail, a number of commonalities emerged relating to their research enterprise strategies. Among the seven plans, all written in 2011 or later, six were developed at the AMC level and one at the SOM level. Four of the plans were from private institutions, and three were from public institutions. The sample of seven research strategic plans represented the following universities: University of California, San Francisco; Johns Hopkins University; University of Pennsylvania; University of Michigan; University of North Carolina at Chapel Hill; Northwestern University; and University of California, Los Angeles.

**About the Authors**

**Rand Haley** is a Senior Manager at ECG Management Consultants. He has devoted his career to helping organizations strengthen their research enterprises. Rand has over 15 years of experience providing strategy and management consulting services to research universities, AMCs, hospitals, health systems, and independent research institutes. He earned an M.S. in biochemistry and molecular biophysics from the University of Pennsylvania; an M.A. in science, technology, and public policy from The George Washington University; and a B.S. in physics from the Georgia Institute of Technology.

**Thomas J. Champagne, Jr.,** is Chief Research Administrator and Associate Vice President at Rush University Medical Center. His 31-year professional tenure, dedicated to research and academic affairs, includes time with the Howard Hughes Medical Institute, Emory University, McKinsey & Company, and Huron Consulting. He received his B.B.A. in management from Sam Houston State University and his MBA from Hood College.
This section includes practical guidance and tools — reports, flowcharts, checklists, etc. — relating to issues concerning academic medical centers. This material is culled from a variety of authoritative sources.

Conflicts of Interest in Academia-Industry Biomedical Research

The possibility of financial conflicts of interest (FCOI) in the research endeavor is always present, and as academia-industry relationships increase, so too the level of concern with financial conflicts of interest. (For a broader discussion of financial conflict of interest compliance, see ¶1530.1.)

Since the National Institutes of Health (NIH) “Objectivity in Research” or conflict of interest regulations were published in 1995, developing appropriate policies and practices concerning financial conflicts of interest affecting sponsored research has been a priority for colleges and universities. Continued media coverage of real or perceived COI associated with university investigators and clinicians and recent congressional interest in the topic, as well as the scrutiny on and by NIH, the topic serve as reminders to institutions of the importance of this topic.

New Regulations Issued

The rule updates the existing regs because “interactions among government, research institutions, and the private sector have become increasingly complex. This complexity, as well as a need to strengthen accountability, led to changes that expand and add transparency to” principal investigators’ disclosure of significant financial interests and “enhance” compliance and institutional oversight and management of FCOI, according to the regs. In a recent blog posting, NIH Office of Ex-
tramural Research Deputy Director Sally Rockey said that also driving the changes “has been increased scrutiny of investigators’ financial relationships from Congress and the public” (http://nexus.od.nih.gov/all/rock-talk).

For the most part, the final rule closely follows the notice of proposed rulemaking published in May 2010. (Figure 2130.1-1 describes some of the major changes included in the final rule.)

<tbody>
<tr>
<td>Institutions must take reasonable steps to ensure that investigators working for subs comply with the regs by requiring those investigators to comply with the institution’s policy or by requiring the entities to provide assurances to the institution that will enable the institution to comply with the regs.</td>
<td>For an identified FCOI, an institution must develop and implement a management plan that shall specify the actions that have been, and shall be, taken to manage such FCOI. (See also “Retrospective Review” below.)</td>
</tr>
<tr>
<td>- Incorporate as part of a written agreement terms that establish whether the FCOI policy of the awardee institution or that of the subrecipient will apply to subrecipient Investigators and include time periods to meet disclosure and/or FCOI reporting requirements.</td>
<td></td>
</tr>
<tr>
<td>- Subrecipient institutions that rely on their FCOI policy must report identified FCOIs to the awardee institution in sufficient time to allow the awardee institution to report the FCOI to the PHS Awarding Component (e.g., NIH through the eRA Commons FCOI Module) to meet reporting obligations.</td>
<td></td>
</tr>
</tbody>
</table>

| Manner of compliance with regs not specified (“manage, reduce, or eliminate” are options). | Institution is required to conduct a retrospective review in those cases of non-compliance with the regulation but is not required to report the review to the PHS Awarding Component. The institution will be required to notify the PHS Awarding Component promptly and submit a report to the PHS Awarding Component only in cases where bias is found. The report will address the impact of the bias on the research project and the actions the institution has taken, or will take, to eliminate or mitigate the effect of the bias. |

| Retrospective Review (“Mitigation plan” discussed in proposed rules) |  |
| - Not mentioned |  |

| Public Accessibility |  |
| - No requirement | Make certain information available concerning identified FCOIs held by senior/key personnel via a publicly accessible website or by a written response to any requestor within five business days of a request, and update such information as specified in the rule. This information will include at a minimum the investigator’s name; the investigator’s title and role with respect to the research project; the name of the entity in which the SFI is held; the nature of the SFI; and the approximate dollar value of the SFI, or a statement that the interest is one whose value cannot be readily determined through reference to public prices or other reasonable measures of fair market value. Senior/key personnel means the PD/PI and any other person identified as senior/key personnel by the institution in the grant application, progress report, or any other report submitted by the institution under the regulations. |

| FCOI Training | Each investigator must complete training prior to engaging in research related to any PHS-funded grant or contract and at least every four years, and immediately under the designated circumstances: |
| - Institutional FCOI policies change in a manner that affects investigator requirements |  |
| - An investigator is new to an institution |  |
| - An institution finds an investigator noncompliant with its FCOI policy or management plan. |  |

Compliance Date for New Rule. Although the rule has an “effective” date of Sept. 26, the “compliance dates” for applicant institutions are Aug. 24, 2012, and “immediately” after an institution makes its FCOI policy publicly accessible as described in the regulation. NIH, in reviewing the over 100 comments received in response to the proposed rules, decided not to extend the implementation date beyond one year, as suggested by several commenters.

The revised regulations will apply to each grant or cooperative agreement with a Notice of Award issue date after the compliance date of the final rule (including noncompeting continuations) and to research solicitations issued and contracts awarded subsequent to that date, the rule states.

Until August 2012, grantees are to remain in compliance with the 1995 regulations.

Figures 2130.1-2 – 2130.1-3 provide overviews of the new requirements and were created by NIH.

</tbody>
</table>
Institutions must
• Establish standards that provide a reasonable expectation that the design, conduct, and reporting of NIH-funded research will be free from bias resulting from investigator financial conflicts of interest.
• Maintain an up-to-date, written, enforced policy that complies with the FCOI regulation and make it available via a publicly accessible website.

Records Maintenance
Maintain records of all investigator disclosures of financial interests and the institution’s review of, and response to, such disclosures (whether or not a disclosure resulted in the institution’s determination of FCOI) and all actions under the institution’s policy or retrospective review, if applicable
• for at least three years from the date of submission of the final expenditures report or, where applicable,
• from other dates specified in 45 C.F.R. 74.53(b) and 92.42 (b) for different situations.

Application Certification
Certify in each application for funding that the institution
• Has in effect an up-to-date written and enforced administrative process to identify and manage FCOIs related to all PHS research projects
• Shall promote and enforce investigator compliance with the regulation pertaining to disclosure of SFIs
• Shall manage FCOIs and provide initial and ongoing FCOI reports to PHS/NIH
• Agrees to make information available upon request relating to any investigator disclosure of financial interest and the institution’s review of, and response to, such disclosure, whether or not the disclosure resulted in the institution’s determination of an FCOI
• Fully complies with the requirements of the regulation

Designated Institutional Official
• Designate an institutional official(s) to solicit and review disclosure statements from each investigator planning to participate in, or is participating in, PHS/NIH-funded research
• Provide guidelines to identify conflicting interests related to proposed or PHS/NIH-funded research
• The designated institutional official(s) shall develop management plans that specify the actions that have been, and shall be, taken to manage FCOIs

Inform Investigators
Must inform each Investigator of the
• regulation;
• institution’s policy on FCOI; and
• investigator’s responsibilities regarding disclosure of SFIs

Investigator Training
Institutions must require that each Investigator complete FCOI training
• Prior to engaging in research related to any NIH funded project;
• At least every four years, and
• Immediately when any of the following circumstances apply —
  • Institution revises its policy in a manner that affects the investigator;
  • When an investigator is new to the institution; or
  • When the institution finds an investigator is not in compliance with the institution’s policy or management plan

Investigator Disclosure of SFIs
• At time of Application: Require that each investigator, including subrecipient investigators, if applicable, planning to participate in PHS/NIH-funded research to disclose to the designated official(s) at time of application.
• Annually: Require each investigator, including subrecipient investigator, if applicable, to submit an updated disclosure of SFI at least annually, in accordance with the specific time period prescribed by the institution, during the period of the award.
• Within 30 days: Require each investigator, including subrecipient investigator, if applicable, who is participating in the NIH-funded research to submit an updated disclosure of SFI within thirty days of discovering or acquiring (e.g., through purchase, marriage, or inheritance) a new SFI.

Management of FCOIs
• Take necessary actions to manage FCOIs of its investigators, including those of subrecipient investigators
• Develop a management plan(s) and monitor compliance
• If an institution identifies an SFI that was not disclosed or reviewed in a timely manner, the designated official(s) shall within sixty (60) days review the SFI, determine if an FCOI exists and implement an interim management plan, if needed.

continued
### Figure 2130.1-3: Institutional Responsibilities, continued

#### FCOI Reporting
- Provide initial and ongoing FCOI reports to NIH:
  - Prior to the expenditure of funds
  - During the period of award: within 60 days of identifying a new FCOI
  - Annually
    - Report on the status of FCOI and any changes in management plan
    - Due at same time as when grantee submits annual progress report, including multi-year progress report, or at time of extension
  - All FCOI reports are submitted to NIH through the eRA Commons FCOI Module

#### Elements of an FCOI Report
- Grant number
- PD/PI or contact PD/PI
- Name of investigator with the FCOI
- Name of the entity with which the investigator has an FCOI
- Nature of FCOI (e.g., equity, consulting fees, travel reimbursement, honoraria)
- Value of the financial interest $0-4,999; $5K-9,999; $10K-19,999; amounts between $20K-$100K by increments of $20K; amounts above $100K by increments of $50K or a statement that a value cannot be readily determined
- A description how the financial interest relates to NIH-funded research and the basis for the institution’s determination that the financial interest conflicts with such research
- Key elements of the institution’s management plan

#### Subrecipient Requirements
- Incorporate as part of a written agreement terms that establish whether the FCOI policy of the awardee institution or that of the subrecipient will apply to subrecipient investigators and include time periods to meet SFI disclosure, if applicable, and FCOI reporting requirements.
- Subrecipient institutions who rely on their FCOI policy must report identified FCOIs to the awardee institution in sufficient time to allow the awardee Institution to report the FCOI to the PHS/NIH Awarding Component (i.e., to NIH through the eRA Commons FCOI Module) to meet FCOI reporting obligations.

#### Public Accessibility
Prior to expenditure of funds, make certain information concerning FCOIs held by senior/key personnel publicly accessible via a website or available within five business days of a written request.
- Update the website annually and within 60 days of identifying any new FCOIs
- Retain information for three years

### Figure 2130.1-4: Summary of FCOI Regs Noncompliance

#### FCOI Report (within 60 days)
Whenever an institution identifies an SFI that was not disclosed, identified, reviewed, or managed in a timely manner, the designated official(s) shall within 60 days review and make the determination of an FCOI and report the FCOI, if it exists, to the PHS/NIH.

#### Retrospective Review (to determine bias)
If an FCOI exists, complete and document a retrospective review within 120 days of the institution’s determination of noncompliance. Implement, on at least an interim basis, a management plan that shall specifies the actions that have been, and will be, taken to manage the FCOI going forward.

#### Update/Revise FCOI Report (following retrospective review)
If applicable, update existing FCOI report to specify the actions that have been, and will be, taken to manage the FCOI going forward.

#### Mitigation Report (promptly after retrospective review)
- If bias is found, notify NIH promptly.
- Submit Mitigation Report through FCOI Module (eRA Commons).

#### Annual FCOI
Submit annual FCOI report thereafter.
Institutional Conflict of Interest

Institutional conflict of interest (iCOI) is becoming a more popular focus of attention. In its August 2011 final rule amending its 1995 FCOI regulations for grantees and contractors, NIH said it is a significant and timely topic worthy of serious consideration, but it declined to regulate such conflicts at this time.

The Association of American Medical Colleges (AAMC) and the Association of American Universities (AAU) issued an 87-page report in February 2008 designed to assist medical schools and universities with implementing policies to manage financial conflicts of interest (www.aamc.org/jointcoireport). “Protecting Patients, Preserving Integrity, Advancing Health: Accelerating the Implementation of COI Policies in Human Subjects Research” offers the following recommendations to schools of medicine and teaching hospitals:

◆ “Accelerate the development of COI policies that cover the financial interests of faculty, institutions and their officials, including deans, department chairs, and division chiefs

◆ “Implement a reporting, evaluation and management process for both individual and institutional financial COI that includes a review system that involves a standing internal committee or an external review entity

◆ “Complete the development and implementation of institutional COI policies in the next two years.”

In 2007, the Institute of Medicine (IOM) appointed the Committee on Conflict of Interest in Medical Research, Education, and Practice to examine conflicts of interest in medicine and “to recommend steps to identify, limit, and manage conflicts of interest without negatively affecting constructive collaborations.” The report of the committee’s work, “Conflict of Interest in Medical Research, Education, and Practice,” was published in 2009. It “stresses the importance of preventing bias and mistrust rather than trying to remedy damage after it is discovered” (www.nap.edu/catalog.php?record_id=12598).

HHS OIG Weighs In. Oversight of investigators’ financial conflicts of interest is insufficient to guarantee that federally funded research is unbiased, according to a report released in January 2011 by the Office of Inspector General of the Department of Health and Human Services. Instead, the report says, NIH should require institutions to develop their own financial conflict of interest policies and disclose to NIH conflicts that do arise, along with a management plan.

This is not the first time OIG made such a recommendation; it expressed a similar sentiment in a 2009 report (OEI-03-07-00700). The agency said the presence of institutional COIs is undisputed, and organizations such as the Institute of Medicine have recommended the adoption of policies that manage them. “An institution’s financial interests (for example, royalties, equity, stockholdings, and gifts) or those of its senior officials can become institutional conflicts when the financial interests pose a risk of undue influence on decisions involving the institution’s research,” OIG said.
The report includes data on 156 institutions that responded to a survey OIG undertook; of these, 52 had reported an investigator COI to NIH and 104 had not. The survey found that “although not required for institutional financial interests, 70 of 156 responding NIH grantee institutions have written policies and procedures addressing institutional interests.”

---

**Practical ‘Tools’ from FASEB**

In summer 2007, the Federation of American Societies for Experimental Biology (FASEB) launched its COI Toolkit, a Web site designed to help the scientific community better navigate financial relationships between academia and industry. The toolkit consists of three parts: Introduction, Guiding Principles, and Tools.

The guiding principles are the following:

- **Guiding Principle 1: Investigators must conduct research activities objectively.** All investigators participating in research (industry-funded or not) have a professional obligation to the integrity of their studies.

- **Guiding Principle 2: Investigators must operate with transparency.** Transparency in academia-industry relationships in research is important to advance research and promote trust of colleagues and the public.

- **Guiding Principle 3: Investigators must be accountable to all stakeholders.** Investigators are accountable to all stakeholders including the public, sponsors of research, home institutions, research teams, and human subjects and patients.

Included in the third section are tools for five specific stakeholder groups: investigators, institutions, publishers, scientific and professional societies, and industry partners.

 Resources for Managing the Research Enterprise’
AIS editors

The Association of American Medical Colleges (AAMC) has assembled a collection of 13 peer-reviewed articles, previously published in its journal, Academic Medicine, on the theme of research compliance and related issues. “Management Series: Managing the Research Enterprise” pulls together material that “looks at the challenges of managing the research enterprise and addresses some of the policies and strategies implemented by medical schools and teaching hospitals to tackle these challenges.”

Topics addressed in the collection range from financial management, to the reinvention of an institutional review board, to how to manage relationships with industry sponsors. A new introduction written for the collection also is included. Articles in the collection include the following:

◆ “Promoting Translational Research in Academic Health Centers: Navigating the Roadmap,” by Timothy P. Cripe, MD, PhD, Blythe Thomson, MD, Thomas F. Boat, MD, and David A. Williams, MD

◆ “The Financial Management of Research Centers and Institutes at U.S. Medical Schools: Findings from Six Institutions,” by William T. Mallon, MD

◆ “The Benefits and Challenges of Research Centers and Institutes in Academic Medicine: Findings from Six Universities and Their Medical Schools,” by William T. Mallon, MD

◆ “A Program to Provide Regulatory Support for Investigator-Initiated Clinical Research,” by Harvey M. Arbit, PharmD, MBA, and Mark S. Paller, MD

◆ “Establishing Procedures for Institutional Oversight of Stem Cell Research,” by Patricia Zettler, Leslie E. Wolf, JD, MPH, and Bernard Lo, MD

◆ “Rejuvenating a Foundering Institutional Review Board: One Institution’s Story,” by Kenneth De Ville, JD, PhD, Gregory Hassler, JD, PhD, and Michael J. Lewis, MD, PhD

◆ “Adapting Postdoctoral Training to Interdisciplinary Science in the 21st Century: The Cancer Prevention Fellowship Program at the National Cancer Institute,” by Shine Chang, PhD, Stephen D. Hursting, PhD, RD, MPH, Susan N. Perkins, PhD, Graça M. Dores, MD, MPH, and Douglas L. Weed, MD, MPH, PhD

◆ “Creating an Infrastructure for Training in the Responsible Conduct of Research: The University of Pittsburgh’s Experience,” by Barbara E. Barnes, MD, MS, Charles P. Friedman, PhD, Jerome L. Rosenberg, PhD, Joanne Russell, RN, MPPM, Ari Beedle, MBA, and Arthur S. Levine, MD

◆ “Industry, Academia, Investigator: Managing the Relationships,” by David Korn, MD
◆ “Restoring and Preserving Trust in Biomedical Research,” by Mark Yarborough, PhD, and Richard R. Sharp, PhD

◆ “Policies of Academic Medical Centers for Disclosing Financial Conflicts of Interest to Potential Research Participants,” by Kevin P. Weinfurt, PhD, Michaela A. Dinan, Jennifer S. Allsbrook, Joëlle Y. Friedman, MPA, Mark A. Hall, JD, Kevin A. Schulman, MD, and Jeremy Sugarman, MD, MPH, MA

There is no charge for viewing the articles online at www.academicmedicine.org. Click on “Management Series” in the right-hand column.

Other collections in the series address (1) “mission-based management,” which includes a collection of nine articles from the Academic Medicine archive and (2) “strategic alliances,” featuring articles from Academic Medicine about strategic alliances and mergers in the academic medicine community.
2130.3  HIPAA Checklists*

AIS editors

The Health Insurance Portability and Accountability Act (HIPAA) and its implementing regulations govern the federal privacy and security protections for personal health information. Research organizations and researchers may or may not be covered by the HIPAA Privacy Rule. HIPAA applies only to a medical center that is a “covered entity” or “a health care provider who transmits any protected health information in electronic form.”

Sponsored programs offices may become involved with HIPAA when health care information is likely to be transmitted in the course of conducting sponsored programs and under other circumstances (see 2105.6). (For resources relating to HIPAA compliance, see Figure 5, page 2105:30.)

Starting on page 2130:10, you will find three sample HIPAA research checklists: one for research institutions (Figure 2130.3-1), one for researchers (Figure 2130.3-2), and one for covered entities (Figure 2130.3-3).

Reminder
The National Institutes of Health has a Web site that provides information on the HIPAA privacy rule for the research community. Link: http://privacyruleandresearch.nih.gov.

*These checklists are reprinted from HIPAA Patient Privacy Compliance Guide, Chapter 2000, which was originally written by Diane M.L. Lee, Esq., of the Davis Wright Tremaine Law Firm in San Francisco. They are reprinted with permission of the publisher. ©2007 Atlantic Information Services, Inc.
Figure 2130.3-1:
Checklist for Research Institutions (Sample)

1. Develop IRB policies and procedures on HIPAA requirements for all research.
   - Waiver criteria
   - Waiver approval processes
   - Waiver documentation
   - Waiver forms

2. Train IRB members in requirements and work with IRB to coordinate HIPAA and the
   HHS and FDA protection of human subjects regulations.

3. Educate investigator and research coordinators on the specific HIPAA requirements
   as they will apply to the research entity. Explain whether the research entity is a covered
   entity or not, and if a hybrid entity, how the research entity relates to those parts that
   are covered entities.

4. Review the standard HIPAA requirements, such as authorizations, minimum necessary,
   and accounting for disclosures.

5. Educate investigators and research coordinators that protocols and consents submitted
   for approval also will be required to meet HIPAA requirements.

6. Develop standard authorization language for stand-alone authorization or format for
   integration into informed consent for participation in research. A valid research
   authorization must contain the following:
   - A specific, meaningful description of the PHI that is to be used or disclosed.
   - The name or other specific identification of the persons or class of persons
     authorized to make the requested use or disclosure of the PHI.
   - The name or other specific identification of the persons or class of persons by
     whom the information may be used and/or to whom the information may be
     disclosed.
   - A description of each purpose of the requested use or disclosure.
   - An expiration date or an expiration event that relates to the individual or the
     purpose of the use or disclosure. The statement “end of the research study” or
     “none” or similar language is sufficient for research, including for the creation
     and maintenance of a research database or research repository.
   - The signature of the research subject and the date, if the authorization is signed by
     a personal representative of the research subject, a description of the
     representative’s authority to act for the research subject also must be provided.
   - The research subject’s right to revoke the Authorization in writing, any exceptions
     to the right to revoke the Authorization, a description of how to revoke the
     Authorization, and a statement that data collected prior to the revocation of
     authorization may remain in the study.
☐ A statement that any disclosure of information carries with it the potential for an unauthorized redisclosure and may not be protected.

☐ The consequences of failure to provide authorization for research-related treatment, that is, no treatment will be provided without the authorization.

7. Develop policies and procedures and guidance on HIPAA exceptions, such as use of PHI for preparatory to research and decedents. [Optional: Develop standardized forms for investigators to use for these exceptions.]

8. For research institution that is also a covered entity:

☐ Develop provider-wide ability to identify inpatients and outpatients who are participating in research.

☐ If applicable, ensure that researchers understand when they are working in the capacity of the covered entity and when they are not.

9. For research institutions that are part of a hybrid entity:

☐ Determine which parts of the hybrid entity are covered entities and which part are not.

☐ Educate researchers/investigators as to the status of the parts and the HIPAA application to each.
Figure 2130.3-2:
Checklist for Researchers (Sample)

1. Determine whether the research is subject to HIPAA.
2. Determine whether the institution that employs you is a covered entity.
3. Determine whether your research requires IRB approval and/or a waiver of both Common Rule and HIPAA authorization, or a privacy board approval/waiver only.
4. Complete necessary forms for submission to IRB/privacy board, as appropriate.
5. Obtain authorizations, if required, using a HIPAA-compliant research authorization.
7. If requesting information from an external covered entity, determine the covered entity’s procedures, and complete any forms necessary to submit to the covered entity.
8. As required, keep a log of all records used for purposes of the accounting of disclosures.

*Know which entity must receive copies of forms and representations throughout the process. Check both HIPAA office, and, if applicable, IRB instructions, as well as covered entity requirements.*
Figure 2130.3-3: Covered Entity Checklist for Release of PHI For Research Purposes (Sample)

Covered entity employees who receive a request to disclose PHI for research purposes must follow these procedures before releasing PHI to the researcher.

(1) For paper or electronic records, obtain the completed and signed form entitled “Request for Access to Protected Health Information for Research Purposes.”

(2) Forward a copy of the completed request form plus documentation to the __________ as soon as possible.

(3) Limit access to a period of time not to exceed the duration of the IRB approval for the research protocol, noted on the IRB approval letter.

Covered entity employees, who have responsibility and authority for responding to research requests, may disclose PHI for research purposes for the following circumstances after obtaining the proper documentation:

For (1), (2), and (5), a copy of the IRB approval letter must be presented by the researcher in addition to HIPAA documentation:

(1) Researcher presents:

   __ authorization signed by the patient or
   __ copy of informed consent documentation signed before April 14, 2003
   and
   __ IRB approval letter.

This covers release of all PHI described in the document.

(2) Researcher presents:

   __ IRB waiver of authorization
   and
   __ IRB approval letter.

This covers release of all PHI described in the document.

(3) For research eligibility prescreening and/or subject recruiting, prior to obtaining, the PHI researcher presents:

   __ written IRB waiver of authorization or
   __ IRB limited waiver of authorization for recruitment
   and
   __ IRB approval letter.
Figure 2130.3-3 (continued)

(4) For review preparatory to research, obtain a written statement from the researcher that states the following:

__ The researcher wants access to the PHI solely to determine whether there is sufficient data to support a specific protocol or an idea for a research study;
__ The researcher will not record any individually identifiable PHI;
__ The researcher will not remove any PHI for the records;
__ The access to the PHI is necessary for preparation for research; and
__ Patients will not be contacted using PHI obtained in this review preparatory to research.

Review preparatory to research does not include access to PHI for research subject eligibility prescreening and/or recruitment contact.

(5) For PHI on decedents, obtain a written statement from the researcher that states the following:

__ The access is requested solely for research on PHI of decedents;
__ The PHI of these decedents is necessary for the research study; and
__ Upon request, the researcher will provide documentation of the death of the individuals whose PHI is accessed and used.

Accounting of Disclosures Requirements:

Covered entity staff who disclose PHI for research purposes must maintain a written accounting of each individual disclosure as required by the covered entity accounting of disclosures policy for the following circumstances:

__ IRB waiver of authorization (less than 50 individuals).
__ IRB waiver of authorization (50 or more individuals): An individual written accounting of each disclosure does not have to be maintained; however, covered entity is required to maintain a master list of protocols for which PHI of 50 or more individuals has been accessed, including all information required with respect to such protocols as specified in the covered entity HIPAA research policy.

Accounting of disclosures is NOT required for the following circumstances:

__ release pursuant to a valid research authorization;
__ limited data sets; and
__ de-identified information.
Getting Started….

◆ Plan

  • Develop a recruitment plan during the protocol planning stage.
  • Avoid unnecessarily restrictive inclusion and exclusion criteria; think about the widest net, not the “perfect” participant.
  • Develop a profile of prospective study participants with consideration for —
    • What would motivate individuals to join the study.
    • Sources from which they obtain information.
    • Radio and television stations and programs they listen to and watch.
    • Where they live, work, shop, and play.
    • Media outlets to use for recruitment advertisements.
    • Caregivers and relatives that might serve as referral sources.
    • Community organizations (e.g., local churches, etc.) that might promote the study and encourage participation if educated about the disease/problem and the need for participation in studies.
  • Review recruitment, dropout, and screening success rates from previous studies and implement strategies that build on previous successes and incorporate lessons learned.
    • Consider assessments at locations convenient for participants.
    • Consider offering participants transportation to and from the study site.
    • Choose appropriate staff members to conduct recruitment.

◆ Budget

  • Consider costs for start-up training, advertising, staff time, and other related expenses.
  • Develop a compensation strategy for participants’ time and expenses.
  • Add costs for ongoing participant contact such as holiday and birthday cards.
  • Consider items that provide study identification – key chains, sweat shirts, pill boxes, magnets.

Once the Study Starts …

◆ **Participants Come First**
  - Contact interested candidates as soon as possible. The longer an individual waits before hearing back from study staff, the less likely it is that he or she will ultimately enroll in the study.
  - Stress the importance of compliance during the informed consent interview and throughout the study.
  - Establish rapport with the participants.
  - Remember that retention —
    - Begins with the participant’s first visit.
    - Is an ongoing process.
    - Is everyone’s responsibility.
  - Treat participants and their caregivers with respect.
  - Assure a welcoming atmosphere where participants are seen.
  - Be considerate of the participant’s time.
  - Identify and resolve issues in a timely manner.

◆ **Use the Referral Sources**
  - Network with clinic staff not working on the study.
  - Network with other local health care providers.
  - Send direct mailings to selected health care providers.
  - Give presentations about the study for clinic staff and provide periodic updates on the study’s progress.
  - Participate in health fairs, speaking engagements, support groups, television and radio interviews, and other forums.
  - Ask for public service announcements on radio and television.

◆ **Track Progress**
  - Track the number of participants enrolled against expected per site.
  - Monitor recruitment and intervene quickly to change recruitment techniques that are proving unsuccessful.
  - Identify barriers to recruitment.
  - Do not stop at one strategy; incorporate all that work for the study.

◆ **Implement Retention Strategies**
  - Consider modifying the MOP to streamline assessments and procedures that are excessively burdensome and time consuming.
  - Use regular teleconferences with project staff at study sites to “brainstorm” on retention strategies.
  - Send reminder notes to let the participant know you will be calling shortly for their next assessment.
• Be persistent. Document all attempts to contact participants, and keep trying.
• Ensure that all of these efforts preserve the privacy of the participant.
• Use the contact information for a missing participant that has not withdrawn consent. The telephone numbers for friends and/or relatives in the contact log should be accessed to locate the participant. If the participant has given consent for home visits, visit the participant’s home.
• Use public information to try to locate the participant. For example, in some states, the motor vehicle administration and other government agencies will release an individual’s contact information if it is considered to be part of the public record.
§2130.5 Informed Consent Checklist*
National Institute on Aging

(Note: Please refer to DHS HHS OHRP 45 CFR 46 §46.116 for details concerning the regulations.)

Included in the American Recovery and Reinvestment Act was the HITECH act, which beefed up both the security and privacy rules governing protected health information. With enforcement of the security breach notification rule under the HITECH Act now in effect, covered entities should have in place a plan for dealing with possible breaches of security involving protected health information (PHI). In reviewing your plan as a covered entity, be sure to consider the possible “pitfalls” as outlined in the following chart that could lead to security breaches.

<table>

\[2160\] **Statistics and Survey Results**

This section includes statistics and survey results from reputable sources relating to sponsored research administration at academic medical centers.

\[2160.1\] **Trends in NIH Sponsored Funding to Medical Schools**

AIS editors

The National Institute of Health (NIH) provides the bulk of federal funding for biomedical research to U.S. institutions of higher education, and biomedical-related research is the bulk of NIH external or extramural funding. The NIH Office of Extramural Research makes available a variety of statistical information relating to its awards and funding trends to medical schools and other institutions at http://report.nih.gov/index.aspx.

In light of the fairly recent trend for NIH’s budget to remain relatively flat, it may be particularly useful to take a snapshot look at the trend in NIH funding to medical schools (see Figure 2160.1-1). Another helpful chart shows the NIH research project success rate for medical schools by individual departments for the most current fiscal year (see Figure 2160.1-2). (Some historical success rate data for medical schools is available at the site referenced above.)

**Ranking Tables**

Although NIH routinely has generated annual “comparative ranking tables on its medical research funding” (see Figures 2160.1-3), the agency will no longer be doing so. Instead, NIH has developed a Web-based tool to help an institution determine funding awarded to any one organization or department. According to NIH, “The tool will also allow you to download aggregate data, on a per fiscal year basis, so that you can conduct your own analysis.” This Web-based tool and organization data is available at http://report.nih.gov/index.aspx.

NIH is making this change in part as a result of responses received from the grantee community that suggested that the current ranking tables were not necessary and because of the establishment of multiple investigator awards, which “makes the total dollar amounts of funds received by individual departments impractical.” (For a discussion of multiple PI awards, see ¶2520.1.)

Some historical data is still provided for medical schools (for FYs 1996 through 2005) at the Web site referenced above.

* Success rates indicate the percentage of reviewed “research project grant” (RPG) applications that receive funding. This is computed on a fiscal year basis. Dividing the number of competing applications funded by the total number of competing applications reviewed determines success rates. Applications that have one or more amendments in the same fiscal year are only counted once.

The Q&As at ¶2190.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 2100 has been understood. *Note:* For the answer key for ¶2190.1, see ¶2190.3, which appears on a separate page (page 2190:5) for testing purposes.

Discussion topics at ¶2190.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶2190.1 Q&As

1. One of the primary jobs of the university’s Institutional Review Board is to
   (a) Sign and approve federal contracts on behalf of an institution
   (b) Review and approve initially and periodically research involving human subjects
   (c) Approve compensation for principal investigators involved in clinical trials
   (d) Issue policies and procedures with respect to accounting for clinical trials

2. The following principles were defined in the Belmont Report as basic to the protection of human subjects EXCEPT:
   (a) Compensation
   (b) Respect for persons
   (c) Beneficence
   (d) Justice

3. An IRB and OSP often work together when an institution is applying for accreditation from the
   (a) Federal Demonstration Partnership
   (b) Association for the Accreditation of Human Research Protection Programs
   (c) Office of Research Integrity
   (d) Office for Human Research Protections Program

4. An academic medical center is said to have a traditional “tripartite” mission as follows:
   (a) Education, patient care, research
   (b) Effort reporting, cost sharing, closeout
(c) Forms completion, application submittal, acceptance
(d) See no evil, hear no evil, speak no evil

5. Under HIPAA, PHI stands for
(a) Private health information
(b) Protected hereditary information
(c) Protected health information
(d) Principal health information

6. Limited data sets may be used for all of the following EXCEPT
(a) Telemarketing health care options to clinical trial participants
(b) Research purposes
(c) Public health
(d) Health care operations

7. An AMC may have a relationship with which of the following federal agencies that operates hospitals and clinics
(a) National Science Foundation
(b) National Cancer Institute
(c) Institute of Medicine
(d) Veterans Affairs

8. It is not uncommon for medical centers to establish offices of “corporate alliances” or “corporate relations” in order to
(a) Facilitate collaborations between university researchers and corporate scientists
(b) Satisfy an NIH award requirement
(c) Comply with a VA contract requirement
(d) Construct appropriate material transfer agreements
1. The risks of inadequate administration of sponsored programs in a medical school are great. What are the primary sources of these risks and what is the role of the sponsored research office in mitigating such risks?

2. Working with the Department of Veterans Affairs (formerly the Veterans Administration) presents unique issues for AMCs. Do you agree or disagree with this statement, and explain your answer.

3. What are the considerations involved in obtaining accreditation for your human subjects protection programs?

4. The issues concerning effort reporting and clinical trials are often complex. How is this so, and how can an OSP help investigators best comply with these confusing requirements?
¶2190.3 **Answer Key**

Following are the correct answers to the questions included at ¶2190.1.

1. (b) Review and approve initially and periodically research involving human subjects
2. (a) Compensation
3. (b) Association for the Accreditation of Human Research Protection Programs
4. (a) Education, patient care, research
5. (c) Protected health information
6. (a) Telemarketing health care options to clinical trial participants
7. (d) Veterans Affairs
8. (a) Facilitate collaborations between university researchers and corporate scientists

Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter addresses special challenges for the research administrator in managing the research enterprise at predominantly undergraduate institutions (PUIs).

Milton Cole of Villanova University, at ¶2305, offers a thorough analysis of the cultural, resource allocation, and reward structure of the predominantly undergraduate institution (PUI). Cole’s chapter contains a thoughtful discussion of what makes PUIs different from research universities, particularly with regard to their approaches to seeking and carrying out sponsored research projects. Cole also provides a complete presentation of “faculty development” and the incentive programs that PUIs may offer to encourage faculty participation in sponsored programs.

Cole’s chapter includes a discussion of the role of the office of sponsored programs at the PUI and how that role may differ from the role of similar offices at research universities. For many research administrators, the institutional model toward which one strives is best represented by the research-intensive university where considerable value, and pressure, are placed on the ability of faculty members to successfully compete for grants and contracts. Cole provides the reader with a clear understanding that this is definitely not the case at the PUI and goes on to explain why.

Research administrators who want to be successful at PUIs, as well as research administrators who work with PUIs, need to “know the territory” and Cole’s chapter provides an excellent map of the field.

This chapter will continue to respond to the information needs of research administrators over time through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶2305, as appropriate. Content added to other sections of the chapter will provide readers supplementary discussions of related topics (at ¶2320), practical tools (at ¶2330), case studies (at ¶2340), and statistics and survey results (at ¶2360). A “knowledge check” containing Q&As and discussion topics is included at ¶2390.
Special Issues for Predominantly Undergraduate Institutions
Milton T. Cole, Ph.D.
Assistant Vice President of Academic Affairs
Villanova University

Predominantly undergraduate institutions (PUIs) are institutions that generally emphasize instruction over research and concentrate resources on undergraduate versus graduate programs. They are by primary focus, culture, and resource allocation very different from research universities or research-intensive universities.

This chapter identifies significant distinctions between “research” and “instructional” (predominantly undergraduate) institutions as a valuable exercise in understanding the nature of PUIs and to highlight some of the challenges facing an office of sponsored programs (OSP) at a PUI. It is important to note, however, that research universities, as comprehensive institutions, essentially set the accepted standard toward which all universities strive.

This chapter also discusses the use of institutional resources and incentives and the role and staffing of the OSP at PUIs, and it provides an overview of sources of funding.

Focus on Undergraduate Instruction

Predominantly undergraduate institutions are not sufficiently understood if looked at based only on size. Although many PUIs are “small” institutions in terms of number of students, this characteristic does not necessarily apply to all PUIs, nor does it accurately explain them. With regard to physical size, there are land grant state colleges and universities that have vast campuses and several thousand students, yet are classified as PUIs.

The most accurate way of fully understanding the “predominantly undergraduate” institution is to focus on the importance the institution places on instruction and the size of its graduate school. The faculty at the PUI mostly is composed of individuals who have determined that student instruction is a better fit for them than a career built upon and evaluated by an information-production standard. Accordingly institutions that hire this type of faculty have a commitment to instruction.

Because the majority of graduate degrees, even at the master’s level, involve some element of new information generation, PUIs, with their emphasis on instruction, generally target undergraduates. PUIs range from small, liberal arts institutions with fewer than one thousand students to large state universities that offer some master’s programs but emphasize, and hire faculty based upon, the pre-eminence of undergraduate instruction.

1 Among the many discussions of graduate education and scholarship, including how institutional size factors in, this work by Ernest Boyer is one of the clearest explications. See Ernest L. Boyer, Scholarship Reconsidered: Priorities of the Professoriate, San Francisco, CA, Jossey-Bass Publishers, 1990.
The preponderance of research at the collegiate level takes place in graduate schools where the imperative is to produce new insights, data, and understandings, which form the basis of master’s theses and doctoral dissertations. Institutions with a declared purpose of producing this level of information focus not only on providing a fundamental education within a field but also on the production and dissemination of new information in the field. This is the important strategic difference between predominantly undergraduate institutions and graduate institutions.²

Bear in mind that a fundamental measure of the quality of colleges and universities of any description is its faculty. And the metrics (measures) for evaluating faculty per se are heavily weighted toward faculty members with impressive publication and funding histories.

12305.2 Institutional ‘Cultural’ Challenges

PUIs and graduate institutions have different world views or institutional cultures. “Institutional culture,” with regards to colleges and universities, can be defined as the way in which an organization in the business of higher education carries out its mission and defines its goals. A graduate research institution defines its purpose and evaluates its success by using indices of research and the concomitant production of new knowledge. Such an institution to be successful requires a faculty that is involved in state-of-the-art research and must commit the resources necessary to attract and retain such faculty members.

A graduate research institution must recruit students who want to initiate careers in research by working with active, leading researchers. Because there are a limited number of research positions which these research-motivated students can hold, the faculty and universities that enroll these students are able to be highly selective in choosing students and comparatively generous in the “packages” which they can offer them. The package usually includes, but is not necessarily limited to, reasonable stipend, tuition payment or waiver, laboratory assignment, and housing. The teaming of active research faculty and carefully selected, highly motivated graduate students is an essential part of the fundamental prescription for research success.

Contrast this with the institutional culture more often found at the PUI. The faculty at the PUI is composed mostly of individuals who have determined that student instruction is a better fit for them than a career built upon and evaluated by an information production standard. Therefore they chose to establish their careers at instruction-focused institutions, where research may be well thought of but not stridently encouraged.

²The Carnegie Foundation makes distinctions between types of universities that can be particularly illustrative of this point. See www.carnegiefoundation.org/classifications/index.asp.
**Graduate Programs**

Master’s level programs at PUIs are designed for students to extend their undergraduate degrees in subject areas significant to the local job market and economy. This is one of the reasons that education and business programs are the most successful master’s level programs at predominantly undergraduate institutions. It would appear that few individuals enter graduate level courses at a PUI to pursue terminal degrees because the great majority of doctorates are received at institutions at which the degree recipient also received his or her master’s degree.

Faculty members who have completed successfully a doctoral program also create dissertations. A dissertation is an original work of scholarship developed to earn a terminal degree. While those new Ph.D.s who primarily want to continue the scholarly pursuit gravitate toward post-doctorate and/or junior faculty positions at institutions defined by their scholarly output, someone who is not so driven pursues a situation where there is a less-intense demand for scholarship. Smaller institutions are historically defined by their interest in instruction and, for the most part, the publication and grants and contracts histories of their faculties reflect more dedication to classroom activities than scholarly pursuits. This, of course, is most clearly the case in the natural and physical science(s) and engineering fields where significant investment in laboratories is often required to be competitive in the scientific research arena.

**Teaching and Service**

Differences in institutional cultures between PUIs and research institutions are also reflected in the nonresearch-related obligations that fall to the faculty of each institutional type. To state the obvious, more class time is required of instruction-focused faculty than of research-focused faculty.

Service can mean many things depending upon the institution. Therefore, serving on faculty and university committees, volunteering for local charitable events, participation in mission trips, responsible positions in organizations unrelated to academic discipline, or all the above can be evidence of service that universities expect of their faculty. The role of service is usually greater at smaller institutions and, in some cases, it appears to be as important as scholarship.

**Tenure Policies**

Perhaps the most illustrative evidence of the cultural differences between instruction-intensive and research-intensive institutions is the research incentives built into tenure and promotion guidelines. Review an institution’s promotion and tenure policies and one will get a clear idea of the weight given to the quantity and quality of publications, service as an officer of a professional organization, and the receipt of awards for professional and scholarly performance or service. From such a review, a picture will emerge

---

3 A perusal of the mission statement of any small college will indicate the importance of instruction and encouragement of research. Research activity, however, is never to be confused with the dominant role of instruction at the PUI. The university where the author is employed is representative of the category. See for example: www.heritage.villanova.edu/.
as to what attributes of an academic career are most valued by the institution. No reasonable university official criticizes sponsored research activity per se but many institutions categorize organized research activity as peripheral to the primary instructional focus of the institution and many of these institutions are PUIs.

There is also a more personal dimension to the application and administration of promotion and tenure policies at PUIs. Members of the typical promotion and tenure committee are tasked to apply the institution’s standards, yet, as human beings, each member has his or her own academic career as a model of the faculty standard. It often appears, therefore, that the manner in which the committee members are chosen can greatly influence the weight accorded scholarship (e.g., grants and publications) standards in promotion decisions.4

Tenured faculty with modest research experience may not see research as being a critical quality in their recommendation of a colleague for promotion. When sitting on a tenure committee, such faculty may emphasize instructional, collegial, and service activities rather than scholarly achievements such as grant awards and numerous publications in tenure deliberations. In making tenure recommendations based on such criteria, these faculty are, in a manner of speaking, defending their careers. It may be necessary to remind deans and provosts from time to time that if they are sincere about increasing scholarly activity, the most important factor is recruitment. It is easier to hire researchers than to create them.

**Grant Award**

For most researchers and sponsored projects personnel at larger research universities, the awarding of a grant is a financial process that enables a particular “statement of work” to be performed, which furthers the creation of new knowledge. At the smaller, instruction-focused institution, a grant award is just that — an award. The implication here is that in receiving a grant, the efforts of the principal investigator (PI) at a PUI are being trumpeted for crafting a proposal with a commendable level of analytic or evaluative potential. In other words, at a PUI the singular grant award often is thought of as a lasting career milestone and not simply one of many stones to tread in developing an illustrious research career, which is the common perspective at research institutions.5

---

4Service activities of faculty members at smaller institutions are often equally as valued as research, yet subordinate to teaching. Senior faculty who do not have a research history are often among the longest-serving members of various institutional committees, including the influential tenure and promotion committees.

5The discussion of smaller institution culture is very important when attempting to view PUIs through the lens of research. Accordingly the most interesting articles about dramatic improvements in research activities come from smaller institutions. See for example: Barbara Mulligan, “A Research Renaissance: Faculty Research Funding Successes Benefit Students and Bolster Reputation,” Lafayette Magazine, Fall 2003 and NSF-AIRE@Reed (www.reed.edu/nsfaire/science.html).
Resource Challenges
In institutions where instruction is the primary goal, it is anticipated that the academic officers of these institutions would provide support and encouragement for instruction. While research at such institutions is seen as positive, it is the research that involves the smallest institutional investment in time and other resources that is most appreciated.

Faculty Time
Some observers suggest that smaller schools that desire a greater involvement in research would be wise to reconsider such ambitions. The admonition is based upon the argument that the costs of doing research are never adequately recovered. While research administrators acknowledge that F&A (facilities and administrative or indirect) costs are never completely reimbursed, universities too often overlook that the costs of preparing proposals is forever lost. It is a common occurrence for only 25 percent of an institution’s proposals to be accepted for funding. This means that thousands of hours of faculty time required to develop the rejected proposals has to be covered by the university, and institutions continue to submit proposals at an ever-increasing rate. It is the costs in faculty time that may be the greatest burden on a PUI seeking to obtain sponsored research funds.

Uncommitted faculty time is scarce at the PUI. Time and all other costs associated with research activity are a crucial part of the appeal of research. If faculty members are to be evaluated on the basis of their research activity, they want to be assured that resources will be available for that activity, including proper laboratories, graduate students, supplies and materials, and, perhaps most importantly, the time to perform experiments, analyze data, and write reports, proposals, and articles.

At a PUI the costs of instruction are offset by the tuition and fees paid by students for this type of service. All of the revenue aspects of research are more difficult to specifically enumerate without showing a possibility of higher costs than revenue, hence a deficit. In other words, since a PUI doesn’t have significant money flowing into the institution from grant and contract activity, it is relying upon tuition as the primary source of revenue.

The PUI justifies the tuition on the basis of the educational services being provided to the student. Therefore, at teaching institutions, the amount of tuition charged must be specifically attributable to the quality and costs of the instruction being provided because that instruction is the primary product.

The most productive research faculty can command the highest salaries, may require expensive laboratories, and may need frequent support from university administrative personnel (i.e., from the OSP and/or financial accounting office) all of which cannot be fully paid for from sponsored awards. Competition among elite research universities for leading scholars in certain fields continually escalates the costs of hiring and retaining outstanding researchers. Facilities and state-of-the-art laboratories are expensive to establish and maintain. Hiring staff to stay on top of sponsored research compliance requirements — which are always increasing — also is costly.

The PUI rarely becomes involved in such contests; instead it must look for faculty members who fit the PUI profile yet who have the potential to achieve some research
distinction. Just as the faculty must primarily concentrate on instruction while pursuing an occasional commitment to a research project, facilities at the PUI often must primarily support instruction and serve double duty as part-time research labs.

**Award Budgets**

The division of a calendar year on the typical grant’s budget also underscores the importance of time as a resource. Few sponsored projects involving basic research take place solely within the academic year. This, however, is the impression that might be drawn from an analysis of a standard budget that has separate columns for academic and calendar years. This type of budget form provides for an academic year concentration on instruction with “summer months” available for research. This form also allows for the fact that research conducted on a 12-month basis may be restricted to the form of summer salaries for research faculty. The use of a “calendar year” category could be most appropriate for research universities while the “summer months” category is a better fit for PUI culture.6

If a faculty member is at an institution that pays him for 100 percent of his activity for the academic year, then he is paid by the institution for all of his time during that academic year, which usually runs nine or ten months. If this is the case, when can the faculty member perform any additional activities? The summer months, therefore, become the period in which a researcher may be paid for additional activity (in this instance research) if he is paid for all of his time for the rest of the year. The budget structure dictates this distribution of time because, in fact, it is rare if not impossible for quality research to be performed only during a predetermined time frame.

Most research universities estimate the amount of time that research personnel will spend on a project and distribute that time proportionately throughout the budget year. For example, if Dr. X were working for the equivalent of two months during a budget year he would be paid two-twelfths per month throughout the budget year. At PUIs, he would be paid from the grant only during the months that he was not paid his other salary, so that there would be no conflict as to when he had available time to perform research activities.

**Release Time**

When a sponsor pays to replace a faculty member “released” from the classroom in order to do research, this is known as requesting “release time.” Release time is an unpopular idea with many sponsors, yet it is often of critical importance in order for a PUI researcher to receive institutional permission to commit to a research project. Without this salary supplement in a research budget, the PUI would have to use its own funds to cover the instructional responsibilities of the absent faculty. If a teaching load is determined with the expectation that at least one-quarter to one-half of a

---

researcher’s time will be involved with sponsored research activity, then that teaching load is prepared with research in mind. Where research comes as an exception to the normal teaching load, then provisions must be made to cover courses that would normally be a part of the now-modified load. This marks a difference between research institutions and PUIs.

Those faculty members teaching “full loads,” however defined by the institution, who do not seek release time could be seen by some to be either shortchanging their instructional obligations or shortchanging the proposed research work by trying to add significant responsibilities to an already full (teaching) schedule. The legitimacy of effort reporting (the detailed distribution of a faculty member’s time as outlined in a proposal) may also be damaged by simply adding to the fully committed “100 percent” of activity. Release time funds are, by definition, a salary supplement to enable the researcher’s institution to hire a qualified person to teach a course for the sponsored investigator who will be using that portion of his instructional time for research. Therefore, extra salary is requested to pay someone to teach for the funded investigator.

The issue of release time sparks much debate within smaller institutions and some criticism directed at sponsors who are unwilling to understand the PUI predicament. For the most part, sponsors who do not understand or accept the need for “release time” funds at smaller institutions are requiring certain institutions to cost share or simply discouraging those institutions from applying for these sponsors’ research funding.

**Cost Sharing**

The problematic concept of cost sharing presents special burdens for the PUI. “Cost sharing” is the cost of a project not borne by the sponsor. A sponsor may require an institution to contribute to the cost of a research project, or the institution may choose to offer to share a portion of the project costs to make its research proposal more attractive to the sponsor.

---

**Research Time Commitment**

The federal government under A-21 allows institutions of higher learning to estimate the amount of time that must be committed to research on sponsored projects. This time becomes a part of the total effort of the researcher, and all time commitments aggregated must equal 100 percent of the researcher’s time for all research and nonresearch activities. If 25 percent of one’s time is being committed to research, 60 percent to teaching, and 15 percent to service, what happens if another research grant representing a 15 percent commitment of the researcher’s time is received? Some would say that if the faculty member worked on the grant after his classes and on weekends then perhaps he could equal the same total hour commitment as his service involvement. The problem with this approach is that what was once 100 percent of the faculty member’s time has now, due to convenience, become 115 percent of his time. Any attempt to modify the definition of 100 percent for convenience damages the integrity of the personnel obligation on grant/contract budgets and violates OMB circulars that determine the methods used to determine costs in grant and contract activity.
A small grant to support a research visit to a library with exclusive holdings exacts a much smaller contribution from the institution than would a commitment to contribute a significant percentage to an expensive piece of laboratory equipment purchased under an award. Even if the equipment support is provided, the procuring faculty member must first and foremost demonstrate its value as an instructional tool to make an argument for a larger institutional benefit if institutional cost sharing is required. This practice frequently has resulted in the PUI being unable to apply for awards that have cost sharing requirements.

Complying with Federal Requirements

A substantial cost for all institutions seeking government research funding can be summed up by the ominous term — compliance. To simplify, compliance means that a specific practice is required by a sponsor, usually federal, to ensure that its standards are fully met. There are compliance requirements covering the entire spectrum of university research activities ranging from financial reporting, to the purchase and distribution of equipment, and to the use and protection of research subjects, all of which require rigorous attention.

Problems arise when compliance requirements necessitate hiring additional staff to monitor compliance or the installation of expensive systems without providing appropriate avenues for recovery of these costs. For example, a faculty member seeking to conduct research into immunological reactions may think that acquiring a colony of rats and outfitting the necessary environment in which to study them is rather simple to cost out. A closer look at the budget will find that in addition to possibly needing assistance from someone who knows the federal requirements regarding animal protections — depending upon the type of rats or the particular type of immunological response under study — the temperature controls in the facility might have to be independent from the facility’s other ventilation systems, the light and temperature in the lab may have to be monitored 24 hours a day, special feed may be necessary, inoculations and special clothing may be required for laboratory personnel, and the list goes on.

What appeared at first to be a simple equipment and animal procurement, could require thousands of dollars in initial costs and thousands more for regular maintenance and monitoring throughout the life of the project. This causes difficulties for all categories of institutions, but especially for the PUI.

Using Faculty Inducements or Incentives

Is the motivation to write research proposals a major issue at most large universities? The answer, for the most part, is “No” because the culture of research is well established and spelled out, for example, in faculty handbooks and promotion and tenure policies. Many prominent universities, however, do have “incentives” for research activity but those incentives are directed more at identifying exceptional or outstanding

---

research work rather than simply generating proposals. Because efforts by PUIs to increase sponsored research are somewhat limited by an institutional culture that does not strongly emphasize the role of research, OSPs at such institutions emphasize faculty incentives available for proposal preparation.

**Types of Incentives**

Incentive schemes can be baldly monetary — such as an institution awarding bonuses to or increasing the travel budget for faculty members who generate proposals. Or they can be idealistic and ego-boosting — such as when an institution promotes the notion of greater professional fulfillment for faculty in becoming a published scholar or in receiving an award of a research grant. Generally speaking incentives fall into three categories: monetary, time, and ego. A general rubric used for the intended effect of these incentives is *faculty development*.

Much has been written in research administration about inducements or incentives to encourage faculty members to seek sponsored grant and contract funding. Two well-known researchers in this area, Drs. Michael McCallister and Terry Manns, have developed a unique approach to explain the role of incentives in faculty development by asking the question: “What do faculty want?” Their study shows that in general peer “acknowledgement” and “enhanced standing within one’s profession” rank very high with senior faculty. For junior faculty, while those things are nice, financial rewards also are very important. It is generally financial incentives that form the core research incentives.8

8 In an educational institution where research is not a priority and does not always result in obvious rewards, inducements, known as incentives, are often thought to be a key to greater research activity. There is much information available from colleges and universities regarding the incentives offered by their respective institutions. As the material is examined, it becomes obvious that the level of incentives range from a cash bonus and a larger piece of the indirect cost distribution on the financial side, to inviting researchers to an event to recognize their research achievement on the promotional side. An interesting group of incentive policies to examine is: United Arab Emirates Faculty Incentive Policy, http://72.14.207.104/search?q=cache:6_4T3w75s7YJ:sra.uaeu.ac.ae/English/research; and Policy of Research Incentives, Fort Hays State University, May 29, 2002, www.fhsu.edu/policies/directory/research_incentives.html.

The University of Oklahoma has on its Web site the SRI: Sponsored Research Incentives Program, at http://research.ou.edu/policy/SponsoredResearchIncentive.htm, which deals exclusively with F&A distribution.

See also NCURA Neighborhoods, Interactive Learning Series, June 17, 2003, *The Ins and Outs of Faculty Incentives*, with Bob Lowman and Pam Whitlock.

Many national and regional professional conferences include presentations that emphasize the tremendous variety of so-called incentives in place at colleges and universities. As expected, sessions are offered that particularly target the concerns of PUIs and historically black colleges and universities (HBCUs), as sponsored research activity is more exceptional at these institutions than at larger institutions.
To understand the entire spectrum of research proposal incentives, the McCallister/Manns distinction between junior (nontenured), mid-career (mostly tenured), and senior (tenured) faculty is helpful.9

At the risk of oversimplification, McCallister and Mann tell us that
◆ junior faculty require mentoring, developed databases in their respective fields, proposal writing assistance, personal contact assistance, start-up labs and support for related costs, and travel money;
◆ mid-career faculty require travel money, some proposal review, assistance with new and modified methodologies, release time, and assistance completing their promotion packages; and
◆ senior faculty require funding for seminars, networking travel funds, teaching assistants, and support for large-scale (and sometimes high-risk) ventures such as research centers and multidisciplinary programs.

The PUI wanting to implement any incentive program must have institutional commitment ranging from the financial allocations from central administration to the setting of divisional and departmental priorities.

Mentoring would likely be the least costly of any incentive, depending upon how the senior faculty member arranges the effort. Mentoring is, in essence, “being shown the ropes.” This type of advising function from senior faculty would involve no additional cost and could produce real dividends for the junior faculty member. The effectiveness of any mentoring is contingent upon the expertise held by senior faculty members and whether assistance is requested by a new hire.

Helping faculty with proposal writing could be accomplished by using existing qualified academic and/or experienced administrative staff. Most other faculty incentives, however, likely would involve expenditures that are not routinely included in departmental budgets at smaller colleges and universities.

If an institution intends to place research expectations on junior faculty, discussions regarding such expectations should start during the hiring process. If there are research expectations, all candidates must be informed about them, and the PUI should be prepared to address the inevitable follow-on questions from candidates regarding research start-up funds and teaching loads.

Incentives are intended to provide faculty members with the wherewithal to perform research and entice faculty members to make the effort to write proposals for external funding. The incentive approach usually emphasizes positive inducements to reward research and research-related activities. Positive inducements range from special events to acknowledge research activity and to publicize the names of all grant

---

9 “Faculty development” is also a term used to include not only incentives for research activity but also training and related compliance issues. See Michael McCallister, “Faculty Development,” *Journal of the Society of Research Administrators*, Winter/Spring, 1996-1997. The text refers to Michael McCallister and Terry Manns, “Faculty Development Programs: Ideas for Thought,” NCURA Annual Meeting, Washington, DC, November 2004.
and contract recipients, to travel and research perquisites that support, and recognize, 
the importance of research activity.

Institutional (Internal) Research Funding

An important incentive that most smaller institutions offer in one form or another is 
institutional research funding. “Institutional” means that the funding is provided by 
the institution itself. Such funding represents an acknowledgement by the institution 
that research is fundamental to institutional culture and, most importantly, that the 
institution that offers this type of internal award program recognizes that its faculty is 
comparatively disadvantaged in seeking external funds when compared with faculty 
from larger institutions.

Institutional funding programs may be institutionwide or within specific divisions 
of the institution, and the pool of funds offered for this funding can range from $50,000 
campuswide to a small college in California, for example, that assigns $400,000 to this 
function. Institutional funding is typically used to

◆ generate quality research projects,
◆ support the continuing development of existing research projects,
◆ help active research faculty members change research direction if their project focus 
is no longer fundable, and
◆ help complete ongoing project development that is close to submission stage.

The broad scope of this type of funding exists in recognition of the many levels of 
faculty experience and to assist a project in development that might require a push to 
reach a state where it could be seriously considered for submission to a funding agency 
or ready for publication in a recognized journal. For example, for a junior faculty 
member, the funding could be used to initiate his or her first external funding attempt 
beyond the dissertation, while for mid-to-senior-level faculty, the funding could be 
used to facilitate the enhancement of previous research or the transition from one 
research focus to another.

Programs of institutional research funding may take many forms and reflect different 
goals or requirements, such as the following:

◆ Often summer salary support is requested to provide income to faculty who would 
otherwise be teaching during the summer and unable to commit sufficient research 
time
◆ In the social sciences and humanities, travel is often crucial to reviewing documents 
in distant libraries throughout the world
◆ Support for data storage costs and computer or computer component charges often 
is provided
◆ Student support is often necessary for the data gathering and analysis component of 
research projects
At most institutions the tangible goal of such a program is the actual submission of a proposal to a funding agency. Hence the goal is to transition a research program from the institutional research category to the sponsored research category.

**Internal Research Activities.** Much of the research that takes place at a PUI is internal institutional research. Institutional research at colleges and universities without a research history is frequently the only research that is examined when the institutional promotion and tenure process evaluates academic careers in light of the traditional standard of teaching, research, and service. Some of these institutions might have less-intensive publication standards and are not necessarily committed to transitioning faculty research to a level of much greater recognition outside the institution. Insufficient internal financial commitment for sponsored research and an acceptance of a recruitment and hiring philosophy that prioritizes collegiality over scholarly potential, reinforces at PUIs a standard of internal institutional research over extramural research.

Colleges and universities that want to step up internal institutional research goals must deal not only with the associated pull on the institution’s financial resources but also with the scope of these funding programs. It is generally accepted that a standard for proposal submission can be set for the physical sciences, natural sciences, and engineering, but what about for other departments — such as the humanities, social sciences, business, and nursing — where the potential sources of funding are not as readily available? All institutions wrestle with this issue. The result is usually a “publication” standard for those disciplines where sponsored funding is more limited.

However, the difficulties do not end with the creation of this standard. If publication is a standard, then the quality of the journal, or of the book published, must be assessed, and the quantity of articles or monographs that satisfy desired goals must be determined. Of course this is a problem for all institutions, not only PUIs.

Further, in the case of creative works such as theatre, visual arts, fiction, and poetry, standards of project evaluation are very difficult to determine. Usually what one proposes to do artistically in a research proposal is related to what the artist has done previously, and no detailed “statement of work” applies. For beginning developers of creative works, awards do not have an experiential or tangible standard and must, therefore, be determined using a different measure. Of course this is a problem for all institutions but smaller institutions often cast their nets broadly for faculty with whom to work. At larger institutions the clientele are often well established in the natural and physical sciences and engineering. This is less often the case at smaller institutions. Therefore, it is possible, for example, that a National Endowment for the Humanities “Summer Seminar” grant could be a very prominent component of the research portfolio at a PUI with little science and engineering research support.10

---

10See the NEH Web site: www.neh.gov/projects/si-university.html.
Setting Resource Priorities

The establishment of priorities is crucial to the coordinated effort to advance any endeavor, but it is especially true when one is challenged by severely limited resources. It has already been said that efforts by smaller institutions to increase sponsored research are limited by the general resources available for research at the typical PUI. Most organizations demonstrate the importance of a goal or activity in their willingness to invest in its accomplishment. Therefore, given severely limited institutional resources to support research, how can an institution determine how best to use its money?\(^{11}\)

Resource Distribution

There are at least three schools of thought in considering resource distribution, as follows:

◆ One approach is to spread the resources like sowing seeds on a field and wait to see which ones germinate.
◆ A second approach is to host an internal competition to determine the most promising (and realistic) ideas for research, and then fund those that rise to the top.
◆ A third approach is to find faculty who already are involved in promising research and apply resources to their endeavors to help turn them into research “stars.”

The first approach, when used at an institution without a history of research activity, can be inefficient. Good ideas alone are insufficient for winning competitive grants. Certain potential researchers at these institutions may not have had the resources to stay current in their respective disciplines and therefore may frame ideas and concepts that are not state of the art.

The primary difficulty with the second approach is the degree of rigor brought to internal project reviews by the submitting researcher’s colleagues. In other words, the tendency often is to exhaust the funding available for the support of institutional research projects by funding any and all projects, whether or not the proposals are deserving of support. This is an understandable institutional dynamic, but one that can often lead to support for both promising and unpromising projects.

The third approach is controversial, often autocratic, and the most efficient of the three. The institution could decide to fund only those projects that demonstrate high-quality, productive, publishable, fundable research. The institution could help develop research “stars,” whose work could eventually heighten the reputation of the institution or one of its centers or programs, expand to provide the institution additional distinction in and funding for the research area, and serve as a role model for other

\(^{11}\) This discussion is meant to be controversial. There is a raging debate between the democratic impulse to fund faculty “fairly” based upon a set formula that attempts to discern potential and evaluate costs, versus increasing resources for projects and people that could be termed the institution’s “best investments.” Some maintain there must be a landmark that identifies the institution as producing some research of distinction in order to provide a basis for realistic and timely research growth.
departments. The funded projects could be in a research area that if promising could become the basis for future strategic allocations, faculty hiring, and graduate student selection. Ultimately this approach to spending institutional resources could prove to be the most cost effective in that institutional resources would be sustaining a demonstrated capability rather than investing in an unproven area.

The controversy surrounding this practice is that it appears to be unfair. There is greater equality among a faculty whose members uniformly lack distinction than among a faculty with a few conspicuous “achievers.” At many PUIs, instituting the third approach would face resistance from the faculty and be difficult to establish. On the other hand, overcoming the difficulties may be worth the effort, as the practice could help to establish a significant research presence at the institution.

\[\text{2305.6 Offices of Sponsored Programs at PUIs}\]

A research administrator occasionally encounters faculty researchers who believe that “every boat floats on its own bottom.” Such researchers feel they are in command of their own “ship” independent of anyone else’s “ship” and independent of the institution itself. These researchers, particularly if they are experienced, may feel they “know everything necessary to know” about funding available to support their research projects. For such faculty members, the staff in the sponsored projects office becomes more like obstacles to overcome before the research funding can be established, than expediters or facilitators. Further such faculty members often have indifference for many of the institutional controls exercised by OSPs to protect universities.

It is in this area of sponsored research — that of accepting support from and recognizing the contributions of the institution’s OSP — where smaller institutions often have an advantage over larger ones. Because smaller institutions frequently have less-experienced faculty researchers, OSP staff members are usually viewed favorably by faculty when they take affirmative steps to encourage, facilitate, and expedite research grants and contracts. When the OSP staff tells a PUI faculty member that institutional concern over publication language, intellectual property controls, and certain clauses in an award are to protect the PI and the integrity of the scientific work, the input usually is welcomed and accepted.

At the PUI a fundamental activity of the sponsored projects office is to build a client base. The number of faculty who submit proposals usually is relatively small and the OSP must support the faculty by continually disseminating targeted information on funding opportunities. While this is an important function at all institutions, in the case of PUIs it is particularly important. At larger institutions faculty members themselves likely are monitoring funding opportunities, whereas at a PUI the sponsored programs office may be the only body doing so. Because finding sources of funding is so critical, in disseminating funding opportunities at PUIs, sponsored projects staff should be always encouraging of and solicitous to faculty. (For a related discussion, see “Benchmarking the Small Sponsored Programs Office,” ¶2360.1.)

Smaller institutions typically have policies and official institutional guidance in all areas in which it is required by appropriate authorities and develop policies in other areas as the need arises. The greater the depth and breadth of the organization’s re-
search experience the more explicit and detailed the policies of the institution would be to handle existing responsibilities and prepare for similar issues in the future. One of the primary concerns of smaller institutions relative to new sponsor initiatives is that sponsors will assume that complex procedures are required for full compliance at institutions regardless of size, and regardless of whether the targeted activity happens once or one thousand times per year.12

Communications with Other Offices
The OSP at all types of colleges and universities must interact with several other institutional offices on a regular basis. Among these are
◆ payroll,
◆ student affairs,
◆ institutional advancement,
◆ accounting (more specifically research accounting),
◆ procurement,
◆ graduate studies,
◆ public affairs,
◆ offices of the individual deans and departmental chairpersons,
◆ student financial aid,
◆ general counsel, and
◆ safety and compliance.

At smaller institutions it may be necessary to introduce many of these above-listed functions to the “special handling” required of sponsored funds and to the terms and conditions of research awards that may not completely compliment similar institutional policies. Larger institutions, because of their commitment to sponsored research activity, are organizationally well versed in the distinction, for example, between permanent and soft money appointments, general and sponsored expenditures, and scholarships versus student stipends. Smaller, less-research-active institutions may handle these types of distinctions on a case-by-case basis because the need to know them is infrequent.

12 While there are many organizations associated with higher education that have historically done an excellent job at analyzing the costs to institutions attributable to federal or state initiatives, many of the most significant define their membership by size of financial activity, thus effectively excluding smaller institutions. The organized vigilance regarding these issues, to be fair, is usually detected by larger institutions and communicated to smaller ones through highly respected organizations such as the National Council of University Research Administrators (NCURA, www.ncura.edu); the Society of Research Administrators (SRA, www.srainternational.org); the National Council of University Business Officers (NACUBO, www.nacubo.org), and the Association of University Technology Managers (AUTM, www.autm.org) to name just a few.
Senior Administrators. Where research achievements are visible and heavily promoted as part of an institution’s public relations efforts, the senior administration is attentive and supportive of research activity. For example, in large research institutions that have teaching hospitals and hundreds of health-related grants and contracts, the institution’s president is invariably well informed about the National Institutes of Health and fiscal and compliance issues associated with that prominent research sponsor.

In smaller institutions, which do not traditionally have research achievements as a major component of the institution’s identity or public relations efforts, specific knowledge about sponsors and their practices and policies may not be as readily known by the institutions’ chief administrators. An OSP at such an institution, therefore, may have to make some effort to promote internally the institution’s research activities and inform the senior administration of critical issues, as appropriate.

¶2305.7 Staffing an Office of Sponsored Programs

Some large institutions appear to have the equivalent of law firms working in the area of sponsored research compliance. Whether or not this is actually true is not important. Rather it reflects the current complexities surrounding sponsored research compliance. In other words, even if an institution doesn’t have a law firm working for it, it certainly could use one. The ability to effectively address research compliance is another area where PUIs and large institutions differ.13

Sponsored projects staff often find that college administrators appreciate the role OSP staff play in ensuring that complex federal research compliance standards are properly interpreted and adhered to. The creation of the position of compliance officer at many large institutions speaks to the critical need for personnel with expertise in the research compliance arena. Smaller institutions must comply with most of the same requirements as larger organizations, however smaller institutions, whose research volume and resources would not support dedicated staff, often rely more on professional groups to help them assess their compliance capabilities.14 (For a related discussion, see “Establishing Technology Transfer Operations at PUIs,” ¶2320.1.)

Staff ‘Generalists’

Sponsored projects staff are notorious multitaskers and nowhere is this more evident that at the PUI. In some of the smallest institutions it is not uncommon to have grants and contracts or grants and development (or grants and fundraising) located in the same office, where the same individuals work in both areas. The “full-service” office, an office that performs pre-award and post-award grant and contract functions, is also typical of many OSPs at small institutions.

14 See the organizations listed in footnote 12 above.
An office of sponsored programs at a PUI would require, at a minimum

- at least one person to track and disseminate funding opportunity announcements;
- one or two persons to assist inexperienced faculty develop proposals;
- one or two persons (contingent upon the number of proposals) to examine and process proposals;
- at least one person to establish the sponsored financial account in the event of an award (often the same person who processes the proposal);
- an individual to stay abreast of the latest compliance requirements (from electronic proposal submission to human subjects); and
- an individual to monitor technical and financial reporting requirements.

The above persons likely would be full-time employees, where one person would handle more than one task. Obviously smaller offices typically require “generalists,” as opposed to specialists.

As many students of organizational theory have long recognized, the more complex the requirements of an organization, the stronger the tendency toward formalization.15 It is, therefore, understandable that larger institutions with numerous and diverse researchers submitting an ever-increasing number of proposals, often develop OSP structures that have staff members who specialize in the core sponsored research functions (i.e., pre-award, post-award, and financial compliance) as well as other research-related functions (including intellectual property and human research subject protections). This is not likely true of PUIs.

The scale of the research activities at the PUI allows for a greater likelihood of cooperation across disciplinary lines than at some larger institutions where each divisional unit typically attempts to function with as much independence as possible.

**Responsibilities of Central vs. Division Staff**

PUIs would overwhelmingly have centralized OSPs, but the nature of the institution itself might mean that certain functions usually performed solely by the OSP are performed elsewhere. In the situation where the PUI has developed a “star,” this researcher may have the local resources for a type of assistance that permits the researcher to do funding searches, prepare payroll documents, and produce institutional

---

15 Of the many discussions of this phenomenon that run throughout the literature on organizational theory and public administration one of the most lively is the discussion characterized as “organizational pathologies” in the popular book by George Berkley and John Rouse, *The Craft of Public Administration*, Ninth Edition, McGraw Hill, 2004. Their discussion conveys the inevitability that as organizations become larger and more complex, personal, informal practices become overwhelmed by new people, new methods, and new requirements. Formal rules, specific assignment of responsibilities, and a more formal bureaucratic structure evolve to handle the additional demands as the organization grows and diversifies. To use an extreme, but not rare example, gone are the days of the person who knew exactly who to call to get something done; instead now one often encounters a prerecorded message providing various “touch-tone” options for the required service.
reports and to form separate centers of activity that are able to perform many of their administrative responsibilities in-house. These practices would still require the “sign-off” of the OSP, which is the cognizant authority for grant and contract activity.

The number of subdivisions within any particular organizational structure is clearly related to the size and complexity of the operation. The goal is to have the overall OSP structure at an institution integrate the tasks of the central unit with its division counterparts. This is usually the configuration of larger offices, but there are some examples where certain specializations at the division level can help achieve the fundamental purpose of the central office.

Take, for example, the case of the central sponsored projects office that could not persuade the university president that an intellectual property (IP) specialist should be hired to work with the university counsel. Knowing of the central administration’s intransigence, the dean of engineering contracted with a local law school to have an honor student consult on IP matters. Soon this student’s sponsored research expertise had developed to the point that she was also reviewing material for the biology and chemistry departments and the college of arts and sciences. The central OSP encouraged these shared resources, recognizing that a combination of central and division resources could outperform central office capabilities alone. In a similar vein, a college of arts and sciences was able to hire a technically savvy person who could better perform targeted funding searches than could his counterpart in the central office.

\[2305.8\] Is PUI Research an Oxymoron?

If it is established that large research institutions are better geared for and even defined by the research they perform, then why should smaller, less-prepared institutions bother? There are moments when almost anyone involved with sponsored research at either type of institution has considered this question. The larger institutions receive the overwhelming preponderance of funding in those areas of research that involve a large investment. This is obvious, particularly when one looks at the amount of National Institutes of Health funding flowing to medical schools and teaching hospitals with their tremendous investments in health care facilities and infrastructures.

Similarly large engineering schools have the physical capabilities to accept projects on a vastly larger scale than can engineering schools at most smaller institutions. In other words smaller institutions may not be able to compete with their larger counterparts for awards involving “big science” (that is, certain projects in the health sciences, chemistry, engineering, and applied physics). However, if one looks at scholarship in the humanities and social sciences, for example, one may find that many of the most intriguing hypotheses and analyses today come from faculty research at smaller institutions.\(^{16}\) At the individual researcher level, therefore, where the ideas for research are

\(^{16}\) American Council of Learned Societies (ACLS), Final Fellowship and Grants Lists for Competitions Held in 2004-2005, October 2005, www.acls.org. This document lists 125 grants awarded by ACLS for meritorious projects in the humanities. Of the 125 awards, 26 went to predominantly undergraduate institutions. This is a healthy representation in an area where large infrastructure investment is not required, as would be required for the natural and physical sciences and engineering.
generated and the dedication to a research program develops, many smaller institutions can compete.

Sponsored projects personnel at smaller institutions must support and encourage their faculty members by believing sincerely — and conveying this belief to them — that a research idea or methodology under development at the PUI is as good as that deriving from elite research universities.

\[\text{\textsection 2305.9 Sources of Research Funding for Smaller Institutions}\

Recognizing that there is no “level playing field” upon which research-intensive and instruction-intensive institutions can consistently compete for sponsored funding, federal agencies have created funding programs specifically aimed at providing research opportunities to smaller institutions and schools with scarce resources.

Whenever a research administrator at a PUI approaches a sponsor about its interest in funding a project, he or she should inquire as to whether any special program, or consideration, is provided for smaller institutions. This is not to cry poverty but to alert the funding source of one’s institutional circumstances. Of course the request must be made in the context of full confidence in the project and the researcher.

Due to the academic cultures at small institutions that do not stress organized research and inquiry in a purely scientific sense, the funding of research at the PUI can be considered “high risk.” The “risk,” in this instance, stems from the hope that funded research programs will produce an organized system of scientific inquiries that will incrementally evolve and produce valuable insights over time in natural, physical, and/or theoretical processes that prove valuable to researchers in particular fields of study. If the project analyzes one question and fails to sufficiently develop related lines of inquiry, for example, it cannot sustain itself and terminates.

The average research effort at the PUI is to prepare a proposal to address a particular issue and to “interrupt” one’s usual PUI responsibilities while examining that question. The goal of the PUI researcher is rarely to establish a line of ongoing inquiry through sponsored activity that would continue over years and, accordingly, provide a permanent adjustment to teaching, service, and research time distribution. The prolonged research project is the expectation of the research university and the exception at the PUI.

\textbf{Targeted Programs}\

Federal agencies are responsible for using public monies wisely and efficiently. Federal agencies, including the National Institutes of Health (NIH) and the National Science Foundation (NSF) have determined that their research grants should not only meet an efficacy and efficiency standard, but a representative standard as well. Thus support of the scientific elite is balanced against the intention of spreading funding around to include high-risk research that may have an opportunity to show substantive strength. Federal research funding is used to fertilize the college and university environment overall in order to generate creative research concepts and methods.
Funding programs for research at the PUI anticipate that resource levels will differ from those at larger institutions. Many programs exist with smaller institutions in mind, such as the following:

- *NSF Research in Undergraduate Institutions (RUI)* and *NSF Research Experiences for Undergraduates (REU)* (www.cimms.ou.edu/~cortinas/nsf4.html) (This site includes 137 pages of program descriptions for NSF REU programs.)

In consideration of the differences between large research institutions and predominantly undergraduate institutions, funding programs for smaller institutions have been developed that are often described as small or seed grants. Ideas and methods funded under these programs are in a developmental stage. Results from successful seed projects may lead to an opportunity to propose larger, more expensive projects that could compete with research institutions for funding.

**Set-Aside Programs.** Another approach to target PUIs used by large funding entities is the “set-aside” program. Under these programs, agencies take a portion of their allotted research funding and reserve (“set aside”) a portion for a special category of institutions or for a special program or activity. This practice has become somewhat controversial because in awarding such grants, factors other than strictly merit are considered. Nonetheless the use of set-aside programs has increased the number of research proposal submissions to federal agencies from instruction-intensive institutions.

**12305.10 Conclusion**

Undoubtedly many PUI faculty members possess the requisite skills, energy, and persistence to be productive, long-term research faculty. It is the role of the sponsored research administrator at these smaller colleges and universities to encourage and assist the faculty, regardless of the level of support needed, in building research project proposals that have a solid chance of being funded.

Although the faculty may not necessarily be prepared and the culture of the smaller institution not specifically geared for a major investment in research activity, research — and the attendant scholarship and publications that it produces — remains a steadfast measure of academic quality and vigor in institutions of higher learning regardless of their size. Consequently smaller institutions likely will remain in a somewhat permanent “transition stage” where the faculty is committed to the fundamental value of instruction while also attracted to the rewards and recognition that can be derived from sponsored research funding.
Supplementary Material

This section includes expanded coverage of topics relating to special issues for predominantly undergraduate institutions. These materials are culled from a variety of authoritative sources.

12320.1 Establishing Technology Transfer Operations at PUIs

By Stephen Auvil, Director, Office of Technology Development, University of Maryland, Baltimore County

Universities with limited research activity like those at predominantly undergraduate institutions (PUIs) have an opportunity to engage in technology transfer activity; however, they must often overcome the challenges of creating the required infrastructure in an environment of scarce resources. There are many reasons why a PUI would want to engage in technology transfer activity including fostering economic development, creating a potential new revenue source for the university, and recruiting entrepreneurial faculty. For a PUI that wants to engage in technology transfer activity, it is helpful to understand what resources are required to establish technology transfer operations.

Organizing the Technology Transfer Function

Rather than establish a stand-alone technology transfer office, PUI’s have a number of options related to technology transfer activity. The first option, easily enough, is not to engage in such activity. A university can remain in compliance with the Bayh-Dole Act (implemented by 37 CFR 401) by waiving title to its inventions. (For a full discussion of the Bayh-Dole act, see ¶1905.12.)

When faculty create inventions in federally funded research, the ownership, or title, of the invention can be waived to the federal government. With other sponsors, title can be waived to the sponsor (a practice that corporate sponsors would embrace), or the research can be published thereby releasing technologies into the public domain. A conservative approach to engaging in technology transfer is to ask another university to manage your inventions or to assign them to a patent management firm that will commercialize technology if it looks promising. In either case, the institution likely will be required to pay a fee or share a portion of any licensing revenues with the organization managing the institution’s technology.

Reminder

What is technology transfer? Technology transfer, sometimes referred to as T2, is the process of developing practical applications — commercial products and services — for the results of scientific research.

1 This discussion is based on material presented at the NCURA Annual Meeting, November 1, 2005.
The approach that many PUIs take is to start technology transfer operations within their sponsored programs office. This is a good approach for a small institution because a sponsored projects officer can spend a portion of his or her time on technology transfer matters. Once an institution has enough invention disclosures, the technology transfer operation can transition into an office separate from sponsored programs.

**Assessing Capacity**

One of the challenges for a PUI is determining when it makes sense to establish a technology transfer operation and what it costs to have such an operation. One can look to the data collected by the Association of University Technology Managers (AUTM) in its annual “Licensing Survey” to develop benchmarks based on national averages, or one can look to peer institutions that have already established a technology transfer operation.² (See Figure 2320.1-1.) It is best to look at both models and other factors, such as the nature of research conducted at the institution and the degree of entrepreneurial spirit ingrained in the institution’s culture.

**Figure 2320.1-1: Technology Transfer Efforts: Benchmarks**

</table>

The AUTM Survey results can provide a point of reference for establishing a number of metrics. The first metric to consider is the number of disclosures that an institution should be generating. Using the AUTM Licensing Survey for FY 2003, one can establish a benchmark for this metric. By taking the total number of disclosures for U.S. universities (13,718) and dividing by total research expenditures for the same institutions ($34.8 billion), one can derive a ratio of 3.94 disclosures per $10 million in research activity. A small institution with a heavy emphasis on the physical sciences, natural sciences, and engineering might be expected to exceed this number, while an institution focused on research in the social sciences and humanities might have a slightly lower figure. In any case, this metric suggests that an institution with $20 million in research expenditures can be expected to generate about seven–eight invention disclosures per year.

² Further information about AUTM and its licensing survey can be found at www.autm.org.
**Gauging Expenses**

The largest expense for a technology transfer operation is typically patent expenses so it is important to be able to estimate these costs before deciding to engage in technology transfer activities. Again, one can look to the AUTM statistics to benchmark this metric. (See Figure 2320.1-2.)

**Figure 2320.1-2: From Benchmarks to Budget**

![Diagram showing budget calculations]

**Legal Fees.** If the total legal fees spent by U.S. universities ($176.2 million) were divided by the total number of U.S. patent applications filed (11,755), the average spent per patent was approximately $14,989. This is a rough number that does not take into consideration a number of factors, including the costs of foreign applications, the lower costs of filing continuation applications, and other legal expenses paid.

The actual cost of prosecuting a patent also varies with the type of technology and its complexity. The AUTM data suggests that 0.53 U.S. patents are filed per disclosure (7,203 new patent applications/13,718 invention disclosures), so an institution generating 7–8 invention disclosures per year should budget at least $60K (or $60,000) (8 disclosures * .5 patents/disclosure * $15K/patent) for patent expenses each year.

**Staffing.** The other greatest expense for a technology transfer operation is its staff salaries, so estimating the size of the staff required is another important consideration. The AUTM Licensing Survey data indicates that on average each licensing full-time equivalent (FTE) manages 20.97 disclosures (13,718 invention disclosures/654.15 licensing FTEs). A licensing person is typically a professional that evaluates inventions, manages patent prosecution, and negotiates licenses.
These individuals often rely on support staff to manage a variety of the administrative functions required for a technology transfer operation. The AUTM Licensing Survey data also indicates that the ratio of support staff to professional staff is approximately one to one (654 Other FTEs/654 Licensing FTEs) for U.S. universities. Therefore, an office with seven–eight disclosures would likely require about 0.5 FTE at a professional level and 0.5 FTE for support staff. Estimating $90K as an annual salary and benefits for a professional level person and $52K for a support person, one should budget approximately $71K ([90K * 0.5] + [52K * 0.5]) for staff salaries.

Institutions with mature technology transfer operations typically require more administrative support due to the larger patent and license agreement portfolios that accumulate over time. Newer offices may not require the same degree of administrative support. The AUTM average is likely skewed toward established and mature offices. The salaries used above are rough estimates. AUTM has published a salary survey that can be used for a better estimate of salaries. Using this methodology, an institution conducting $20 million in research annually would need to budget approximately $131K ($60K for patent expenses and $71K for staff) for a basic technology transfer operation.

Examining Other PUI Programs

Another approach to benchmarking is to look at peer institutions. The AUTM Survey data can be useful for this as well. It is useful to find a number of “peer” institutions that can be used for comparison. The challenge is that it is difficult to find peers with equivalent research activity. Rather than making direct comparisons with peer institutions, it is useful to normalize data to the total research expenditures. So, one would compare disclosures per research expenditure rather than simply disclosures. It might also be useful to normalize to the number of disclosures received if one’s disclosures vary significantly from what one would expect for the level of research expenditures at your institution. In either case, this approach provides a little more flexibility and makes it possible to take into consideration the type of research conducted, the entrepreneurial culture, and other factors when selecting peers.

The methodologies described above can be useful for estimating the costs of establishing a technology transfer operation or benchmarking an existing operation. Using the totals for all U.S. universities reporting to AUTM likely skews the data to an average U.S. institution. PUIs, by definition, would probably not be considered average in the company of major research institutions; therefore, the best approach might be to identify a number of peer PUIs and perform an analysis similar to that described above using totals from the selected peers rather than totals from all U.S. universities reporting to AUTM.
Conclusion

Establishing a technology transfer operation is an important decision for an institution and a number of factors could be considered including its mission and its environment. Nevertheless, it is useful to have a frame of reference relative to other institutions. The AUTM Licensing Survey data can be used in a variety of ways to provide that reference.
The Role of External Grants in Faculty Development at Predominantly Undergraduate Institutions*
Sally J. Southwick, Colorado College

Faced with shrinking budgets and the pressure to secure external dollars, all too often, we get trapped into viewing faculty grant support as being about money. It is never just about money. Rather, the work of applying for and securing external funding is more fundamentally about faculty development — that ongoing process of becoming better educators, researchers, scholars and practitioners who contribute new knowledge to their disciplines and bring greater visibility and prestige to the institution. With this view in mind, professionals working in sponsored programs administration, as well as deans, provosts, and department chairs, can promote the grants application process in ways that will benefit faculty across all disciplines and at all stages of their careers. Here are some suggestions:

First and foremost, keep the focus on the applicants and on the process as much as on the product. This is not to say that the desired outcome — a successfully funded proposal — isn’t important, but the process itself promotes professional development and benefits faculty and their projects.

Help faculty view the proposal development process as an integral part of research and as a creative activity in itself. Writing a grant application can provide faculty with the opportunity to think critically about their work and to articulate ideas more fully, as well as to identify goals, possible outcomes, and the intellectual merit of the project. Proposal development itself is a form of scholarship because it helps focus on the larger context for the project and express why it matters beyond the individual’s interest or program. In this way, proposals can serve as incentives to think clearly and in-depth about the work’s relevance. For example, a junior faculty member in English needed to write a short proposal for a library residency to conduct archival research. The application activity helped him to focus on how the chapter of his manuscript that would be based on the library’s collections related to the whole of his book. As a result of crafting the proposal, he ended up with a chapter outline and greater clarification of how the chapter fit into his overall interpretation.

In the long-term, faculty can use the proposal format to begin articulating new ideas or areas of research and to reflect on one’s own intellectual development and direction. The advanced planning necessary to apply for grants creates a timeline for professional activities, allowing faculty to chart their careers three or more years ahead. Developing such a professional plan can involve activities such as outlining a project, establishing a research agenda, an experiment or field work schedule, or a writing plan, and identifying what kinds of results (e.g., conference papers, articles, and book chapters) can be anticipated at set points in the future. Newly-tenured faculty can plan for a sabbatical year or a longer-term project, such as a translation. More senior faculty can pursue interests with broader effects, such as a science outreach program.

* This article is reprinted from the NCURA Newsletter, Vol. XXXVIII, No. 4, September/October 2006, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Encourage faculty to approach proposals as a scholarly work in progress. Because many proposals are peer-reviewed, the application process can require the same level of academic rigor needed for drafting a scholarly article or conference paper. Both share similar expectations of critical consideration and constructive feedback. This process of incorporating high levels of academic rigor can be especially important for junior faculty applying for highly competitive federal grants. As research administrators, we should encourage junior faculty to submit proposals knowing that external review may help shape their project’s development. For instance, early in her tenure-track position, a chemist applied to the National Science Foundation and to the National Institutes of Health, anticipating at least two preliminary rejections before success in getting the grant. She planned ahead and sought smaller grants from private funders while she intentionally used the process of applying to the NSF and to the NIH and getting peer review to clarify and improve both her successive proposals and the project’s structure.

Sponsored research officers can help faculty view grant activity as the basis for later work, reframing the text created for proposals for subsequent uses. A short, targeted application could become material for an article or conference paper abstract, while a longer one that describes a whole project could serve as the basis for a later book proposal. Difficult though it may be, faculty should never view grant applications as an isolated effort, but rather expect them to serve other purposes and weave them into longer-term professional development plans. Faculty can even use proposal text as draft material for third-year review or tenure files or for other forms of professional development plans. Time spent articulating ideas and trying to communicate them more clearly is not time wasted; this focus will ultimately strengthen the project. Viewing grant applications as part of a larger professional activity can help remove some of the sting of inevitable rejections.

Grant and research support can be tailored to [extend] support to all phases of faculty careers in all disciplines. Sponsored programs administrators can help to make clear the role that grants can play for junior faculty, for recently tenured faculty, and for senior faculty who may be seeking new directions or trying collaborative projects. In the case of junior faculty, whether in the humanities or the sciences, applying for a number of grants of varied types and sizes can be an important way to get their work in front of peer-review panels, which can be as much a part of career building as winning the award.

Established faculty can be more targeted in their applications, because they may already be known to the reviewers, have proven their ability to complete the proposed work, and have a successful track record of getting grants. For the established faculty at his or her mid-career, a prestigious national award can be used to leverage a promotion. The award can also lead to invitations to serve on the editorial or governing board of a prominent journal or give a lecture at a prominent event.

In a similar vein, senior faculty can use high-profile grants to secure invitations to coveted visiting professor positions or can use external funding to explore new lines of collaborative research with colleagues elsewhere, whether at a social science institute or a research lab in another country. Small colleges in rural areas may especially benefit from international grants for faculty exchanges.
Proposals and the resultant grants can be another way to be an active, visible part of the profession, connect with others in or beyond the discipline, and can lead to new professional networks. For example, a senior faculty member in European Studies, in need of time more than monetary support, applied for a residency at a writer’s colony where freedom from campus and domestic obligations and interaction with other writers assisted her in revising her novel. Publication of her creative work will enable her to contribute to the literature of her native culture after decades of studying and writing about the literary contributions of others, and it will put her work before a larger audience, including a nonacademic one.

In another case, a faculty member in religious studies at a rural college who works on Native American religious rights received a small grant early in his career to enhance a service-learning component in one of his courses. At a grant-related conference hosted by an Ivy League research university, the religious studies faculty member made connections with colleagues from other institutions and discovered ways to become more involved with public scholarship that addresses the needs of tribal communities. During the faculty member’s leave, he sought additional training in law and identified the kinds of applied research in which he could involve his students after his return to the classroom.

Grant support can have effects not only on individual faculty careers but can also enhance the relationship between faculty and the institution. The proposal planning process can be an occasion for faculty to consider the connections between their research interests and the needs and goals of the college, and to think more about what potential effects an external award would have on the institution. Will the research or project result in a new course? Will the grant add expertise in a certain area or initiate campus-wide discussions on a certain topic? Will it create outreach possibilities or lead to professional activity elsewhere and a potential for sustained collaboration? Externally funded research can provide the faculty and the administration with an opportunity to discuss the relationship between individual scholarly activities, teaching, and the broader campus climate. Grants can enable a small group of faculty to host a conference or a summer institute that brings in colleagues with a range of expertise or fund a visiting scholar who is able to assist with course development and research training for students.

Similarly, grant administrators can help successful applicants see the informal mentoring potential in their activities and use their grant experiences as a way to develop internal leadership. Those who have received grants can serve on campus grant panels or do peer-to-peer advising on seeking external funding. Through such activities, faculty can talk with their colleagues about what they’ve learned through the grant application and project management process — what works and what doesn’t, administering the grant, implementing the project, reporting progress, and sustaining a positive and productive relationship with the funding agency. Sharing experiences with other faculty colleagues helps to maximize learning and deepen the kind of college culture that supports grant-seeking and creative scholarship.

In summary, as sponsored programs and research administrators, we need to be mindful of individual needs and connect with faculty on a personal basis before they
begin the process of identifying and applying for grants. This prior contact makes it possible to be better prepared to help faculty navigate the entire process — when they’re ready — and keeps the focus first and foremost on individuals. The personal and professional goals of faculty are intertwined so we should always be aware that grantseeking and success in securing external funds can have lasting effects on individuals, their departments, and the larger institution.
Managing Internal Competitions*
Christa Johnson, Southern Illinois University Edwardsville

Federal funding agencies have been placing special restrictions and eligibility requirements on proposal submissions with increasing and alarming frequency. Such restrictions and requirements include limits on the number of applications accepted per funding cycle as lead or non-lead institution; the type of institution allowed to submit; the level of established research at an eligible institution; and the level of previous funding from specified sources. This trend is viewed by some in the university community as a cost-cutting effort, which effectively shifts the burden of proposal review from the sponsoring agency to the applicant institution. Despite concerns, no slow down is expected. It is crucial, therefore, that institutions step up their efforts to explore policies that address the challenges presented by sponsor limits and eligibility requirements, and develop effective and efficient procedures to pre-screen proposals and manage internal competitions.

Quickly Identifying the Programs
The first management challenge is how to quickly identify programs. Research administrators commonly use the phrase “limited competition” interchangeably with “internal competitions” to describe any program that would require internal coordination before approval for external submission. The phrase “limited competition,” however, can cause confusion as the industry has yet to adopt a standard definition. For example, some sponsors, such as NIH, use the phrase “limited competition” in their announcements for a group of programs that do not generally require an internal screening system prior to submission. The only way to identify all true limited programs that require internal coordination or competition is to read through each program announcement carefully.

After identifying which programs will require internal coordination, staff must quickly determine the institution’s eligibility, which is no longer necessarily tied to the DUNS number, 501.c.3 designation, status as a Primarily Undergraduate Institution (PUI) or Historically Minority-Serving and Black Institution (HMBI). New eligibility requirements often require quick access to information that is not easily retrievable either from existing grant databases (such as the expiration dates of existing grants received in response to specific solicitation numbers) or from any university information system (such as the number of years of a faculty member’s involvement in a particular field of research). Pre-award offices will ideally have available staff to research institutional eligibility and program limits on a regular basis.

* This article is reprinted from the NCURA Newsletter, Vol. XXXVIII, No. 2, April/May 2006, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Establishing Internal Peer Review
A second management issue is how to select which proposal will be submitted to the agency. Peer review is the standard method of ensuring an objective and fair evaluation of research proposals, and some institutions use a separate, internal committee for peer review. However, many institutions neither possess adequate resources, nor have institutional structures in place that would make it feasible to conduct a peer review in every case. In such instances, a standing committee model will suffice, yet, even here, challenges may arise.

It may be difficult, for example, to secure commitments from faculty, deans, and department chairs to serve on a selection committee and simultaneously ensure that adequate expertise is represented. Potential conflicts of interest and individual scheduling concerns will inevitably complicate matters further. More importantly, the internal review process can expect to generate several politically delicate challenges, including adequate and/or proportionate representation at the school/college level, equitable voting procedures, appropriate levels of confidentiality, and assurances that the committee considers the interests of the institution and the chances of the success of each proposal in the external competition. Finding adequate solutions to these concerns can have major consequences for the institution on various fronts. It is crucial, therefore, that the sponsored research offices are not expected to manage the review process in isolation. The importance of these internal competitions should not be underestimated and merits the significant involvement of the highest levels of research administration.

Managing the Process
A third challenge is how to manage the selection process. Most research administrators would agree that transparent and widely disseminated policies and procedures help promote participatory governance and empowerment at all levels and foster the political backing of faculty, deans, and vice chancellors. An investigator’s predictable disappointment about an unsuccessful outcome may be mitigated if, for example, the process and policy is ratified by the faculty senate.

Simple matters such as what to submit for internal review should be clearly delineated. For example, coordinating staff will need to recognize when the amount of material requested is either unreasonably expansive or so narrow that it will likely prompt a second request for information from the committee. In setting the internal deadline, staff will need to ensure the investigator has adequate time after the internal competition and before the external deadline to prepare the much longer and enormously time-consuming full proposal.

Several administrators have reported that the use of a central website for posting all internal and external deadlines, coupled with email announcements referencing the website, can help ensure faculty members at all schools and colleges remain well-informed. A central website can help coordinate among several schools and offices at institutions with decentralized administrative structures. If the central website is linked to a database of past and present competitions, it can also help to keep track of the ever-increasing volume of the competitions themselves, as well as document the entire
process in order to ensure staff and office accountability and control. Tracking and documentation is particularly important since certain aspects of the internal competitions, as well as information about the candidates are often kept confidential.

New Challenges

By all indicators, the research community can expect the trend in sponsor restrictions on proposal submissions to continue to rise. The National Science Foundation’s Integrative Graduate Education and Research Traineeship (IGERT) Program provides a good example. In the past, the institutional limit on IGERT submissions applied only to invited, full proposals. Because there was no specified limit, few administrations kept track at the pre-proposal stage and were therefore often caught off-guard at the last minute when too many full proposals came through the NSF Fastlane stream. This year [2006], the NSF restricted the number of preproposals for IGERT as well. Other federal programs have also begun to include separate institutional limits on the number of proposals they will accept from an institution as lead and as non-lead. This opens up an entirely new area in the field of internal competitions. Universities will not only have to conduct separate internal competitions for all preproposals, sub-contracts and collaborative projects, but will also have to evaluate proposals from these two separate categories against each other.

The policy questions for the institution abound. How is the committee to choose between a proposal from its own faculty as lead investigator, and a collaborative proposal as non-lead with a much larger budget from, say, an institution with a much better research profile, name recognition, and potentially better chance of success? Moreover, should renewal applications be evaluated together in the same competition with new applications or receive special consideration? These are only a few of the areas that will continue to be the subject of discussion for much time to come.
¶2320.4  **Meeting the Challenges of Risk Management and Compliance at a PUI***
Pam Whitlock (retired), University of North Carolina at Wilmington

Based on these definitions (see box), risk management has three steps — (1) identify the probability of adverse consequences; (2) estimate the magnitude; and (3) gain influence over the occurrence.

Risk management is a hot topic in today’s university community. We are faced with threats of violence, legal actions, pandemics, regulatory non-compliance, safety and fiscal/ethical issues. At first glimpse, implementing a process and infrastructure to properly manage these various risks seems insurmountable, especially if the person is at a PUI and the stock answer for every “Who’s in Charge of This?” question is “Them.” In reality, performing a risk assessment and management exercise can be very beneficial, especially at a PUI where the sponsored programs office may be valiantly trying to educate the campus as to the multitude of vulnerabilities facing a maturing institution. A risk or compliance matrix is a roadmap tool validating necessary policies and processes. It can be utilized to justify reports and resources needed to successfully manage external funding. It also can reflect the progress being made during accreditation or audit.

Risk management requires an organizational wide review of every activity that could affect an institution’s ability to achieve its objectives. Yet it can start in just one office. A matrix of events/actions possibly affecting an organization should include assessing the probability and impact of an occurrence, as well as identifying the responsible unit for ensuring proper actions or compliance to a regulation is followed. An inventory of necessary policies and procedures should be included to ensure adequate monitoring for each identified risk. Some of these will be central to sponsored programs, others tangentially related. Use it as an opportunity to take a leadership role and be the catalyst to initiate the process. Set the example.

It all sounds simple, doesn’t it? It’s not. A PUI has both advantages and impediments to successfully implementing the process. As a smaller organization, it is often simpler to get the necessary people together to discuss and formalize a process

---

* This article is reprinted from NCURA Magazine, Vol. XL, No. 3, July/August 2008, published by the National Council of University Research Administrators. It is used with permission of the publisher. Pam Whitlock (retired) was director of the Office of Sponsored Programs at the University of North Carolina at Wilmington and is a past president of NCURA.
to implement this. There are fewer levels and the organizational structure is often less complex. On the other hand, as a smaller organization, a PUI may encounter a culture not valuing the risk assessment process nor the compliance activities necessary to mitigate potential risks. The culture of a PUI is normally not inclusive of a focus on research or the compliance infrastructure necessary to successfully grow the programs. We tend to be very centralized. Many tasks that at larger institutions would be distributed to various stand alone units are housed in the Sponsored Programs office and, often, with one person. This consolidation alone increases the risk to an organization unable to establish a separation of duties.

At some PUIs, one may wonder what thought process is behind the distribution of responsibilities. Quite often, it was an attempt by the university to ensure a separation of duties, especially in the financial arena. At the same time, this very consolidation is a strength enabling the office to be aware of nearly all the activities involving sponsored programs on campus. The communication necessary to ensure all “bases” are being covered is often strained during a growth period when a restructuring might be necessary to ensure reasonable workloads. A risk assessment is a useful tool for gap analysis.

At a PUI, faculty have not been as immersed in regulations, protocols, and fiscal responsibility. Teaching (the talents and strengths for which they were recruited) does not require the constant monitoring of financial and regulatory actions. Many have never managed an organizational budget nor managed personnel, contracting, or even adherence to university policies and requirements. The environment at many PUI’s does not lend itself to written policies. If there is a stable, long time faculty, “this is the way we’ve always done it” may be the de facto policy. It then becomes the sponsored projects unit’s responsibility to start the educational process throughout the campus. Recruit select faculty, talk to other divisions and units about issues, gain the buy-in of upper administration, draft policies and float through the channels and be tenacious. Seek out other NCURA PUI members, exchange successful experiences. Take the message back to your campus. Convince upper administration, show examples of peer institution assessments.

Culture has to change, new lines of communication must be formed, and “territorial boundaries” modified. The research enterprise itself may be morphing into a new being. New risks emerge with growth and new organizational units. Managing the risks associated with educating students, being a good community citizen, and doing business with outside organizations becomes critical and must be on the radar of every institution, regardless of size or mission.

There are a multitude of risk assessment/management resources available and can be tailored to your environment, structure and culture. Look around, many colleagues are very willing to share what they have, NACUBO (National Association of College and University Business Officers), business schools, commercial entities, and associations dealing with risk measurement have available examples. This may be a good project for a graduate student to apply their knowledge to a real life situation.
PUI’s are not “different” in that they don’t need to take risk management and the ensuing compliance activities seriously or they don’t see them applying to them. A PUI just sometimes has to approach the problem differently because the culture has not changed as the institution matured. Just saying “NO” doesn’t work unless there is a commitment from the top to do things right. That support must be apparent in both words and actions to make a successful leap to a culture of compliance, understanding and self-assessment. Remember, as Bo Bogdanski said in last month’s issue, not making a decision is a decision. It takes hard work, perseverance, and good leadership to successfully move our emerging institutions forward. I would recommend starting there.
Managing Time by Building Relationships at a Predominantly Undergraduate Institution

Beth Seaton, Western Illinois University

As the director of sponsored projects at a predominantly undergraduate institution I find myself constantly evaluating how I can most effectively manage my, oftentimes conflicting, priorities. Is it more important for me to spend time sitting down with a junior faculty member and walking her through the NSF GPG or should I attend the meeting with the internal auditor who is trying to convince the provost that all payments to faculty from grant funds should be disallowed immediately? Should I read through the second draft of a faculty member’s Fulbright-Hays grant application or should I meet with the vice president to explain what an allegation of scholarly misconduct really means to the institution?

I was at a meeting recently with sponsored programs staff from other institutions—the majority from research or medical schools. Someone in the audience asked what role a sponsored research office plays in faculty development and development of proposals. Most of people agreed that they play a minor or insignificant role in that area. Nothing could be further from the truth at a PUI. Our faculty members have chosen to work at our institutions usually because of the importance PUIs place on undergraduate instruction. Because of this non-research focus, they are not, for the most part, well-versed in proposal development.

Being effective in my job entails time spent getting to know individual faculty and their research interests, meeting with them and providing proposal writing assistance which might include getting them in touch with the appropriate program officer in Washington, D.C. or helping them navigate through an RFP. Individual meetings and multiple revisions to narratives and budgets take a lot of time, but establishing a positive working relationship with the faculty member is essential at a PUI. It builds trust which can save me considerable time in the future. I am fortunate to have staff in my office so that even if I can’t devote more of my time working one-on-one with the faculty I have someone else who can.

Unlike my counterparts at research intensive institutions I spend an inordinate amount of time trying to communicate the uniqueness of sponsored funding—that these grants and contracts sometimes require special decision making. Because our offices are not a central focus on campus there are many people who don’t know what it is we do or why we exist. Some people think we write grants, some people think we raise money, some people think we are just here to pad the faculty members’ salaries and others see as merely a regulatory roadblock to their research. It is imperative that I, as the Director of the Office of Sponsored Projects at a PUI, communicate with the rest of the campus about what we do and about the very different

---

1 This article is reprinted from the NCURA Magazine, Vol. XL, No. 5, December 2008/January 2009, published by the National Council of University Research Administrators. It is used with permission of the publisher. Beth Seaton is director of sponsored programs at Western Illinois University.
nature of sponsored awards. This effort can include explaining facilities and administrative cost recovery to the new vice provost for research and graduate studies, the importance of a cost transfer policy to the accounting clerk, or the concepts of “reasonable,” “consistent,” and “allocable” to the department secretary who is, for the first time, in charge of federal grant expenditures.

Cultivating relationships across campus to facilitate this process is very time-consuming, but again, essential. Taking the time to talk to the person in the budget office about why the faculty member is getting salary from a grant account, or to the Board of Trustees about the recommended changes to the intellectual property policy, or to the purchasing office about why an agreement is being negotiated after the activities have already begun facilitates the processing of transactions on sponsored awards. Because some sponsored activities occur so infrequently, they have to be literally walked through the systems to ensure approval and completion. Having developed a personal level of trust through relationships in the deans’ offices, payroll, purchasing, human resources, etc. goes a long way when I need to get something accomplished quickly.

Working in the sponsored projects area at a PUI is challenging in that we are required to comply with all of the same regulations as the well-funded research intensive institutions. The time required to draft and adopt policies on conflict of interest, scientific misconduct, human and animal subjects, biosafety, etc. is the same whether you receive $5 million in sponsored awards or $500 million. This is where I can really rely on the relationships we have established through NCURA membership to help. If we don’t have a policy on export controls, instead of spending countless hours researching the topic I can contact an NCURA member who deals with that issue on a daily basis for some advice. I rely on my NCURA colleagues to help me navigate through a lot of issues that may come up very infrequently at a PUI, thereby saving me a lot of time.

We need to remember that when we are working on cultivating relationships with other offices on campus, with the upper administration, with the faculty, and with others in NCURA, we are building a network of people who understand our needs better and who can help us save time in the future. This can mean more time for that one-on-one work with the faculty.
Universities Swap Ideas for Meeting NSF, NIH RCR Training Mandates
Report on Research Compliance

Predominantly undergraduate institutions may have only a few students who work on grants that fall under the National Science Foundation requirement for training in the responsible conduct of research and, perhaps, none at all who fall under NIH’s training mandate. Comprehensive universities may have many researchers who already receive training as required by certain NIH grants; they, too, face the NSF requirement.

“Many of the PUIs don’t have training set up, nor do they constantly have funded projects by the NSF and NIH, and it is up to them to provide training as they see fit,” said Linda Mason, coordinator of grantsmanship for the Oklahoma State Regents, whose system includes two comprehensive universities and 23 PUIs.

Mason moderated a podcast on this topic sponsored by the National Council of University Research Administrators. She was joined by Bob Holm, director of the Institute for Research and Scholarship at Butler University in Indianapolis, a PUI, and Megan Losh, associate director of the Research Ethics, Education and Policy office at Indiana University, which is part of IU’s Office of Research Administration. Together they shared compliance strategies they have used in meeting the training requirements of both NSF and NIH.

Training Requirements Differ

The American COMPETES Act required the NSF director to mandate “that each institution that applies for financial assistance from the foundation for science and engineering describe in its grant proposal a plan to provide appropriate training and oversight in the responsible and ethical conduct of research to undergraduate students, graduate students, and postdoctoral researchers participating in the proposed research project.” This requirement, which went into effect in January, does not specify the type of training or a preferred format. NSF leaves it up to the institution to determine the format of training, whether online, in-person, or some combination.

NIH’s training requirement applies to “all NIH institutional research training grants, individual fellowship awards, career development awards (institutional and individual), research education grants, dissertation research grants, or other grant programs with a training component that requires instruction in responsible conduct of research as noted in the funding opportunity announcement.” At least eight hours of training is required, to cover a variety of topics, including conflict of interest, research misconduct, human subjects protections and “responsible authorship and publication.”

---

1 This article is reprinted from the April 2011 issue of Report on Research Compliance. For further information, visit www.reportonresearchcompliance.com.
In addition, the NIH training cannot be solely online and should involve mentoring by faculty. As NIH stated in a November 2009 update to its RCR training policy, “While online courses can be a valuable supplement to instruction in responsible conduct of research (RCR), online instruction is not considered adequate as the sole means of instruction. A plan that employs only online coursework for instruction in responsible conduct of research will not be considered acceptable, except in special instances,” which NIH describes. (For more information, see http://grants.nih.gov/grants/guide/notice-files/NOT-OD-10-019.html.)

CITI Programs Form the Foundation
Holm said that Butler is “developing our RCR program on two parallel tracks that in the very immediate future will intersect and become one.” Further, “One of the tracks is that we have drafted an RCR policy for the university that involves an integrity officer,” she added. “This is in response to any type of allegation of irresponsible conduct of research, such as data manipulation, plagiarism [and] falsification of data.” This policy will be in place after a review by a committee of the Butler faculty senate and then the full senate. It will be shared with Butler’s board of trustees as well, said Holm, who noted that he had recently been named Butler’s integrity officer.

The second “track” actually has two components. One, Butler is a fairly recent subscriber to the Collaborative Institutional Training Initiative. CITI is a suite of online classes and training modules that can be used by undergraduates as well as faculty. “We had a group of undergraduate students take the RCR modules last summer, and [they] did very, very well and didn’t really have many negative reactions to us asking them to do this; this was kind of our first test group to do that,” Holm said.

Second, “We will also be working with faculty to develop a mentoring philosophy amongst them and their undergraduate students,” Holm said, adding that as a PUI, “we don’t have any graduate students per se that are doing any kind of research.” Butler has a couple of post-doctoral students in its College of Pharmacy, he said. “For those students that are associated with a faculty member that is funded by or going to be funded by NSF or NIH, we would encourage and monitor the mentoring that the faculty member gives to the undergraduate student in his or her laboratory,” Holm said.

NIH awards are infrequent at his university, he added. But should one be received, Butler would comply with the requirements and “do the additional amount of training in terms of the faculty mentoring for the undergraduate student in their laboratory,” Holm said. “And then our office would be responsible for monitoring and recording all the information in terms of time spent by each of the faculty researchers mentoring their students.”

IU Is Building on Existing Policy
Losh described a similar process under way, and now partly operational, at IU. “We already have a policy on research misconduct, and that’s been in place for a while,”
Losh said. IU also uses the CITI modules for online training. But the NIH requirement states that training cannot be limited to just online courses, so, to fulfill this portion, researchers and students are also attending on-campus classes on research ethics, Losh said.

“We do offer training sessions and some for-credit classes that cover the topics of RCR,” Losh said. “So the principle investigator can send the students to those classes as well.” Ensuring and documenting that students and faculty take the required training are key, and IU has a process in place to do just that.

“Our office is the one that does document what they’re doing,” she said. “And what we are going to be doing is sending out a request to the researchers that have the specific grants … two times a year, every six months, asking them to document what have they done in addition to the CITI training. We are able to log into the CITI training and see who’s paid off a grant, specific for NIH and NSF, and if they have taken CITI. If they have not, we notify the researcher and say, ‘Look, you need to have this person take CITI as well.’”

PIs will be asked what topics were covered, how long the training took, and what form it was in, Losh said. “There might be a lot of different types of training that the researcher does,” Losh added. “There might be a laboratory meeting, or it could be more of a session where you have somebody come in and talk to the whole group,” she said, and IU wants to be able to capture these events.

“We work really closely with the researchers, and find out what they’re doing in their classes or with their post-docs, people who are paid off the grant. If there is a PI on the NIH grant, we try to find out what they are doing and document it,” she said. Thus far, classes are held only on the Indianapolis and Bloomington campuses. “Our goal in the next year or so is to reach out to all the other campuses within the IU system and put on classes for them as well,” Losh said.

Losh said that the training program IU utilizes for NIH compliance would also be adequate for meeting the NSF mandate, “as long as there is an understanding between the PI and the institution as to what does that mean for their specific grant.”

Oklahoma Regents Will Help PUIs

Mason spoke from the perspective of a statewide system, saying, “We are now working on a collaborative response to the [RCR requirement] that will be available to all of the 23 PUIs and maybe other private institutions that want to join this response.”

“We are developing a model that is based on the University of Oklahoma model at the Norman campus,” Mason said. “Their model has been funded by NSF and NIH and is a response to the requirements of both of those agencies, and they provide training only for their graduate students. Their undergraduate students are provided training on an individual mentoring basis.”

The Norman campus previously used CITI modules, “but they have since developed this on-campus training model,” she said, which is two eight-hour days of training, typically on a Friday and Saturday. The classes are noncredit, Mason said,
and offered at the end of every month. Some 1,500 graduate students annually participate in the training. “They require all of their paid graduate students to take the training regardless of their source of pay,” Mason said. The training is a “case-based model,” meaning it is tailored to the student’s area of study.

“They have the students look at written cases, video clips of cases, and then they do some role-playing to establish a discussion about what would be the ethical conduct of research based on standards … for each of the student’s backgrounds,” Mason said. “For example, if they are from fine arts, they look at fine arts standards of ethical conduct, and if they are engineering, they look at the engineering and so on [for] different schools.”

Mason said the regents will use the Oklahoma University’s case study materials and will provide training in one central location, perhaps at the regents’ facilities in Oklahoma City, which she and faculty members from the PUIs will teach researchers. “We think that [institutions working together] is an important part of the training so that the students can interact with each other from different campuses. And the campuses and the universities will determine which of their students will go through this training, depending on their grants on campus or their policy on campus,” Mason said.

A second part of the training, which will be “back on [each] campus,” is still in development, Mason said “I will work with each of the campus-sponsored program directors to develop a customized, individualized response for the faculty members who are conducting research on the campus to provide a second component,” she said.

In addition, “On a statewide level, we are going to have all the principal investigators, and the researchers who may not have an active grant but do have student research[ers], take the ‘train the trainer’ workshop,” which is also offered by Oklahoma University, Mason said. Mason also noted that she is available to PUI staff “at any time” and can provide individualized instruction to PIs.

**Training for All?**

Mason and Holm also said they felt strongly that all students — irrespective of their research duties — should receive some training in ethical conduct, saying to provide such training would be “ideal.” Holm pointed out that students may run into issues of plagiarism and other related concerns regardless of whether they are conducting research. Mason said her system also sees value in this idea.

“We’re engaging in discussions of having everybody receive training, all students, not just all researching students, but all students….because it’s a valuable thing to do for students in their academic pursuits,” she said.

2320.7 Faculty Perceptions of Research, Scholarly, and Creative Activity and Grant Seeking at a Predominantly Undergraduate Institution

Cynthia E. Carr and Joseph C. McNicholas, Loyola Marymount University; and Robert R. Miller, Miller & Associates

Sponsored projects offices at institutions of higher education are responsible for encouraging and assisting faculty as they work to acquire grant funding for research, scholarly and creative activity (RSCA). External funding can allow faculty to pursue more extensive research projects because it can bring faculty release time, equipment, travel funds, and professional assistance (for example, data analysis, or program management). Grant funding can also enhance the institution by contributing to indirect or facilities and administrative costs (F&A), bringing a new income stream into the institution (Cole, 2007). Predominantly undergraduate institutions (PUIs) are the teaching engines of U.S. higher education. By its very nature, the sponsored projects office in the predominantly undergraduate environment represents an on-the-ground institutional commitment to research through pre-proposal assistance, and tends to build closer and more collaborative relationships with faculty than similar offices in research universities (Pogatschnik, 2008). Lowry and Hansen (2001) suggested that the role of sponsored projects offices at PUIs should encompass the institutional integration of research and teaching, a proposition fraught with policy issues, historical biases, and personnel considerations:

Whether by conscious intent or by acquiescence to an imitative model inherited from doctoral institutions, research administration offices perpetuate old divisions between teaching and research. The end result is that we contribute to conflict and mixed signals both within the university and with agencies external to it (Lowry & Hansen, 2001, p. 12).

These offices at PUIs sometimes increase tension among faculty by increasing the institutional resources allocated to research administration activities (pre-award activities, accounting, compliance, etc.), and therefore away from teaching activities. Another source of tension can emerge because externally funded research may not be critical to processes of tenure and promotion at PUIs. It is beyond the scope of this study to suggest the proper purview of sponsored projects offices at all PUIs, except to note that each office might serve best by becoming aware of the interests and needs of its own faculty and addressing them. Many sponsored projects offices attempt to do this by conducting faculty surveys.

Boyer and Cockriel (1998) conducted a survey of College of Education faculty at Association of American Universities (AAU) Research I institutions to explore barriers and motivating factors in grant seeking. Results reflected the nature of these research institutions: the greatest motivations included promotion and tenure, the building of professional reputation, and the commitment of the institution’s presi-

1 This article is reprinted from Research Management Review, Volume 17, Number 1, Fall/Winter 2009. It is used with permission of the publisher.
dent to grant seeking. Barriers included lack of training in the grants process, lack of understanding of budgeting, and unfamiliarity with funding sources. These results from research universities differ from the most cited common barrier for PUIs: the lack of time.

In their 2008 study of perceptions of female associate professors toward the barriers to and supports of grant writing at Boise State University, Idaho State University, and the University of Idaho, Easterly and Pemberton (2008) found that top institutional barriers included a heavy teaching load, heavy committee assignments, or a lack of key resources, including: knowledge of funding sources, peer networks, and travel funds to attend conferences. Personal barriers included perceived lack of training and lack of mentors. Respondents felt that their institutions strongly supported their efforts; however, they were not always aware of the services provided by the grants office. Based on their data, Easterly and Pemberton pointed out that although strong support may exist at an institution, faculty must know about services in order to use them.

In 1995, Dooley investigated a shift in institutional culture toward increased grant-funded research at the College of Education at Texas A&M. Texas A&M is a research-intensive university; however, up until the period studied, the College of Education had emphasized teaching, and so processes examined by Dooley are similar to those of PUIs. Dooley identified barriers and incentives to grant writing, and found that a primary consideration of Texas A&M College of Education faculty was acquiring sufficient time to prepare the proposal and conduct the award. Barriers included heavy teaching and advising loads, as well as receiving relevant information too late to prepare a competitive proposal. The top services provided by the local grants office included information on how to create a budget, search for opportunities, and prepare the necessary documents for administrative approval of the submission.

Sterner (1999) conducted a survey of tenured and tenure-track faculty at Bradley University, a PUI, to measure attitudes toward RSCA and teaching. She found that while faculty emphasize teaching over research, they also strongly value the effect of RSCA on their professional development, on the quality of instruction and on excellence in teaching. Faculty at Bradley believe that external funding activities are considered in the tenure and promotion process.

The Office of Sponsored Programs at California State University at Chico conducts regular assessments of faculty needs (LeBlanc, Jackson, & Wright, 2003). In 2001–2002, the assessment concentrated on perception of the teacher-scholar model in an institution that has seen great change from a strong teaching mission to growing emphasis on scholarship. The authors found that deans, department chairs, and new tenure-track faculty agree on a conceptual level that colleges and departments encourage faculty to seek external funding to pursue RSCA and that the pursuit of external funding contributes to professional growth, and tenure and promotion. Results on grant-seeking behaviors were different, however:

University leadership also espouses the benefits of the teacher-scholar model. But the majority of department chairs—the gatekeepers
of the retention, tenure and promotion process and, typically, members of the senior faculty—disagree over the significance of seeking and obtaining external funding as well as whether it is legitimate to equate the pursuit of external funding with doing research (LeBlanc, Jackson, & Wright, 2003, p. 28).

**Background**

Loyola Marymount University (LMU) is a PUI and four-year, private, comprehensive Master’s I, Catholic institution sponsored by the Society of Jesus (Jesuits) and the Religious of the Sacred Heart of Mary. LMU was established in Los Angeles, California in 1911, and had a 2008 enrollment of 5,667 undergraduates and 3,205 graduate students, including the students of Loyola Law School. The student-to-faculty ratio is 11:1.

LMU faculty have historically shared a fundamental interest in pedagogy, as reflected in the mission, goals, and objectives of the institution, and throughout the *Faculty Handbook* where teaching is always listed before scholarship. The *Handbook* sets teaching and advising as the first Specific Faculty Responsibility:

> Excellent teaching is central to the University’s mission and rooted in the traditions of the founding religious orders. The faculty member plays a vital role in carrying out the mission of the University by challenging and encouraging students to become life-long learners (Loyola Marymount University, 2009, p. I-22).

In recent years, LMU has increasingly emphasized the importance of faculty engagement in externally funded research projects by increasing support services through the development of the administrative lattice, as Massy might put it (Massy, 2003). In 2007, a Vice President for Research was hired, and the Office for Research and Sponsored Projects (ORSP), a primarily pre-awards office, was augmented by the hiring of two additional positions: an Executive Director for Research and Compliance and an additional pre-award administrator. This increase in resources devoted to research has resulted in a near tripling of awards, from $2.3 million in 2004 to $6.5 million in 2009.

**Purpose**

The development of this research infrastructure has been welcomed by most faculty at LMU. Nevertheless, ORSP staff is cognizant of the fact that an increased emphasis on research may occasion tensions regarding the tenure process, as well as faculty responsibilities as instructors and scholars. Three themes recurred:

1. Some faculty felt that external funding might not be important to faculty careers.
2. Others thought that the pursuit of external funding did not seem to be recognized in the tenure process.
3. Another group of faculty wondered whether there was assistance on campus for the pursuit of external funding.

ORSP staff were interested in knowing more about the prevalence of these
views, and, if necessary, how the institution should address them. Therefore, in 2009 two of the authors, members of the ORSP staff, conducted a survey self-report to measure faculty perceptions of: (1) the relationship of RSCA to the pursuit of external funding; (2) the importance of the pursuit of external funding to the tenure process and career development; and (3) the perceptions of faculty regarding ORSP outreach and service.

**Methodology**

The authors began preparing the survey instrument in summer 2008, and guided it through several iterations and a pilot study. RSCA questions were based in part on the Sterner (1999) study of faculty attitudes toward external grant seeking. Other questions were developed based on ORSP management experience, and in conjunction with faculty, administrators, the Director for Institutional Assessment, and the LMU Research Council over a six-month period of preparation. IRB approval was granted in 2008. Administration of the survey was delayed twice due to institutional concerns about faculty survey fatigue, and it was finally deployed in fall 2009.

The final survey consisted of 24 items, including four demographic questions, five questions on RSCA and tenure, four questions on the effectiveness of ORSP outreach, and seven questions on the effectiveness of ORSP service.

Quantitative data were gathered using a 5-point Likert scale: (1) Strongly Agree, (2) Agree, (3) I don’t know, (4) Disagree, and (5) Strongly Disagree. “I don’t know” was included to offer a neutral response or to indicate lack of knowledge.

For purposes of survey distribution, LMU tenured and tenure-track faculty members were divided into two groups. The first included those who had worked with the ORSP to submit a grant proposal at least once during the previous 27 months (July 15, 2007–November 1, 2009), a total of 140. This group will be referred to as the “client” group. The Vice President of Research and Dean of Graduate Programs emailed an invitation to this group that included a link to the survey, housed on Survey Monkey: www.surveymonkey.com. They received two reminders in one-week increments.

The second group consisted of 100 faculty members selected randomly from the remaining group of 265 tenured and tenure-track faculty members, provided by the Office of Institutional Research. This group will be referred to as the “nonclient” group. One week after the invitation was sent to the first group, the second group was similarly invited by email to participate, provided with a separate link to the same survey housed on Survey Monkey, and reminded twice, in one-week increments. The two links to the survey were each kept live for four weeks and then the survey was closed.

**Results**

Most academics believe that research begets good teaching and that good teaching begets educational quality (Massy, 2003, p. 87)

Of the 240 faculty members approached, 136 tenured and tenure-track faculty members responded, 87 clients, or 60.8%, and 49 nonclients, or 33%—altogether, a 56.7%
return. Three nontenure-track ORSP client faculty also responded and are included in the results. Sixty-three percent of respondents were male, and 38% were female. Fifty-nine participants (42.4%) were from the College of Liberal Arts, and 40 (28.8%) were from the College of Science and Engineering, with the rest distributed between 4% and 9% among the School of Film and Television, the School of Education, the College of Communication and Fine Arts, and the College of Business Administration. Loyola Law School professors were not approached for this survey.

**Research, Scholarly and Creative Activity at LMU**

In keeping with presumed faculty interest in the ties between teaching and RSCA at LMU, the survey responses to Questions 5a, 5b, and 5c, adapted from Sterner (1999), reflect these concerns. Given LMU’s strong mission-centered impetus toward teaching and the drive toward research that currently permeates higher education, LMU faculty seem amenable to the kind of teaching-research fusion espoused by such thinkers as Boyer in *Scholarship Reconsidered* (Boyer, 1990). Figure 2320.7-1 shows survey respondents had high rates of agreement with statements that reflect the value of RSCA to the quality of instruction (91%), excellence in teaching (77.4%), and remaining current in their disciplines (97.8%). One might expect that ORSP client faculty, who had applied for grants sometime during the two years preceding this study, would express more agreement with the positive aspects of RSCA. When disaggregated into client and nonclient groups (Figure 2320.7-2), however, there was somewhat less agreement on the value of RSCA relative to excellence in teaching (form or pedagogy) or the quality of instruction (content). Responses by nonclient faculty reflected higher rates of agreement with the connection between RSCA and quality of instruction and excellence in teaching than client faculty.

These data suggest that the perception of respondents on the importance of RSCA for teaching and instruction does not necessarily indicate that the pursuit of external funding for research at LMU is a highly valued activity. Most faculty at LMU see the importance of RSCA as it reflects on their daily teaching duties, and all see it as important to remaining conversant with trends in their disciplines; however, this does not necessarily result in grant-seeking behavior. Faculty members’ positive valuation of grant seeking, coupled with a relatively low grant proposal preparation behavior (34.5%), may be caused by time considerations—a primary barrier to grant seeking at PUIs, according to the literature. Another possible factor is that not all RSCA is easily funded by external sources, such as the scholarly activities of liberal arts faculty—however, this hypothesis calls for further study.

Pursuing Grants at LMU

Most survey respondents (79.4%) reported that tenure expectations are clearly articulated, as shown in Figure 2320.7-3. A small percent reported that they either did not know whether tenure expectations were clearly articulated (5.3%), or disagreed with the statement (15.3%). Despite this indication that they understand tenure expectations, only 53.4% of respondents strongly agreed or agreed that the pursuit of externally-funded projects is recognized in the tenure process (Figure 2320.7-4); about 13% of respondents expressed uncertainty (I Don’t Know). ORSP client faculty were more likely to report that the pursuit of grants is recognized in the tenure process (57.9%) than nonclient faculty (51.1%). Further, ORSP nonclients were much more likely than ORSP client faculty (39.5% versus 28.9%) to disagree with this statement, perceiving that the pursuit of external funding is not recognized in the tenure process.

Figure 2320.7-5 demonstrates that LMU ORSP clients are much more likely to consider grant writing important to their career advancement and professional growth than nonclients (69.3% versus 46.5%), and this may be an important motivating factor. Nearly as many nonclients (41.9%) reported that writing grants is not important to them in terms of career advancement and professional growth.

**ORSP Outreach and Services**

As members of a service-oriented office, LMU ORSP staff are extremely interested in feedback on performance. Consequently, survey questions in this section were chosen with great care (Figure 2320-7-6). Questions were based on: samples uncovered during our literature review (Question 11, source of grants assistance); recent changes to ORSP services (Question 12, updated website); and current ORSP service
standards (Question 15, clear submission procedures, and Question 16, validation of assistance). Questions 14, 19, and 20 represent variations intended to ascertain satisfaction with services overall. Results from Question 11 indicate that general outreach efforts, which were expanded in 2008, have been successful, with 90% of faculty indicating they know to call ORSP regarding their grant and contract projects. This result is very positive given Easterly and Pemberton’s (2008) conclusion about the importance of faculty awareness of services. The LMU ORSP website (Question 12), which was recently revised (2008) to present a wide range of materials to assist with proposal development, was relatively unknown, with 38.2% of faculty agreeing that the website is helpful, and 44.3% of faculty unfamiliar with it.

Questions 14–20 brought generally good marks for the office, with a decisive majority of faculty reporting that they had excellent experiences working with the ORSP (69.9%), that submission procedures are clear (61.7%), that questions are answered (79.4%) that the staff is helpful in the submission process (72.8%), that they are treated with courtesy (90.3%), that they look forward to working with the office again (66.3%), and that they would recommend the ORSP to colleagues (72.6%).

All in all, there was satisfaction with these results, as well as suggestions for improvement.

*Aggregated Agree and Strongly Agree
**Aggregated Disagree and Strongly Disagree

**Statistical Analysis**

A MANOVA was performed to examine differences between the colleges and schools on level of agreement ratings concerning the following questions:

5b. RSCA helps University faculty members attain excellence in teaching.

6. Tenure expectations are clearly articulated to faculty in my department.
7. In my opinion, the pursuit of external funding for RSCA is recognized in the tenure process in my department.

8. Writing grants is important to me in terms of career advancement and professional growth.

16. The staff member(s) I worked with made sure my questions were answered.

17. The staff member(s) I worked with was/were helpful in the grant preparation process.

20. I would recommend the LMU ORSP to other faculty members for assistance with a grant.

The homogeneity of variance assumption was not met for several of these dependent variables (Levene’s test, \( p < .05 \) for all). A natural log transformation was performed on each of the seven dependent variables and the assumption was satisfied for each of the variables (\( p > .25 \) for all). Faculty at different colleges and schools in the University were compared on level of agreement ratings regarding the dependent variables, including faculty at the College of Liberal Arts (\( n = 34 \)), the College of Science and Engineering (\( n = 31 \)), and other colleges and schools (\( n = 20 \); \( N = 85 \)). Using Pillai’s trace, there was a significant overall multivariate test (\( V = 0.60, F(14, 154) = 4.68, p < .001 \), partial \( \eta^2 = .30 \)). This finding indicates a significant effect of college and school on level of agreement ratings regarding the dependent variables.

Subsequent univariate ANOVAs revealed a significant effect of college/school on level of agreement ratings concerning three of the dependent variables:

5b. RSCA helps University faculty members attain excellence in teaching, \( F(2, 82) = 5.27, p < .01 \), partial \( \eta^2 = .11 \);

6. Tenure expectations are clearly articulated to faculty in my department, \( F(2, 82) = 12.97, p < .001 \), partial \( \eta^2 = .24 \);

7. In my opinion, the pursuit of external funding for RSCA is recognized in the tenure process in my department, \( F(2, 82) = 9.32, p < .001 \), partial \( \eta^2 = .19 \).

Univariate ANOVAs regarding the remaining dependent variables were not significant (\( p > .10 \) for all).

Further analyses were conducted to understand the significant findings. For level of agreement ratings concerning 6. Tenure expectations are clearly articulated to faculty in my department dependent variable, post hoc Bonferroni comparisons of means indicated that faculty in the College of Liberal Arts (\( M = 1.79, SE = 0.16 \)) and the College of Science and Engineering (\( M = 1.74, SE = 0.17 \)) each demonstrated a significantly higher level of agreement than faculty in other colleges and schools at LMU (\( M = 3.15, SE = 0.21; p < .001 \) for all). Faculty in the College of Liberal Arts and the College of Science and Engineering did not significantly differ in their level of agreement ratings on this variable (\( p > .05 \)).

For level of agreement ratings regarding 5b. RSCA helps University faculty members attain excellence in teaching dependent variable, faculty in the College of Liberal Arts (\( M = 1.50, SE = 0.18 \)) demonstrated a significantly higher level of agreement
than faculty in the College of Science and Engineering ($M = 2.23, SE = 0.18; p < .01$). Faculty in neither of these colleges significantly differed in their level of agreement ratings on this variable compared to faculty in other colleges and schools in the University ($M = 1.80, SE = 0.23; p > .05$ for all).

For level of agreement ratings concerning 7. *In my opinion, the pursuit of external funding for RSCA is recognized in the tenure process in my department,* the dependent variable—faculty in the College of Science and Engineering ($M = 1.84, SE = 0.19$)—demonstrated a significantly higher level of agreement than faculty in the College of Liberal Arts ($M = 2.91, SE = 0.18; p < .001$) and faculty in other colleges and schools at LMU ($M = 2.85, SE = 0.24; p < .01$). Faculty in the College of Liberal Arts did not significantly differ in their level of agreement ratings on this variable compared to faculty in other colleges and schools in the University ($p > .05$).

Two multiple regression analyses were performed to investigate the relationship between faculty satisfaction in working with the ORSP and particular ORSP staff services. The first analysis measured faculty satisfaction according to level of agreement ratings regarding 14. *I had an excellent experience working with the ORSP.* The second analysis measured faculty satisfaction according to level of agreement ratings concerning 20. *I would recommend the LMU ORSP to other faculty members for assistance with a grant.* For both analyses, level of agreement ratings regarding particular ORSP staff services served as the set of predictor variables, and included:

11. *If I had an idea for a grant proposal that I would like to submit to a federal or state agency, foundation, corporation, or professional or scholarly association, I would know what office to call on campus for help;*

12. *The website of the ORSP is very helpful;*

15. *The procedures for submitting a grant proposal were clear to me;*

16. *The staff member(s) I worked with made sure my questions were answered;*

17. *The staff member(s) I worked with was/were helpful in the grant preparation process; and*

18. *The staff member(s) I worked with exhibited professional courtesy.*

The first analysis regressed level of agreement ratings concerning *14. I had an excellent experience working with the ORSP* on the six office services. The test of the overall model suggests a significant relationship between level of agreement ratings regarding *14. I had an excellent experience working with the ORSP* and office services ($F(6, 81) = 56.80, p < .001$). The multiple correlation was .90, indicating that approximately 81% of the variance in level of agreement ratings concerning *14. I had an excellent experience working with the ORSP* was accounted for by the linear combination of predictor variables. Regarding each of the predictor variables, level of agreement ratings concerning *17. The staff member(s) I worked with was/were helpful in the grant preparation process* and *15. The procedures for submitting a grant proposal were clear to me* were strong predictors of level of agreement ratings concerning *14. I had an excellent experience working with the ORSP.* Level of agreement ratings regarding *16. The staff member(s) I worked with made sure my questions were answered* was a moderate predictor. Each of the remaining predictor variables was a poor predictor.
presents the results of the first regression analysis.

The second analysis regressed level of agreement ratings concerning 20. *I would recommend the LMU ORSP to other faculty members for assistance with a grant* on the same six ORSP staff services. The test of the overall model suggests a significant relationship between level of agreement ratings regarding 20. *I would recommend the LMU ORSP to other faculty members for assistance with a grant* and office services ($F(6, 81) = 41.28, p < .001$). The multiple correlation was .87, indicating that approximately 75% of the variance in level of agreement ratings concerning 20. *I would recommend the LMU ORSP to other faculty members for assistance with a grant* was accounted for by the linear combination of predictor variables. With regard to each of the predictor variables, level of agreement ratings concerning 17. The staff member(s) I worked with was/were helpful in the grant preparation process and 16. The staff member(s) I worked with made sure my questions were answered were strong predictors of level of agreement ratings concerning 20. *I would recommend the LMU ORSP to other faculty members for assistance with a grant*. Each of the remaining predictor variables was a poor predictor. Figure 2320-7.8 presents the results of the second regression analysis.

According to collinearity statistics, multicollinearity was not a problem in the regression analyses since values for the VIF were not excessive.

### Discussion

The survey responses provide insights into the three areas of concern expressed by LMU faculty that provided the purpose for this study, as well as the pursuit of external funding for RSCA and its relevance to the teaching mission of LMU. The insights are not always those that might have been anticipated by faculty conversations, however.

1. **Some faculty felt that external funding might not be important to faculty careers.**

   *In fact, RSCA and external funding were reported as very important to many faculty careers.* Findings indicate that rates of LMU faculty agreement with statements regarding the importance of RSCA to teaching and keeping current in their disciplines are strong. Surprisingly, compared to ORSP client faculty, nonclient faculty were more likely to impute importance to RSCA for quality of instruction (95.3% vs. 87.9%) and to excellence in teaching (83.7% vs. 73.5%). Faculty recognition of the importance of RSCA to teaching, therefore, does not necessarily translate into increased production of proposals for external funding. This may be an important result for those interested in increasing proposal production at PUIs, especially in consideration of well-documented findings that for most faculty teaching and research are mutually exclusive activities (Fairweather, 2005). Faculty who report grant seeking important to their careers are more likely to engage in grant seeking behaviors as clients of the ORSP.

2. **Other faculty thought that the pursuit of external funding did not seem to be recognized in the tenure process.**

   *In fact, most faculty perceive that the pursuit of external funding is recognized in the tenure process.*
A majority of the faculty respondents (79.4%) felt that tenure expectations were articulated clearly, and ORSP client faculty were more likely than ORSP nonclients to consider the pursuit of external funding as important to the tenure process in their departments (57.9% vs. 51.5%). Nonclient faculty perceived that the pursuit of grant funding was not recognized at a much higher rate than ORSP client faculty (39.5% vs. 28.9%). ORSP clients were far more likely to report that grant seeking is important in terms of career development and professional growth (69.3% vs. 46.5%). This result suggests that tenure expectations may have an impact on whether faculty pursue external funding—another element of interest to those who seek to increase faculty grant-seeking at PUIs.

The College for Science and Engineering faculty respondents demonstrated significantly higher levels of agreement concerning 7. In my opinion, the pursuit of external funding for RSCA is recognized in the tenure process in my department, more than their colleagues from the College for Liberal Arts and faculty at other schools and colleges at LMU. This result corroborates the importance of the pursuit of grant funding in the sciences generally as scientific investigations tend to require resources and equipment which cannot be easily supplied by most universities. It is to be expected that acquiring external grant funding to support scientific investigations will often be important to completing research that leads to publications and this can lead to tenure and career advancement.

On the other hand, results show that faculty from the College of Liberal Arts are more likely to agree with 5b. RSCA helps University faculty members attain excellence in teaching. It is unclear whether this is due to more awareness of the development of the RSCA-teaching paradigm among liberal arts faculty generally (i.e., the Teacher-Scholar model), or whether the physical arrangement of the campus may have an impact. The LMU Center for Teaching Excellence, a strong proponent of the RSCA-teaching paradigm, is located in the same building as the College of Liberal Arts.

(3) Another group of faculty wondered whether there was assistance on campus for the pursuit of external funding.

In fact, the majority of the faculty members who have worked with the ORSP are satisfied with the services provided.

Despite the rather high degree of satisfaction shown with LMU ORSP services, only three of the six services were predictive of faculty agreement with the statement, 14. I had an excellent experience working with the ORSP. The assistance ORSP staff provided in submission, in making submission procedures clear, and answering questions regarding submissions seemed to make the difference to ORSP clients in their assessment of the office. This finding supports Campbell’s (1998) observations that active helping behaviors encourage faculty to engage in the submission of grant proposals. Despite the high rating faculty gave LMU ORSP staff for courtesy (90.3%), for example, this did not influence faculty satisfaction with the office. Further, to bring faculty members to the point of taking an active, positive step regarding the ORSP, that of recommending the office to a colleague, the predictors were more limited. Only 17. The staff member(s) I worked with was/were helpful in the grant preparation process and 16. The staff member(s) I worked with made sure my questions
were answered were predictive of a recommendation. The high multiple correlation in each regression analysis was not surprising, as it is likely that faculty satisfaction working with the ORSP is mostly affected by the quality of ORSP staff services that were represented by the set of predictor variables in each analysis. A concern of this study was whether substantial differences existed among these services in influencing faculty satisfaction.

These preliminary results have clear ramifications for the service orientation of the LMU ORSP, and perhaps for PUIs generally: active helping behaviors—in this case, assisting in grant preparation and answering questions about submission—are the services that matter to grant-seeking faculty at LMU. Making submission procedures clear is also helpful. Other factors, including courtesy and a service-oriented website, do not make a difference in terms of positive faculty estimation of service. Naturally, courtesy should still be an important part of service standards; however, we predict that courtesy will only be reflected in faculty estimation of excellence and recommendation if it were to drop below a certain (unknown) threshold. These results suggest that the primary objective of ORSP services should be actively assisting faculty with grant submissions in order to best serve their needs. However, this is a pilot study. Further investigation is warranted.

Acknowledgments

The authors are grateful to the following individuals for their assistance in conducting the project and in preparing the manuscript for publication: Joseph Hellige, Ph.D., Senior Vice President and Chief Academic Officer, LMU; John Carfora, Ed.D., Associate Vice President for Research Advancement and Compliance, LMU; Margaret Kasimatis, Ph.D., Vice President for Academic Planning and Effectiveness, LMU; Laura Massa, Ph.D., Director of Assessment, LMU; and the LMU Research Council, which provided valuable feedback on the instrument.

Dr. Miller is a licensed psychologist, with 15 years of experience in teaching clinical and quantitative courses at the graduate level.
The Transparent PUI Sponsored Programs Office: Building Trust with Faculty, and Gaining Support from Institutional Leaders

Kris Monahan, Wellesley College, and Anne Pascucci, Christopher Newport University

Transparency extends beyond seeing through physical objects and applies more metaphorically to seeing through processes, behaviors, or intentions. When used in a social context, transparency implies openness, communication, and accountability. While the federal government is working toward fiscal transparency of government funds, the concept of transparency can be applied to many other areas of our work. Research administrators at PUIs don’t develop, implement, and evaluate sponsored research policies, procedures, and systems of support in a vacuum – we seek feedback and advice from our stakeholders to ensure that their views are heard and their needs are met. This transparency is critical to the day-to-day operations of a PUI where a very small staff, perhaps even a solo professional, is the point of contact for all things sponsored research within an institution.

Strengthening relationships with faculty may very well be the most critical foundation in building transparency, creating a culture of communication, and enhancing an office’s operations and support to an institution. But where does the PUI research administrator begin to build relationships with faculty and to engage faculty in an office’s operations? Making the effort to gain an understanding of faculty perspectives, the challenges PIs face, and the opportunities available to them at a PUI may shed light on ways to engage faculty more deeply, an important factor in building transparency.

The realities of faculty pressures are brought to light, or made transparent, when we consider a day in a life of a PUI faculty member. Faculty members don’t work nine to five jobs; they work, or think about work, day and night. A noon time meeting may sound like a good idea, but for many faculty this would be inconvenient and even impossible: they may be in the lab, in the classroom contributing directly to the institution’s focus on teaching, or in the field (with or without students).

PUI faculty teach from four to eight courses per year, whereas faculty at research intensive institutions may teach only one or two courses. Teaching involves more than showing up and lecturing off the top of one’s head, (although we might all recall a professor or two from our college days who did just that). Teaching, among other things, requires planning for classes, meeting with students, and consulting with community agencies to find projects and viable service-learning opportunities. PUI faculty members often teach hundreds of students per year and their institutions do not typically have teaching assistants to grade work or give introductory lectures.

One of the benefits of attending a PUI is the focus on educating undergraduates and the personal attention that students receive from their professors. Key aspects

---

1 This article is reprinted from NCLURA Magazine, Volume XLIII, No. 9, March/April 2011. It is used with permission of the publisher.
of this attention are student-focused activities like academic advising and mentoring undergraduate student work; these take time, a lot of time when done well. Outside of the student-focused activities, a faculty member attends departmental meetings, accepts committee assignments, finds time to write publications and present her work, and balances work and family commitments. Research and the administrative bureaucracy that accompanies it are of a varying level of priority and commitment for any given faculty member.

Transparency vis-à-vis faculty begins with: a) understanding and validating your faculty and stakeholders’ perspectives; b) building relationships by providing regular and multiple modes of communication; and c) providing opportunities to engage faculty in designing and implementing systems of support. Taking a moment to reflect and consider faculty perspectives and validate the realities of faculty stresses and multiple priorities may give the research administrator the necessary patience and creativity to find ways to connect and build trust with faculty. Trust is the underpinning of transparency.

While faculty are the key stakeholders of a sponsored programs office, institutional leaders, auditors (internal and external), and sponsors are also interested parties. Just as faculty demand transparency, so too do these groups, no matter how daunting it may seem for a sponsored programs office to be transparent in all it does. Creating a transparent office at a PUI may seem to leave the office more vulnerable because there are fewer people in the office to absorb criticisms or negative findings. If managed correctly, however, transparency can actually empower a sponsored programs office.

Being transparent means putting all of your cards on the table and taking control of how and in what context errors and omissions will be viewed. If fear of transparency is a concern, then the leadership of the institution should revisit its objectives with regard to compliance. Leaders should encourage staff to identify errors, misunderstandings of processes, or simply lack of knowledge on a topic. This is not an opportunity to scold, but one from which all can learn. When mistakes are made they should be researched and the findings shared with the rest of the office. This reinforces a unified understanding of rules, regulations, and processes and sends the message that mistakes are okay as long as we learn from them. Just as we would encourage someone on the staff to share a new method for streamlining processes and providing better support, we should also encourage a colleague who has identified a gap in their professional development to share this information and their strategy to rectify the situation. Transparency requires a strong leader who will protect staff who come forward with problems. Working in a small office requires one to have a thick skin, an appreciation of the benefits of openly correcting errors, and the persistence to seek and gain the support of institutional leaders.

The process of undergoing an audit teaches us the value of transparency. When there are missteps, we must clearly identify the problem, mitigate the issue (stop whatever it is that is being done wrong), create a procedure or policy to ensure that it never happens again, highlight this new procedure or policy in the file, and document the process for the audit trail. If an auditor finds this file, his or her first ques-
tion should be, “Has this practice stopped?” followed by, “How have you ensured that it will not be repeated?” If this transparent process is adopted, then it is clear that the office is not trying to hide anything. In fact, the office will have already answered the two most pressing questions about the problem.

Being transparent is about the limitations of being human and a willingness to do the best work possible within the confines of time and change management. The nature of research administration is constant change and we must be vigilant in our efforts to keep up with that change. PUI’s have limited human and financial resources to assist with change. As a result, research administrators at PUIs must prioritize their actions to ensure that their offices are as transparent as can be. Transparency builds trust with faculty and gains the support of institutional leaders.

About the Authors

Kris A. Monahan, MPA, is the Director of Pre-Award Services, Wellesley Centers for Women, Wellesley College. She is a doctoral candidate in the joint PhD Education program of University of Rhode Island/Rhode Island College. She has more than ten years experience in teaching and research administration positions at Predominantly Undergraduate Institutions. She is currently Chair of the Region I Volunteer Membership Committee and member of NCURA Region I Program Committee, Awards Committee, and Advisory Board. She also currently serves as a member of NCURA’s PUI Neighborhood Committee.

Anne M. Pascucci, MPA, CRA has been in research administration since the early 1990’s. Her experience ranges from major research institutions such as the State University of New York, Central Administration in her work at the Rockefeller Institute to nonprofits such as AIDS Care Ocean State and now most recently to starting her own consulting business focusing on both research administration for predominantly undergraduate institutions and nonprofits. She is a Certified Research Administrator since 2004 and recently received her Certification in Nonprofit Studies from Rhode Island College.
Growing the Research Enterprise at Predominantly Undergraduate Institutions
Melody Bentz, University of Hawaii

Exceptional customer service is one way to grow the scholarly and research enterprises at your campus. This article offers strategies that make a huge impact, not only on your everyday work life, but that of your customers’ as well. Going that extra mile begins with a single step.

Add Value And Make Life Easier
The University of Hawai‘i (UH) System is comprised of a flagship research campus (UH Manoa), which holds land-, space and sea-grant designations, three baccalaureate campuses (UH Hilo, UH West O‘ahu and Maui College) and six community colleges. UH also serves Hawai‘i through university and education centers, and medical and research facilities located on six islands.

In 2007, the Office of Research Services’ senior administrator recognized that scholarly and research enterprises could grow by expanding services throughout the system. Since then, satellite service centers have been established at key locations including Kaka‘ako, Maui, West O‘ahu, and Manoa, as a commitment to excellence to add value and to make life easier. While service centers provide cradle-to-grave services, support and specialized services such as administration, contracts, compliance, IT and accounting remain at the systems office. This model establishes a single point of contact to make life easier for the customer from proposal development to award closeout. Though predominantly undergraduate institutions (PUIs) and community colleges have teaching at their core, the presence of satellite service centers reaffirm that they make valuable contributions and are important to UH’s scholarly and research enterprise.

Make Customer Service A Priority
Given the modest grant seeking history at some UH campuses, it is essential that the satellite service centers make customer service a TOP priority. Wikipedia defines customer service as “the provision of service to customers before, during and after a purchase.” For the research administrator, whether you provide pre-award, post-award, specialized or cradle-to-grave services, seldom can you do your job effectively without customer interaction.

Research administration is a deadline-driven and emotionally draining profession. Delivering exceptional customer service on a regular basis may prove to be difficult or at times an impossible task. It’s not unusual for research administrators to receive frantic communications from their customers — sometimes daily. How we choose to deal with the situation (yes, it’s a choice) is key to our success at getting the job done in an effective and timely manner...one that leads to a positive outcome.

---

1 This article is reprinted from NCUIRA Magazine, March / April 2014, Volume XLVI, No 2. It is used with permission of the publisher.
experience for all.

**Know Your Customers**
In research administration there are customers at all levels. For instance, within the institution there is a range of primary, secondary, and perhaps tertiary customers. Faculty, staff, and senior administrators may be primary customers; whereas, institutional service providers such as accountants, auditors, attorneys, and librarians may be secondary. Students may be direct or indirect customers. Outside of the institution, other campuses, collaborative partner sites or sponsors may be external customers.

Customer service begins with the initial greeting, whether it’s in person, on the phone, via Skype, or through email. Using good people skills will increase the chances for a positive first impression. To get to know your customers:

◆ Keep a communications log of who is contacting you, whom you are contacting, the nature of the inquiry, and how you respond. Don’t forget to include your colleagues. Ask yourself: Was the experience positive for one or both? What could have been done differently to make it a better experience?

◆ Look at your list. If your customer walked through your door, would you recognize them? If not, look them up on Google, Facebook, LinkedIn or other social media sites. If they are within your organization, search to see who they are and what they do. Add value to your relationship by incorporating what you’ve learned into your next communications to let them know you are interested. When you have a face to go with a name, you establish a connection that shows you care, making it easier for the two of you to have a more positive relationship in the future.

**Be A Good Communicator**
Once the initial meeting is over, how you respond to your customers’ communications influences how you are perceived as a person, a professional, and a peer. In this technological age, it’s so easy for you to make a great impression. It’s also even easier for you to make a bad one. You want to ensure that your communications are always friendly, helpful and positive. Ask yourself: Do I respond promptly to emails and phone messages? Do I follow up when promised? Are my responses appropriate and reflect favorably on me and my office? If you answered “no” to any of these questions, here are some ways to improve your communications skills.

◆ Many times, your customers will work on their projects around their teaching schedules. This often results in you getting emails after business hours. While you do not need to be on the clock 24/7, you can use technology to your advantage and send a quick acknowledgment with minimal effort such as: “I received your [email/phone call] and I will get back to you first thing [Monday morning].” The key is to follow through as promised. It’s helpful to set up a reminder in your calendar. You will be surprised how positive an impression you can make with a simple 30-second response.
◆ Have you ever received an email that makes you ask “What are they thinking?” Your first reaction may be to put them in their place or set them straight. If you feel the need, you can certainly write that email to get it off your chest; however, don’t send it! It’s not easy to take things back once the communication has been made. Your answers to sensitive emails and phone calls will require you to demonstrate a great deal of finesse and restraint. In these cases, it’s important to send that “I will get back to you soon” email. Take time to sit back, breathe, mull it over or discuss it with your supervisor or a colleague. Once you are composed, put a smile on your face and write your response. You will be happy you waited!

◆ Take a proactive approach to addressing your customers’ needs. For example, when you have your customers trained to submit federal reports using a specific process, determine how you can adapt that same process to other expectations you have of them. Standardizing processes will lessen training time and help customers adapt quickly and easily. Proactive behavior makes you their friend... reactive behavior makes you defensive.

When evaluating customer service, think back to how you’ve been treated as a customer. It’s not easy to forget a bad experience...it will stay with you for life. Whether it was good or bad, add value to your job by learning from your own experiences.

Be A Good Listener

Being a good listener is essential to being a good communicator. Addressing customer issues effectively and promptly necessitates taking time to actively listen to the entire problem or read their correspondence carefully. It’s important to grasp the full meaning since many issues require the guidance of others. To make life easier, take notes during a meeting or phone call. At the end, review them with the customer to ensure you have captured their needs accurately. The same is true with written communications. If you are unsure about any part of their communications, ask questions—get clarification!

Word Of Mouth Is Very Impactful

Word of mouth is powerful: while good news travels fast... bad news travels even faster. It’s human nature for people to share their experiences with others, especially bad ones. When a customer’s experience is a positive one, you may not hear anything. Cling to the saying “No news is good news.” However, it’s almost a guarantee that a bad experience will make its way through the grapevine and come knocking at your door. If you do reap rewards, accept your good fortune with a smile and take pride in a job well done!

Go the Extra Mile!

In 2011 UH launched its myGRANT electronic research administration program to streamline tedious paperwork processes. Now, customers are no longer overburdened with walking forms around for signatures. Although it is preferred that an organization promote exceptional customer service as their mantra, it’s not neces-
sary. All it takes is for one individual to be willing and committed to raising their standards of service. As colleagues see the benefits of how good service adds value to the organization and its relationships with customers, they will and small to make positive impacts.

Clearly, customer service makes a difference! It’s as simple as asking “What would my customers’ experience be like if I weren’t here for them?” Due in part to the extended customer service offered by satellite service centers, proposal submissions at UH have increased by 14%. If you can say that because of your contributions you have made a positive impact on your customers’ scholarly and research endeavors then you have reached your service goals. By demonstrating exceptional customer service you will lay a solid foundation that you are a knowledgeable, caring and dedicated research administrator. As your relationships grow your customers will learn to trust you and your expertise and that they can rely on you to “go the extra mile” for them. Ultimately, exceptional customer service will keep your customers coming back to you for more.

About the Author

Melody Bentz, CGP, is a Contracts and Grants Specialist for the University of Hawaii (UH), Office of Research Services where she helped establish the UH West O’ahu Satellite Service Center, assisting faculty and other research administration staff with services from searching for funding opportunities that are the right fit for their projects to project closeout and most everything in between. Before arriving at UH in January 2012, she worked at East Carolina University (ECU) as a Program Specialist for the Thomas Harriot College of Arts and Sciences where she helped launch the first Office of Research. Prior to her work in the college, Melody was a Grants and Contracts Officer with ECU’s Office of Sponsored Programs. In 2001, she began her career in Research Administration at a small PUI, Montana State University-Northern, where she held the positions of Grants Administrator and Director of the Sponsored Programs Office. ¶2320.10 How Building Relationships Can Expand International Opportunities for PUIs

Mark Roltsch and Steven M. Gerardi, St. Mary’s University

The perceived need for international research is on the rise, especially in biological and health sciences (Ramirez, 2007; Lombe, Newransky, Crea, & Stout, 2013). In support of this perceived need, funding is available for international research. The National Institutes of Health (NIH), through the Fogarty International Center (n.d.) and various NIH Institutes, provide opportunities to apply for research and training funds for both U.S. and foreign researchers in the developing world. Today, NIH’s Fogarty International Center “funds some 400 research and training projects involving more than 100 U.S. universities.” Last year NIH funded $198,587,000 in grants to foreign countries (NIH Research Portfolio Online Reporting Tools, 2013). The National Science Foundation (NSF, n.d.) also has several programs to support collaboration between US and foreign institutions. The Office of International and Integrative Activities (IIA) at the NSF currently has 597 active grants. A review of that list revealed one from a PUI, a grant to CUNY Medgar Evers College for $13,958 entitled Developing new research collaboration with the University of Malaya. At present, despite the fact that funds are available for international research, few of the studies currently being funded are being done in collaboration with researchers from PUI’s. However, it does not have to stay that way. Researchers at PUI’s can take practical steps to increase their chances of getting a piece of the international research funding pie. This article offers some useful tips for researchers and research administrators in building relationships with potential international research collaborators in order to identify and to expand upon opportunities for PUI’s to engage in international research.

Building Connections

Conducting international research requires collaboration with international partners. For someone at a PUI who is considering the possibilities of conducting international research, this requirement may seem like an insurmountable barrier. To overcome this challenge, researchers must seek out and build connections with potential international collaborators. For example, when the first author worked at the National Heart Lung and Blood Institute (NHLBI)/NIH, he was involved with the review and training development of a global network of ten Collaborating Centers of Excellence (CCE; NHLBI, 2013). Each CCE paired an academic institution in a developed country with a partnering institution in the USA. The CCE’s were tasked to develop infrastructures for research and training to enhance their capacity to conduct population-based or clinical research to monitor, prevent, or control chronic diseases. Each year the primary investigators and trainees from the CCE’s met to discuss the accomplishments of the centers and to collaborate on research. Through these meetings, the first author developed friendships with a number of investiga-

1 This article is reprinted from NCLIRA Magazine, December 2013, Volume XLV, No. 6. It is used with permission of the publisher.
tors, post-doctoral fellows, PhD students, and student mentors. Connections such as these are fertile ground for nurturing future international research projects. The importance of the role of relationship building cannot be overstressed. In a study of intimate partner violence in Canada and Ethiopia, Bender et al (2011) found “that the best international collaborations may be those that are understood within system realities but are approached first as social relations between people who respect and trust one another” (p.73).

So how does someone at a PUI develop such relationships? Thinking back to one’s undergraduate years, a person may recall having a desire to establish new relationships of the romantic variety. He or she may also recall that the odds of being successful in this endeavor were greatly enhanced by getting out of the dorm room and going places where they were apt to meet people with similar interests. While some time has passed, and motives have changed since the undergraduate years, the ways to establish new relationships are much the same. In order to develop relationships with potential international collaborators, faculty have to go out and meet international researchers with similar interests! One great way to connect with potential collaborators is to meet at conferences in the faculty member’s field.

Connecting At Conferences

Conferences are an obvious place to make connections with people with similar research interests. The best place to make connections at conferences is at poster sessions. An aspiring collaborative investigator can review the poster abstracts in advance to ascertain potential international research posters of interest. Poster presenters are typically eager to discuss their research, especially with an informed researcher with similar interests. Even if the poster presenter is a student, it is likely that their research adviser is close by. Additionally, one is likely to meet other scholars with similar interests who are also visiting the same poster presentation. Many researchers have made productive connections this way.

As in any relationship, potential research collaborators begin feeling each other out for their suitability to carry on a sustained relationship. Just like in dating, if the two don’t “hit it off,” the relationship is likely to go no farther than the first meeting. However, if there is a spark of interest, potential collaborators may decide to take their relationship to the next level. This may include an invitation to speak or work together on a small project. For example, after meeting someone at a poster session, the first author was invited to speak at the presenter’s school in Thailand. After developing a sense of mutual respect and trust, the relationship that started at the poster presentation has continued to evolve to the point where they are presently collaborating on a proposal for a small international grant from their professional association. It is worth noting that these small beginnings are important for larger scale collaborations in the future. For example, some professional associations offer international grants specifically to nurture these types of relationships. When reviewing NIH proposals, reviewers often ask: How much work have the PI’s done together and what have they published together? Given this, working together on a writing project is a good first step for potential research collaborators to establish a
working relationship in the eyes of a grant reviewer.

**Connecting With International Alumni**

A second way to make connections with potential international collaborators is by cultivating relationships with former international students or international alumni from the PUI who have gone on to earn PhD’s or MD’s and returned to their home countries. Institutions’ alumni associations will be helpful in making such connections. Former students are a great source of potential collaborators because researchers already have an established relationship and work history together and may have already collaborated on poster presentations or publications. Other former undergraduate students and alumni may not have gone on to graduate school but may now be in leadership positions in foreign governments or corporations that may be interested in collaborating on research projects. USAID supports the development of these types of collaborations.

**Connecting Through Academic Social Networks**

A third way to make connections with potential international collaborators is to use one of the social networks developed specifically for academics and researchers: Academia.edu and ResearchGate.net. These social network sites were developed expressly for scientists and researchers. These sites afford researchers the opportunity to share papers and data sets, and to ask questions or have online conversations about topics of interest. Both sites were launched in 2008 and already have several million users. In a recent online article on the collaborative power of ResearchGate, Leena Rao (2013) highlights the example of how Orazio Romeo, a researcher in Italy, and Emmanuel Nnandi, a PhD student in Nigeria, met through ResearchGate and collaborated to discover a deadly plant yeast that had killed an infant in Nandi’s hometown. In another example, Rao points out how “Sohail Malik (Political Science and Engineering, Pakistan) was looking for help in statistics, when he found Michael Sandholzer (Radiologist, UK) on ResearchGate. Together, they worked on Malik’s project to identify risk factors generating terrorism and insurgency in Pakistan. Their article has been accepted by a peer-reviewed journal and will appear in 2014.”

**Finding Funding for International Research**

NSF offers several funding opportunities to foster international relationships and collaboration on its website http://www.nsf.gov/funding. One such program is called Catalyzing New International Collaborations (CNIC). This program offers funds for brief international visits or workshops which are expected to lead to research proposals submitted to NSF. Other NSF funding opportunities include the International Collaboration in Chemistry between US Investigators and their Counterparts Abroad (ICC) and the International Research Experiences for Students (IRES) program. Additionally, the NIH Fogarty International Center website www.fic.nih.gov is a great place to direct faculty to look for other funding opportunities. The site lists NIH international opportunities and also lists non-NIH international prospects. Some other places for faculty to look for funding opportunities are the Earthwatch Institute www.earthwatch.org which supports scholarly research
worldwide in the biological, physical, social, and cultural sciences through a variety of grants; and the American College of Sports Medicine’s Oded Bar-Or International Scholar Award. This award allows professionals to gain technical expertise and/or scientific knowledge through an international exchange program.

Summary

Hopefully, this brief discussion will encourage you to consider the potential opportunities in international research. If international research aligns with your institution’s business plan, then consider this quote attributed to Ross Perot (n.d.): “Business is not just doing deals; business is having great products, doing great engineering, and providing tremendous service to customers. Finally, business is a cobweb of human relationships.” Although funds are available to support international research, PUI grant success is dependent upon how effective the institution is at building their web of human relationships. So, if research is your business, get out there and start building!

Mark Roltsch, Ph.D., is Executive Director of the Office of Academic Research and Sponsored Projects and a faculty member in the Department of Exercise and Sport Science at St. Mary’s University, San Antonio, Texas. Previous positions include Peer Review Administrator at NASA and Scientific Review Officer at the National Heart Lung and Blood Institute. He can be reached at mroltsch@stmarytx.edu

Steven M. Gerardi, MS, is a Visiting Instructor in the Department of Exercise and Sport Science at St. Mary’s University. He retired from the U.S. Army after a 30 year career, having gained international experience in Germany, Honduras, Iraq, Korea, and Kosovo. He can be reached at sgerardi@stmarytx.edu
Research Cluster Development at a PUI

S. J. Langley-Turnbaugh and T. Shehata, University of Southern Maine

Abstract
The University of Southern Maine (USM) designed and implemented an internal Research Cluster Seed Fund competition with the goals of building USM faculty expertise to address industry and community needs, deepening the impact of research through an interdisciplinary approach to solving problems, and leveraging external funding to sustain collaborative efforts. Through two rounds of competitions we funded five teams of faculty and students who have come together with industry and community partners to conduct research ranging from how Maine businesses should address cyber security breaches, to better management of chronic illnesses through the use of information technology. Faculty have reported that learning how to work together in an interdisciplinary team and with external partners is an evolving process that takes time. But, they are all extremely positive about what they have gained by coming together. Faculty needed assistance in setting goals and measurable objectives, and in understanding how a research cluster needs to be more than a sum of its parts. Thus, this competition was a learning process for all involved. We hope this model will continue as a way to focus and leverage USM’s scholarly strengths while developing solutions to the most pressing issues facing our region.

Introduction
The complexity of current societal, global, and scientific problems often requires a wide range of disciplines collaborating across traditional boundaries to bring knowledge to bear on issues of intellectual, scientific, social, economic, environmental, and cultural importance. This complexity and the importance of interdisciplinary research is recognized by the National Academies’ Committee on Facilitating Interdisciplinary Research, Committee on Science, Engineering and Public Policy (2004), as well as several federal funding organizations. Examples include the National Science Foundation’s (NSF) INSPIRE (Integrated NSF Support Promoting Interdisciplinary Research and Education), which supports interdisciplinary research into complex scientific problems (NSF INSPIRE, 2014); the joint effort between NSF and the National Endowment for the Arts to develop a national agenda for funding and collaboration integrating the arts, sciences, and engineering (Harrell & Harrell, 2011); and the National Institutes of Health’s Interdisciplinary Research (IR) program, which is designed to change academic research culture such that interdisciplinary approaches and team science spanning various biomedical and behavioral specialties are encouraged and rewarded (NIH, 2014).

Many universities have pushed to develop more interdisciplinary research projects, and several have developed Centers of Interdisciplinary Research, although these Centers are primarily located at research universities rather than PUIs. For

---

many of these Centers, creating linkages between their interdisciplinary research projects and state, regional, and local public and non-profit entities is of utmost importance. Challenges include articulating the relationship between interdisciplinary research and hiring, promotion and tenure policies, and resource allocation (National Academy of Sciences, 2004). It should be noted that the National Academy of Sciences study primarily focused on major research universities. Little information is available on how primarily undergraduate institutions, such as the University of Southern Maine, are prompting interdisciplinary research.

In spring 2013, USM’s Office of Research Administration and Development designed and implemented an internal Research Cluster Seed Fund competition with the goal of building USM faculty expertise to address industry and community needs, deepening the impact of research through an interdisciplinary approach to solving problems, and leveraging external funding to sustain collaborative efforts. Although this effort preceded USM’s plan to transition to a Metropolitan University, the cluster missions, visions, and partnerships align well with a primary goal of an MU, which is to become a steward of place. The purpose of this paper is to describe the process, challenges and lessons learned in developing research clusters in a predominantly undergraduate institution.

Institutional Context

Located in the city of Portland, USM is the state’s only publicly supported predominantly undergraduate metropolitan university, serving approximately 8,000 students. Many students are non-traditional in that they are first-generation college students, part-time, and often older than traditional undergraduate students. Since the late 1990s, USM has been committed to strengthening both its educational mission and its targeted research portfolio.

The Research Cluster competition is funded by the Maine Economic Improvement Fund (MEIF). In 1997 the Maine Legislature (MRS Title 10, Chapter 107-C) established the Maine Economic Improvement Fund to administer investments in targeted research and development and product innovation, primarily focused on applied scientific research and related commercial development conducted by employees and students in the member institutions of the University of Maine System, the seven target areas identified by the Maine Legislature. The target areas are the targeted technologies for which applied research and development is considered most likely to produce significant benefits to the people and economy of the State. These areas are: aquaculture and marine sciences, biotechnology, composites and advanced material technologies, environmental technologies, information technologies, advanced technologies for forestry and agriculture, and precision manufacturing. The MEIF also provides the basic investment necessary to obtain matching funds and competitive grants from private and federal sources.

As directed by Maine law, MEIF funds are annually appropriated to the University of Maine System; the Board of Trustees is responsible for administering the funds.
Research Cluster Seed Fund Competition

Purpose
The purpose of the Fund is to seed- support the development of faculty-led multi-disciplinary research clusters that bolster and expand scholarship and innovative high-impact research across college lines and to work more effectively with the private sector, other institutions, and the community. The outcomes of funded cluster proposals are to: (a) coalesce the depth of USM faculty expertise to address industry and community needs; (b) bring greater internal and external attention to USM faculty research and scholarship, deepening its cumulative impact; and (c) help leverage external funding for sustained collaborative efforts.

Competitive Process
We have released two rounds of internal requests for proposals to seed clusters at $150,000 over two years. We required that proposals demonstrate faculty collaboration across two or more colleges, focus on research projects that address the needs of one or more of the state’s target technology sectors, and have at least one industry partner and one community partner actively engaged in the development and sustainability of the cluster. We defined industry partners as private, for-profit companies, and community partners as other organizations that are not private, for-profit organizations. We did not specify cluster size, but suggested 3–7 individuals inclusive of industry and community partners as an initial starting point for cluster development.

The program announcement also emphasized that the development and growth of the cluster should not end when external funding proposals are submitted or funded. There is full expectation that competitive cluster proposals will include detailed strategies, developed jointly with industry and community partners, for growing and sustaining the cluster beyond the two years of funding, including pursuing external funding.

Allowable Use of Funds
All line items are allowable as long as the amounts are fully justified. Funds may be used to support nine-month faculty summer compensation, undergraduate and graduate student stipends (with graduate tuition), consultants, materials and supplies, remodeling or alteration of facilities (per university policies and procedures and approval), equipment purchases, community workshops, in-state and out-of-state travel (no foreign travel) as long as travel is directly related to the proposal project, course release (cost for a part-time faculty only), or other ways to bring a diffuse but related group of research entities into sustainable, productive collaboration. Although curriculum development is not an eligible activity in this competition, in some cases curriculum development may be a component of an application but it must be justified in the context of seeding the research cluster and meeting the needs of industry and the community partners, and should not be a major cost.

Letter of Intent
We required a letter of intent two months before the deadline for the full proposals
to help us manage the external review process. Each letter of intent must include the project title, the name and title of Principal Investigator, and the names and affiliations of Co-PIs; a one-paragraph description of the proposed cluster; the target technology sector(s); the funding request amount; project duration; the name and contact information for the person in the PI’s department or college who will be the point person for financial management of the grant if awarded; and names and contact information for five individuals with expertise in the proposal’s subject matter. These individuals must reside outside the state and must not have any conflicts of interest with the proposal, the PI, and Co-PIs. In the announcement we informed the applicants that we would contact these individuals to inquire about their interest in assisting us in the external reviews of the proposals and to ensure they do not have conflicts of interest. Applicants were instructed not to contact the potential reviewers and alert them of their interest in participating in the review. Applicants were also informed that we may ask them for additional names if we do not secure at least three reviewers for each proposal.

Proposal Format and Content Requirements

The program announcement included a full description of the required format and contents of a full proposal as described below. Required format included font type, font size, margins, line space, and page limit per narrative section. We encouraged applicants who were considering submitting an application to be absolutely sure that they were submitting a “cluster-ready” application and that all of the items listed in the narrative sections were being answered completely. The content requirements included a Cover Page, a 250-word abstract, the proposal narrative (15 pages), references, budget and budget justification, biosketches using NSF or NIH formats, and letters of commitment from all partners, department chairs, and college deans. Required sections of the narrative included: Rationale and Significance; Rationale Behind Team Composition; Cluster Vision, Goals, and Measurable Objectives; Research Overview; Implementation Plan; Specific Plans for the Target Grant Application(s); Management Plan; and Evaluation Plan.

Review Process

We employed a two-stage process to review proposals. In the first stage, each proposal was reviewed by at least three vetted reviewers external to the University and with subject matter expertise partially based on information collected from the letters of intent. The external reviewers were asked to comment on the proposal’s strengths and weaknesses without scoring, and were also asked to recommend whether an Internal Review Panel should further consider the proposal. Only proposals with substantial strengths and minimum weaknesses would be submitted to the second stage of review by an internal evaluation panel selected by the Provost and the Associate Provost for Graduate Studies and Research, Scholarship and Creative Activity (APGR).

For the internal review process, we developed the following evaluation rubric, the elements of which were included in the announcement as discussion items for what would constitute competitive proposals:
Quality of Response to Instructions (25 points)
Quality of Rationale and Significance (15 points)
Quality of Rationale Behind Team Composition (15 points)
Quality of Cluster Vision, Goals, and Objectives (10 points)
Quality of Research Overview (10 points)
Quality of Implementation Plan (15 points)
Quality of Specific Plans for the Target Grant Application(s) (10 points)
Quality of Management Plan (10 points)
Quality of Evaluation Plan (10 points)
Quality of Budget and Budget Justification (5 points)

The rubric’s evaluation elements are similar to those used by the U.S. Department of Education to inform applicants what the reviewers will be looking for in addition to emphasizing the quality of the responses. The maximum number of points a proposal could score is 125. Prior to meeting as a panel, each member of the internal review panel was asked to score a proposal using the rubric. At the panel meeting, each applicant was provided 15 minutes to present their proposal, focusing primarily on the comments of the external reviewers. After some discussion, panel members were provided the opportunity to change the initial scores before submitting their final evaluations. Based on the average scores for each proposal, the panel recommended to the APGR a rank order of the proposals to be funded.

Award Conditions
In addition to progress and final reports, the award letter to the Principal Investigator outlined specific conditions that included: at least one submitted proposal to an external sponsor before the end of the project period with a total value exceeding twice the value of the cluster grant amount; an annual presentation of the cluster’s work to the university community; published or otherwise publicly available work in some form; and participation of the PI and Co-PIs in a grant-writing seminar offered by the Office of Research Administration and Development during the grant period.

We withheld 20% of the grant amount to ensure compliance with the award conditions. The award letter also specified that overspending of the authorized grant amount would default to departmental funds, and that, in addition to programmatic responsibility, the PI would be responsible for the financial management of the grant, including payroll, human resources and purchasing.

Funded Clusters
Through two rounds of competitions we have received 12 proposals and funded five teams of USM faculty and students who have come together with industry and community partners to conduct research ranging from how Maine businesses should address cybersecurity breaches, to better management of chronic illnesses through the use of information technology. These clusters are engaging over 20 faculty and staff members from all four USM colleges and over 25 academic depart-
ments, along with several undergraduate and graduate students and eight external partners. Both graduate and undergraduate students are engaged as research assistants directly by the faculty in the cluster, based on student skill sets and needed expertise. Some clusters request funding for graduate student assistantships and tuition reimbursements, while others request funding for undergraduate research assistants. The clusters include:

**Health Lifestyle Management Technologies.** A team representing nursing, social and behavioral sciences, computer science, technology and exercise health and sport sciences are developing and piloting a technology-based lifestyle management system. Initially, it will track and help manage weight as an indicator of chronic illnesses. The team has completed its first pilot study with data analyses ongoing and is gearing up for the second pilot. Preliminary results suggest no significant difference between pre- and post-intervention. This may be a result of sample size, as recruitment of participants was an issue. However, the cluster participants have learned much about student perceptions of facilitators and barriers to healthy eating, and they will use this knowledge to improve the second pilot. Plans to improve participation include early recruitment and implementation of strategies to foster more interaction between participants. They have also identified a National Institutes of Health–National Institute of Nursing Research program for funding to further test the system’s application to other areas of chronic illness.

The cluster has benefited from the involvement of students. Specifically, two undergraduate students were very involved in developing the healthy lifestyle website intervention which is being implemented during the second pilot study and a graduate nursing student was very helpful during recruitment of participants for the second pilot. The project PI reports that the students are learning a lot about the research process, as they are formally members of the research team and have been included in meetings and decision-making about aspects of our project.

**Digital Maine.** Faculty, students, and staff throughout the College of Arts, Humanities and Social Sciences and the Muskie School of Public Service are working with computer scientists to harness digital technologies in such a way that a variety of types of research are more accessible to a much wider audience. The team is working on diverse topics ranging from the impact of a rise in sea levels, to the labor history of Maine’s paper mills, through the development of new software applications and the use of geospatial technologies. Currently two subprojects are underway—one focused on envisioning sea change, and a second focused on digitizing a women’s history trail in Maine. They also brought an internationally recognized digital humanities scholar to campus to offer suggestions for improvement of the cluster. The faculty team needs to work to ensure that the cluster is not simply viewed as a digitizing service, but a collaborative interdisciplinary research cluster.

The cluster has engaged several students who, in close association with the PIs, have researched the subjects, collected information, and developed a database that includes data sets with geo-tags, notes on historical contexts, digitally created artwork, and digital photos of historical sites.

A photograph of Envisioning Change by one student assistant was featured in
a recent report made by the Union of Concerned Scientists - a coalition of scientists dedicated to making a healthy planet and safer world. By working with classmates and people outside of USM, and with community groups with a shared goal of applying the knowledge and skills gained in class to real-world situations, these students are making good use of the opportunity afforded by the cluster to engage in experiential learning.

**Web-based Systems to Support Disadvantaged Populations.** This project is providing opportunities for youth campers to stay connected all year with a critical web-based support network. The pilot project focuses on Camp Susan Curtis, a Maine camp for children struggling with poverty, but long term the project will pioneer technological approaches to creating safe and enticing educational experiences for other disadvantaged populations. The project brings together USM’s School of Social Work, Departments of Computer Science, Technology, and Communication and Media Studies with off-campus partners Maine College of Art, Maine Medical Center’s Barbara Bush Children’s Hospital, Maine’s Office of Information Technology, and Poland Spring. The initial pilot in the form of a private social network did not engage the population, so they have made engagement a top priority for the next pilot. The second pilot is currently ongoing, and a stronger sense of place has been created with virtual reality, in collaboration with a business partner. Access to campers after the summer months for data collection and assessment purposes is an issue. Faculty have begun to identify the cluster’s next target population.

The cluster has engaged students to work in the areas of generating content for website development, creating online games, facilitating website migration, learning about the complexities of website security for children and participating in creation of website monitoring protocols, conducting web and stakeholder research during the project planning phase, and capturing imagery in film and video to be used in site design. The PIs believe that the students have gained valuable skills through participation in these activities. In fact, a computer science student was hired recently for full-time employment at a company in Maine that required the experience that he acquired while engaged in the project. Another student completed a final senior presentation based on the project work. The interdisciplinary synergy of this effort has demonstrated to students the value of and need for bringing together different areas of expertise toward a common goal.

**Cybersecurity.** Initially funded in year 1, this cluster brought together faculty from philosophy, communications, and technology to support research and education on workplace ethics and strategic communication important for data security. Midway through the first year, the cluster was folded into a larger research cluster, the Maine Cybersecurity Cluster (MCSC), which has a much larger vision encompassing all aspects of cybersecurity research. MCSC serves as a research, education, and training resource for the state, and its Academic Excellence in Information Assurance proposal is under review by the National Security Agency. MCSC also operates the Cybersecurity Laboratory, the only one of its type in Maine, as a shared and secure testing and evaluation environment for private and public entities. The National Science Foundation has notified the PI that it will fund the MCSC project to pilot an
inter-institutional virtual cybersecurity collaborative learning laboratory as a shared educational environment that enables students in different locations to gain practical collaborative experience in preventing and mitigating cyber-attacks in real time.

**Health Informatics.** This cluster brings together faculty from computer science and public health, and partners such as HealthInfoNet and the Maine Health Management Coalition to develop solutions for linking and analyzing big health data to improve health care delivery and quality and respond to local industry and community needs. Transformational shifts in the delivery and financing of health care have heightened the information needs of health systems, while at the same time the amount of electronic data created by the health care sector has increased exponentially. Maine is on the cutting edge for many health data developments, including having the only operational statewide Health Information Exchange, and one of the first all-payer claims data warehouses. While these and other data hold enormous promise for research and changes to clinical practice, the size, scope, and design of health data systems have created numerous challenges to data access and operability. The proposed research cluster will tackle these and other big data problems in health care delivery, financing, and population health. Representing faculty and staff from two colleges, three degree programs, and two research programs, cluster members reflect a diverse body of knowledge and an extensive theory-based and applied research portfolio with clear relevance to health informatics and health care system performance. In collaboration with external partners, the USM team intends to develop solutions that improve health care delivery and quality and respond to local industry and community needs.

**Lessons Learned**

As shown in Figure 2320.11-1, the implementation of Round 1 enabled us to identify areas that needed to be addressed in Round 2. There were weaknesses in conceptualizing research clusters, in forming business partnerships, in visioning and goal setting, in proposal writing, in budget preparation, and in the external review process.

**Figure 2320.11-1 Areas addressed between Round 1 and Round 2 of the competition**

| External review process was faulty in that reviewers had no appreciation of the USM environment. | • Restrict external reviewers’ comments to the strengths and weaknesses of the proposals without scoring.  
    • The internal review panel will consider external reviews and all other aspects related to USM, as well as relationships to industry and management.  
    • Provide applicants the opportunity to respond to external reviewers’ comments during oral presentations to the Internal Review Panel. |

**Faculty Perspective**

Faculty have reported that learning how to work together in an interdisciplinary team and with external partners is an evolving process that takes time. But, they are all extremely positive about what they have gained by coming together with colleagues from different disciplines and now truly appreciate that working together is powerful—the sum is better than its parts. They also acknowledge that working with interdisciplinary groups requires extensive and constant communication in order to create unity, but the benefits far outweigh the time involved.

**University Research Management Perspective**

The research clusters have succeeded in bringing together interdisciplinary groups of faculty with common interests who would not otherwise have initiated collaborative research projects. The clusters have not only received substantial financial support, but also the time and expertise of the staff in Research Administration and Advancement. We were unprepared for the faculty’s lack of expertise in setting goals and measurable objectives, and in understanding how a research cluster needs to be more than a sum of its parts. Addressing these issues required considerable time on our part and delayed the progress of the first group of funded clusters. Thus, this competition was a learning process for all involved.

**Conclusion**

Although the clusters are less than two years old, we hope that this model will continue as a way to focus and leverage USM’s scholarly strengths while developing solutions to the most pressing issues facing our region.

About the Authors

Samantha Langley-Turnbaugh is Associate Provost for Research and Graduate Studies at the University of Southern Maine. She has a B.S. in Forest Engineering from the University of Maine, an M.S. in Soil Science from the University of New Hampshire and a Ph.D. in Forest Soils from University of Wisconsin-Madison, and has completed the HERS Leadership Institute. As Associate Provost, Langley is an advocate for university research and is a champion for interdisciplinary approaches to local and regional problems and for establishing faculty/community partnerships. Samantha’s areas of research interest include the role of soils and dust in triggering adult and childhood asthma, the applications of phytoremediation techniques in mitigating lead contamination in urban soils, and the interactions between soil quality and vegetation health in urban and forest ecosystems. Dr. Langley-Turnbaugh is passionate about improving science education for all, including persons with disabilities.

Terry Shehata is Coordinator of Institutional Grant Development at the University of Southern Maine (USM). He also assists faculty in developing competitive technical narratives, manages several internal grant competitions and teaches grant writing classes for faculty, undergraduate and graduate students. Independent of his work at USM, he is the Director of the Maine Space Grant Consortium, which is a member of the national network of state-based consortia supported by NASA’s Office of Education. Before coming to USM, he gained his successful grant writing experience over a 30-year period in various occupations including the Maine State Toxicologist, Director of the Environmental Health Program at the New Jersey Department of Health, Vice President of the Maine Science and Technology Foundation, and over 10 years in the private sector. He received his Ph.D. in Animal Nutrition with specialization in Biochemistry from the University of Maine in 1981.
¶2320.12 Calculating the Cost of Compliance at a PUI
Joseph McNicholas, Duke University, and Patrick Hogan, Loyola Marymount University

Instead of just complaining about regulatory burden, colleges and universities should take the time to calculate actual cost of compliance -- including the cost of personnel, information systems, specialized facilities, and programmatic changes that are required to meet regulatory standards . . .

— Diane Auer Jones, Former Assistant Secretary for Post-secondary Education U.S. Department of Education

Abstract
The cost of complying with regulations is often cited as one of the drivers of the high price of college tuition. However, almost no published work on calculating this cost at the institutional level exists. The authors conducted in-depth research on the cost of compliance with federal, state, local and NCAA regulations at a Division I, predominantly undergraduate institution. Administrators from the six primary units on campus identified employee effort spent on compliance activities, as well as costs related to software, training, fees, and external consultations to maintain or report on these activities. This article lays out the methodology used, identifies the parameters, limits and definitions employed, and provides historical context on previous work in this area. It identifies costs by category and by unit and briefly addresses the issue of regulation as a factor in higher tuition costs.

Introduction
Loyola Marymount University, established in 1911 and located in Los Angeles, is a private, not-for-profit, 4-year and above university committed to providing students with a humanistic, liberal arts education in the Jesuit and Marymount tradition. LMU comprises four colleges and three schools: the Bellarmine College of Liberal Arts, the College of Business Administration, the College of Communication and Fine Arts, the Frank R. Seaver College of Science and Engineering, Loyola Law School, the School of Education, and the School of Film and Television. LMU offers 57 major and 51 minor undergraduate degrees and programs. The Graduate Division offers 43 master’s degree programs, one education doctorate, one doctorate in juridical science, one juris doctorate and 13 credential programs. The athletics program competes in NCAA Division I. The University enrolls 6,162 undergraduates and 3,133 graduate students, and employs 550 full-time faculty.

In 2014, the Board of Trustees and the Chief Financial Officer at Loyola Marymount University (LMU) asked LMU’s Regulatory Compliance Committee (RCC) to discover the cost of regulatory compliance on a university-wide scale. As we began researching the question, we found little existing professional literature and no published models for universities to consider in attempting to ascertain these costs. This is true in spite of the fact that 77% of governing boards at institutions of higher edu-
cation report discussing operational, legal and regulatory risks at their board meetings (AGB/UE, 2014, p. 6). Likewise, there was little common language available to define crucial terms. Over the course of 18 months, the authors worked extensively with the RCC and with leaders across campus to develop a model that would adequately capture these costs at Loyola Marymount University.

**Review of Literature**

Though institutions of higher education (IHEs) frequently cite the cost of compliance as driving up the price of a college education, there is, in fact, little published work on the topic. Only three other universities have made such information publicly available: Stanford University, Vanderbilt University and Hartwick College. While our task force worked on developing a model that would help LMU identify regulatory compliance costs, the American Council on Education (ACE) produced the United States Senate’s Task Force on Federal Regulation of Higher Education. This seminal work will inform regulatory compliance policy and debates in higher education for a long time to come, and it confirmed our sense that there is little information to go on. The report comments that “attempts to systematically quantify [regulatory compliance] costs have been few and far between” (ACE, 2015, p. 11).

Vanderbilt University hired the Boston Consulting Group to conduct a study reporting that Vanderbilt spent $150 million to comply with federal regulations in 2012-2013 (Atkinson, 2015). That number, representing 11% of Vanderbilt’s total non-hospital expenditures, became a central figure in a public debate about the cost of college tuition and was cited in the ACE report, in popular press, and in higher education forums. The Vanderbilt study also added fuel to political debates surrounding the reauthorization of the Higher Education Act in 2015 (Stratford, 2015). And, although Vanderbilt did not release its methods (Blumenstyk, 2015) the study’s findings have received much commentary regarding combining costs for research compliance with costs for student-oriented regulations and for not distinguishing costs applicable to all business from costs unique to higher education.

In any case, it is unlikely LMU would benefit from knowing Vanderbilt’s costs and methods. As a major research institution, Vanderbilt’s activities, and thus their compliance costs, are highly divergent from LMU’s in both kind and scale. Funded researchers, for example, spend a larger share of their time on compliance-related issues. The FDP Faculty Burden Survey conducted in 2009 found “42% of the time spent by an average PI on a federally funded research project was reported to be expended on administrative tasks related to that project rather than on research” (Rockwell). Much of that effort is related to compliance, and may well be unique to federally funded grants. Therefore, the more an institution relies on federal research dollars, the more likely they are exposed to those kinds of costs. Vanderbilt expended $572 million on research and was ranked 35th in the National Science Foundations’ Higher Education Research and Development Survey (HERD) in 2013. That same year, LMU, a predominantly undergraduate institution, ranked 364 in NSF survey, with $6.7 million in R&D expenditures.

Hartwick College, a private, liberal arts and sciences college in New York, pro-
duced a report in December 2012 that provided detailed information on an internal audit into the cost of compliance and accreditation (Zack-Decker, 2012). The document, and its extensive appendices, contains much practical information about the kind and range of regulatory compliance activities undertaken at IHEs. It also draws a useful distinction between requirements to comply and requirements to report. Considering the scope of the work conducted, we were surprised at the relatively low cost numbers reported: $297,008 including salary, fringe benefits, direct costs, and accreditation costs. This number accounts for approximately 0.04% of the college’s annual operating budget. Subsequent to the production of that report, Hartwick College President, Margaret Drugovich, said that the final number for Hartwick and other colleges is likely much higher, pointing out that “some of my colleagues estimate it to be 15 to 20, even 25% of their overall operating budget” (McNutt, 2014).

The only previously reported number we could find was produced by Stanford in 1997. Then Stanford President, Gerhard Casper, reported to the National Commission on the Cost of Higher Education that Stanford spent $20 million on compliance annually and that “‘7.5’ cents of every Stanford tuition dollar goes toward supporting these regulatory costs.” (Ingram, 1997). Like Vanderbilt’s 2015 figures, Stanford’s 1998 figure became part of the political debate around changes in the Higher Education Act.

Thus, at the time of this writing, the most credible, publicly available claims of the costs of regulatory compliance range from less than 1% of operating costs at a private liberal arts and sciences college to 7.5% and 11% at premiere research institutions. Unfortunately, the dearth of published, reliable, information on the methods used to arrive at these cost figures makes it difficult to generalize from them or to apply their method to LMU. And, therefore, we lack a benchmark against which to set our management expectations. However, it is widely understood that pinning a dollar value on compliance costs is extremely challenging. Anne Gross, vice president for regulatory affairs at the National Association of College and University Business Officers (NACUBO) has commented, “It’s very difficult to give a number. . . Trying to quantify the cost of regulation is something we’ve talked about for years, but frankly we’ve never figured out how to do it” (Marcus, 2015).

The authors do not claim that we have done it either. However, we do feel that we have developed a means of helping our own university identify our compliance costs in order to better understand their sources and to begin to manage them even more effectively. In what follows, we present a detailed overview of the design and implementation of our self-study to enable others to perform (and refine) similar work at their college or university. The authors have also sought to identify resources already in place at LMU to facilitate this work, as it is likely that the level of available resources will vary widely across institutions.

**Methodology**

*Envisioning the project*

The Regulatory Compliance Committee (RCC) charged with gathering this information is chaired by the University Risk Manager, and includes representatives
from the six major divisions within the university including Business and Finance, Student Affairs, Administrative Services, Academic Affairs, Loyola Law School, and University Relations, plus a representative from Internal Audit. The RCC met monthly and, later, as the project developed, bi-monthly, to discuss the scope of the project including which information might already be available and accessible, which information would require effort and knowledge to ascertain, and which simply would not be possible or desirable to discover.

The Committee reviewed and discussed a range of “mandatory” costs that may or may not be labeled costs of “regulatory compliance.” Early on, the committee determined that costs associated with internal policies or business practices would not be considered regulatory compliance costs. It was also determined that accreditation costs would be excluded. This is a significant constraint on the scope of the work because securing and maintaining accreditations often entails considerable costs.

LMU is accredited by the Western Association of Schools and Colleges (WASC) Senior College and University Commission as well as 15 other program-specific accreditations ranging from the Accreditation Association for Ambulatory Health Care to the National Council for Accreditation of Teacher Education. Maintaining these accreditations involves extensive effort in research, preparation and submission of the required reports, as well as the work to ensure our programs meet or exceed the standards in the first place. These costs were excluded from the scope of this report after much discussion, as they represent another cost category (perhaps more related to educational quality) worthy of study on its own.

Another area of mandatory costs involves effort devoted to human resource training such as harassment, sexual and interpersonal misconduct, etc. These expenses are partially captured in this study through inclusion of the cost of acquiring software to conduct this training. However, the survey used does not specifically capture the effort expended in completing the training. And though the number of personnel involved may be high, the number of hours involved is quite low—approximately 3 hours per year. The total personnel expense is unlikely to exceed two-thirds of an FTE. While this specific cost does not appear in the current study, we plan to include it in future questionnaires as we fine-tune the research.

As the committee and the authors discussed the range of activity that might be considered compliance related, we identified the following costs to be within the scope of the report:

◆ Costs related to maintaining compliance with federal, state, and local regulations
◆ Costs related to documenting and reporting compliance with federal, state, and local regulations;
◆ Costs related to complying with and reporting on NCAA regulations (LMU is a Div. I NCAA school).

Prior to crafting a method of gathering information, the committee recognized a need to design a lingua franca for the initiative. We created a short list of definitions (see Appendix A) for use by the committee and ultimately by the people asked to complete the questionnaire. The single most important term/definition, and the one
referenced most frequently throughout the initiative, is:

**Regulatory Compliance Effort**: “Regulatory compliance effort” refers to the percentage of time devoted by LMU employees to read and understand applicable regulations, to design, implement, or modify compliance activities for those regulations, to monitor and oversee specific regulatory compliance efforts, to gather and confirm relevant data, and to generate and submit reports to appropriate agencies or organizations. Thus, “regulatory compliance effort” refers to both the work of keeping the university in compliance and the work of generating the reports that document compliance activities.

This definition helped all participants determine which activities should be included and which excluded from the final numbers. As a general statement, the term interpreted compliance-related effort broadly (as opposed, say, to “the cost of preparing reports” which was the standard employed by Hartwick), and that broader definition is more helpful to LMU as we look for ways to manage these costs (Carlson). In a similar vein, our study does not distinguish between regulatory compliance required of all business and regulatory compliance specific to higher education.

**Determining goals and methods**

The RCC determined that the following specific information would be essential to the project:

- The identification of any employee with responsibility for regulatory compliance issues;
- The amount of time (effort) the employee spent on regulatory compliance;
- The amount of annual fees paid to regulatory agencies;
- Any training paid to maintain certification and licensure for employees or to develop competencies required to comply with regulations;
- Any software or computer programs purchased to help maintain compliance;
- Any payments made to consultants and public accounting firms to help maintain compliance.

A range of methods to gather this information was considered. For example, the committee explored conducting an analysis of the financial statements to identify expenses related to compliance. That approach was deemed impractical due to limits in how expenses are identified and the range of position titles involved. At LMU, for example, only four job titles include the word “compliance,” and even then, always in a hybridized form such as “Director, Information Security and Compliance” or “Associate Athletics Director/Compliance.” Instead, responsibility for compliance effort is shared across existing job titles and categories. Higher education as an industry, however, seems to be moving toward greater specification of compliance titles and roles. According to the ACE Report (2015), “The American Action Forum found that the number of individuals in higher education with the title of ‘compliance officer’ has grown by 33% in the last decade” (p. 11). This is an important indus-
try trend that warrants further investigation; however, counting titles clearly would not address our needs in determining costs at LMU.

Rather, it was decided that in order to secure the most informed and reliable information, we should turn to work previously done by the RCC to create a compliance database (Appendix C). During that phase of work, LMU compiled a list of 113 federal, state, and local regulations that require specific information to be collected and/or actions to be taken. The list also linked each regulation with the parties responsible for compliance within LMU, (known as “compliance owners”) as well as the due dates for reports. This information populated a dynamic, web accessible database that allows the University Risk Manager to readily access information, sort by due dates, and identify LMU employees who would have more information. Note that this approach is distinct from Hartwick’s, which included cost figures only for reporting activities, but which also included a list of regulations for which no reporting is required.

Creating the Questionnaire

The mechanics of questionnaire development and administration will vary extensively from campus to campus. LMU subscribes to Qualtrics to help students, faculty, staff, and senior administrators gather a range of information for research, internal control reviews and process improvement purposes. Fortunately, LMU enjoys robust Survey and Evaluation Support through the Office of Assessment whose mission includes providing “leadership and support in the University’s efforts to create a culture of evidence, learning centeredness, and continuous improvement [including] designing and implementing institution-level assessment projects . . . [emphasis added].” The Associate Director generously helped us formulate appropriate questions for the types of data we desired to receive, identify question formats and prompts that facilitated users’ understanding of the questionnaire, and create plans for organizing the data we would ultimately gather (Appendix D).

One section of the questionnaire allowed for a qualitative answer. We asked each respondent the following:

◆ In fiscal year 2014, did the cost or effort of maintaining regulatory compliance increase, decrease, or stay about the same?

◆ Do you anticipate the cost or effort to maintain regulatory compliance in fiscal year 2015 will increase, decrease or stay about the same?

Administering the Questionnaire

In December, 2014 we piloted the questionnaire with a select group of employees with compliance responsibilities. Their input led us to improve the phrasing of certain questions, clarify the units to be reported (for example, hours or percent effort), and improve the functionality and navigability of the survey.

Upon creation of a final questionnaire and prior to distribution, the University Risk Manager presented the project to LMU’s Vice President’s Council, which consists of all Vice Presidents, Vice Provosts, and Associate Vice Presidents that have
responsibility for compliance oversight. The University Risk Manager fielded their questions and concerns, and also clarified that the VP Council members should forward the questionnaire to the subject area experts, including the compliance owners, on their staffs for completion. This step was critical to underscoring for employees the institutional importance placed on their answers. It also likely contributed to the 100% response rate we received. All answers had been gathered by June 2015, at which time they were compiled into unit level reports and sent back to the members of the VP Council for review, modification, further information, and/or confirmation. In almost all cases, the data was verified as accurate. A few Council members requested revisions or correction.

Generating Cost Figures

Once the data was confirmed, the Director of Financial Planning and the Vice President of Human Resources identified the listed employee positions in the Human Resources Management System (HRMS) and used their effort levels to calculate corresponding salary and fringe amounts. The RCC was not privy to any salary and fringe information; this data was kept confidential per LMU policy. However, the total salary and fringe calculations by unit were provided to the authors and were combined with the other survey responses to determine our best estimate of the overall cost of compliance for FY 2014.

Results

Our study found that LMU expended $8.8 million on compliance or 3.5% of net tuition and fee total dollars. A total of 292 employees spent some portion of their time on compliance issues in FY 2014. This figure represents 23% of our overall staff count of 1,246, and does not take into account any faculty effort in their role as faculty (i.e. outside of formal administrative functions they may have). It translates to 58 financial FTEs. Salaries and fringe costs alone comprise 75% of the total calculated cost of compliance. In December, 2015 a written report was presented to the LMU Board of Trustees including total figures as well as unit-level explanations of cost categories (Appendix E).

¹ Auditing and Legal fees are included in Consulting. Note that a five-year average of legal fees was utilized to address natural and on occasion wide variations.
We also found that these costs were borne unevenly by the various divisions. Business and Finance carried 40% of the burden for regulatory compliance costs (a figure that includes the software costs of the major administrative systems) followed by Student Affairs (25%), Administration (20%) and Academic Affairs (12%). We projected the cost of compliance to FY 2015 by applying budgeted salary increases with no estimated increases to other elements.
In addition to the impact of annual salary increases and increased benefit rates, we expect to see other cost increases related to future changes in regulatory statutes. Additional regulations usually call for additional resources to be invested to address both compliance and the effort to monitor and report on compliance. Most of our survey participants “expect the unexpected” in terms of increased costs due to unanticipated regulatory change. A change in focus by regulators can increase the cost of compliance even if there is no change to reporting costs. These expenses cannot be projected accurately. However, there are some known increases that will impact years subsequent to fiscal 2014 as a result of the Affordable Care Act and the changes in California’s state compensation laws.

Discussion

The cost of compliance with regulations is often cited as one of the drivers of the high price of tuition. Rolf Wegenke, president and CEO of the Wisconsin Association of Independent Colleges and Universities and a former board member of the National Association of Independent Colleges and Universities says that “the fastest-growing contributor to increased administrative staff and overall operating expenses for colleges is federal, state, accrediting and other associated regulatory compliance obligations. . . .” For evidence to support this claim, he refers to the 2012 Hartwick College study (McNutt, 2014). However, if the cost of compliance at Hartwick is actually less than 1% of university expenditures, it seems unlikely to be the fastest growing contributor to staff and operating expenses.

Nevertheless, the authors do not dismiss the significance of the cost of compliance altogether; even 3.5% can have a profound impact at an independent, private college that relies primarily on tuition income. At LMU, we are keenly aware that nearly $9 million in regulatory compliance expense represents a lot of missed opportunities: opportunities to provide student scholarships, to keep tuition increases low, to enhance educational and research programs, and to otherwise fulfill the primary mission of the university. Nor does LMU, or any predominantly undergraduate university, have the power to attract hundreds of millions of dollars in federal grant money, and the indirects they bring, to pay for a larger compliance staff and develop economies of scale. In any case, the ACE Report (2015) correctly points out that regulatory requirements should not be perceived as providing a “free good,” and that “the Department [of Education] should accurately analyze compliance costs and seek to minimize them” (9).

While acknowledging that it is possible that regulatory costs are not as high as administrators believe, Diane Auer Jones suggests that whatever their costs, revealing regulatory burdens on institutions of higher education (IHEs) can be a teachable moment. She proposes that colleges and universities “should add a line to their tuition bills called the Federal Regulatory Compliance Fee, so that parents and students (and, yes, politicians) know just how much regulations cost them” (2010). Indeed, in the absence of good information on the cost of compliance from the institutions involved, neither the Department of Education nor any other government agency, will be in a position to make informed decisions about the effects of their regulatory policies. While
the mantra that “less regulation is better” certainly appeals to many, that notion must be tempered with the recognition that many regulations provide for the health, safety and welfare of students, faculty and staff. They foster a more equitable and just society. They help provide an even playing field for all in higher education. In short, many of these regulations serve as partners in higher education to help us fulfill our missions.

Conclusion

We believe the method presented here provides our institution a reliable baseline measurement for future efforts to capture regulatory compliance costs. In particular, benchmarking the effort expended is the first step toward implementing greater efficiencies to drive down the labor costs associated with compliance. Further, analyzing this effort will help LMU refine its understanding and management of regulatory costs, improve business processes and, where feasible, automate regulatory reporting by leveraging existing systems and tools. More efficient systems may both drive down costs and result in yet higher level of compliance, as well. This self-study also positions us to incorporate annual monitoring into our business practice and measure our progress by revisiting the regulatory compliance cost questionnaire periodically every few years.

Further, we feel that conducting this exercise to identify the costs of compliance has in itself contributed profoundly to strengthening the culture of compliance we have been creating at LMU. Because of the broad involvement of so many across campus, the study communicates to unit leaders the importance of balancing high standard of regulatory compliance with judicious, informed cost management. We have embodied the vision perhaps best articulated by Peter F. Lake (2013)”to create a culture in which compliance is seen as everyone’s job... [and] the specific tasks of compliance [are] delegated to a variety of administrators and offices.”

Acknowledgements

The authors would like to express our gratitude to the following people, without whom, this work would not have been possible. Former LMU President David Burcham and the Board of Trustees Finance Subcommittee challenged us to tackle this problem. LMU President Timothy Law Snyder, Provost Joseph Hellige and Chief Financial Officer Thomas O. Fleming, Jr. encouraged us to pursue the research wherever it led. Doug Moore, the University Risk Manager, provided leadership in chairing the Regulatory Compliance Committee, helpful guidance on the conduct of the survey, and insightful editorial comments to the final document. Maureen Cassidy, Director of Internal Audit, who asked questions, anticipated issues and lent us her considerable editing skills. The Educational Advisory Board provided the RCC with preliminary external research on the costs of higher education. The members of the RCC contributed input and feedback to the survey design and questions. Christine Chavez, Associate Director of Survey Research at LMU, assisted us in creating and troubleshooting the questionnaire. Abbie Robinson-Armstrong whose Senior Vice President Fellows Program, provided Joseph McNicholas the opportunity to join the RCC to coordinate the documentation, perform data collection, and write up the results.

About the Authors
Joseph McNicholas is Director of Research Opportunities, Franklin Humanities Institute at Duke University. Joseph previously served as Director of the Office for Research and Sponsored Projects at Loyola Marymount University. He holds a doctorate in American Literature from the University of Texas, Austin and an MBA in Finance from the University of Redlands. Joseph regularly presents at conferences and publishes on research administration at predominantly undergraduate institutions. He has co-authored a professional micrograph that provides guidance for research administrators at smaller institutions titled Establishing and Managing an Office for Sponsored Programs at Non-Research Intensive Colleges and Universities (NCURA 2014). More recently he co-authored “Creative Funding Strategies for Undergraduate Research at a Primarily Undergraduate Liberal Arts Institution” (Council on Undergraduate Research Quarterly, Winter 2015).

Patrick Hogan is Director of Financial Planning and Budget at Loyola Marymount University. He is responsible for oversight of the university budget, financial modeling and internal controls. Patrick received a Bachelor of Business Administration degree from Loyola University Maryland with a focus on Management Information Systems. Prior to joining Loyola Marymount University, Patrick held performance management consulting positions at Capgemini and Longview Solutions with clients in industries including aerospace, banking, energy, entertainment, government and higher education.
Opportunities for Advancing a Culture of Grant Seeking

Jeremy T. Miner, University of Wisconsin-Eau Claire

One of the challenges faced by many research administrators at predominantly undergraduate institutions is advancing a culture of grantseeking. Because teaching is recognized as the top institutional priority, often far ahead of service and scholarship, research administrators frequently find themselves educating faculty about the grants process as well as persuading them that it is a worthwhile and rewarding activity. Some research administration offices even offer a range of incentives to encourage faculty to write grants, such as additional summertime compensation, reassigned time during the academic year, access to human resources in the form of student research assistants and technical consultants, matching funds for equipment purchases, and supplemental funding for travel to conferences, project supplies, and professional development opportunities. Beyond incentivizations, there’s another place where changes can occur that would help facilitate a positive culture of grantseeking: doctoral programs.

It is axiomatic that some of today’s graduate students will become tomorrow’s college faculty. As such, an obligation exists to train doctoral students not only to be “better students” and “better college teachers” but also to be “better assistant professors” (Gaff & Lambert, 1996, p.44). Graduate programs are effective in developing students’ skills in researching and scholarly publishing but sometimes fall short in developing their skills in teaching, advising, mentoring, time management, service, and administration (Austin, 2002; Campbell, Fuller, & Patrick, 2005; Nerad, Aanerud, & Cerny, 2004; Solem & Foote, 2004; Wright, et al., 2004). Future faculty need to know that grantseeking will be an integral part of their scholarly expectations, not an added responsibility.

Although the National Science Board (1998) has long acknowledged that the competitive grant system itself helps “shape the culture and working environment in universities,” grantseeking has a limited role and low-to-modest profile in many graduate programs. Its standing tends to be influenced by the interests of individual students and the expertise of particular faculty rather than a deliberate structure of the program. While a topic such as ethics is often woven into the fabric of the curriculum, students interested in grants must assemble their own patchwork of internships, independent studies, advising relationships, and, when available, specific grant writing courses. Tightly structured graduate programs compel doctoral students to place value on curricular offerings that, first and foremost, meet degree requirements and second, are perceived to prepare them adequately for academia. Unfortunately, many students complete their graduate programs without a clear understanding of the true breadth of responsibility that goes along with being a member of the faculty. Consider: of two common indicators of scholarly activity, graduate students are quick to recognize peer-reviewed publication; less well-known is serv-

---

ing as a principal or co-principal investigator on an externally funded grant (Abbott & Sanders, 1991; Fairweather, 2005; Massey & Wilger, 1995; Stratten & Owens, 1993).

By incorporating grantseeking activities into an overall professional development plan, doctoral programs and faculty mentors can assist graduate students in their transition from incipient to ardent academics. Put differently, doctoral programs must recognize that the traditional three-legged stool of academia has braces on it, rungs that join each of the legs together. Grant dollars represent rungs that connect, support, and enhance faculty teaching, service, and scholarship. Grantseeking is integral to, not separate from, achieving individual, departmental, and institutional goals.

Myriad opportunities exist to infuse an appreciation for grantseeking into doctoral programs:

◆ **Show students how to identify and qualify sources of project funding.** Basic reference tools are available online through most universities, colleges, and large public libraries for finding public and private grantmakers. These database tools offer tutorials for conducting effective keyword searches.

◆ **Involve students in the process of designing projects and writing grants.** Analyzing RFPs (Requests for Proposals) involves asking a series of questions to determine whether the grant program is a good match for a potential project and how much work will need to go into developing a competitive application. Immersing students in strategy and writing sessions helps to demystify the process by which proposals evolve from “good” to “excellent.”

◆ **Engage students in the administration of grant awards.** Winning a grant is not an end in itself; it is a means to enhancing teaching, service, and scholarship. Implementing a project once a grant has been awarded may involve navigating through both institutional and sponsor administrative processes to hire personnel, issue purchase orders for equipment and supplies, submit travel requests, secure approvals from the IRB (Institutional Review Board) or IACUC (Institutional Animal Care and Use Committee), manage regulatory agency compliance requirements, formalize subcontract agreements, reallocate budget funds, and request no-cost extensions.

◆ **Inform students when they are benefitting directly from grant support.** Sponsors trust that awardees will be good stewards of their funds. When items such as research assistantships, conference registration and travel, and materials and supplies are supported by internal and external grants rather than departmental funds, convey to students that this represents a strategic investment by the sponsor. An awareness of the source of funding may increase their respect for the grant-maker, their commitment to the project, and their appreciation for the support itself.

◆ **Provide access to networks of academics, community members, and other professionals who might serve as resources on grant projects.** The value of networking cannot be understated. A casual introduction among colleagues in the office hallway, at a school board meeting, or between sessions at a national conference can lead to short-term benefits such as timely information exchanges, and long-term benefits such as productive research collaborations. Program officers from federal agencies
regularly attend the regional and national conferences of professional associations to provide agency updates, meet grantseekers, and discuss project ideas.

◆ Expose students to the different types of collaborations that exist within academia, between academia and industry, and between academia and nonprofits. As a way to maximize their funding, some public and private sponsors are strongly encouraging, or even requiring, collaboration in grant applications. Partners, whether within academia or across industry and nonprofit organizations, do not always share the same definition of “collaboration.” Further, partners do not always recognize that different types of collaborations exist, varying in their degrees of goal sharing and interaction. This awareness in itself helps to manage grant project expectations.

◆ Build discussions of grants into research methods courses. The responsible conduct of research includes considering legal, moral, and ethical dimensions of the grant project’s design and the qualifications of the principal investigator. Thought may be given as to whether a proposed project truly reflects the principal investigator’s scholarly agenda or simply amounts to chasing grant funding. Deliberations may also occur as to whether funding should be accepted from a particular sponsor, depending on terms and conditions that are associated with a grant award.

◆ Offer a specific course on grantseeking. Engaging in a semester-long course on planning and writing grant proposals will allow students a distinct opportunity to practice new concepts and skills. The course can provide breadth, overviewing ways to develop fundable projects, identify and qualify sponsors, write public and private grants, and construct budgets. The course can also be designed to provide depth, focusing exclusively, for example, on seeking funding from a particular federal agency and include mock proposal reviews.

◆ Recognize and reward students who attend grant trainings. Many institutions of higher education offer grant trainings on campus put on by the Office of Research and Sponsored Programs, Development Office, or Continuing Education. Some periodically organize events where federal agency representatives or consultants conduct one-day informational sessions or grant writing workshops. Students who participate in these activities may have the capacity and inclination to support the development of a grant.

◆ Celebrate successes. Preparing major grant proposals can take a great deal of time and energy. In recognition of this commitment, it is important to acknowledge individual and collective efforts. Funding rates vary widely among sponsors, so celebrations should recognize a job well-done, independent of a grant award. That is, students need to know that trying “counts.” A pat on the back, a handwritten note of thanks, a celebratory meal, an announcement in a department meeting, or an update in an internal newsletter, represent but a few of the numerous ways to reinforce desired behavior. Grantseekers who feel good about the process are more likely to continue writing proposals, regardless of the outcome of any particular submission.

In an era when stiff competition exists for limited internal university budget dollars, grantseeking takes on an even more pronounced role: faculty who have the
ability to secure external funding to support their teaching, service, and scholarship enjoy greater license to pursue an uninterrupted scholarly agenda. Accordingly, the time to learn grant writing is during graduate school. By embedding the topic of grants into a deliberate structure, doctoral programs can provide ongoing exposure to a range of grant-related experiences, from planning and writing proposals to networking with potential collaborators and program officers, to administering awards and celebrating successes. This programmatic change holds the potential to lay the foundation for a positive culture of grantseeking, shaping the way future faculty perceive and react to the constructive advances of research administrators, as well as to enrich the preparation of graduate students for their impending careers in academia.

Help in Selecting an Outside Auditor
AIS editors

The Mid-America Intergovernmental Audit Forum publishes *Selecting an External Auditor: Guide for Making a Sound Decision*. According to the report’s Foreword, “The benefits of having a high-quality audit of a government’s financial statements are both immediate and long-term. For example, high-quality audits can result in recommendations for immediate improvements in management operations. Furthermore, high-quality audits can result in increased accountability over government programs and long-term improvements in public confidence in government.” Further, Circular A-133 expects grantees to consider audit quality factors in addition to price when choosing an external auditor.

The guide lists “five basic steps for an effective audit procurement process”:

◆ Step 1: Planning — determining what needs to be done and when
◆ Step 2: Communicating Audit Requirements and Soliciting Proposals — writing a clear and direct solicitation document and disseminating it widely
◆ Step 3: Selecting a Qualified Auditor — authorizing a committee of knowledgeable persons to evaluate the ability of prospective auditors to effectively carry out the audit
◆ Step 4: Writing the Agreement: Documenting Expectations — documenting the expectations of both the entity and the auditor
◆ Step 5: Monitoring the Audit: Ensuring a Quality Audit — periodically reviewing the progress of the audit

At the end of each discussion, there is commentary on the needs of small entities and special considerations when contracting for a single audit.

For further information, contact the Mid-America Intergovernmental Audit Forum at www.auditforum.org.
Distinguishing Support Mechanisms

AIS editors

The question sometimes arises as to what type of “mechanism” is funding a particular project. This sometimes happens when the sponsored programs office has had little up-front involvement in a project. A simple distinction often can be made concerning external funds as follows: A *gift* or *voluntary donation* of funds is generally *not* considered sponsored funding. Gifts or donations usually have few or no restrictions on use (and are often irrevocable) and few or no reporting requirements. A *grant* is an award of funds to support a specific purpose. A grant usually extends for a defined period, comes with reporting requirements, and has terms and conditions. The recipient could risk loss of award funding if found to be noncompliant in any way. A *contract* is a form of federal procurement for the purpose of acquiring goods and services. A contract usually extends for a defined period, comes with reporting and/or deliverable requirements, and contains detailed performance specifications that must be satisfied (see ¶1705.7 and ¶2705.1).

Accounting and auditing requirements generally differ for a gift vs. an assistance award. In larger institutions, gifts are usually not handled by the sponsored research office, but rather the development or fundraising office. In smaller institutions, this may not be the case.

Federal Awards.

In the case of the federal government, it “uses a variety of funding mechanisms to achieve national priorities through partnerships with nonfederal parties” particularly colleges and universities.¹ Federal *grants* and *cooperative agreements* are forms of assistance in which a federal agency transfers something of value, such as money or property, to a party for a purpose, undertaking, or activity of the grantee that the government has chosen to assist. The Federal Grant and Cooperative Agreement Act of 1977 sets down criteria for executive agencies in selecting appropriate legal instruments to achieve uniformity in grant and cooperative agreement use, a clear definition of the relationships they reflect, and a better understanding of the responsibilities of the parties to them.

The language of the agreement should guide in determining what type of mech-

---

anism is involved (see ¶1305.1). The main distinction between a grant and cooperative agreement — both considered forms of “assistance” — is that substantial involvement is expected between the federal agency and the university when carrying out the activity contemplated in a cooperative agreement, whereas such involvement is not expected in carrying out a grant agreement. Cooperative agreements are useful where federal project management would be helpful due to the novelty or complexity involved, collaborative research is desirable, or federal involvement is needed in early stages where standards are being developed.²

Federal contracts are mutually binding legal relationships obligating the “seller” to furnish the supplies or services and the buyer — the government — to pay for them. The federal government typically uses contracts (rather than grants) as a mechanism when the principle purpose of the funded activity is to provide something for the direct benefit of the federal government. For example, contracts can be used to procure independent evaluations of programs or to conduct research for agency missions.

A review of how two federal agencies — National Institutes of Health and National Science Foundation — define assistance awards may prove helpful (see Figure 2330.2).

| Cooperative Agreement: OMB circulars |
| Contract: Federal Acquisition Regulations |

| Scope of Work | Grant: Developed by PI |
| Cooperative Agreement: Developed by PI |
| Contract: Developed by sponsor |
**Figure 2330.2-1: Forms of Federal Assistance**

◆ **Assistance, Award**

*Assistance* is the award of money, property, or services to a recipient to accomplish a public purpose as authorized by federal statute. Assistance relationships (e.g., grants) are expressed in less detail than are acquisition relationships (contracts), and responsibilities for ensuring performance rest largely with the recipient or are shared with the government. (NIH)

*Financial assistance* is the transfer of money or property to an eligible entity to support or stimulate a public purpose authorized by statute. (NIH)

An *award* is the provision of funds, based on an approved application and budget or progress report, to an organizational entity to carry out a project or activity. (NIH)

*Assistance awards* entail the transfer of money, property, services or other things of value from the federal government to a recipient to accomplish a public purpose of support or stimulation. Assistance awards involve the support or stimulation of scientific and engineering research, science and engineering education; or other related activities. Grants or cooperative agreements are used for this purpose. (NSF)

◆ **Grant, Grantee**

A *grant* is a financial assistance mechanism providing money, property, or both to an eligible entity to carry out an approved project or activity. A grant is used whenever an NIH Institute or Center anticipates no substantial programmatic involvement with the recipient during performance of the financially assisted activities. (NIH)

A *grant* is a type of assistance award and a legal instrument that permits an executive agency of the federal government to transfer money, property, services or other things of value to a grantee when no substantial involvement is anticipated between the agency and the recipient during the performance of the contemplated activity. Grants are the primary mechanism of support. (NSF)

A *grantee* is an organization awarded a grant or cooperative agreement that is responsible and accountable for the use of the funds provided and for the performance of the grant-supported project or activities. The grantee is the entire legal entity even if a particular component is designated in the award document. The grantee is legally responsible and accountable for the performance and financial aspects of the grant-supported project or activity. (NIH)

A *grantee* is the organization or other entity that receives a grant and assumes legal and financial responsibility and accountability both for the awarded funds and for the performance of the grant-supported activity. Grants are normally made to organizations rather than to individual principal investigator/project director(s). (NSF)

◆ **Cooperative Agreement**

A support mechanism used when there will be substantial federal scientific or programmatic involvement. Substantial involvement means that, after award, scientific or program staff will assist, guide, coordinate, or participate in project activities. (NIH)

A type of assistance award which should be used when substantial agency involvement is anticipated during the project performance period. Substantial agency involvement may be necessary when an activity is technically and/or managerially complex and requires extensive or close coordination between the agency and the awardee. Examples of projects which might be suitable for cooperative agreements if there will be substantial agency involvement are:
research centers, large curriculum projects, multi-user facilities, projects which involve complex subcontracting, construction or operations of major in-house university facilities and major instrumentation development. (NSF)

♦ Contract (R&D)

An award instrument establishing a binding legal procurement relationship between the agency and a recipient obligating the latter to furnish a product or service defined in detail by the agency and binding the agency to pay for it. (NIH)

♦ Cooperative Research and Development Agreement (CRADA)

Any agreement between one or more NIH laboratories and one or more non-federal parties under which the Public Health Service, through its laboratories, provides personnel, services, facilities, equipment, or other resources with or without reimbursement (but not funds to non-federal parties) and the non-federal parties provide funds, personnel, services, facilities, equipment, or other resources toward the conduct of specified research or development efforts which are consistent with the missions of the laboratory. (NIH)

Hiring a new employee is an opportunity and dilemma for which few of us are prepared. Inevitably, we are placed in the position of defining what it is that our offices do and what tasks will be included in the position. The uncertainty of the situation is perhaps the most problematic. How can we know that we have hired the “right” person? Can we learn enough during the interview to generalize the “results” to ensure a good fit in the office and institution?

Is humor a mandatory qualification or just a desirable quality?

In a recent PUI discussion, John Falconer (University of Nebraska at Kearney) offered that “…everything you are looking for has to be connected to the job…” While many PUIers lobbied for a sense of humor as a desirable trait, others put “good sense of humor” explicitly in the job descriptions. The interviewers at those institutions also discuss the sense of humor in detail during the interviews with candidates, and give it some context. The responses of the candidates give you some added and beneficial insight into the person who is being interviewed. Say the major proponents of this approach, “We’re serious about one’s sense of humor!!!,” and “There are so many wonderful, interesting, nutty, exciting, nerve-wracking and frustrating people and situations that we deal with — a sense of humor is often the only thing that gets you through the day!”

On the other hand, several other more cautious PUIers acknowledged that “sense of humor” could not be specified in the job posting itself. Rather, the wording would need to suggest that the successful candidate should have a balanced perspective, flexibility, and cheerfulness. Such wording then allows for the qualities to be directly linked to one of the aspects of the job. In one example, it was clear that a good sense of humor was very useful. At one unnamed PUI, two U.S. Department of Education grants were awarded. “Good news! Congratulations!” you say. But wait! The principal investigator no longer works there? And no internal approvals were obtained before submitting the grant? So the good news is really bad news, requiring a sponsored research administration sense of humor!

What other qualities and qualifications are sought?

The most commonly cited qualities that research administrators value in employees include

- loving to work with other people;
- ability to handle difficult people and situations;
- ability to put the needs of the office before needs of self on most occasions;

---

1 This article is reprinted from the *NCURA Magazine*, Vol. XXXVIII, No. 5, Dec. 2006/Jan. 2007, published by the National Council of University Research Administrators. It is used with permission of the publisher. At the time of publication, Frances Jeffries served as special assistant to the provost, Wheaton College.
ability to “multi-task”;  
outstanding character;  
terrific personality;  
delivers excellent customer service;  
use of good judgment;  
ability to have fun;  
care and attention to detail; and  
discretion (especially able to keep confidences).

The majority of research administrators concurred that most technical skills can be taught to new employees if they are inclined to pay attention to details.

What tools and techniques help you gather the most useful and valid information?

The most helpful tools often come from among “our own.” The favorite interview question offered by Frannie Nuttall (West Texas A&M University) is “Briefly, tell me about a time when you had a situation with a difficult client/boss and how did you handle the situation?” The tough part for the interviewer is to sit quietly and let the interviewee talk. Most people are extremely uncomfortable with the silence and begin almost immediately to fill it. The interviewer will be surprised at what the candidate will say, allowing you to discern much from their response. But a word of caution: if the candidate says, “I’ve never had such a situation” — pass them by!

Beth Koenig at the College of St. Catherine shared the following questions to use in an interview:

- Why are you interested in this position at this time? How does it fit into your overall career plan?
- What do you enjoy most about being in an academic environment?
- This position often needs to work with excel spreadsheets and computer applications other than word processing and lotus notes. How are your computer skills? Do you like fiddling around with new programs? Do you have any experience working with web pages?
- How would you go about establishing relationships and working with critical/difficult people?
- Describe a difficult situation you have been in with a faculty member and how did you handle it?
- How would your current supervisor describe your work?
- What do you need from a supervisor? (Working style, etc.?)
- What kinds of things typically frustrate you? What kinds of things typically drive you crazy?
What do you need to make you feel satisfied in a job?
What questions do you have for me?

Good luck in your hiring!
This section includes statistics and survey results from reputable sources relating to sponsored programs offices and their functions and activities at predominately undergraduate institutions (PUIs).

**Benchmarking the Small Sponsored Programs Office**

By Nancy Kay Peterson, Director of Grants & Sponsored Projects, Winona State University

In fall 2003, Winona State University (WSU), in southeastern Minnesota, embarked on an institutionwide planning effort to develop a “new university.” Faculty and staff set out to identify “best practices” nationwide in all areas of operations and conducted a Web search for benchmarking data on sponsored programs offices. Only a single national sponsored projects administration survey was found, one conducted by the Higher Education Benchmarking Consortium (HEBC) (www.higheredbenchmarking.com).

Of the 51 respondents to the HEBC survey, 17 fit in the “small” category, which was defined as annual sponsored programs expenditures of less than $43 million. Other data indicated the survey participants represented large research institutions, not teaching institutions (for example, a median of 43 percent of faculty working as PIs, a median pre-award sponsored programs staff of 11, etc.).

WSU did not seem to fit the profile as outlined by HEBC: in its best years it brings in slightly more than $2 million in grant dollars, representing at most about 8 percent of the faculty. The sponsored programs office consists of one FTE (full-time equivalent staff person), a half-time assistant, and an eight-hours-per-week work study student. Clearly, benchmarking WSU against the “small” institutions in the HEBC study would be a case of comparing apples and onions.

**The Survey**

The decision was made to collect new benchmarking data. In email consultations with a representative of the HEBC and a colleague at another Minnesota state university, a two-page “Small Shop Zip Survey” was designed to collect general comparison data from directors of “small shops” — sponsored programs offices in predominantly undergraduate institutions where faculty are hired to be teachers, not researchers, and grant seeking tends to focus on curriculum or faculty development, instrument acquisition, or special projects, rather than pure research.

The survey was distributed to the RESADM-L listserv (1,568 subscribers) and NCURA (National Council of University Research Administrators) Region IV (including the states of IL, IN, IA, KS, MI, MN, MO, NE, ND, OH, SD, and WI) listservs.

---

1 This discussion is based on material presented at the NCURA Annual Meeting, October 31, 2005.
Surveys were also distributed at the NCURA annual conference in Washington D.C., on November 2–5, 2004.

Upon analyzing the 41 surveys returned, it became clear that missing were two key pieces of data — number of full-time faculty (necessary to calculate student-to-faculty ratios) and teaching load (because faculty often site this as the reason they don’t have enough time to write grants). Since most respondents had sent in their original surveys via email, they were re-contacted via email with follow-up questions. A total of 31 of the 41 institutions responded to a request for information on the number of full-time faculty and 17 institutions responded to a later request for information on faculty load.

**The Respondents**

Responses were received from four doctoral, 22 masters, and 15 baccalaureate institutions. (See Figure 2360.1-1.) The pool contained 23 public institutions and 18 private institutions, 11 of which had a religious affiliation. Enrollments ranged from 1,100 to 15,000 with a median enrollment of 5,300. The number of full-time faculty (reported by 31 institutions) ranged from 96-660, with a median of 261. The student-to-full-time faculty ratio ranged from nine-25, with a median of 22. Institutional operating budgets reported for 31 institutions ranged from $10 million to $275 million with a median of $68 million. Reported income from external sponsors ranged from $430,000 to $30.5 million. The median income was $2.5 million.

</tbody>
</table>
Total sponsored programs staff ranged from one half-time position to an FTE of 14, with a median of two. Twenty-four reported having a staff FTE of two or less. Only nine institutions reported having more than three FTE staff members. (Note: The reported staff figures may be inconsistent. Some offices did not appear to include student workers in their staff totals while others did. It was also unverifiable whether directors included themselves in their total staff counts.)

In essence, given the external income level and the small staff sizes reported, a clear majority of “Zip Survey” respondents appeared to fit the targeted comparison group; that is, they represented “small shops” in terms of sponsored programs income and number of staff. Furthermore, they were primarily teaching institutions. Respondents were asked to provide a breakdown of grants received for “special projects (e.g., special projects, curriculum/program development, service activities)” vs. “research awards (e.g., independent research projects, scholarly and creative activities).” Of the 19 institutions providing a breakdown, only two reported receiving more research awards than sponsored projects awards, and both of these institutions had very low levels of overall activity, receiving only 14 and 15 awards annually.

**The Sponsored Programs Offices**

All offices in the study had pre-award responsibilities, that is, their primary function was the identification of funding sources and the facilitation of proposal submissions. (See Figure 2360.1-2.) However, 82 percent were also responsible for regulatory compliance functions (policy development, regulatory advising and monitoring, etc.). Some 80 percent were working in the regulatory area of human subjects protections, 44 percent in animal care and use, and 20 percent in biohazards. Other compliance areas included financial conflicts of interests, misconduct in research, responsible conduct in research, and chemical and radiation safety. Half of the offices also had some post-award duties (issuing contracts, monitoring budgets, preparing financial reports), and approximately one-third were involved in the preparation of contracts for fees for services and deliverable products. Half also reported being responsible for internal award programs, such as institution-supported grants and affiliated foundation awards to faculty.

</tbody>
</table>

Staff size did not seem to be related to responsibilities assigned to the offices, though two of the three largest offices, reporting FTE staffing of 10.5 and 11.5, also reported handling 100 and 150 contracts, respectively, as well as having responsibilities for a significant number of post-award duties. They handled many accounting functions often housed in a business office or comptroller’s office.

Of the 33 institutions reporting operating budget figures for their offices, two-thirds reported figures that appeared to include salaries, making comparisons difficult, especially given the uncertainties about the staffing numbers. Figures obviously not including salaries ranged from $6,000–$18,000, with a median of $10,000. While 20 offices (most in public institutions) reported receiving a share of facilities and administrative (F&A) costs, only half (11) reported the amount was determined as a total percentage of F&A funds received. Amounts of $10,000–$800,000 were allocated to sponsored projects offices without explanation or “as needed” or in percentages ranging from 10–50 percent of the total F&A costs received.

Data was not collected on whether sponsored programs offices receiving F&A dollars used them to cover salaries, basic operating expenses, or for other purposes (internal grants, grant writing incentives, grant matching funds, etc.).

**Benchmarking.** Most sponsored programs offices self-assess by monitoring activity levels (the number of proposals submitted) and income levels (dollars received). (See Figure 2360.1-3.) For comparative purposes, the number of proposals submitted was
defined as the grand total of the number of submitted pre-proposals, new proposals and non-competitive continuing proposals. The total number submitted ranged from nine–385. The median number submitted was 60. In terms of external dollars received, the median was $2.5 million. Some offices also monitor success rates. In this study, the median success rate was 56 percent.

Figure 2360.1-3: Overall Benchmarks

| Median # of proposals submitted annually | 60 |
| Median success rate                      | 56% |
| Median amount of external dollars received annually | $2.5 million |

Findings at a Glance
The survey data indicates, in roughly decreasing order of significance the following:

◆ The more proposals submitted, the more dollars received.
◆ The larger the number of full-time faculty, the more dollars received.
◆ The greater the success rate, the more dollars received.
◆ The more incentives offered, the more dollars received.
◆ At institutions with the sponsored programs office located in academic offices, more dollars were received.
◆ The student-to-full-time-faculty ratio does not appear to be related to dollars received.
◆ Lower faculty teaching loads do not appear to be related to dollars received. In fact, institutions with lower faculty loads were slightly less likely to be in the upper tiers in terms of dollars received.

The first three findings appear to be simply a matter of common sense. More proposals, more faculty, and higher success rates equal more dollars. That leaves four findings to consider further:

◆ Role of incentives
◆ Student-to-faculty ratio
◆ Faculty load
◆ Reporting lines

Role of Incentives. The more incentives offered, the more dollars received. The five most common incentives, regardless of the institution’s success (in terms of dollars received) were, in order:
◆ Portion of facilities & administrative (F&A) costs received returned to project
director, department and/or college
◆ Recognition given (e.g., certificates, receptions, internal publications)
◆ Grant writing activities considered in promotion and tenure decisions
◆ System for securing cost share (matching funds) is grant writer friendly
◆ Release time given for grant administration

Some 35 percent of the institutions that were at or above the median in terms of
dollars received also provided additional incentives, such as release time for grant
writing activities, stipends for grant writing (either directly or through internal competi-
tions), seed money for preliminary research, stipends for grant administration (often
only through grant awards) and travel to technical assistance workshops or funding
agency offices. (See Figure 2360.1-4.)

<table>
<thead>
<tr>
<th>Figure 2360.1-4: Most-Effective Incentives Offered by Respondents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Of those institutions that were at or above the median in dollars received —</td>
</tr>
<tr>
<td>♦ 3 offered grant writing release time</td>
</tr>
<tr>
<td>♦ 1 offered grant writing stipends</td>
</tr>
<tr>
<td>♦ 5 offered both release time and stipends</td>
</tr>
<tr>
<td>BUT</td>
</tr>
<tr>
<td>♦ 7 of these 9 offered 4 or more incentives</td>
</tr>
<tr>
<td>♦ 4 of these 9 offered 7 or more</td>
</tr>
</tbody>
</table>

Interestingly, the five most common incentives may not be the most effective. All
nine of the institutions that offered either release time for grant writing or stipends for
grant writing or both (five offered both) were at or above the median for dollars re-
ceived. However seven of those nine institutions offered four or more incentives and
four offered seven or more. It is difficult to accurately gauge the effectiveness of one
incentive over another. The key conclusion is the more incentives offered, the more dollars
received.

**Reporting Lines.** Of the 10 out of 41 institutions in which the sponsored programs
officer reported to other than an academic officer, five were in the lowest quadrant in
terms of dollars received. The others were spread out evenly across the spectrum of
income levels. One could speculate that sponsored program staff who are assigned to
development/institutional advancement or foundation offices spend time on other
fund-raising efforts besides grant writing, but data was not collected that could confirm
that suspicion.
**Student-Faculty Ratio and Faculty Load.** Perhaps surprising, the survey did not find a connection between student-faculty ratio or teaching load and grant writing dollars received (nor number of proposals submitted nor success rate).²

It could be that institutions with low student-faculty ratios and low faculty teaching loads may place a greater emphasis on personalized learning and student-faculty interaction inside and outside the classroom. Faculty may be expected to be heavily involved in student and community activities as part of their scope of duties. The emphasis on personal interaction and the intense time commitment that requires may leave little time for grant writing. But, that can’t be confirmed by the data. Another problem is teaching load in and of itself may not reflect total faculty workload. Teaching load does not provide any details on other variables, such as additional faculty student advising responsibilities, committee assignments, and the credit-hour structure.³

**Conclusion**

Survey results suggest that the key to encouraging faculty grant writing is offering multiple incentives. As a corollary to the benchmarking study, a review of the professional literature was undertaken. In general, the commonly cited barriers to grant writing reported can be condensed to two shortcomings: faculty claiming to not have enough time and not receiving enough recognition. Since the study did not find a correlation between student-faculty ratio or faculty load and grant writing, it may be that recognition is the more important shortcoming. And that “recognition” may be reflected in the incentives offered grant writers. If an institution claims it values grant writing, but provides no incentives for such activities, the real “value” is clearly communicated to potential grant writers.

² This was surprising, because faculty, at least at WSU, consistently point to lack of time as a primary reason for not engaging in more grant writing. Furthermore, the author’s own office records do provide some evidence that involvement in nonteaching activities has an impact on grant writing activity levels. For example, there was a noticeable decline in activity levels at WSU prior to a quarter-to-semester term conversion, and there was another decline when WSU was engaged in its “new university” benchmarking efforts.

³ At WSU, for example, faculty are required to be student advisors. They are expected to be actively involved in university service via committee service and/or administrative assignments. These activities are in addition to their teaching load. At other institutions, some respondents noted university service was counted as part of overall faculty load, thus reducing the actual teaching load. Faculty also have claimed that credit-hour structure has an impact, that there is a difference between a faculty load of four three-credit-hour courses vs. a faculty load of three four-hour-credit courses. Again, there is no way to assess these variables.
Perhaps more important than offering incentives themselves is the fact that they are offered — the more, the better — because their presence offers tangible evidence that grant writing is valued by the institution and that the faculty who engage in grant writing are recognized and rewarded for their efforts.

Clearly more research is needed. (See Figure 2360.1-5, page 2360:8.) Better data on staff responsibilities and what office operating budgets support in the way of incentives would be useful. There was also limited data on faculty teaching load and curriculum structure and not enough information on how load was calculated at each institution. More information on how incentive programs are administered might provide a strategy for evaluating the effectiveness of one incentive over the other.

**Figure 2360.1-5: Areas for Further Exploration**

Need more specific data on
- staff responsibilities
- office operating budgets and incentives supported
- faculty teaching load
- curriculum structure
- incentives offered and how administered
- how to evaluate effectiveness of incentives

Knowledge Check

AIS editors

The Q&As at ¶2390.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 2300 has been understood. Note: For the answer key for ¶2390.1, see ¶2390.3, which appears on a separate page (page 2390:5) for testing purposes. Discussion topics at ¶2390.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶2390.1 Q&As

1. A predominantly undergraduate institution (PUI)
   (a) Is usually a large research-intensive institution
   (b) Tends to place a great deal of emphasis on undergraduate instruction
   (c) Is defined as a small liberal arts institution with fewer than 5,000 students
   (d) Is defined as a publicly funded institution with fewer than 5,000 students

2. Which of the following generally is TRUE of a PUI?
   (a) Affording staff to stay on top of research compliance requirements presents no special problems for a PUI.
   (b) The concept of cost sharing presents no special problems for PUIs.
   (c) The institution often provides faculty incentives for proposal preparation and submission.
   (d) Tenure policies at PUIs frequently are heavily weighted toward research activity.

3. Institutional funding available for research-related activities typically is NOT used to
   (a) Generate quality research projects
   (b) Provide child care services for PIs to enable them to meet project proposal deadlines
   (c) Support the continuing development of existing research projects
   (d) Assist active research faculty change research direction if their project focus is no longer fundable

4. In which of the following areas of sponsored research do smaller institutions often have an advantage over larger ones:
   (a) PIs often more readily accept support from and recognize the contributions of the institution’s OSP.
(b) There are ample resources available to support research compliance.
(c) They usually have extensive graduate-programs to support research-intensive endeavors.
(d) Faculty are usually hired with extensive experience as principal investigators.

5. Efforts by smaller institutions to increase sponsored research often is limited by
   (a) The general resources available for research at the typical PUI
   (b) The location of the typical PUI
   (c) The length of the fiscal year at the typical PUI
   (d) The number of male vs. female faculty at a typical PUI

6. There are at least three schools of thought in considering research-related resource distribution at a PUI. Which of the following is NOT one of them?
   (a) Spread the resources like sowing seeds on a field and wait to see which ones germinate.
   (b) Host an internal competition to determine the most promising (and realistic) ideas for research, and then fund those that rise to the top.
   (c) Find faculty who are already involved in promising research and apply resources to their endeavors to help turn them into research “stars.”
   (d) Fund only proposals in the humanities, as there is less competition in this arena and PUIs usually have strong humanities departments.

7. Because smaller institutions often have less-experienced faculty researchers, OSP staff members are usually viewed favorably by faculty when
   (a) They facilitate and expedite research grants and contracts.
   (b) They offer to work as co-PIs on multiple PI submissions.
   (c) They demand to contribute to project proposals.
   (d) They are helpful in suggesting ways to solve the “problem” at the center of the proposal.

8. Faculty development is a term often used to include all of the following EXCEPT:
   (a) Incentives for research activity
   (b) Training in proposal writing
   (c) Ongoing education on compliance issues
   (d) Gifts from foundations
9. **What are set aside programs?**

(a) Programs developed to allot research funding to a special category of institutions or for a special program

(b) Programs developed to fund research graduate school education

(c) Programs developed to fund facility renovation

(d) Programs developed to fund equipment purchases

### 2390.2 Discussion Topics

1. What are some of the principal differences between how a PUI and a research-intensive institution view sponsored research activity? In answering, consider both the perspective of faculty and administrators.

2. Why do faculty incentives continue to be so important at a PUI?

3. Sometimes OSPs need to train their accounting and finance offices on the intricacies of a federal or nonfederal award. Why might this be so and how can an OSP help the institution’s accounting/finance staff get up to speed quickly and, further, learn to “embrace” sponsored research?

4. Why should PUIs bother to compete for sponsored research funding?

5. If you were asked to develop a strategy for expanding the research enterprise at your institution, what type of considerations would go into your strategy? Ultimately, you want to increase the total dollars in sponsored funding coming into your institution. To this end, would you look to increase the total number of proposals submitted by your institution, to expand the number of faculty submitting proposals, or both? What goal is most realistic at your institution? What specific strategies would you take to achieve each goal?

Would you look for more large awards, or simply more awards in general? Would you look to diversify your funding; that is, would you plan to expand the source of funding—federal, state, industry, foundation— that you receive? What additional compliance expertise will be needed when dealing with different types of sponsors as well as larger, likely more complicated, awards?

Do you currently have guidelines for the types of research proposals that can be submitted? How would you modify—or develop—such guidelines to accommodate a more robust research enterprise at your institution?

What additional resources will your institution need to achieve a more expansive research program as you see it? Where will the resources come from?

6. In a recent presentation, an official from the National Institutes of Health listed the following items as “compliance pitfalls”? In assessing your institution’s internal controls with respect to these compliance areas, do you think you are vulnerable in any particular area (or areas)?

   - Unallowable costs
• Misallocation of costs
• Excessive cost transfers
• Inaccurate effort reporting
• Incomplete other support
• Inadequate subrecipient monitoring
• Administrative and clerical costs
• Noncompliance with assurances and special terms and conditions of award
2390.3 Answer Key

Following are the correct answers to the questions included at ¶2390.1.

1. (b) Tends to place a great deal of emphasis on undergraduate instruction

2. (c) The institution often provides faculty incentives for proposal preparation and submission.

3. (b) Provide child care services for PIs to enable them to meet project proposal deadlines

4. (a) PIs often more readily accept support from and recognize the contributions of the institution’s OSP.

5. (a) The general resources available for research at the typical PUI

6. (d) Fund only proposals in the humanities, as there is less competition in this arena and PUIs usually have strong humanities departments.

7. (a) They facilitate and expedite research grants and contracts.

8. (d) Gifts from foundations

9. (a) Programs developed to allot research funding to a special category of institutions or for a special program

Introduction
Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter covers the important functions of pre-award services and how these services foster a successful sponsored research enterprise.

It all starts with the proposal. Stephen Hansen of Southern Illinois University Edwardsville goes back to the origins of research administration in colleges and universities to discuss the organization and structure of pre-award services. Research administration offices as we know them today generally began as the place where proposals were reviewed, approved, and submitted. In many cases, particularly in smaller institutions, the pre-award offices also provided direct assistance to the faculty in producing, i.e., typing and duplicating, the proposals.

Hansen identifies and describes the fundamental purposes of the pre-award office as providing support to the faculty, facilitating the grant process, and mediating among the interests of the investigator, the institution, and the sponsor. These fundamental attributes of the pre-award organization have not changed in a significant way over the past half-century. Of course, Hansen acknowledges that the methods by which many of these services are provided have changed dramatically over the years and will likely continue to evolve. At the heart of the process, however, is Raymond Woodrow’s notion that research administration, including pre-award services, is the management for research, not the management of research.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to §2505, as appropriate. Content added to other sections of the chapter will provide readers supplementary discussions of related topics (at §2520), practical tools (at §2530), case studies (at §2540), and trends data and other related statistics (at §2560). A “knowledge check” containing Q&As and discussion topics is included at §2590.
Pre-Award Services
Stephen Hansen
Associate Provost for Research and Dean, Graduate School
Southern Illinois University Edwardsville

Pre-award services are the activities and processes that legally and ethically enable faculty to obtain externally funded research and sponsored programs. The exact nature of those services varies, depending upon the size of the institution, its culture, and mission. Generally, however, pre-award services include:

◆ assisting with proposal development;
◆ reviewing and approving proposals;
◆ managing the proposal submission process; and
◆ negotiating, accepting, and activating an award.¹

Pre-award services have changed over time. Functions in pre-award offices three decades ago were far less specialized than today. In 1982, for example, Kenneth L. Beasley described the typical pre-award office as having a staff that included a person to help with grant budgets, a person who managed grant information, a person who helped develop proposals, and a person who managed the grant submission process.² Today functions, processes, and staffing are significantly more complex. For example, the changing legal and regulatory environment has led some universities to develop specialized pre-award activities to include areas such as material transfer agreements, subaward negotiations, and legal and ethical compliance.³

This chapter includes an overview of the functions and types of pre-award services typically provided by universities. Some of the more specialized functions that are part of some pre-award offices, such as compliance, intellectual property, subawards, and training, are excluded from this discussion because they are covered in separate chapters of the Guide. (See Chapters 1500, 1900, 3700, and 1100, respectively.) This chapter also discusses organizational and staffing models for pre-award functions and some issues and factors critical for successfully managing these functions. Special issues for predominantly undergraduate institutions also are covered.

Readers should note that the discussions throughout this section focus on the functions — not the processes — of pre-award services.

Summary of Pre-Award Services

Regardless of the degree of specialization in the pre-award office or the extent of the services, pre-award functions are governed by the same basic principles. The functions and processes of pre-award activities are designed to
◆ support the faculty;
◆ facilitate the grant process; and
◆ mediate among the interests of the institution, the sponsor, and the faculty.

To paraphrase Raymond J. Woodrow, pre-award services are the management for sponsored programs, not the management of sponsored programs. As one research administrator concisely stated, the job of pre-award is to "enable our faculty to submit their proposals without impediments."5

Pre-award services support the institution’s and the faculty’s capacity to obtain sponsored programs. These services are critical for helping faculty and for providing the institution with quality assurances as well as regulatory compliance. Below is a broad presentation of many of the types of pre-award services offered by universities.

◆ Proposal development: Proposal development activities include the dissemination of funding opportunities and other kinds of programs and activities designed to promote the development of grant proposals, such as grant-writing workshops. The purpose of these activities is not only to stimulate proposal writing but also to give the investigator the tools and techniques for writing proposals.

◆ Proposal assistance: Proposal assistance activities may include editorial support, budget development, and agency liaison. These activities may also involve the coordination of interdisciplinary and collaborative proposals.

◆ Proposal review and approval: Pre-award activities typically involve the review of proposals for compliance with university and sponsoring agency policies. Of special importance is the review of the proposed budget. For a number of pre-award offices, proposal review and approval also includes a review of the quality of the proposal. Lastly, these activities may involve the coordination of internal competitions when an agency limits the number of submissions from an institution.

◆ Proposal submission: Proposal submission activities include assuring that all departmental, school or college, and other approvals have been obtained for the proposal. They also include securing authorized signatures for certifications and representations. Lastly proposal submission activities typically involve the actual submission of the proposal, whether electronic or print.

◆ Award negotiation and subawards: Many pre-award offices negotiate awards and manage subawards. Associated activities include negotiating with the sponsor the

---

scope of the grant, the budget, and the terms and conditions. They also may involve the process of subgranting or subcontracting with various collaborating institutions.

◆ Award acceptance: Most pre-award offices include managing the acceptance of an award, which includes securing the approvals of the key university officials, such as the department head, the dean, and grants fiscal management.

Each of these services is discussed in separate sections of this chapter, beginning on page 2505:7.

In addition to these functions, a pre-award office typically is responsible for the tracking and reporting of submissions and awards. Various offices in the university as well as some external agencies will require reports on the number of submitted and awarded proposals by agency type and discipline. The pre-award office often provides the data for these reports.

Some pre-award offices also manage competitions for university-funded research projects. Often this funding is intended as seed money to help a researcher begin a project that will lead to external support.

12505.2 Organization and Staffing

The organization and staffing of a pre-award office depend upon the institution’s culture, mission, and system of management. In some universities, many of the pre-award services are performed at the departmental level, while for other universities, all pre-award services are centralized. At still other institutions, few pre-award services are provided at all.

Organizational Models

There are a variety of organizational models for pre-award services. Figures 1-3 illustrate examples of three different university organizational structures.

For small offices of sponsored programs, pre-award functions may be managed by only one or two individuals. In Figure 1, for example, the university has a director and three support staff: a clerical person to manage the submission of proposals; a technical person for information dissemination, performance of funding searches, and database management; and a professional staff member to provide faculty assistance, such as editing.

Colleges and universities smaller than the one illustrated in Figure 1, however, may simply have the director of the office handle the functions of proposal development.

---

and information dissemination while a part-time clerical person would manage proposal submission.

Large centralized pre-award offices may be organized in a variety of ways. Some universities assign pre-award staff to academic colleges/schools or disciplines. Others arrange their pre-award staff according to sponsoring agency. Each approach has advantages and disadvantages. In the example below (Figure 2), this university has organized its functions along traditional divisions of responsibility. This university employs 12 FTE (full-time-equivalent) staff, not including clerical support, to manage “proposal submission and management,” “proposal development” and “proposal assistance.” Additional staff members perform the functions of information dissemination, information technology, subawards, and internal grants.

At large decentralized universities, the pre-award office may only coordinate the information databases, the transmission of proposals, and the negotiation of
subawards. All the other pre-award functions, e.g., “proposal development” and “proposal assistance,” if performed at all, are managed at the college/school or departmental level. In Figure 3, for example, eight pre-award staff members transmit annually over 4,000 grant and contract submissions.

While most research administrators agree that every university, regardless of size and complexity, should have a central pre-award office that manages proposal review, approval, submission, negotiation, and acceptance, not all agree about the necessity and location of other pre-award services. Some research universities maintain that the faculty should already know how to prepare proposals, and consequently, do not provide editorial assistance, grant-writing workshops, and funding searches.

Other universities maintain that these pre-award support activities are an important service to the faculty. For those universities, some provide support at the departmental or college level, where the research administrator has more personal contact with the faculty member, while other universities offer those kinds of pre-award services centrally, maintaining that it is more efficient to provide the faculty with a “one-stop shop” approach to research administration. Either approach can be effective, depending upon the strength of the communication among offices and the quality of services provided.
Staffing
A review of a number of university Web sites reveals a wide variety in how universities staff their pre-award offices, as summarized below:7

◆ Some universities employ a team approach where two or three research administrators manage a proposal from “cradle to grave.” This “portfolio” approach provides the faculty member with personalized grant support.

◆ Other pre-award offices assign staff to manage all proposals for a particular sponsor. In this approach, staff is able to gain a great deal of knowledge about a specific set of agencies, which can be a significant help to faculty.

◆ A third approach is to dedicate staff to a group of academic disciplines. In this way, staff becomes familiar with the needs, funding sources, and styles of particular disciplines.

Regardless of the manner in which the staff is organized, there are some basic functions pre-award personnel typically perform. The following is a generalized typology of staffing; universities may use different titles and may assign responsibilities differently.

◆ **Budget Specialist**
  - Assists faculty in developing proposal budgets
  - Maintains current knowledge of institutional and sponsor allowable costs
  - Assists faculty with indirect cost calculations and fringe benefit rates

◆ **Proposal Development Specialist**
  - Assists faculty with proposal editing
  - Develops interdisciplinary and collaborative projects
  - Presents proposal writing and grantsmanship workshops
  - Assists faculty in developing fundable projects
  - Maintains current knowledge of funding priorities and trends

◆ **Information Specialist**
  - Maintains current knowledge of sponsor programs, priorities, and funding trends
  - Conducts funding searches for faculty
  - Assists faculty in accessing automated funding databases
  - Maintains a library of sponsor information

---

7 See for example, University of Wisconsin, Madison (www.wisc.edu), University of California, Irvine (www.uci.edu), University of Kentucky (www.uky.edu), New York University (www.nyu.edu), University of Kansas (www.ku.edu), Washington University (www.wustl.edu), and Southern Illinois University Edwardsville (www.siue.edu).
• Assists with obtaining agency guidelines

◆ **Grants and Contracts Specialist**
  • Assists in the negotiation of grants and contracts
  • Assists in the preparation of subawards

◆ **Proposal Submission Specialist**
  • Submits proposals, electronically and in print
  • Assures that all approvals and compliance requirements have been secured
  • Coordinates the certifications and authorizing signatures

Regardless of how pre-award offices are organized or how they are staffed, pre-award services are intended to facilitate and expedite the grants process for the faculty. The following discussions (on pages 2505:7-13) are a broad presentation of many of the types of pre-award services offered by universities. As stated previously, the mission, size, and culture of the university determines to a large extent the exact nature of its pre-award services.

### Proposal Development

Pre-award offices cannot really initiate grant proposals. Only faculty and researchers can initiate proposals. However, pre-award offices can stimulate the development of proposals by providing a variety of activities and programs. Discussed below are four different programs employed by universities to further proposal development.

#### Dissemination of Funding Information

There is little doubt that knowledge of sponsor interests and limitations is the best basis for preparing a competitive grant proposal. Many pre-award offices, consequently, target funding information to faculty about grant opportunities, proposal deadlines, and funding priorities for a variety of potential sponsors. Today, most universities subscribe to one of the many electronic databases that automatically notify individual

---

faculty of upcoming funding opportunities. In addition to this service, many pre-award offices conduct individual funding searches for faculty as well as target funding information to specific individuals.

Disseminating information to faculty may involve more than just funding opportunities. Some pre-award offices also provide information on changes in federal regulations, congressional appropriations information, and other relevant news to the faculty. Lastly many offices publish, either electronically or in print, newsletters as well as other types of publications that provide general information to the faculty and staff about grants. Regardless of the techniques employed or the kind of information disseminated, research administrators have noted the importance of disseminating funding information in helping faculty and staff members develop grant proposals.

**Faculty Workshops**

Many pre-award offices sponsor a variety of workshops for faculty and staff for the purpose of helping them develop grant skills. At a number of universities, these kinds of activities are conducted at the departmental level. Sometimes these workshops are held in conjunction with the central office. Regardless of who sponsors the workshops, typical topics cover subjects such as budget preparation, proposal submission processes, proposal review, intellectual property, and funding information.

Some universities also conduct workshops and seminars on effective proposal writing. Often these programs are targeted to junior faculty members and are more comprehensive than what can be provided in an afternoon workshop format. Universities also typically invite sponsor representatives to campus to conduct sessions for the purpose of helping researchers understand in more detail the interests of a particular agency or program.

**Internal Grant Programs**

Some pre-award offices coordinate university sponsored research programs. Typically the purpose of these dollars is to stimulate the development of external grants by helping the faculty gather data and develop preliminary results for a larger study. University sponsored research can also help as a bridge for senior faculty when funding agendas change or funding priorities shift. Regardless of the purpose, these kinds of programs can be effective tools for pre-award offices in helping faculty develop external proposals. For a number of predominantly undergraduate institutions, internal grant programs are very important components to helping faculty develop grant proposals.

---

10 For example, the University of Kansas has a program entitled “Research Administration 101,” which is a 20-hour course on the fundamentals of research administration for faculty and staff. Southern Illinois University Edwardsville (SIUE) offers a five-week grant-writing program for new members of the faculty in the summer immediately following their first year of employment at SIUE.
Interdisciplinary and Institutional Proposals

A number of pre-award offices serve the important function of bringing researchers together from different disciplines to respond to either interdisciplinary or institutional funding opportunities. Bringing faculty together can be critical to the development of multi-investigator grants, such as National Institutes of Health (NIH) construction grants, center grants, and training grants. It is also important in helping investigators from different disciplines collaborate on multidisciplinary grant proposals.

 Proposal Assistance

Universities may offer a variety of proposal assistance services. While the principal investigator (PI) is responsible for the quality and veracity of a proposal, pre-award offices can offer assistance that helps investigators get their proposals ready for submission by providing editorial help and budget assistance, and by acting as an agency liaison. Providing PIs policy manuals and guides and general institutional background information also can be useful in proposal development.

Editing Services

Editing can range from line editing for grammar and syntax to commenting on a proposal’s consistency and internal logic. Editing also typically includes a check to assure that the proposal is consistent with agency guidelines. For most pre-award offices, editing is offered as a service to investigators and never as a requirement.

Budget Assistance

Nearly all pre-award offices offer some kind of assistance to the faculty in preparing grant budgets. For a number of universities, assistance with the proposal budget is provided at the departmental level. For others, the central office provides this service as well. Assistance with the budget can be very valuable for both the investigator and the institution. It can eliminate arithmetic errors, assure compliance with agency and university regulations, and resolve difficult issues such as release time and cost sharing. Equally important, budget assistance can help assure that the investigator prepares a realistic budget. A budget that fails to request an adequate amount of funds is just as fatal to a proposal as one that requests an unrealistically large sum of funding.

Agency Liaison

Pre-award offices at a majority of universities act as a liaison in some fashion between the investigator and the sponsoring agency. The pre-award office can provide a valuable service to investigators by clarifying with sponsors the agency guidelines, the funding priorities, and other information specific to a proposal. For some pre-award offices, these services also include travel funds for investigators to visit directly with potential sponsors.

It should be noted that the pre-award office agency liaison services are distinct from the functions of governmental relations. Governmental relations, often managed at the vice presidential or presidential level, are typically focused on larger university-wide concerns, as opposed to the project-specific issues addressed by the agency liaison functions of the pre-award office.
Manuals and Guides
Some pre-award offices prepare manuals for investigators as guides to services and sources of pertinent information on a variety of issues. Some manuals have basic information such as fringe benefit rates, indirect cost rates, and instructions on how to submit a proposal. Other types of guides include those on pertinent university policies — such as conflict of interest, intellectual property, and misconduct in research. Often these manuals and guides are provided on a Web site rather than in print form. Grants manuals and guides can be convenient references for faculty as they prepare proposals.

Institutional Information
A number of pre-award offices provide to investigators institutional information on the university and the region. Being given this kind of “boilerplate” information saves investigators considerable time and effort. It also serves the purpose of assuring that proposals have consistent and accurate information about the institution and the community. Boilerplate information can range from simple factual information on the institution — such as enrollment, types of academic programs, and size of research volume — to narrative descriptions about the university, its mission, academic goals, and accomplishments.

12505.5 Proposal Review and Approval
The review and approval of a proposal generally involves consideration of its quality, fiscal requirements, and compliance with university and sponsor policies and regulations. Although universities follow a variety of approaches for reviewing and approving proposals, this activity is considered the sine qua non of pre-award services.

Quality Review
Not every university considers a review of a proposal’s quality to be its responsibility, much less a service it should provide. Those pre-award offices that do review a proposal’s quality are very mindful of issues of academic freedom and research integrity. Further, since few offices have the expertise to critique a proposal’s technical merit, reviewing a proposal is typically limited to basic quality control, i.e., assurance that the proposal is clear and that it is representative of the university. Quality review is not intended to be an evaluation of the merit of a proposal. Such reviews and judgments are the responsibility of department chairs and deans.

Budget Review
Departments, schools and colleges, and the university review and approve proposal budgets. Budgets are checked for compliance with guidelines and with university policy. They are also carefully reviewed for commitment of university resources, whether those resources are the time and effort of the investigator or other forms of cost sharing, such as space. A number of issues can arise in the review of budgets, such as the commitment of university resources in the proposal narrative not reflected in the budget, a discrepancy between what a sponsor allows for costs and what the university policy permits, and the application of the appropriate F&A rate. Sometimes investigators apply the wrong F&A rate to a budget, and sometimes investigators wish to use a
lower rate for various reasons. Regardless of the circumstances, the pre-award office is responsible for assuring that the correct F&A rate is applied to the budget.

**Compliance Review**

In the review and approval of proposals by pre-award offices, proposals are checked to assurance compliance with agency and university policies. Whether emanating from the sponsor or the university, policies can be complicated and delicate. All are significant. A major task of pre-award offices is to assure that the proposal is in compliance with all relevant policies and regulations. Ethical compliance, such as the protection of human subjects and the care and use of laboratory animals, may or may not be housed in the pre-award office. Nevertheless, the pre-award office needs to know when proposals require Institutional Review Board (IRB) and Institutional Animal Care and Use Committee (IACUC) review.

**Internal Competitions**

A number of sponsors limit the number of proposals that may be submitted from an institution to a particular competition. Often the pre-award office is charged with the responsibility of coordinating the internal competition to determine which proposal the university will submit. This task can be politically sensitive and requires careful management. Many pre-award offices rely upon a faculty committee to make the decision on which proposal is submitted by the institution.

### Proposal Submission

Proposal submission is more than the physical transmission, whether electronic or print, of a proposal to a potential sponsor. Proposal submission also involves the process of assuring that all university reviews and approvals have been obtained for the proposal. Since the university is accepting the legal responsibility for the proposal, it is critical for the pre-award office to manage carefully the reviews and approvals during the submission process.

**Obtaining Approvals**

In addition to the aspects of approval and review described above that the pre-award office independently performs, the pre-award office must assure that all relevant units have also performed those same functions. As part of the proposal submission process, the pre-award office must check that all appropriate officials have “signed off” on the proposal before it is submitted. Proposal submission includes checking to make sure that all the forms are properly completed, that the information is correct, and that the certifications and representations have been signed.

**Submission**

Prior to the 1990s, submission of proposals involved copying and mailing. Today most proposals are submitted electronically. Despite being relieved of the burden, for example, of collating 30 copies of a proposal with five extra copies of the face sheet and two extra copies of the investigator’s curriculum vitae, being careful to bind but not
staple, and rushing it to a mail service to guarantee delivery by the deadline date, submission processes remain demanding and unyielding.

The pre-award office must now understand the different electronic systems employed by various agencies and deal with interrupted Internet services as well as software and hardware issues. A number of federal agencies working with the Federal Demonstration Partnership and the Office of Management and Budget (OMB) are seeking a common federal electronic submission process through Grants.gov. Regardless of the system used, proposal submission remains a basic function of pre-award offices. (For a full discussion of electronic proposal submission and Grants.gov, see Chapter 900.)

\(\text{2505.7 Negotiation and Subawards}\)

Although a number of universities do not include the negotiation of awards and the development of subawards as part of their pre-award services, many universities do incorporate these activities into the pre-award office. Although administering contracts and subawards are discussed in separate chapters of the Guide, it is appropriate to summarize some basic points from the perspective of pre-award services. (For a full discussion of administering research contracts and subawards, see Chapters 2700 and 3700, respectively.)

**Award Negotiations**

There are three major components to negotiate in an award:

1. Scope of the research
2. Budget
3. Terms and conditions

Negotiations concerning the scope of the project must involve the investigator and must be coordinated closely with changes in the budget. The role of the pre-award office is to assure that there are no implicit or explicit obligations in the performance of the project that cannot be accomplished given the amount of time and budget. Typically the scope of a project is reduced as a result of budget decisions or cuts in funding.

The terms and conditions of an award cover a variety of issues. Patents and copyrights, termination, audits, indemnification, insurance, period of performance, cost principles, payment schedules, and financial reporting are only some of the terms and conditions that are often negotiated in an award. Depending upon the award mechanism — whether it’s a grant, contract, or cooperative agreement — and upon the sponsor — whether federal, state, or private — the terms and conditions will vary significantly. Federal grants and contracts, for example, are governed by public law, executive order, OMB circulars, agency policies, and procurement regulations, such as the Federal Acquisition Regulation (the FAR). Typically there is not much flexibility in negotiating

---

\(^{11}\) Information on the Federal Demonstration Partnership can be found at its Web site: www.thefdp.org.
federal terms and conditions in grants unless it is a reduction in the budget and the scope of the work. For federal contracts, negotiations are conducted within the context of the FAR. For either grants or contracts from private organizations, foundations, and industry there is much greater flexibility and variability in negotiating terms and conditions. Additionally private and public sponsors often differ in their concern over a variety of issues ranging from intellectual property to liability and indemnification.

Negotiating all three aspects of an award — scope, budget, and terms and conditions — requires highly skilled personnel in the pre-award office. In addition, pre-award offices often will need the help of the university’s legal counsel to understand and negotiate some of the terms and conditions of a grant or contract.

**Subawards**

The development of subaward agreements between universities and other nonprofits that also operate under OMB Circular A-110 has become much simpler over the past two years because of the work of the Federal Demonstration Partnership. Regardless, it is important to have skilled individuals who can develop subaward agreements for the university. Even when making a subaward with another A-110-governed university, the grant project or the university may require special provisions or terms in the agreement. Additionally, when collaborating with other kinds of institutions, the pre-award staff needs to be aware of a variety of issues that arise with agreements, such as payment schedules, flow-down provisions, and subrecipient monitoring. (For a full discussion of subawards, see Chapter 3700.)

12505.8 **Award Acceptance**

All grants and contracts must be formally accepted by the university to complete a legal agreement between the sponsor and the university. The process by which a university accepts an award typically follows the same review and approval process the institution employs when a proposal is first submitted. The formal acceptance of the award is the signal for the activation of the project.

**Acceptance Process**

After an award notification arrives, and after the budget, the scope, and the terms and conditions have been negotiated, the pre-award office begins the formal process of coordinating the legal acceptance of the grant or contract. Just as when the proposal was first submitted, the department head and school or college dean typically review and approve the award before the central pre-award office moves the award through the remainder of the acceptance process. For some institutions, legal counsel must also review and approve the award before the authorizing institutional official accepts the award for the university.

---

12 The Federal Demonstration Partnership developed a National Subaward Model Agreement Form. The Subaward Agreement Form was endorsed by the Research Business Models Subcommittee of the National Science and Technology Council in January 2005. The Subaward Model Agreement may be used by all universities and nonprofits subject to OMB Circular A-110.
Award Activation

After the authorizing institutional official has accepted the award, the pre-award office typically is responsible for activating the award. At the very least, the pre-award office should distribute copies of the award instrument and budget to relevant university offices, such as the investigator, department chair, school/college dean, and accounting office. In addition to distributing copies of the award documents, some institutions also prepare and distribute an “award summary” that highlights important award requirements.

Notifying the university that an award has been accepted may be all for which the pre-award office is responsible in terms of activating an award. For other universities, the pre-award office may be the unit that actually establishes a grant account for the award. It may also be responsible for initiating all subawards to collaborating institutions.

Issues and Factors Critical for Success

Colleges and universities offer a wide variety of pre-award services to their faculty and staff. Not all large institutions have the full range of services described above, nor are all of those services required for fostering and supporting a large volume of grants and contracts. Colleges and universities employ a variety of strategies and combinations in pre-award services that result in highly successful operations. The California Institute of Technology, for example, confines its pre-award services to proposal approval and review, proposal submission, award negotiation, and award acceptance/initiation. At the other end of the spectrum, New York University provides the full range of pre-award services with an estimated 50 percent of its staff effort devoted to proposal assistance to researchers. Between these two examples is the University of California-Irvine, which describes itself as having a partnership in pre-award services with departmental and school/college units, where the central office supplements many of the proposal assistance functions of the units but also manages the unique functions of proposal review and approval.13

Regardless of the extent of services or how those services are organized, there are some common issues and factors affecting the success of pre-award offices.

The first critical issue affecting the success of pre-award services is recognizing the important role of centralized pre-award services in all universities. Whether the institution has extensive or limited services, most research administrators recognize the importance of a centralized pre-award office to assure consistency of proposal review and approval.14 In addition to review and approval, many research administrators also

---

view strong centralized pre-award services as critical because of the “accretion of regulation.” As one colleague stated, “one can’t overemphasize the importance of having a single point of contact for receiving and conveying information” about expanding rules and regulations governing research grants and contracts. The central pre-award office is the most effective unit for managing that task for the faculty.\(^{15}\)

A second issue for pre-award offices is assessing the effectiveness of their services. For example, given the rapid expansion of automated databases and their growing sophistication in identifying funding opportunities, a number of pre-award offices have begun to reassess their approaches to disseminating funding information. Since faculty can conduct their own funding searches and receive targeted electronic funding updates weekly, if they wish, many centralized pre-award offices have discovered that devoting significant time and effort to this task is ineffective and inefficient.

Another area that some pre-award offices have found to be less effective is conducting training workshops for faculty in sponsor regulations and university policies. This issue is paradoxical for a number of reasons. First, universities are educational institutions and the idea that training is ineffective is contrary to the reasons for their existence. Second, many federal agencies and higher education associations recommend, and in some cases, mandate, training programs for faculty. Nevertheless, some pre-award offices have found training programs to be ineffective for a number of reasons.

First, many faculty believe, rightly or wrongly, that their time is wasted in training sessions because grant regulations are a burden best left to professional research administrators to manage. Second, grant regulations can be esoteric, regardless of their importance, and providing effective training in a workshop format is extremely difficult. The challenge for pre-award offices is to find a productive means for providing the training investigators need to conduct their funded projects.

Service, most research administrators agree, is the element essential to success in pre-award offices. Nothing destroys the effectiveness of a pre-award office as quickly as an officious and rigidly bureaucratic staff. The pre-award office should stand as a buffer for the faculty against stifling bureaucracy, not be part of it. One research administrator stated that pre-award offices need to understand faculty requirements and find creative solutions to problems that are perceived as obstacles to their research.\(^{16}\)

All pre-award offices likely would agree that communication is the single most critical element to the success of their operation. Communication among offices, whether departmental, legal, or fiscal, is important in furthering all the elements of pre-award: developing proposals, assisting with proposals, reviewing and approving proposals, negotiating awards, and accepting awards. Communication with the faculty is equally important. Personal meetings help overcome the shortcomings of formal training, buffer against the coldness of the bureaucracy, and address the need to understand the faculty point of view.

\(^{16}\) Peggy Lowry, Oregon State University, to the author, Nov. 14, 2005.
Special Issues for Predominantly Undergraduate Institutions

The size, mission, and culture of a predominantly undergraduate institution (PUI) significantly affect the role of grants and contracts at those colleges and universities. Typically the teaching load and the promotion and tenure policies make sponsored programs more of an extramural activity that is less critical for a faculty member’s career advancement than, for example, the individual’s performance in the classroom. This role for grants and contracts impacts the pre-award office in two broadly significant ways.

First, it means that many pre-award offices need to put extra emphasis on development activities designed to stimulate grant activity. Second, the extramural role of sponsored programs means that the PUI pre-award office has fewer resources to support grant and contract activity. The impact of these two factors is that pre-award offices at PUIs may often have less technical expertise than their counterparts at large research institutions, but out of necessity, may be more broadly knowledgeable and inventive in their solutions to issues. The discussion below illustrates some of these special issues for PUIs.

Proposal Development Resources

The pre-award offices at a number of PUIs have very active and sophisticated proposal development programs. Many of these programs are designed to accomplish three basic goals. First, the purpose of many of these proposal development programs is to stimulate grant activity by providing incentives for faculty to participate in sponsored programs. Most of the incentives are intrinsic in nature, i.e., they provide recognition for the faculty member’s participation rather than monetary reward. Second, these programs are designed to provide the faculty with the technical skills necessary to obtain a grant. PUI pre-award offices, consequently, offer numerous workshops on proposal writing and budget preparation. Third, proposal development programs are designed to lower the obstacles to grant writing. Lowering the obstacles may mean providing something as simple as information on how to process a grant through the local bureaucracy to offering a more complicated program on funding searches and interpreting guidelines.

These same three goals of offering incentives, providing technical support, and lowering obstacles are reflected in many of the services of the pre-award office. These purposes are particularly evident in the manner in which many of the pre-award offices at PUIs have elaborate and sophisticated proposal development programs. Many of these programs are designed to accomplish three basic goals. First, the purpose of many of these proposal development programs is to stimulate grant activity by providing incentives for faculty to participate in sponsored programs. Most of the incentives are intrinsic in nature, i.e., they provide recognition for the faculty member’s participation rather than monetary reward. Second, these programs are designed to provide the faculty with the technical skills necessary to obtain a grant. PUI pre-award offices, consequently, offer numerous workshops on proposal writing and budget preparation. Third, proposal development programs are designed to lower the obstacles to grant writing. Lowering the obstacles may mean providing something as simple as information on how to process a grant through the local bureaucracy to offering a more complicated program on funding searches and interpreting guidelines.

These same three goals of offering incentives, providing technical support, and lowering obstacles are reflected in many of the services of the pre-award office. offices facilitate the grants process for the faculty. The level of personal service provided to the faculty members is often the difference between a proposal being written and submitted or not.

**Staffing and Other Resources**

The mission of undergraduate institutions naturally means most of the institutional resources are devoted to instruction. The shortage of resources, lack of adequate staff, and insufficient expertise in specific kinds of issues hamper the abilities of pre-award offices at PUIs to provide the same degree of services frequently offered by large research universities. The ability of the PUI pre-award office to overcome these obstacles often spells the difference between managing a thriving program of grants and contracts and one that remains marginal to the faculty and the institution.

One strategy employed by PUI pre-award offices is to develop partnerships with other universities. By collaborating with other undergraduate institutions or with research universities, a PUI pre-award office can find the expertise to handle a variety of issues. For example, rather than trying to develop the expertise and resources to manage human subjects compliance, the PUI pre-award office could enter into a cooperative agreement with another institution. Likewise the pre-award office could collaborate with area institutions in arranging for agency and other speakers to conduct faculty workshops.

A second strategy employed by many PUI pre-award offices is to develop a reliable network of other research administrators. Through such a network, the pre-award office can get a number of questions answered without having to develop the technical expertise itself in, for example, intellectual property or export controls. A number of helpful listservs exist for undergraduate institutions. NCURA also manages an electronic “Neighborhood” for PUIs that addresses a variety of issues for undergraduate institutions. These forums as well as developing personal networks are extremely beneficial in helping PUI pre-award offices overcome some of their special challenges. (For an in-depth discussion of special issues for PUIs, see Chapter 2300.)

**2505.11 Conclusion**

Pre-award offices, their structure and staffing, vary greatly among universities and colleges, as do the extent and nature of their services. Regardless, effective pre-award offices understand the academic context in which they operate and recognize the critical role sponsored programs play for the faculty and for the institution. Successful pre-award offices also understand above all else their critical role in managing the grant and contract process for the faculty.
This section includes expanded coverage of topics relating to pre-award administration. These materials are culled from a variety of authoritative sources.

**Reviewing the Multiple PI Option for Applications**

AIS editors

The complexity of scientific problems and the growth of interdisciplinary research are driving an increase in the number of multiple principal investigator (PI) projects being undertaken. The addition of such projects on federal grant applications arose partly in recognition of recent scientific breakthroughs involving collaborative efforts. Besides facilitating and encouraging these types of projects and research, allowing multiple PIs provides excellent training opportunities for graduate students and post-docs.

**Background**

In January 2005 the Office of Science and Technology Policy (OSTP) issued a directive to all federal agencies to allow multiple PIs on applications. OSTP’s Request for Information (RFI) to the broader scientific community, published July 2005 (70 Fed. Reg. 41226, July 18, 2005), posed a series of questions around each agency’s implementation plan.

**Agency Implementation.** In September 2007 OSTP and the Office of Management and Budget issued a “notice of policy on recognition of multiple Principal Investigators (PIs) on awards made under federal research and research-related programs” (72 Fed. Reg. 54257, Sept. 24, 2007). The policy directs federal agencies to recognize multiple PIs on research projects, but does not replace the use of the single PI when that is most appropriate for a project.

For purposes of the policy, a principal investigator is defined as the following:

A Principal Investigator is the individual(s) a research organization designates as having an appropriate level of authority and responsibility for the proper conduct of the research, including the appropriate use of funds and administrative requirements such as the submission of scientific progress reports to the agency. When an organization designates more than one PI, it identifies them as individuals who share the authority and responsibility for leading and directing the research, intellectually and logistically. The sponsoring agency does not infer any distinction in scientific stature among multiple PIs.

The policy notes that naming multiple PIs for a proposed research project “is solely at the discretion of the proposing institution(s).” Further, the policy does not intend to alter existing collaborative processes and that institutions will continue to have flexibility in such proposed arrangements.

Each agency’s implementation plan will include the following elements:
Worth Noting?

A recent study suggests fostering the multiple PI approach because it could be more productive than solo work. The study, a review of 19.9 million papers published in the past 50 years and of 2.1 million patents, found that “teams increasingly dominate solo authors in the production of knowledge. Teams typically produce more highly cited research than individuals do, and this advantage is increasing over time,” the authors report. The study, appearing in the magazine Science, provides details for the sciences and engineering, social sciences, arts and humanities, and patents. Link to abstract: www.sciencemag.org/cgi/content/abstract/1136099.
National Science Foundation

NIH Policies
The National Institutes of Health’s (NIH) creation of a multiple PI option on research grant applications culminated in February 2007 after nearly four years of discussions, task forces, directives, and requests for information (RFIs).1

NIH issued a final rule amending its regulations to revise the definition of principal investigator to include “one or more individuals designated by the grantee in the grant application . . . who is or are responsible for the scientific and technical direction of the project.” The definition of principal investigator is in section 52.2 and the conditions for multiple or concurrent awards in section 52.6, paragraph (d) of its Grants for Research Projects regulations, codified at 42 CFR part 52. The final rule, published in the November 10 Federal Register, was effective December 10, 2009.2

The change came as part of the NIH Roadmap for Medical Research (http://nihroadmap.nih.gov). The change is also in keeping with the January 2005 directive from the Office of Science and Technology Policy to all federal research agencies.

AAMC’s Recommendations. In response to OSTP’s RFI in July 2005, the Association of American Medical Colleges (AAMC) stated support for the definition of principal investigators as “individuals who share the major authority and responsibility for leading and directing the project, intellectually and logistically.”3 Offering linked awards directly from federal agencies in contrast to a subcontract model for PIs at different institutions was also encouraged by the association. However, AAMC added that there are some instances where a subcontract arrangement would serve as a more

---

effective arrangement for certain projects, such as those where a secondary institution
does not have a PI and makes a limited scientific contribution. AAMC strongly sup-
ported a proposal that agencies’ databases track apportionment of research project
budgets to the leaders of the project team.

Specific Requirements. Applicants and their institutions may identify more than
one PI to NIH in most research grant applications submitted electronically through
Grants.gov using the SF424 R&R application package. Grant applications that cur-
cently accommodate more than one PI include: R01, R03, R13/U13, R15, R18/U18,
R21, R21/R33, R25, R33, R34, R41, R42, R43, and R44 (see http://era.nih.gov/Elec-
tronicReceipt/strategy_timeline.htm). Applications that still do not allow more than
a single PI are individual career awards (K08, K23, etc.), individual fellowships (F31,
F32, etc.), dissertation grants (R36), director’s pioneer awards (DP1), and Construc-
tion Grants (C06/UC6), Grants for Repair, Renovation and Modernization of Exist-
ing Research Facilities (G20) and Shared Instrumentation Grants (S10). The restric-
tion to a single PI will be described in announcements for those programs. Multiple
PIs may be identified on some paper applications submitted on PHS 398 application
forms, however, the multiple PI option must be clearly specified in the Request for
Applications or Program Announcement.

Awards involving PIs at different institutions will be managed using a subcon-
tract model. Developing a system of linked awards is under NIH consideration.
A Web site specific to NIH’s multiple PI implementation is accessible at http://

Department Rankings. NIH tracks its funding of medical research and other
support and annually compiles this information. NIH has announced that it will no
longer provide comparative ranking tables on its medical research funding. Instead,
it has developed a Web-based tool that allows institutions to access the data. The
tool also allows for downloading aggregate data, on a per fiscal year basis. Award
data is accessible through NIH’s new Reports, Data, and Analyses (RePORT) Web

According to NIH this change comes in part from responses received from the
grantee community that suggested that the current ranking tables were not neces-
sary and in part by the establishment of multiple investigator awards making the
total dollar amounts of funds received by individual departments impractical. The
rankings have been used as a recruiting tool for scientists, for internal institutional
considerations, and to compare institutions with each other, and the discontinuation
has elicited mixed responses from the academic community.

‘Team’ Science. NIH says that eligible projects for the multiple PI option include
ones that clearly require a “team science” approach. The traditional, single PI model
is not meant to be replaced by this new option. Investigators interested in applying
for an award using a multiple PI model are encouraged to discuss the proposed
project with an NIH institute or center program staff member to determine whether
a multiple PI approach may be more effective. NIH says the multiple PI model
is not synonymous with “big science,” and that a project can include as few as
two PIs. However, there is no limit on the number of PIs allowed. NIH adds that the organizational structure and governance of the project director/principal investigator (PD/PI) leadership team, in addition to the knowledge, skills, and experience of the individual PD/PIs will be factored into the assessment of the overall scientific merit of the application. Multiple PDs/PIs on a project share the authority and responsibility for leading and directing the project, intellectually and logistically, according to NIH.

**Contact PIs and Leadership Plans.** When applying for an award using the multiple PI model, a contact PI must be selected. The first PI listed serves as the contact PI and must be affiliated with the institution submitting the application. This PI is responsible for communication between NIH and all of the PIs; however, the individual does not assume any supreme authority or responsibility over the project. All PIs share equal responsibility in leading and directing a project.

NIH defines a PI as “the individual(s) judged by the applicant organization to have the appropriate level of authority and responsibility to direct the project or program supported by the grant. …” All listed PIs must be registered in eRA Commons with a PI role type, and all will have access to “Status” on eRA commons (see https://commons.era.nih.gov/commons). All PIs will also be listed on summary statements and notices of grant award (NOGA).

Applications with multiple PIs will contain a new section for a leadership plan following the “Research Plan” section in PHS 398 and SF 424 R&R. The plan should describe the governance and organizational structure of the research project including the following:

- rationale for multiple PI approach;
- communication plans;
- process for making decisions on scientific directions;
- procedures for resolving conflicts;
- allocation of resources;
- intellectual property issues;
- publications; and
- each PI’s administrative, technical, and scientific responsibilities for the project.

Also, any requested allocation of funds to components of the project or the associated PIs must be included in the leadership plan.

Some in the research community have noted that the exercise of completing the leadership plan should not be taken lightly. The process of developing the plan could help PIs carefully think through the process, which could help defuse any disagreements that may arise throughout the conduct of the project. Examples of leadership plans can be found at Figure 2520.1-1.
New Investigators. NIH policies on “New Investigators” will only apply when all involved PIs are classified as New Investigators. Also, the New Investigator box on the application may be checked only when all PIs involved are classified as New Investigators. The standard five review criteria will be applied to multiple PI institutions, with the following additional text applied to the “Approach” criterion: “For applications designating multiple PIs, does the Leadership Plan ensure that there will be sufficient coordination and communication among the PIs? Are the administrative plans for the management of the research project appropriate, including plans for resolving conflicts?”

Post award, NIH will track re-allocation of funds and revisions to leadership plans through the noncompeting continuation (Type 5) application.

---

New Investigator Policies: NIH

- NIH policies related to new investigators will be applied to applications only when all PIs involved are classified as “new investigators.”
- The New Investigator Box on the application may be checked only when all PIs involved are classified as “new investigators.”
- For the purpose of classification as a “new investigator,” serving as a PI on a multiple PI grant will be equivalent to serving as a PI on a single PI grant.

---

Figure 2520.1-1: Examples of Project Leadership Plans 
For Multiple PI NIH Grant Applications

According to NIH, for multiple PI applications, a new section for Leadership Plans (PHS 398, Section I) must be included, unless the request for application (RFA) announcement requests the information be provided in another section. There are no page limitations for Section I. Leadership Plans should address the following administrative processes and PI responsibilities:

• Roles/areas of responsibility of the PIs
• Fiscal and management coordination
• Process for making decisions on scientific direction and allocation of resources
• Data sharing and communication among investigators
• Publication and intellectual property (if needed) policies
• Procedures for resolving conflicts

Examples of Single Project Leadership Plans

Examples of Leadership Plans for single project applications (i.e., R01, R21, etc.) are provided below. (Applicants should follow any special instructions in the specific RFA/PA to ensure the requested information and format is included.)

Example 1

PI#1 and PI#2 will provide oversight of the entire Program and development and implementation of all policies, procedures, and processes. In these roles, PI#1 and PI#2 will be responsible for the implementation of the Scientific Agenda, the Leadership Plan and the specific aims and ensure that systems are in place to guarantee institutional compliance with U.S. laws, DHHS, and NIH policies including biosafety, human and animal research, data and facilities.

Specifically, PI#1 will oversee aim 1 and be responsible for all animal research approvals. PI#2 is responsible for aims 2, 3, and 4 including the implementation of all human subjects research and approvals. PI#1 will serve as contact PI and will assume fiscal and administrative management including maintaining communication among PIs and key personnel through monthly meetings. He will be responsible for communication with NIH and submission of annual reports. The responsibilities of the contact PI will be rotated to PI #2 in even years of the grant award. Publication authorship will be based on the relative scientific contributions of the PIs and key personnel.

Example 2

PI#1 at Institution A will be responsible for the oversight and coordination of project management for aim 1 involving the molecular design and production of vectors expressing tumor specific antigens. PI#2 at Institution B will be responsible for aims 2 and 3 including the in vivo and in vitro testing of vaccines. Each PI will be responsible for his own fiscal and research administration.

The PIs will communicate weekly, either by phone, e-mail, or in person, to discuss experimental design, data analysis, and all administrative responsibilities. All PIs will share their respective research results with other PIs, key personnel, and consultants. They will work together to discuss any changes in the direction of the research projects and the reprogramming of funds, if necessary. A publication policy will be established based on the relative scientific contributions of the PIs and key personnel. PI#1 will serve as contact PI and be responsible for submission of progress reports to NIH and all communication.

Intellectual Property. The Technology Transfer Offices at Institutions A and B will be responsible for preparing and negotiating an agreement for the conduct of the research, including any intellectual property. An Intellectual Property Committee composed of representatives from each institution that is part of the grant award will be formed to work together to ensure the intellectual property developed by the PIs is protected according to the policies established in the agreement.

continued
Figure 2520.1-1 (continued)

Conflict Resolution. If a potential conflict develops, the PIs shall meet and attempt to resolve the dispute. If they fail to resolve the dispute, the disagreement shall be referred to an arbitration committee consisting of one impartial senior executive from each PI’s institution and a third impartial senior executive mutually agreed upon by both PIs. No members of the arbitration committee will be directly involved in the research grant or disagreement.

Change in PI Location. If a PI moves to a new institution, attempts will be made to transfer the relevant portion of the grant to the new institution. In the event that a PI cannot carry out his/her duties, a new PI will be recruited as a replacement at one of the participating institutions.

Example 3

PI#1, PI#2, and PI#3 will serve as PIs for the project. PI#1 will be responsible for the gene expression studies. He will supervise Technician #1 for all microarrays. PI#2 will be responsible for the endothelial cell studies and flow cytometry studies proposed in the grant. She will supervise the Technician #2 at 50% effort for the flow cytometry studies and the post-doc for the endothelial cell studies. PI#3 will oversee all bioinformatics work in the gene expression and flow cytometry studies and will work with PI#1 and PI#2 on all data analysis.

The PIs will form a Steering Committee (membership may include PIs, key personnel, consultants, etc.) that will manage the oversight and coordination of project management, research administration, publications and data sharing, and integration of all resources needed for the project. The Institution will subordinate the award funds and each PI will be responsible for his own budget. The Steering Committee will oversee decisions on minor changes in research direction and have the authority to reallocate funds and resources between PIs. PI#1 will serve as Chair of the Steering Committee and be responsible for communication among PIs, including meeting schedules and agendas. The position of Chair will rotate among the PIs on a yearly basis. PI#2 will be designated the contact PI and be responsible for submitting all necessary documents to NIH, including IRB approvals, and annual progress reports.

Intellectual Property. The PIs will grant necessary access rights to the pre-existing patents and or the patents potentially generated within the frame of this project for the purpose of this research project to all the other PIs and key personnel on a non-exclusive royalty-free basis. Each PI shall take appropriate measures to ensure that he/she can grant these access rights. Right in any pre-existing intellectual property will remain the property of the party that created and/or controls it.

Conflict Resolution. If a potential conflict develops, the appropriate Departmental administrators representing the PIs shall meet and attempt in good faith to settle any dispute, claim, or controversy arising out of or relating to the interpretation, performance, or breach of this disagreement. However, if the Departmental administrators fail to resolve the disagreement within thirty business days, then such disagreement shall be referred for resolution to a designated senior executive of the parties who has the authority to settle the disagreement but who is not directly involved in the disagreement.

Change in PI Location. If one of the PIs moves to a new institution, attempts will be made to transfer the relevant portion of the grant to the new institution. In the event that a PI cannot carry out his/her duties, a new PI will be recruited as a replacement, subject to the approval of the Steering Committee and the Institution.

Future Considerations. NIH may in the future implement a linked award model for multiple PI projects involving PIs located at more than one institution. A disadvantage of the subcontract model is that the prime institution has additional administrative and financial burdens. The institution must submit noncompeting and competing grant renewals. However, the linked awards model also has its disadvantages, including budget allocation based on individual PI percent effort; less control by contact PI over the leadership plan; and preparation of closeout documentation including financial statement, scientific progress, and inventions.

Another future development may concern the creation of data systems. The OSTP memo requires all agencies to make multiple PI data available in award data systems. However, no deadline has been established and agencies are at different points in this process.

Another issue that some in the research community believe needs resolution is the lack of a minimum percent effort (e.g., 15–20 percent) mandated for PIs listed on projects. Physician scientists may have limited time to commit even 10 percent, but still contribute enormous intellectual capital to an investigation. Some also contend that all PIs should have equal access to the NIH study section and recognition and add that not just a contact PI should be given this access.

NIH has indicated that it is also looking into the following with respect to multiple PI projects: (1) the ability to recognize non-PI key contributors to the project and (2) the desirability of formally apportioning funds under a grant to various components of a project or the PIs associated with those components.
**Multiple PIs at NSF**

Policies and procedures for multiple PIs on NSF applications differ slightly from NIH. NSF notes that it has permitted multiple investigators on NSF proposals since 1963. NSF defines a principal investigator as “the individual(s) designated by the proposer, and approved by NSF, who will be responsible for the scientific or technical direction of the project. NSF does not infer any distinction in scientific stature among multiple PIs, whether referred to as PI or co-PI. If more than one, the first one listed will serve as the contact PI, with whom all communications between NSF program officials and the project relating to the scientific, technical, and budgetary aspects of the project should take place. The PI and any identified co-PIs, however, will be jointly responsible for submission of the requisite project reports.”

Like NIH policy, all PIs on NSF projects share responsibility for proper conduct of the project.

**Application Information.** NSF allows a total of five PIs on projects and proposals with PIs at different institutions. Applications may be submitted as a single proposal from one institution that includes subawards information with the collaborating institutions or as a separately submitted proposal from each institution. If using by the latter method, the lead organization’s submission shall include:

- cover sheet;
- project summary;
- project description;
- references cited;
- facilities, equipment, and other resources for the lead organization;
- biographical sketches for senior personnel from the lead organization;
- current and pending support for senior personnel from the lead organization; and
- budget and budget justification for the lead organization.

The nonlead organizations shall include in the application all except the project summary, project description, and references cited. The NSF FastLane system combines separate proposals into a single one for review purposes (www.fastlane.nsf.gov). PIs may use FastLane to access review and award information and check the status of pending actions. In NSF applications, a separate management plan for allocating funds among PIs is not required unless mandated in the funding opportunity. According to the NSF, there has been a steady increase in the fraction of proposals received, of awards made, and of the agency’s budget invested in multiple PI projects over the past two decades. However, single PI proposals still enjoy a higher success rate, according to the agency.

---

5 See the NSF “Grant Proposal Guide” (NSF 10-1) available online at www.nsf.gov/pubs/policydocs/pappguide/nsf10_1/nsf10_1.pdf.
Additional Considerations

The deployment of a multiple PI option on federal award applications at federal agencies brings forth a host of considerations about how to handle matters such as internal credit, allocation of funds, leadership plans, and reports.

Universities should consider whether to use double-counting or allocation to recognize PIs in reports. In the double-counting method, each investigator is credited in reports with the full amount of the award. With the allocation option, each investigator is allocated a portion of the award, which could be based on projected expenditures or on intellectual contribution or effort or responsibility. NIH suggests that the intellectual allocation method is more realistic. The allocation timing is important if intellectual contribution is used. An institution may require allocation at the time of proposal submission, as opposed to award time, since it is often easier to get agreement for the future than the present.

Internal credit policies will also affect the financial accounting of awards. Universities must decide whether to establish separate accounts, or create one account with percentage allocations on its reports. The financial system should have the ability to track percentage allocations. NIH says that if the allocation method is used, the allocation will be noted as a footnote to the grant award, and the institution retains the right to rebudget among allocations as necessary.

Institutions should consider how the data from the credit and allocation methods will be used in promotion and tenure processes, in addition to space allocation. Universities need to establish standards for leadership plans, and they should address in the plans whether one investigator will be responsible for the finalization and completion of any required reports for NIH. A reminder: The agency says that all PIs share equal responsibility and that a designation of a lead PI is only for communication purposes. However, addressing upfront the responsibility of drafting and completing reports is helpful for all PIs involved in a project.
Reporting Financial Support from Other Sources — Overview and Risk Assessment

Ann M. Lichter, Grants & Contracts Practice, Hogan & Hartson LLP, Washington, DC

The reporting of financial support from other sources is a risk area that has not been the focal point of any of the recently reported federal investigations of universities and research institutions, but the issue nonetheless deserves close attention, if only because the potential risks of systematic noncompliance are very high and the consequences may be severe.

This purpose of this article is to provide an overview of the applicable federal rules and to identify the issues that present the greatest problems for grantees. This article addresses the reporting of research support from other sources as required by the policies of the National Institutes of Health (NIH).

NIH Policy Guidance on the Reporting of ‘Other Support’

When applying for an award from NIH, the applicant must report all active and pending sources of other financial support for the research projects of the key personnel listed in the grant application. “Active” support includes funded research projects on which the researcher is currently working. “Pending” support refers to proposed research projects to which the researcher intends to devote effort if they are funded. Key personnel include the principal investigator (PI) and other individuals “who contribute to the scientific development or execution of a project in a substantive, measurable way, whether or not they receive salaries or compensation under the grant.”

NIH defines this category of funding from other sources (commonly referred to as “other support”) to include

all financial resources, whether federal, non-federal, commercial or institutional, available in direct support of an individual’s research endeavors, including, but not limited to, research grants, cooperative agreements, contracts, and/or institutional awards. Training awards, prizes, or gifts are not included.

Applicants must submit complete and up-to-date other support information for key personnel (excluding consultants) before an award may be made. Pursuant to NIH’s “just-in-time” procedures, other support information is submitted upon the request of NIH staff when the award application is under consideration for funding. Once an award is funded, grantees must report any changes in other support for key personnel as part of the annual progress report to NIH.

The reporting of other support at the initial application phase helps the NIH awarding officials to assess whether federal dollars should be awarded to the applicant for the proposed research, or whether because of budgetary, commitment, or scientific overlap, federal investment in the project is unwarranted. NIH does not permit overlap of any kind. By identifying and eliminating overlap, NIH aims to ensure the following:

1. Sufficient and appropriate levels of effort are committed to the project.
2. There is no duplication of funding for scientific aims, specific budgetary items, or an individual’s level of effort.
3. Only funds necessary to the conduct of the approved project are included in the award.\(^3\)

### Three Overlap Categories

NIH has identified three different categories of overlap — (1) commitment, (2) budgetary, and (3) scientific — and defined them as explained below.

- **Commitment Overlap.** Commitment overlap occurs when an individual’s time commitment to research projects exceeds 100 percent, regardless of whether salary is requested for that individual in the application. This rule is consistent with NIH’s overall requirement that no individual on the project is permitted to have commitments exceeding 100 percent of total effort.

- **Budgetary Overlap.** Budgetary overlap occurs when an application includes budgetary items, such as equipment or salary, that have already been provided for by another source.

- **Scientific Overlap.** Scientific overlap occurs when “(1) substantially the same research is proposed in more than one application or is submitted to two or more different funding sources for review and funding consideration, or (2) a specific research objective and the research design for accomplishing that objective are the same or closely related in two or more applications or awards, regardless of funding source.”\(^4\)

NIH instructs individuals to include a summary of whether an active or pending award overlaps in scientific, budgetary, or commitment terms with the work proposed in the application. If there is no overlap, a simple statement indicating as much will be sufficient.

If there is overlap, the applicant should include an explanation of how the overlap would be eliminated should the application be funded. NIH staff members consult with the principal investigator and other applicant institution officials to resolve any overlap issues at the time an award is made. Annual reporting of changes in other support for key personnel by the grantee to NIH helps to ensure that overlap does not become an issue in later grant budget periods.

\(^4\) Id.
Compliance Risks

As the Office of Inspector General (OIG) in the Department of Health and Human Services (HHS) noted in its November 2005 proposed guidance on compliance programs, material misrepresenting other support information or failing to provide other support information could subject an institution to civil or criminal fraud liability under the False Claims Act or other fraud statutes. Both the principal investigator and representative of the applicant institution certify that the grant application, including just-in-time submissions, contain true, complete, and accurate information. In its proposed compliance guidance, the HHS OIG characterized the provision of “complete and accurate” other support information as “critical” to an awarding agency’s ability to determine whether a particular application should receive funding.

Risk to Entire Award. Unlike effort reporting or cost allocation errors, which generally result only in disallowance of particular unsupported charges to an award, misrepresenting other support could put the entire award at risk. To the extent that an applicant’s misrepresentation of other support information prevents an agency from recognizing scientific overlap — an issue that potentially could cause the agency to modify the award or not fund it at all — it is conceivable that federal officials would deem the entire award invalid.

The Scope of ‘Other Support’ Reporting

The scope of the “other support” reporting requirement is quite broad but does have some limits.

Research Endeavors. First, NIH requires applicants to list only other sources of financial support related to individuals’ “research endeavors.” As the NIH policy guidance makes clear, the reporting of other support does not include salary or compensation received for teaching, training, or other non-research endeavors.

Second, the NIH grant application instructions indicate that an individual researcher should list all research endeavors in which he or she is involved, regardless of whether salary is received for any effort contributed. Specifically, the NIH instructions state that

---

5 In November 2005, the HHS OIG issued a “Draft OIG Compliance Program Guidance for Recipients of PHS Research Awards” for public comment (70 Fed. Reg. 71312, Nov. 28, 2005). In June 2006, the OIG announced that it would not be going forward with issuing final guidance. (Instead, the Research Business Models Subcommittee (http://rbm.nih.gov) of the National Science and Technology Council will be developing broader, voluntary compliance guidance.) The proposed guidance is still valuable to review, however, in that it sets forth the OIG’s “general views on the value and fundamental principles of compliance programs for colleges and universities and other recipients of PHS awards for biomedical and behavioral research and the specific elements that these award recipients should consider when developing and implementing an effective compliance program.”

6 At NSF, the OIG has been known to suggest that the misrepresentation of other support may constitute scientific misconduct, because it is a misstatement in a proposal for an NSF award.
“[c]ommitment overlap occurs when a person’s time commitment exceeds 100 percent, whether or not salary support is requested in the application.”

While this directive appears to refer only to whether salary support is requested in the application under review, the overall objective of NIH is to use the other support information to determine whether an individual’s time commitment is greater than 100 percent. Therefore, individuals must list all research endeavors, including those for which they do not receive compensation.

This instruction may seem to be at odds with the NIH definition of “other support,” which is expressed in terms of the receipt of “financial resources,” but it is important to note that even if an individual is not receiving financial support in the form of salary for his effort on a research grant, he is likely still using the outside financial resources in the form of equipment or supplies.

Third, in the past applicant institutions and individuals may have felt obligated to report only other support that an individual researcher receives through the applicant institution. Now NIH expects applicants to report all financial support from other sources that are available to an individual researcher, even if the other support does not flow through the applicant institution, but, instead, is awarded directly to the individual researcher or to another institution with which the researcher is also associated.

This requirement puts the applicant institution in the difficult position of having to certify the accuracy of the scientific, commitment, and budgetary terms of the outside support, even though the institution itself does not hold the relevant records and is not a party to the research agreement under which that support is provided. For example, it may be difficult for the applicant institution to verify an individual’s effort spent on research grants awarded through another institution, because grantees are required to report and certify only the effort spent by an individual on activities performed directly for the institution. Consequently, time spent on “outside” research projects generally will not be included in an individual’s total institutional effort. Nonetheless, NIH at least has been quite clear in stating that key personnel must include in “other support” not only institutional awards, but also “outside” research projects funded by others.

**Reporting Clinical Trials as Other Support.** A final issue worth discussing with respect to the scope of “other support” is how an individual researcher should account for his involvement in industry-sponsored clinical trials. Many researchers are engaged in multiple industry-sponsored clinical trials, most of which require very little effort or time on the part of the researcher. It is sometimes difficult to measure precisely the effort associated with each of the clinical trials because the effort amounts are generally so small and because they vary greatly depending on the phase of a particular trial. An individual researcher may question whether it is necessary to include in his list of “other support” dozens of clinical trials in which he spends less than 1 percent of effort in any given time period.

---

7 PHS 398 Instructions, Part III, p.6.
Nonetheless, NIH makes it clear that in order to comply with the reporting requirements for other support, individuals must include such clinical trials in their list of funded research endeavors. One way of doing so without listing each individual project is to report aggregate effort on the industry clinical trials as a group. This approach appears to be acceptable to NIH, as long as the aggregate effort does not exceed 10 percent. To do so, the researcher should list each clinical trial sponsor separately and provide an explanation as to why he has determined it is best to report his involvement in an aggregate form.

**Commitment and Scientific Overlap**

Given the competition for federal research dollars, it is not unusual for investigators to have multiple applications pending with different awarding agencies. While this practice is generally acceptable, there are certain guidelines that applicants must follow in order to prevent commitment and scientific overlap.

**Commitment Overlap.** As an example of commitment overlap, the OIG stated that it would be “clearly improper for researchers in award applications to separately report to three awarding agencies that they intend to spend 50 percent of their effort on each of the three awards.” The OIG seems to presume that if all three applications were awarded, there would be a clear violation of NIH’s policy that an individual’s commitments may not exceed 100 percent.

Aside from the fact that there is usually no assurance or even likelihood in such circumstances that all three proposals will be funded, this assumption ignores the interactive way in which NIH finalizes award decisions through discussion with the applicant institution and principal investigator. During this process adjustments are often made to the research proposal, including changes to level of effort for key personnel if commitment overlap is a concern. By handling the proposal review process in this way, NIH enables applicants to have multiple applications pending at one time, and doing so is acceptable as long as certain guidelines and restrictions are followed.

When submitting other support information to NIH, researchers should list the actual effort for the current budget period of active research awards. The other support information should also include all pending awards, and researchers should list their proposed effort for the initial budget period of each pending award. As explained in the NIH grant application instructions and the policy guidance regarding other support, resolution of the overlap occurs at the time of an award through discussions with the applicant institution officials, the principal investigator, and awarding agency staff.

If resolving the commitment overlap would require an individual to reduce his effort on a different NIH grant for which he is considered “key personnel,” he may need to secure advance approval from the appropriate NIH official for that award. Grantees must notify the NIH grant officer in writing if the principal investigator or other key personnel specifically named in the notice of grant award will withdraw from the project entirely, be absent from the project for a continuous period of three months or more, or reduce time devoted to the project by 25 percent or more from the
level that was approved at the time of the award. NIH must approve any alternate arrangement proposed by the grantee.\(^8\)

Finally, it is important to note that although the reporting of other support information helps NIH and grantee institutions to monitor an individual’s commitments to research projects, it does not always provide an accurate portrayal of overall effort by an individual on an institutional basis because it does not include instruction or other non-research activities. Grantee institutions should ensure through their internal proposal review procedures that the effort to which the researcher committed in a proposal is consistent with all of the researcher’s other commitments, not just his research commitments.

**Scientific Overlap.** In its discussion of reporting financial support from other sources, the HHS OIG expressed particular concern that without accurate and complete information, NIH may provide duplicate funding to a project whose research aims are already being supported by another source. NIH and the National Science Foundation (NSF) are particularly sensitive to this issue, because the two agencies sometimes have related research funding interests.\(^9\)

NIH’s policy on scientific overlap clearly prohibits applicants from proposing identical or substantially similar research projects to two or more different funding sources. The two exceptions to this general rule are K-series training awards and individual research projects that are identical to a subproject that is part of a P-series grant.

This rule does not, however, prohibit an individual from submitting applications proposing to conduct research in related but distinct parts of a larger research question. If this is the case, an applicant must take care to ensure that “a specific research objective and the research design for accomplishing that objective” are not the same or closely related in two or more applications for awards, regardless of the funding source.\(^10\) One way to help assure the awarding agency that a particular proposal is

---

\(^9\) The NSF policy on “other support” is very similar to NIH, although not set out in as much detail. Although the *NSF Grant Proposal Guide* refers only to listing current and pending other “project support,” this requirement is commonly understood to refer to research activities. *NSF Grant Proposal Guide*, II. C.2.h, p. 31. Applicants should provide the total award amount (not just the initial budget period), as well as the effort devoted to the project per year. If the combined effort on current and pending research projects would exceed 100 percent effort by the researcher, he should include a statement explaining how effort would be adjusted if the pending application is funded.

\(^10\) *PHS 398 Grant Application Instructions*, Part III, p. 6.
distinct from other related proposals would be to include a brief explanation of the relationship between the two in the other support information.\textsuperscript{11}

**Issue Merits Renewed Attention**

In some respects the requirement to report “other support” is a relatively straightforward compliance matter. Upon close examination, however, the requirement is not without ambiguity. NIH considers the review of an applicant’s active and pending other-support information to be an important part of the funding decision process, as well as a method for monitoring the ongoing commitments of key personnel.

Institutions, therefore, must make it a priority to ensure that individual researchers properly include and describe all their research activities, including those only in the proposal stage. Institutional policies and procedures related to the reporting of other support should serve as a safeguard to prevent scientific, budgetary, and commitment overlap by investigators and their institutions.

\textsuperscript{11} Unlike NIH, nearly all NSF directorates permit applicants to submit the same proposal to more than one funding source. NSF explicitly states that “[c]oncurrent submission of a proposal to other organizations will not prejudice its review by NSF.” The Biological Sciences Directorate, however, will not accept proposals that are also being submitted to other federal agencies for simultaneous consideration. Presumably, awards submitted to this directorate would be the ones most likely to duplicate NIH proposals. The only exceptions to the directorate’s rule are the following: (1) when the applicants and program officers at the relevant federal agencies have already agreed to joint review and possible joint funding of the proposal, and (2) when the award is proposed by a “beginning investigator,” i.e., one who has never served as a principal investigator or co-principal investigator on a federal award. *NSF Grant Proposal Guide, “Overview,”* p. 10.
### 2520.3 Timeline for Award Decision-Making

AIS editors

The following overviews are provided as samples of the general, standard time frame necessary for a competing application to the National Science Foundation (Figure 2520.3-1) and the National Institutes of Health (Figure 2520.3-2).

Figure 2520.3-2: NIH Grants Process At-A-Glance

**Planning, Writing, Submitting**

**Planning:** Applicant should start early, collect preliminary data, and establish internal deadlines.

**Writing:** Applicant often begins writing application several months prior to application due date.

**Submitting:** Applicant organization submits application to NIH/Division of Receipt and Referral (DRR), Center for Scientific Review (CSR) (using Grants.gov and eRA Commons for electronic submissions).

**Receipt and Referral**

**Months 1-3**

Application arrives at CSR. (Applications compliant with NIH policies are assigned for review and funding consideration.)

CSR assigns application to an NIH Institute/Center (IC) and a Scientific Review Group (SRG).

Scientific Review Officer (SRO) assigns applications to reviewers and readers.

**Peer Review**

**Months 4-8**

**Initial Level of Review:** SRG members review and evaluate applications for scientific merit.

**Priority Scores:** Available to PD/PIs on eRA Commons.

**Summary Statement:** Available to PD/PIs on eRA Commons.

**Second Level of Review:** Advisory council/board reviews applications.

**Award**

**Months 9-10**

**Pre-Award Process:** IC grants management staff conducts final administrative review and negotiates award.*

**Notification of Award:** IC issues and sends Notice of Award (NoA) to applicant institution/organization.

**Congratulations!** Project period officially begins!

*Requests additional information needed just-in-time for award.

**Post-Award Management**

Administrative and fiscal monitoring, reporting, and compliance.

APPLICATION TITLES, abstracts and statements of public health relevance that are part of your application are read by reviewers, program officers and other NIH staff, but once funded, this information is also available to the public via NIH’s RePORTER website (http://report.nih.gov/index.aspx). It is essential that the public is able to learn about the research projects in which our nation is investing. Therefore, the extramural community has a responsibility to clearly communicate the intent and value of their research to all those interested in learning more—Congress, the public, administrators, and scientists. Take every opportunity to tell people what you do, why you do it, and why they should care — clearly!

Knowing that your title, abstract and public health relevance statements will be public if your grant application is funded means that you should consider more than just reviewers when writing them. Clear, succinct language is appreciated by everyone, reviewers included. That being said, writing clearly and succinctly without compromising the science is a challenge. It is easy to lapse into familiar scientific jargon or to “utilize” elaborate words in an effort to make your writing more technical.

On the other hand, it is often difficult to strike the balance between being too scientific and too colloquial because colloquialisms can lead to misinterpretations of the research value. Nonetheless, a great idea told in a way that an educated audience can understand will speak for itself. So I encourage you to use language that best expresses the importance of your research for the portions of your application that will reach the wider community. Reviewers are being notified to expect plain language in these sections of your application. You have the rest of the application to describe the technical details of your project.

**Tips on Communicating the Value of Your Research Clearly**

- Remember that the audience reading the title, abstract and public health relevance statements may not be scientists.
- Avoid scientific jargon or technical writing.
- Communicate the bigger picture. State what you are proposing, why it is important, and explain the potential impact on public health.

---

More Paper Out the Door: Ten Inexpensive Ways to Stimulate Proposal Development

Robert Porter, University of Tennessee

Abstract
Conventional wisdom says that the way to win more awards is to get researchers writing more proposals. Yet many incentives designed to stimulate proposal development can be hard on the bottom line, especially those that pay researchers for their time or to attend grant-writing workshops presented by outside consulting firms. This paper presents ten inexpensive strategies the research office can use to stimulate researchers to write more and better proposals. Most of these techniques require little more than efficient use of existing institutional resources.

Introduction
In classic management theory, some functions are “line,” which means they relate directly to the goods or services produced by the organization, while others are “staff,” meaning they exist primarily or exclusively to support the line functions. In a university, teaching and research are line functions. Research administration, like human resources, has traditionally been a staff function. Our typical role has been to support, facilitate, and enable our institutions’ researchers in their efforts to find money for their scholarly work. Krauser (2003) described our ideal role as that of an institutional servant-leader.

In the overall flow of events, however, much of our work has been downstream, as most pre-award specialists first engage researchers at the point when a grant proposal is nearly ready to be submitted to a sponsor. If the proposal turns out to be successful (and a declining percentage of them are), then our post-award staff swing into action. For research administration to lead in an increasingly competitive environment, a good case can be made that we need to focus more of our energies upstream, where researchers may or may not be thinking of writing a proposal in the first place.

Ten Strategies
Here are ten ways to get more winning proposals coming in the pre-award door. Accompanying the rationale for each strategy, there are practical tips for implementing and managing the endeavor.

1. Home-grown Workshops
Grant writing, like any skill set, can be intimidating to those who lack confidence in their ability to produce a quality product. Because it is intensely competitive with a greater chance of losing than winning, researchers are faced with the prospect of investing their precious time to no avail. Workshops can go a long way to reduce...
or eliminate such disincentives. Recognizing this, many institutions send researchers to grant-writing institutes or bring consultants on campus to provide the training. Either approach can be inordinately expensive with questionable returns, as many such programs are typically targeted to broad audiences such as public school educators and nonprofit organizations, and not to the specialized needs of academic researchers.

Home-grown workshops, taught by any combination of research office personnel and grant-savvy faculty, are more likely to yield positive returns at a much lower cost. Beginning workshops on basic grant-writing skills should be offered on a regular basis, supplemented periodically by those focusing on specific funding agencies. Especially popular are presentations by successful grant writers and copies of winning proposals (Porter, 2004).

2. Visits by Grant Program Officers

Researchers are stimulated by updates from grant program officers (POs) at major federal agencies, many of whom are encouraged to present information at professional meetings and to make campus visits. While they sometimes balk at traveling to a single institution, it is a different matter entirely if you can invite them to a multi-institutional gathering. Contact research administrators at nearby institutions. Raise the prospect of co-sponsoring a grants conference and offer to be the host institution. With just a few positive responses, you can present POs with the prospect of presenting to a regional grants conference.

Your success rate will be higher if you address your first inquiry to high-ranking administrators at the agency. They typically pass along your invitation to designees who now have a stronger incentive to accept, and these are the people you wanted anyway. You will get much more out of their visit if you plan for double-duty: Start with morning presentations to the assembled group, then arrange afternoon meetings with individual researchers. To be scheduled for a private meeting, investigators must first send you concise abstracts of their proposed research, which are then forwarded to the POs prior to their arrival. Even when the proposed project falls outside the POs’ program

expertise, it is surprising how often they can offer constructive advice. And here is the good news for your budget: By federal rule, they cannot accept honoraria and the government must pay their travel expenses. (An exception is a working lunch, for which high-ranking administrators at your institution might be willing to pay.)

3. Awards Newsletters

Despite the ever-increasing emphasis on interdisciplinary research, many investigators operate within self-imposed silos of their own departments and laboratories (Rhoten, 2004). Frequent communications about your institution’s overall funding activity can do a great deal to force cracks in these walls. Try sending a periodic hard-copy newsletter to all faculty and administrators listing recent awards by principal investigator, sponsor agency and total amount. Readers will quickly see that most large awards are interdisciplinary.

Group the listings by department and/or college. Once a quarter, compile the awards data into bar graphs showing key trends, e.g., number of proposals submitted, total awards, comparisons with last year, etc. Each year, publish the “top ten” awards (or whatever number best reflects your institutional size). The impact of this simple tool can be surprising, and the benefits are many: (a) writers of winning proposals are recognized and celebrated, regardless of the size of their awards; (b) investigators learn about successful principal investigators (PIs) who might become future collaborators; (c) investigators learn about funding sources they were not aware of before; (d) administrators can see how their departments and colleges compare with others, and how they are trending; (e) the whole institution gains a heightened sense of its current research portfolio; and finally, (f) the research office is credited with compiling and disseminating the data.

The University of Tennessee has posted a variety of newsletter formats on its research office web site (http://research.utk.edu). A word of caution: You can expect researchers and administrators (especially those with low numbers) to scrutinize this list and raise questions about how the data are compiled and reported. This is not necessarily a bad thing, as long as you can justify your procedures and apply them consistently. And be forewarned: Any change in your data-reporting method data will only result in a new list of detractors!

4. Collections of Successful Proposals

Reading successful grant proposals has a powerful influence on beginning writers (Friedland & Folt, 2009; Henson, 2004; Porter, 2004). Not only do they pick up valuable lessons on writing style; they also learn about possible new funding sources and how to mold their proposal to fit a particular grant program. Finally, they identify colleagues who can be a font of useful information about how to interact with sponsors and with specific program officers.

Most grant winners like to share their successes, and reading their winning proposals can be an effective way for a newcomer to start a mentoring relationship. To post a sample collection online, start by forming a committee of experienced senior researchers representing a range of disciplines. Distribute a list of recent awards
to your institution and ask the committee to select a diverse sampling of research themes and funding agencies. As a professional courtesy, request permission from the selected PIs to post their proposals on a secure web site, accessible only to researchers in your institution. A few PIs may perceive this as encouraging future competition, but most will be glad to accommodate. Be sure to promote the availability of the collection and keep it updated.

The research office web site at the University of Tennessee features a Grantseekers Tool Kit, a collection of helpful materials that includes successful proposals from a variety of sources (http://research.utk.edu/pd/toolkit.shtml).

What if your store of institutional proposals is limited? Copies of winning proposals in many disciplines can be purchased from The Grant Center at reasonable rates (www.tgcigrantproposals.com). The National Institute of Allergy and Infectious Diseases has posted four recent R01 proposals with reviewers’ comments using the new NIH per review scoring system (www.niaid.nih.gov/researchfunding/grant/pages/appsamples.aspx). Finally, successful proposals can be obtained directly from federal agencies under the Freedom of Information Act with a simple request, but be prepared to wait four to six weeks for the documents to arrive, with sensitive information redacted, such as investigator salaries and intellectual property.

5. Departmental Retreats

Department heads at research institutions are always eager to expand their portfolios of sponsored projects, and annual retreats provide excellent opportunities for grants specialists to provide useful information, including updates on funding opportunities, data on proposal award activity, and a review of the support services offered by the research office. To get on the agenda, let department heads know about recent grants conferences you have attended, such as those sponsored by NSF and NIH, and offer to present relevant updates at their retreats.

Even if you have not attended a recent conference, these agencies often post slides of key conference presentations on their web sites; you can pick and choose which ones would be of most interest to any given audience. Before the retreat, search funding databases such COS, InfoEd SPIN, and the Foundation Directory Online for grants targeted to the discipline at hand. Select a dozen or synopses of programs that appear most promising and distribute copies at the retreat. You will be surprised to see how many faculty are unaware of programs from major agencies that are repeated on an annual basis.

6. Mentor Matchmaking

Young investigators can find themselves in a lonely “sink or swim” environment when it comes to sponsored research, and many are hesitant to approach experienced grant writers on their own. Unfortunately, institutions that provide structured mentoring systems are more the exception than the rule—an odd irony, since senior researchers, especially those in academic settings, are usually willing to share their wisdom if the circumstances are right. So what are the “right circumstances” for low cost mentoring? First and foremost, recognize that busy senior researchers are
jealous guardians of their time. To be effective as a matchmaker, the grants specialist must be both coach and cheerleader.

Start by working with the new investigator to clarify promising research ideas and possible funding sources. The next step is to identify which senior researcher(s) could be a helpful resource. Then contact the senior person and ask for a brief meeting. Escort the junior person to the session to facilitate the dialogue and keep the meeting focused on key questions: Does the research idea appear to be fundable? Which specific grant program in the sponsor agency should be targeted? Does the senior person have personal contacts in that office? Does s/he have any suggestions for developing a strong research design? Would s/he be willing to look at a one- or two-page project overview? After the session, prod the junior person to send immediately a well-written thank-you, with the brief project summary attached. (Be aware that inertia in professional relationships settles in quickly, so success in the matchmaking role often entails some degree of nagging.)

7. Research Forums

An institution’s research portfolio cannot grow substantially if most proposals going out the door are the small, single investigator type. Major multidisciplinary proposals start with researchers sparking ideas off one another, and this cannot happen if investigators remain siloed in their labs. Moreover, whole departments can be locked into a traditional, discipline-driven view of their research potential, too narrow to be competitive in today’s theme-driven, interdisciplinary funding environment. The research office can provide a valuable service by serving as a kind of “executive producer” of research forums focused on promising interdisciplinary issues, such as green engineering, climate change, and the economic potential of social networking.

Of special interest are themes highlighted in the strategic plans of major funding agencies such as the National Science Foundation (2011), the National Institutes of Health (2011), and the U.S. Department of Energy (2011). Coordinating a research forum is time-consuming but not particularly costly, even if no registration fee is charged. Little academic expertise is needed on your part as the more experienced researchers are very good at identifying appropriate speakers and persuading them to come. Once the agenda is set, a little promotion to nearby institutions will usually result in good attendance, as everyone is looking for sponsor updates and future collaborators. The effort does require a strong capacity to plan ahead, a keen eye for detail, excellent communication skills, and the ability to follow through on all assignments—precisely the skills of many folks in the research office.

8. Online Tutorials

There is a wealth of fine grant-writing tutorials online, but few new investigators know where they are. The best grant writing tips for NIH proposals can be found on the web site of the National Institution of Allergenic and Infectious Diseases (www.niaid.nih.gov). (These materials are also useful for USDA proposals.) The Foundation Center offers an excellent short course on writing proposals to private foundations (http://foundationcenter.org/getstarted/tutorials/shortcourse/index.html).
A quick Internet search will locate helpful guides to other government and private agencies. Hot links to several concise, highly readable materials should be featured on the research office’s web page and promoted via the awards newsletter and other channels of communication. The Grantseekers Tool Kit page at the University of Tennessee features numerous guides, articles and manuals—some of general interest, others focused on specific funding agencies (http://research.utk.edu/pd/toolkit-resources.shtml).

9. Helping Researchers Get on Review Panels

Serving on a review panel is like a graduate education in grant writing: This is where researchers learn to step out of their academic boxes and write to the needs and expectations of the folks who have a great deal to say about where the money goes (Porter, 2005). Because the major agencies need thousands of new reviewers each year, grant program officers are constantly on the lookout for fresh talent.

When young investigators have honed their core research theme into a brief two or three paragraph project summary, they are well advised to send that all-important first e-mail to the appropriate PO, inquiring whether the basic idea is a good fit with the program (Porter, 2009). If the response is encouraging, the next e-mail should express a desire to serve on a review panel, and include a brief résumé with picture attached. It is not uncommon for young investigators to be invited to serve, either on a panel or as a mail reviewer, even before they have submitted their first proposal.

Though trips to visit with POs can be expensive for researchers in some locations, those within driving distance should do this on a regular basis. Experienced grant writers view these pre-proposal discussions as critical to their success. Newcomers to the sponsored research game are unnecessarily hesitant about this, as they are uncertain how they will be received. In fact, most POs are highly receptive to such meetings, for practical reasons:

(1) Listening to new ideas for research can be an effective way for a deskbound program officer to learn about possible new directions in the field.

(2) If the research idea is not a good fit, these conversations can reduce the number of noncompetitive proposals that must be processed.

(3) If it is a good fit, the PO can offer helpful tips to shape the proposal for success.

(4) Such meetings are a good way to recruit new talent for future review panels.

If travel to the DC area is not practical, new investigators should be encouraged to look for grant program officers at meetings of their academic disciplines, as POs are encouraged to attend such events.

10. Coaching and Editing

Many, if not most, young researchers struggle with grant writing. Even those with impressive publishing records can find it frustrating to shift from dense academic prose to a concise, energetic proposal writing style. This is where the grants specialist as a coach and editor can provide help that could make the difference between
failure and success. Good grant writing is mostly a matter of rewriting, and if the core idea is fundable, it is well worth the time invested to turn weak writing into a persuasive presentation. Though coaching and editing are labor-intensive at first, the need for assistance tails off rapidly once the researcher catches on to the simpler, more free-flowing style of a winning proposal.

“By extending a helping hand at the most critical phase of researchers’ thinking—whether or not to write a proposal—a proactive research office exerts a powerful upstream influence on the overall flow of the institution’s research activity.”

About the Author

Robert Porter, Ph. D., is Director of Research Development, University of Tennessee, where he conducts grant-writing workshops for faculty and graduate students. Over the past ten years he has presented papers and workshops on grant writing at national conferences and has published prize-winning articles in the *Journal of Research Administration* and *Research Management Review*. Dr. Porter has previously taught at Virginia Tech, Swarthmore College, and Eastern Washington University. He holds graduate degrees in Speech Communications from the University of Michigan.
 Proper Acknowledgement of Awards
Evelyn Goldfield, National Science Foundation

It is very important that all publications that result from the National Science Foundation (NSF) funding properly acknowledge the NSF award by grant number. Proper acknowledgement helps us assess the impact of a given award, better manage our awards and understand our portfolio.

Proper acknowledgement is particularly necessary for principal investigators (PIs) who have multiple lines of funding either from NSF or other federal agencies. For those with multiple awards, please note the following:

1. In your annual and final reports, include only those publications that explicitly acknowledge the given award.

2. In the “Results of Prior NSF Support” section of your renewal proposals, list only those publications that result from the particular referenced award. If there is a valid reason to list other publications, please detail this reason and the actual source of funding.

3. When acknowledging multiple awards in publications, include only those that contributed to the research being reported. Specify the actual contribution of each award to the work; where possible. Please do not use a blanket acknowledgment listing all your grants on each of your publications.

4. If you have more than one line of funding:
   - Indicate the relationship between your proposed research and your funded research, addressing synergy, overlap etc. either in the project description or on the current and pending support form.
   - If you are part of a large collaborative or center, indicate the approximate annual amount that you actually receive. It is also helpful for us to know your intellectual contribution to the collaborative activity or the center.

Awardees are encouraged to reference their specific Award Conditions for further guidance.
Strategies for Promoting Researcher Compliance with Internal Grant Deadlines

Kristine M. Kulage, Columbia University School of Nursing

Although grant applications come in many shapes and sizes and are submitted to a wide array of agencies, a universal reality for all parties involved is the dreaded deadline. Therefore, it’s not surprising that one of the most common challenges administrators face during the grant preparation process is ensuring compliance with deadlines. Researchers know that there is usually no flexibility with an agency’s set deadline for receipt of applications. This is particularly true in the biomedical research field as federal agencies like the National Institutes of Health (NIH) and the National Science Foundation have receipt deadlines that are hardly negotiable.

On the other hand, internal deadlines established by departmental and central grants administration offices are typically viewed as soft deadlines that are “up for debate.” Because research administrators understand the critical role these internal deadlines play in assuring successful, timely grant submissions, enforcing them is a constant source of conflict between faculty and staff. This article offers an overview of the strategies for promoting researcher compliance with internal grant deadlines that we have implemented in the Office of Research Resources (ORR) at Columbia University School of Nursing’s administrative office that works directly with the medical center’s central sponsored projects office on grant submissions. While we have experienced varying levels of success depending on the situation and researcher, overall these tactics have helped ease some of the inevitable tension surrounding internal grant deadlines.

Support from Up Above

At the school or departmental level, I have found unwavering support from higher authorities to be the most effective strategy in promoting researcher compliance with internal deadlines set by a central sponsored projects office. The ORR’s greatest ally in the battle to meet deadlines is our school’s Associate Dean for Research, who also happens to be my direct supervisor. Since joining the School of Nursing seven years ago as Director of the ORR, we have implemented successful initiatives to promote compliance with deadlines. This proactive approach, which helps avoid the problem of last minute submissions all together, is fully supported by our Associate Dean for Research. Her support goes beyond just enforcing a rule; because she truly believes in it, she helps “market” the message by vocally promoting it at faculty meetings and ORR researcher seminars. This has helped create a culture of compliance in our school and an atmosphere of little tolerance for subverting these deadlines.

1 This article is reprinted from the NCUIRA Magazine, Vol. XLII, No. 7, December 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
In an ideal world, every departmental research administration office would have a faculty member in a high level administrative position to back them up in support of enforcing internal grant deadlines. I encourage research administrators to engage in discussions with superiors, Assistant/Associate Deans, and even the Dean or Chairperson regarding the need for compliance with internal grant deadlines and how they might partner with you to not only establish guidelines and policies, but also enforce them. Be prepared to face resistance, as it will take convincing arguments, even from higher authorities, to facilitate change. But let’s face it – we all know that faculty members are more likely to comply with mandates that come from “up above.”

Presentation Is Key
When a new research faculty member joins our school, they attend a mandatory orientation to the ORR. Within the context of presenting the myriad of services we offer to assist researchers in submitting applications and administering funded grants, we gently but firmly review our deadline policies. We not only inform them that our medical center’s sponsored projects administration office (SPA) has established a mandatory internal grant deadline of 5 business days prior to agency due date, but we also explain why our school chooses to vehemently adhere to this deadline. We emphasize that our office works in tandem with SPA as well as researchers as one unified team with a common goal: the timely submission of flawless grant applications. I have found Principal Investigators (PIs) to be much more receptive to deadline policies when they are given an explanation of the legitimate rationale behind them.

What’s in It for Me?
Following this line of thought, rather than presenting the internal deadline to PIs as something SPA has cruelly imposed upon already time-constrained researchers in some secret effort to inhibit their scientific endeavors, we highlight the significant advantages of compliance. Applications submitted on or before internal deadlines are unquestionably given earlier and more meticulous administrative reviews. When a sponsored projects officer is not pressed for time, their reviews can be more thoughtful and thorough rather than just skimming through the application verifying the most basic mandatory information. For example, time is available to give careful consideration to compliance requirements (e.g., conflict of interest, training in research involving human subjects) in order to ensure a smooth, error-free review of the application by the agency’s scientific review panel. This additional set of eyes beyond the departmental grants administration office can only improve the quality of the final application and increase its odds for eventual funding. In addition, if our school’s recognized gold standard is to meet or exceed all deadlines, our good reputation can be used to more easily buy researchers exceptions to the deadlines when unfortunate situations arise that unintentionally cause an application to be late.

Benefits to researchers who comply with internal deadlines go beyond those provided by a sponsored projects office. As a grants manager in a medical center, the majority of our applications are submitted to the NIH through grants.gov and
Supplementary Material

land in the Electronic Research Administration (eRA) Commons. The earlier a grant is submitted to SPA, the sooner it is reviewed and submitted electronically to grants.gov and the eRA Commons. This then allows for a larger window of time in which necessary revisions can be made and fatal errors can be corrected. In addition, the NIH announced via NOT-OD-10-123 that effective January 25, 2011, it will eliminate its error correction window that extends two business days past the due date (e.g., if the application was submitted on the deadline date of June 5, it could still be rejected, corrected, and resubmitted up to June 7; this will no longer be the case). The good news is that PIs can still take advantage of the two-business-day window prior to the submission deadline (e.g., if the application is submitted on June 3 for the June 5 deadline, it can be rejected, corrected, and resubmitted up until June 5).

“NIH, AHRQ, and NIOSH encourage applicants to submit in advance of the due date to take advantage of the opportunity to correct errors and warnings and to review the application in eRA Commons before the deadline” (see http://grants.nih.gov/grants/guide/notice-files/NOT-OD-10-123.html). This upcoming change makes compliance with internal deadlines even more important.

When logical arguments such as these fail to sway researchers, grants administrators can always play the fear factor card. We all have examples to share which illustrate worst-case scenarios that have come true despite our best efforts: the finalized Adobe grant file that suddenly became corrupt; the computer that crashed at the 11th hour; the Internet server that failed to transmit; the Fedex delivery truck that missed the last pick-up of the day.

Help Facilitate Compliance

In addition to constant communication with faculty members and promotion of policies, there are ways in which grants administrators can take an active role in helping facilitate researcher compliance with internal grant deadlines. Our office maintains a schedule of both confirmed and potential future grant submissions, and we frequently initiate dialogue with our PIs by sending gentle reminders to nudge them along in their grant preparation and writing. As internal deadlines approach, we let them know we are ready to assist; we inquire about their progress in confirming their research team; we suggest dates and times for budget meetings; and occasionally we simply check in with our researchers via e-mail to encourage their continued work on the application.

Efforts such as these prevent applications from falling through the cracks. By not sitting idly by and waiting for faculty members to approach us with their needs at various phases of the process, we exert what little control we can over compliance with timelines and deadlines. Again, our facilitation of progress in grant preparation is presented as teamwork toward the common goal of an on-time, fundable grant submission.

No matter how much your school or department strives for compliance with internal grant deadlines, there will always be faculty members who feel they are the exception to the rule or who insist, “Department X isn’t compliant, so why do we have to be?” Implementing some strategies for promoting researcher compliance
with internal grant deadlines can minimize the conflict between administrators and faculty members and help make situations of noncompliance the exception rather than the norm.

About the Author
Kristine M. Kulage is Director, Office of Research Resources, Columbia University School of Nursing and Biomed Corner Contributing Editor.
Which NSF Program Presents the Best Fit for My Research at the Chemistry/Biology Interface?¹

David Berkowitz, Program Director, Chemistry of Life Processes

The Chemistry of Life Processes Program within the Chemistry Division is focused on molecular level inquiries at the Chemistry/Biology interface in which the primary approach or tools employed are those of chemistry. Projects that integrate experimental and theoretical chemical approaches into studies of biomolecular processes in the domain of proteins, nucleic acids, carbohydrates and lipids will be considered. The use of small molecules such as ligands, inhibitors, signal transducers or molecular beacons to interrogate biological systems is a characteristic mode of inquiry for CLP investigators. Studies directed at elucidating cofactor, (metallo)enzyme, ribozyme or riboswitch mechanism/design or characterizing molecular recognition as they relate to macromolecular assembly or macromolecule effector complexation are at the core of the program. Other appropriate areas of inquiry include, but are not limited to, peptide design, alternative base pairs, and molecular definition of emerging “codes” such as those associated with glycomics and histones.

Certain topics at the Chemistry/Biology interface have elements of interest to both the CHE CLP program and clusters within the Division of Molecular & Cellular Biosciences (MCB) (vide infra). In such cases, when considering submission to CLP, please note that to be appropriate for CLP the proposal should, at its nexus, seek to reveal underlying chemical principles. Such topical areas include protein folding, post translational modification and DNA damage and modification.

Also included here are areas of molecular recognition at macromolecular interfaces, such as protein protein and protein nucleic acid interactions. With regard to this latter area, the CLP program is especially interested in proposals that seek to elucidate design principles of molecular recognition, through the modulation of such interactions. Of equal interest is the de novo construction of systems that mimic native protein protein/nucleic acid interactions, based upon the design principles garnered from the study of the native system.

Please note that while projects whose long term scientific broader impacts may have biomedical implications may be acceptable for submission to CLP, those with direct biomedical aims are more appropriate for the National Institutes of Health or other health directed funding agencies, and will be returned without review from the NSF. As always, contact the cognizant program officer(s) at the Foundation if/when in doubt about which program represents the best fit for your science.

In considering submitting a proposal at the Chemistry/Biology interface to the NSF, PIs should be aware that there are several programs at the Foundation at the boundary between the MPS (Mathematical and Physical Sciences) Directorate and the BIO Directorate that should be considered. This piece is meant to both articulate the interests of the Chemistry of Life Processes (CLP) Program within CHE (http://www.nsf.gov/funding/pgm_summ.jsp?pims_id=503417) and act as a guide to the

¹Reprinted from Newsletter of the NSF Division of Chemistry, August 2011, Issue 17.
PI, so that s/he has the overview at the front end of the proposal preparation process, and targets the most appropriate program.

(1) If the project is focused upon fundamental physical principles that underlie biological function, and seeks to interrogate living systems, then submission to the Physics of Living Systems Program (PoLS) within the MPS Physics Division may be in order (http://www.nsf.gov/funding/pgm_summ.jsp?pims_id=6673).

(2) If the proposal at its core is investigating biological materials, be they materials of biological origin, or those that mimic or are inspired by biological materials, then it may be most appropriate for the Biomaterials Program (BMAT) within the MPS Division of Materials Research (DMR) (http://www.nsf.gov/funding/pgm_summ.jsp?pims_id=13699).

(3) If the proposal is primarily focused on answering a fundamental question in biology, then the PI should consider submitting to the MCB Division of the BIO Directorate. MCB divides itself into Clusters as follows:

(a) Biomolecular Dynamics Structure and Function Cluster (BDSF) – (http://www.nsf.gov/funding/pgm_summ.jsp?pims_id=503609&org=NSF) e.g. molecular biochemistry/biophysics; global protein protein interactions, synergy and allosteric, biomolecular structure and dynamics, particularly as studied by X ray, NMR and EPR techniques; (b) Cellular Processes (CP) – (http://www.nsf.gov/funding/pgm_summ.jsp?pims_id=503612&org=MCB&from=home) e.g. membrane protein function, organelle trafficking, cytoskeletal dynamics;

(c) Genetic Mechanisms (GM) (http://www.nsf.gov/funding/pgm_summ.jsp?pims_id=503610&org=MCB) – e.g., DNA replication and repair, gene expression, chromosome dynamics, epigenetics; and

(d) Networks and Regulation (NR) (http://www.nsf.gov/funding/pgm_summ.jsp?pims_id=503611&org=MCB&from=home) – e.g. signaling and metabolic networks, artificial/minimal cells, microbial communities, synthetic biology.

Please note that while projects whose long term scientific broader impacts may have biomedical implications may be acceptable for submission to CLP, those with direct biomedical aims are more appropriate for the National Institutes of Health or other health directed funding agencies and will be returned without review from the NSF.

As always, contact the cognizant program officer(s) at the Foundation if/when in doubt about which program represents the best fit for your science.
Strategies for Successful NIH Training Grant Applications

Jaime S. Rubin, Columbia University Medical Center

Institutional training grants funded by the National Institutes of Health (NIH) are critically important components of a research institution’s portfolio of sponsored projects. While usually providing limited funding for direct expenses and even less for facilities & administrative (F&A) costs, this unique funding mechanism can have a very significant impact on both the teaching and biomedical research missions of an academic institution.

Training Grant Basics

Institutional training grants, also known as National Research Service Awards (NRSAs), are very large, complex applications, sometimes hundreds of pages long. The effort required to submit one cannot be overstated; this is not the job for one investigator and one administrator deciding to apply a few months before the deadline. A team of administrators working together is required, and the process cannot begin too early. Awards may be renewed many times after the initial 5-year funding period, and the NIH RePORT Tool (http://report.nih.gov) shows some training grants have had over 30 consecutive years of funding.

The two most common types of NIH institutional training grants are the T32 and the T35. While the T35 mechanism typically supports medical or veterinarian students for 2-3 months of short-term research training, the T32 provides a full year of research training, supporting pre-doctoral or post-doctoral trainees, or both. Funding is provided for a defined number of “slots,” e.g., 5 pre-doctoral slots and 4 post-doctoral slots. Areas of support include stipend, health insurance, tuition, and travel. Calculating the budget for these applications is not complicated. The NIH annually publishes the stipend level for pre- and post-doctoral trainees and the allowable health insurance (http://grants.nih.gov/grants/guide/notice-files/NOT-OD-11-067.html). Tuition support is formula-driven, and for those in degree granting programs it is generally 60% of the tuition costs, up to a maximum of $16,000 per trainee each year. Funds allowed for travel vary by institute, and the F&A rate is 8% of direct costs, not including tuition.

Strategies for Focusing Training Programs

Institutional NRSAs provide funding for clearly described and unique research training programs. Submissions that are simply looking for a way to provide stipends for pre- or post-doctoral fellows working in a laboratory will not be funded. Additionally, applications that do not present a distinct training program created around related and specific state-of-the-art research themes, as well as those which do not describe program-specific activities for the trainees, will most likely not be funded.

1 This article is reprinted from the NCURA Magazine, Volume XLIV, No. 1, January/February 2012, published by the National Council of University Research Administrators. It is used with permission of the publisher.
It is critical that an institutional training program present an integrated research theme, a graphic example on how to represent this is shown in Figure 2520.9-1. On the left, areas of faculty research interest are represented as thematic, multidisciplinary/interdisciplinary, and collaborative. The converse, shown on the right, can give the reviewers an impression of a research program that is poorly integrated.

Another important strategy is for the program to address a training void at the institution (e.g., support for these trainees is not otherwise available) and possess its own unique identity. At the same time, the training program should also be well integrated into the research and academic infrastructure of the institution such as partnering with a Clinical and Translational Science Award, Cancer Center, master’s degree programs, or interdisciplinary research centers. Letters of support from the Directors of these programs should be included in the application as well as from the Deans of any participating schools and other institutional officials addressing their strong support and commitment of personnel and resources.

**Training Program Organizational Structure**

The proposed training program should have a defined organizational structure for recruiting, selecting, and admitting pre- and post-doctoral trainees, reviewing the trainees’ progress, and assisting in their career development. Figure 2520.9-2 provides a sample structure for a training program which is overseen by both a Program Director and an Associate Program Director who are also faculty members, leaders, administrators, and research mentors with complementing expertise. The External Advisory Committee is comprised of senior investigators whose research interests overlap with those of the program and have experience as training program directors and mentors. The Internal Advisory Committee is comprised of senior faculty members (e.g., department chairs, institute and center directors) who can help ensure institutional support and success of the program.
Senior faculty mentors lend their expertise to the three programmatic committees: (1) the Recruitment and Admissions Committee which selects pre- and/or post-doctoral trainees for support by the training grant; (2) the Research and Mentorship Committee which assists trainees in selecting appropriate mentors and then oversees their progress to ensure that research milestones are being met; and (3) the Career Development Committee which assists the trainees as they transition to the next stage of their academic research careers. Example activities for these committees are shown in Figure 2520.9-3.

**Mentors and Trainees: Quantity and Quality**

In addition to the proposed training program and research themes, the selection of mentors and mentees (or trainees) is critical for successful applications. The information provided in the main body of the text, as well as in the required data tables, should demonstrate to the reviewers in both quality and quantity that faculty members selected to serve as mentors are both excellent scientists and mentors. Quality is demonstrated by providing detailed funding information demonstrating that the
mentors have sufficient NIH and other peer-reviewed extramural funding to support the research efforts of their trainees (as requested in application Data Table 4). A faculty member without extramural support or with only industry support (e.g., clinical trials) in many cases would not be viewed as an appropriate mentor in an academic setting.

There are exceptions to these examples. A promising junior investigator with limited extramural support but with a good start-up package who is conducting exciting research would make an excellent mentor. This assistant professor could be partnered with a more established NIH-funded investigator and offer the trainee a unique co-mentorship arrangement by “pairing” junior and senior faculty. This provides the trainee opportunities for collaboration with the junior investigator as well as the larger research base, expansive knowledge, and international contacts of the senior investigator. Similarly, a clinical investigator who is a world renowned leader in their field and publishes in top-tier journals but lacks NIH funding can be “paired” with an established basic science investigator with solid NIH funding. This co-mentoring arrangement can provide pre- and post-doctoral trainees with a multidisciplinary approach to their research training experience.

Information is also requested on each mentor’s current and previous trainees (as requested in application Data Tables 5A and 5B). Similarly, a mentor whose previous trainees have left academia for private practice, industry, or other non-research positions would not appear to have the skill set necessary to help launch junior investigators into successful academic research careers.

The publication track record of trainees that resulted from their research experiences in the mentor’s research group is another important part of the application (as requested in application Data Tables 6A and 6B). A faculty member with a poor publication history with his or her trainees would not be considered an appropriate choice as a mentor. Reviewers will also examine whether a faculty member’s publications are appropriate for the research themes of the proposed training program as provided on their biographical sketch. For example, a well-funded faculty member may have a strong publication record in top journals in the field of epidemiology; however, if the theme of the application is cancer research, reviewers might have serious doubts as to whether a trainee working in this research group would be investigating a cancer-related problem. Another “use” of a mentor’s publication track record is to examine the history of collaboration among the mentors in a specific research theme. Applicants could stress the collaborative nature of the research program by including a list of joint publications by mentors in the appendix to demonstrate how closely the faculty members work together. This is especially important because training grants are expected to be institutional awards, and mentors should represent departments, institutes, and centers (if not schools) across the institution.

The research interests of each mentor should address at least one of the research themes of the training program. In terms of quantity, each research theme or area requires a “critical mass” of mentors. One or two faculty members do not make a research theme. There should also be adequate gender and age distribution. An application with very few women mentors would probably not be reviewed favor-
ably and an application with few junior faculty members representing the future of the training faculty might also be problematic. The total number of mentors as compared to the number of requested trainee slots is also important. Reviewers look for trainees distributed across many research groups and not “bunched up” in a few select laboratories. Thus, a request of funding for 8 post-doc slots with only 16 possible mentors does not offer trainees a wide choice of mentors.

With regard to potential trainees who represent the applicant pool (as requested in application Data Tables 7A, 7B, 8A, 8B, and 10); again it is important to demonstrate quantity as well as quality. The applicant pool is the number of previous training grant eligible (e.g., US citizen or permanent resident) applicants to the training program. For example, how many students have applied to the relevant Ph.D. programs? How many clinical fellowship applicants have been interested in a two-year research program? How many first year medical students have been interested in summer research experiences? In addition to quantity, quality is important. This is demonstrated by the success of any past research experiences as well as academic records. Has the post-doctoral applicant pool had previous research experiences? What are the GRE or MCAT scores of the pre-doctoral applicants? It is important that this information, which is provided in the often lengthy data tables at the end of the application, be clear, complete, and accurate. Will reviewers read these tables line by line, word for word? Probably not. But reviewers have been known to point out inconsistencies and incompleteness in the tables as a weakness in the overall application.

An institutional NIH training grant application is very large and complex, with a number of separate, but interlocking critical components. Each section must be comprehensively addressed for a competitive application. While very difficult to prepare, successive efforts provide funding and infrastructure, thus allowing research-intensive academic institutions to satisfy their mission to train the next generation of biomedical scientists.

About the Author

Dr. Jaime S. Rubin (jsr9@columbia.edu) is currently the Director for Research Development in the Department of Medicine at the Columbia University Medical Center. She has previously held a number of the senior leadership positions, including Acting Associate Vice President for Research Administration and Acting Associate Dean for Graduate Affairs at Columbia. She regularly lectures and consults on funding, grantsmanship, the career development of junior investigators, and the responsible conduct of research.
¶2520.10  **NIH Requirement to Use the Research Performance Progress Report**  
National Institutes of Health

Grantee institutions are reminded that they are required to use the eRA Research Performance Progress Report (RPPR) Commons Module for submitting Streamlined Noncompeting Award Process (SNAP) and Fellowship progress reports for awards with start dates on or after July 1, 2013 (i.e., due dates on or after May 15, 2013, for SNAP awards and May 1, 2013, for Fellowships). See the NIH Guide Notice NOT-OD-13-035 for more information about the use of the RPPR for these awards. Noncompliance with these reporting requirements will jeopardize the NIH’s ability to issue timely awards to the institution.

   Progress reports submitted in another format for SNAP and Fellowships will not be processed by the NIH and will require resubmission in the RPPR format. If a progress report for a Fellowship has been submitted on paper, the grantee must resubmit the progress report using the RPPR format. If a progress report for a SNAP grant has been initiated as an eSNAP, the grantee must contact the eRA Help Desk (1-866-504-9552 or commons@od.nih.gov) to change the progress report format to the RPPR. It may take eRA up to two business days to reset the progress report so the user can initiate a progress report in the appropriate format.

**Compliance Reminder**

Failure to submit timely RPPR progress reports for SNAP and fellowship awards subject to this requirement may adversely affect future funding to the organization and/or awards to the same Project Director/Principal Investigator. Accordingly, NIH may impose sanctions on institutions that fail to follow these reporting requirements. Such sanctions may include, but are not limited to, corrective actions, removal of authorities, and/or delay or withholding of future awards to the project or program.

**Inquiries**

For general questions about using the eRA Commons:

¶2520.11  NIH Updated Grant Application Forms
National Institutes of Health

Notice Number: NOT-OD-13-074
Release Date: May 30, 2013
Related Announcements: NOT-OD-12-161, NOT-OD-13-075
Issued by National Institutes of Health (NIH)

Purpose
The purpose of this Guide Notice is to alert applicants that NIH is transitioning to updated electronic application forms packages. The new packages will be identified with a Competition ID of FORMS-C and will include the form changes documented at: http://grants.nih.gov/grants/ElectronicReceipt/files/FORMS-C_Changes.pdf.

For due dates on or after September 25, 2013, all applicants will be required to use FORMS-C packages, with the exceptions noted below. The requirement includes electronic applications submitted under the continuous submission policy, administrative supplement requests (Type 3), change of organization requests (Type 6) and change of grantee/training institution requests (Type 7) submitted September 25, 2013 and beyond. Multi-project applications that are transitioning to electronic submission beginning with the September 25, 2013 due dates (see NOT-OD-13-075) will also use FORMS-C packages.

Exceptions
The programs noted below will move to FORMS-C application packages as follows:
◆ Individual Research Career Development Award Programs (Ks), Institutional Training and Career Development Programs (Ts and Ds) and Individual National Research Service Awards (Fs) applicants will be required to use FORMS-C packages for due dates on or after January 25, 2014.
◆ Small Business programs (SBIR/STTR) applicants will transition to FORMS-C packages later in 2014, when we can combine these form changes with anticipated form changes relating to the Small Business Authorization Act.

Background
NIH periodically implements updated versions of federal-wide SF424 (R&R) and agency-specific (PHS) grant application forms in order to remain current with the most recent form sets available through Grants.gov and approved by the Office of Management and Budget.

Beginning this July, the updated forms will be incorporated into new and existing Funding Opportunity Announcements (FOAs). FOAs published between now and July that have submission due dates on or after September 25, 2013, will be posted without application packages. NIH will make every effort to post the FORMS-C ap-

---

plication packages with the FOA at least 60 days in advance of the due date.

**Instructions**

◆ If presented with more than one forms package, applicants should download and use the most recent set of forms to complete their submission. However, applicants submitting to AIDS deadlines should be especially careful in choosing the correct package and be sure to follow guide notice timelines.

◆ Return to FOAs posted without a forms package or existing FOAs with ADOBE-FORMS-B1 or B2 packages 45-60 days prior to the deadline to obtain the FORMS-C package.

◆ Verify you have the correct application package by checking the Competition ID for FORMS-C. The Competition ID field can be found when downloading the application package from Grants.gov, in the application header information of the downloaded package or in the ASSIST FOA summary information for multi-project applications.

◆ Learn more about choosing the correct forms packages at: http://grants.nih.gov/grants/ElectronicReceipt/files/right_forms.pdf.

◆ All applicants should carefully read their FOA and the appropriate “C Series” Application Guide for program-specific instructions before completing their application.

**Inquiries**

Please direct all inquiries to:

Grants Information
Office of Extramural Research
National Institutes of Health
Telephone: 301-435-0714
Email: GrantsInfo@nih.gov
Web: http://grants.nih.gov/grants/oer.htm
**Updating Grants.gov Forms: FORMS-C**

NIH’s electronic Research Administration (eRA) periodically implements updated versions of the federal-wide SF424 (R&R) and agency-specific PHS electronic grant application forms in order to remain current with the most recent form sets available through Grants.gov and approved by the Office of Management and Budget.

NIH and other agencies serviced by eRA use the ‘Competition ID’ field of Grants.gov application packages for quick and easy identification of the forms being used for a particular Funding Opportunity Announcement or individual application package.

NIH will introduce application packages with a Competition ID of ‘FORMS-C’ following the schedule outlined in NOT-OD-13-074.

**Changes to Grants.gov federal-wide forms included in ‘FORMS-C’ packages**

**SF424 (R&R) Cover**

◆ A new field for the ‘Previous Grants.gov Tracking ID’ will be included in item 4 of the SF424 (R&R) cover. Form behavior will be adjusted so that applications with Application Type of ‘New’ require an entry in the ‘Previous Grants.gov Tracking ID’ field rather than requiring an entry in the ‘Federal Identifier’ field.

◆ The Person to be contacted section of the Applicant Information on the SF424 (R&R) cover will be expanded to include the additional contact information we have been including on the PHS 398 Cover Page Supplement form.

◆ The additional contact information will be removed from the PHS 398 Cover Page Supplement.

◆ The label for the ‘SFL or other Explanatory Documentation’ on the SF424 (R&R) cover will be changed to ‘SFLLL (Disclosure of Lobbying Activities) or other Explanatory Documentation.’

◆ A new ‘Cover Letter Attachment’ will be added to the SF424 (R&R) cover.

◆ We will no longer use a separate PHS Cover Letter form. However, NIH will continue to keep the Cover Letter separate from the assembled application image and available only to authorized staff.

**Other Project Information**

◆ The question ‘Does the Project have an actual or potential impact on the environment’ has been changed to ‘Does the Project have an Actual or Perceived Impact – positive or negative – on the environment.’

**R&R Budget and associated subaward budget**

◆ Bug fix; expanding ‘Number of Participants/Trainees’ allowed on cumulative budget from 999 to 9999 (currently maxing out the number on all the budget periods causes the application to fail because the form doesn’t allow a bigger number for the cumulative total)
R&R Sr/Key Person Expanded
◆ Allowing data entry for up to 100 Sr/key persons (old limit was 40)
◆ Biosketch will continue to be required on Adobe forms, but will not be enforced by Grants.gov systems for system-to-system submissions
◆ eRA will enforce the inclusion of biosketch for every Sr/Key person through post-submission agency validations

Project/Performance Site Locations
◆ Allowing data entry for up to 300 sites (old limit was 30)

Changes to PHS forms included in ‘FORMS-C’ packages

Planned Enrollment Report form & Cumulative Inclusion Enrollment Report Form
◆ Adding optional inclusion forms in our packages to allow for the collection as discrete data rather than pdf attachments
◆ Removing attachment fields from PHS Research Plan, PHS Career Development Award Supplemental Form and PHS Fellowship Supplemental Form

PHS 398 Career Development Award Supplemental Form
◆ Removing Inclusion attachments
◆ Adding a new attachment for ‘Letters of Support from Collaborators, Contributors, and Consultants’
◆ Renaming attachment from ‘Career Development/Training Activities During Award Period’ to ‘Candidate’s Plan for Career Development/Training Activities During Award Period’
◆ Renaming attachment from ‘Mentoring Plan’ to ‘Candidate’s Plan to Provide Mentoring (as applicable)’
◆ Changing form section header from ‘Statements of Support’ to ‘Statements and Letters of Support’
◆ Form adjustments to format and numbering

PHS Fellowship Supplemental Form
◆ Removing Inclusion attachments
◆ Updating OMB Number to ‘0925-0001’
◆ Form adjustments to format and numbering

PHS 398 Research Plan
◆ Removing Inclusion attachments
◆ Form adjustments to format and numbering
PHS 398 Training Program Plan
◆ Removing ‘Application Type’ section
◆ Removing ‘Research Training Program Plan Attachment’ header
◆ Renaming attachment field from ‘Introduction to Application (for REVISION or RESUBMISSION applications only)’ to ‘Introduction to Application (for RESUBMISSION or REVISION only)’
◆ Form adjustments to format and numbering

PHS 398 Training Subaward Budget Attachment Form
◆ Allowing for up to 30 subaward budget attachments instead of 10

PHS 398 Cover Page Supplement
◆ Removing Applicant Organization Contact information that will be included on SF424 R&R cover
◆ Add fields from PHS 398 Checklist form
  ◆ We will no longer use the separate PHS 398 Checklist form
◆ Allowing for collection of up to 200 stem cell lines (previous limit was 20)
Top Ten Tips on Negotiating Efficiently with Industry

Sherylle Mills Englander, University of California, Santa Barbara

University-industry collaborations are in an exciting phase, reaching new levels of activity across the country. There are many advantages to both sides in working together – universities are able to provide companies with high quality research on targeted projects on an as-needed basis, while introducing the company to some of the country’s best and brightest emerging scientists and engineers. Companies provide streamlined funding opportunities (no formal proposals or nine month peer review periods), potential jobs for graduating students and an opportunity to work on exciting projects that are not necessarily fundable through traditional federal sources. At times, getting that research agreement in place can take significant effort. In this time of doing more with less, an increase in new industry contracts can quickly become a big challenge. How do you get negotiations with industry accomplished in the most efficient manner? Perhaps these Top 10 Tips can help:

1. Did the company send the right agreement? If the agreement does not seem to make any sense or will requires hours of detailed revisions, ask yourself whether the company sent the right template. Perhaps the company sent a private consultant agreement, the agreement they use to purchase “widgets,” or, in the case of life sciences, a clinical trial agreement instead of a basic research agreement. In these situations, it is much more efficient to call the company negotiator to request the right template or send your own research agreement for consideration rather than spend hours converting the proffered draft into the “right” agreement.

2. Know when to call and when to email. If you are dealing with overarching principles or complex ideas, if you need to understand why certain terms were included or if you need to know the other side’s expectations, it is usually most efficient to talk on the phone. And before the start of any complex negotiation, a “kick off” teleconference is invaluable to establish rapport and understand the expectations of each side. In contrast, if you are choosing more precise wording or making a series of minor modifications, sending a revised draft via email will be sufficient. If you try to email about complex ideas, or if you get on the phone describing routine or minor changes, you lose efficiency.

3. Identify true “dealbreakers” up front, before detailed redlines. As a breed, negotiators hate using the word “dealbreaker” since it pretty much ends the normal give and take and changes the dynamic to a “take it or leave it” scenario. That said, if you are truly faced with one or more dealbreakers that your university simply cannot accept, it is better to get on the phone and identify the dealbreakers up-front to see if the company has any flexibility rather than spend hours on detailed redlines, only to have the deal fall through after all that work due to fundamental principles (Of course, let your PIs know if you are in this situation to prevent them from receiving a shock!). And, sometimes, a project is so close to the company’s “crown

---

1 This article is reprinted from NCURA Magazine, Volume XLV, No. 4, August 2013. It is used with permission of the publisher.
jewels” that it is simply not appropriate for the open, decentralized university environment. Again, better to know that at the beginning.

4. Know WHY a change is requested and articulate it. Instead of relying on a citation of university “rules”, provide an explanation, with examples, of why the contract term causes significant problems in the university environment, how it can create unreasonable or undesired results, or how it can cause legal angst for the university. Typically, a negotiator does not feel particularly compelled to change standard terms just because the other side has decided to make a unilateral rule about it. Most university policies and practices are based on logical, reasonable rationales and the practical realities of the university research environment – know the rationales and realities and educate your counterpart about them to give the company negotiator a logical basis to make the requested change the first time you request it. And, if you get a change from a company negotiator that you do not understand, ask them for the purpose of the change before getting wrapped up in extensive rewording or wholesale rejections – sometimes if you know the explanation, a quick solution is right under your nose.

5. Make it easy for the company to accept your change. Sending an email or letter that outlines all of your requested changes (e.g., “in Section 5, change 30 days to 60 days”), instead of a redlined contract, creates a lot of busy work for the company negotiator because each agreed-upon change has to be entered manually by the company negotiator into the draft agreement. In this situation, it is only human for an overworked negotiator to resent making any changes at all. Make it easy for your counterpart to accept your requests by sending a redlined draft of the agreement. If a modification to the language is needed, take the time to draft new language directly into the agreement so the company negotiator does not need to spend time creating the language necessary to accommodate your request. They can then quickly “accept” or “reject” as they read through the draft. (Hopefully doing more “accepting” than “rejecting”!)

6. Put explanatory comments directly into the draft agreement. Just like you, a company negotiator will often need to get approvals on changes from multiple sources. Putting the background of why you need a particular change directly into the draft agreement next to highlighted change (i.e., using the “Comment” feature in Word) saves you time by allowing you to comment as you draft and eliminating the need for you to draft an explanatory cover email or letter. The company negotiator is also able to communicate the background to his or her stakeholders efficiently since the comments are incorporated directly into the draft agreement. Help the company negotiator by using a form that lets the people “behind the scenes” immediately understand and evaluate why the request was made without the need to refer to multiple documents or communications (Make sure to tell them in your cover email that the comments are in the agreement!).

7. Enlist the help of your PI. It is fairly unusual for contract negotiators to know each other before the negotiation. In contrast, there is a good chance that your PI already knows his technical contacts at the company from previous projects, conferences or even graduate school. And, the company’s technical contacts were
graduate students themselves and often understand the university’s core academic needs, such as protecting the right to publish. If the company’s technical contacts understand the negotiation challenges, they may be willing to work closely with the company negotiators to find work-arounds.

8. Know the company’s history with your university. Did they sponsor research before? If so, can you simply use the same terms as the last agreement? Nothing is simpler or more efficient if you can do that. If you have a solid agreement from a previous interaction, let the company negotiator know you are willing to bypass negotiations and work under the same terms as last time. There’s a good chance they will appreciate your efficiency.

9. Consider master agreements, when appropriate. If you work regularly with a particular company and have arrived at a set of terms that work well for both parties, consider putting a master agreement in place. Master agreements let you add new projects through a simple amendment or task order – once the scope of work and budget are agreed-upon, just add it to the master and get started on the research!

10. Use your NCURA connections! If you are experiencing negotiation challenges and know another university has worked with the same company, reach out to that other university. There’s a good chance they may have already faced the same challenges – and perhaps even solved them. After over a decade in this field, I can definitively report that legal constraints may have limited the amount of information that could be provided, but I have never had a plea for help go unanswered from an NCURA colleague. You have a great community – let them help you!

About the Author

\[2520.13\] **Multidisciplinary Proposal Development**¹

Kevin Dressler, Lorraine Mulfinger, and Niki Page, Pennsylvania State University

**Defining the Problem**

If all faculty were as organized and self-disciplined as the fictional Sheldon Cooper (CBS’ *Big Bang Theory*), wouldn’t our jobs as Research Administrators (RAs) be simpler for the typical research grant application? Where is the episode that shows us how the diverse and interdisciplinary science team of Sheldon, Leonard, Amy, Raj, Bernadette and Howard sit down to write a grant together? Even with Sheldon Cooper’s compulsive need for organization and attention to detail, we imagine the “Winning the Big Grant” episode of the *Big Bang Theory* to end in total chaos and frustration. Can you picture it? At 4:59 PM, everyone is huddled into the RAs office, holding their breath and waiting for the Grants.gov spinning disk to release a tracking number. Only to receive the fatal error message that leads to a missed deadline and an emotional “Big Bang”. In the real-world of proposal development, the disastrous result of this illustration is all too possible. Large interdisciplinary proposal development offers complex challenges and, although many elements and challenges are similar to single investigator proposals, the volume and complexity is arguably more difficult to balance given the collaborative nature and time constraints in grant submission. Thus, task timelines are proposed as a means to avoid chaos and errors in the submission process.

**Planning to Plan**

Developing a plan is the first step toward successfully reaching any major milestone, and grant writing is no different (Russel and Morrison, 2011). The major U.S. funding agencies all caution applicants on planning, some more succinctly than others. The National Institutes of Health (NIH) clearly lists as a preparatory step in the grant writing process to, “Develop a feasible timeline with draft application deadlines. Be realistic about the time it can take to write and revise the application” (U.S Department of Health and Human Services, 2012). The National Science Foundation (NSF) mentions among “Other Considerations” to “Organize a good working team. Distribute duties and develop a firm schedule of activities needed to prepare the proposal in time to meet the proposal deadline” (NSF, 2004). While neither NIH nor NSF suggest the length of time necessary to develop a good proposal, the 90 day window that is minimal for many special calls from the NSF suggest that no less than 12 weeks should go into the planning of any proposal application. The following process challenges us to think about distinct proposal phases, key players and submission timelines.

While putting together a credible proposal in only 12 weeks is a challenge for any experienced single investigator who is pre-equipped with data and references, the difficulty can easily compound when a mid-career investigator steps forward.

¹ This article is reprinted from *NCURA Magazine*, Volume XLV, No. 2, March / April 2013. It is used with permission of the publisher.
to orchestrate his/her first large multidisciplinary proposal development team. The mix of multiple research units, institutions, complex budgets, cost share, and management plans can push even the best PI over the edge. With the 12 week challenge in mind, we set out to devise a model timeline (Figure 2520-13.1; also see Purdue University, 2013) that identifies the major tasks involved in the development of large, multidisciplinary proposals. As the timeline was developed, it became clear that the roles and responsibilities of participating faculty and RAs needed to be considered as coordination that is central to the success of concentric activities.

We acknowledge that a “one size fits all” concept cannot be applied to research administration or grant development at all institutions, but the basic tenets are transferrable. Keeping this in mind, the three phases of the timeline and understanding the type of work in each of those phases are the transferrable concepts. We envision the Principal Investigator (PI) using this model to prevent “task slippage” that will ultimately lead to an insurmountable backlog of work in the last 5 days of the deadline. Guarding against such a pressurized time window is a central challenge that drives the typical RA and Development Specialist (DV) as both project managers and catalysts in the process (Porter, 2005).

Three Phases of Proposal Development

Our timeline is divided into three distinct phases (Figure 2520-13.1; Framing, Collaboration and Refinement). The phases are nominally broken into equal time periods; however, overlaps do occur, and they are provided as a high-level way of understanding whether a team is “behind” or “ahead” in planning resources. Thus, the phases represent a macro-planning guide in which the PI, DV, RA and Advocate (AV), can monitor major milestones and detect delay in the process. For example, notice the three blue triangles in Figure 2520-13.3. In each phase there is a natural point at which the AV can give feedback to the PI and/or make decisions about future resource investments in the proposal. In the framing phase, a good time for AV involvement is immediately after the goals, vision, themes and discriminators have been defined. In this way, the AV remains engaged at critical feedback points in the collaboration and refinement phases.

Each participant has distinct roles and responsibilities throughout the three planning phases (Figure 2520-13.2). Depending on the type of institution and specialized needs within the proposal, adjustments could be made to these descriptions at the beginning of any proposal planning process to better coordinate and improve the chances of success.

Sustainable Process

To translate the idea of a sustainable proposal development model, in terms of personnel resources invested, we have conceptualized the amount of effort that might be required of both the PI and the RA+DV support team (Figure 2520-13.3). We lump RA and DV by adding them together to show the macro differences between the faculty (PI) effort and the combined effort of administration-related functions. In this figure, the personnel time commitments in Figure 2520-13.1 (above) were equally weighted and transferred into a 40-hour work week for a hypothetical

</tr>
</tbody>
</table>
well-managed team. Team member effort may vary greatly across different types of proposals, but few would disagree with the realization that procrastination by team members early in the process leads to long work days in the last week and increases the likelihood of errors and missed opportunities in the application. Figure 2520-13.3 demonstrates that even minor reductions in activities during Framing and Collaboration Phases could create workloads significantly exceeding a 40 hour week in the Refinement Phase, if you were to shift those earlier unspent hours and add them to the hours already needed in the Phase. This “shortening” of Refinement Phase activities introduces a risk in proposal quality by reducing or eliminating the precious time necessary for improving proposal drafts and securing collaborative involvement, considered valuable for success. Further, last minute work typically involves more distracted effort due to the need to interrupt planned work schedules for other proposals and responsibilities that were designed around efficient scheduling.

**Final Thoughts**

This model timeline is not intended as a “one size fits all” approach, but the three distinct phases serve as modules that are transferrable and may be adapted to any specialized institutional or proposal needs. Our focus on planning is a topic every research office deals with and discussion converges to a universal tenet: Careful planning and conscientious attention to timelines help avoid the all-nighters the week before submission and proclivity for errors or missed opportunities in proposals. We hope the 12 week planning guide: 1) Serves as a starting place for planning of personnel and other resource decisions for a sustainable proposal process, 2) Gives the RA a tool for assisting PIs in understanding the differences between single-investigator and large multidisciplinary efforts, and 3) Provides a time and content guided framework for collaboration among a diverse set of professionals...
all in an effort to avoid the Big Bang.

About the Authors

Kevin Dressler, PhD, and Lorraine M. Mulfinger, PhD, are proposal development specialists in the Strategic Interdisciplinary Research Office (SIRO) at The Pennsylvania State University, and Niki Page, is the Lead for Pre-Award Administration and Proposal Submission of SIRO. Together they share responsibility for directing and supporting multidisciplinary teams in the development of technical and cost proposals for large and strategic research-related initiatives. Kevin can be reached at kxd13@psu.edu while Lorraine can be reached at lxm14@psu.edu. Niki can be reached at nlg4@psu.edu.
Crowdfunding: Navigating the New Frontier in Research Funding and Administration

Natasha Chopp, Michigan Technological University; Patience Graybill Condellone, Southern Illinois University Edwardsville; and Jerry B. Weinberg, Southern Illinois University Edwardsville

As grant agencies’ budgets face reduction and proposal volumes increase, crowdfunding is becoming a viable alternative funding source for research, technology transfer, and support for the arts. Crowdfunding is the act of collectively raising funds by pooling together small donations from many individuals. Successful crowd-funding campaigns require the creation of awareness through social media and networks, such as alumni networks, institutional Facebook pages, or Internet communities (Wheat, Wang, Byrnes, and Rangathan, 2012). People across the world, through the Internet, donate to initiatives that are important to them or in their network. By harnessing the power of the crowd, funds are raised, and a goal is fulfilled in support of the proposed project.

Crowdfunding as an Alternative Funding Source

How does crowdfunding work? Projects are posted on a crowdfunding site that includes a description of the project (what the project is, why it is important, and how the funds will be used), a funding goal, and a time limit to raise the funds. Some project creators might even offer rewards to entice donors. The project leader then raises awareness about the project, attempting to raise the necessary funds within the timeframe. Depending on the policies of the crowdfunding site, after the time is expired, the project creator may receive all or none of the pledge contributions, depending on whether the funding goal was met.

A variety of websites specialize in facilitating crowdfunding by connecting the project organizer with potential donors. Crowdfunding websites also provide the financial services of collecting and delivering funds that have been raised. Each website has its own policies, fees, and regulations, and crowdfunding sites tend to specialize in the types of projects they post and promote. Sites such as Kickstarter.com and Crowdtilt.com appeal to a general audience and allow fundraising for social projects (such as parties and gifts), commercialization or start-up projects, as well as research or creative projects. Other websites specialize in research and creative activities; for example, Petridish.org and Scifundchallenge.org focus on science, while Artistshare.com is for musical endeavors. Such sites may be useful to research institutions and have already been discovered by some faculty members and the mainstream media (like NPR’s Science Friday) as a new frontier in today’s research climate.

When looking for an appropriate crowdfunding site it is important to know that three general crowdfunding models prevail: pre-sale, donation-based, and equity-

---

1 This article is reprinted from NCURA Magazine, Volume XLV, No. 5, October/November 2013. It is used with permission of the publisher.
based (Stanco, Popma, and Totterman, 2013). Pre-sale crowdfunding raises money for commercialization of products. For institutions of higher education, this is an appropriate means for technology transfer. Typically people pledge funds with the expectation of receiving the end product. Equity-based crowdfunding is open only to accredited investors who are pledging for an equity stake in a start-up company. Donation-based crowdfunding sites allow people to donate to a project or cause. Typically these sites are registered non-profits that will issue receipt of a donation for tax purposes. Donation-based crowdfunding is most appropriate for research and creative projects.

Within these crowdfunding models, there are two main funding categories: all-or-nothing or all-donation. In all-or-nothing funding, a minimum pledge threshold is set, and it must be met in order to receive funds. If the goal is not met, donors are not charged and the project leader receives nothing. In some cases, the primary investigator has the option to either take none of the pledged contributions or pay a higher percentage fee in order to keep the pledges. In all-donation funding, the proposer may keep all donations.

It is easy to imagine how crowdfunding can potentially transform the research funding climate. Investigators, not solely dependent upon federal funding politics and peer review, can now access a broader, diverse, and perhaps more open-minded audience willing to support riskier projects. Artists may use the web’s inherently visual base to better promote their work. Institutions can use their own crowdfunding sites to target their angels and alumni. At our respective universities, Southern Illinois University Edwardsville and Michigan Technological University, we have been exploring the possibilities for crowdfunding platforms to fill the funding gap for our projects while also developing individual approaches that navigate the particular challenges we face as universities and/or sponsored research offices.

The Challenges

Individuals wishing to raise funds via crowdfunding must do so with awareness to the particular challenges of this market. Thousands of projects are posted on websites, creating high competition. Strong marketing strategies are required to attract interested donors. Often, the all-or-nothing game challenges proposers to not only set reasonable thresholds but also to strategize the best way to raise funds necessary to complete the project. As crowdfunding becomes more popular in academia, questions are being raised about the regulation of projects funded through such open sources and the role of the institution administering crowd-funded projects. If a faculty member uses institutional resources, the institution has an interest in regulating the use of its resources, and in keeping the crowdfunding project in line with compliance matters. Federal regulations require that institutions maintain consistent practices in managing and ensuring the compliance of externally-sponsored projects. Posting a project on a crowdfunding site becomes particularly delicate if the researcher wants to conduct a project that, say, uses human subjects.

Intellectual property (IP) is also at stake: does the crowdfunding portal ask the applicant to relinquish claims to IP? By posting crucial information regarding ideas
prior to provisional patent applications, the investigator’s and the institution’s IP may be at risk. An examination of a crowdfunding site’s policies and close review of information being disclosed in the campaign will need to occur for the university to protect their IP rights.

Furthermore, donors often have high expectations for outcomes gained through the project, and institutions have the responsibility of ensuring funds are spent appropriately. Wise proposers manage the expectations of their audiences and keep the donors updated about progress, lest they face the wrath of the individual donor wanting a refund! Donors want the assurance of prudent financial management of a project that should be offered by an institutional accounting system. Meanwhile, universities will desire to protect their institutional brand by regulating the types of projects advertised in their name and with their facilities. At state institutions like ours, we are careful to avoid the use of public funds and facilities for private gain, and the potential outcomes of projects that must be closely monitored. These matters raise questions about how to best track and report on a project: How does one communicate with the donors “post-award”? What is involved in reporting?

Finally, what is the best way to classify these crowd-funded projects—as gifts or grants? While the donations may be best considered donations, how does an institution manage the compliance, intellectual property, financial, reporting, and institutional brand issues above if there is no monitoring of the project? Is this an issue for the foundation or for the sponsored research office? While some foundations may have the mechanisms and network to attract donors, they may not have the accounting or compliance tools available to the sponsored research office. Many of the answers to these questions lie in the existing framework of an institution and the capabilities of different offices to manage aspects of an externally-funded/crowd-funded project.

**Our Two Models**

At Southern Illinois University Edwardsville, we have established a hybrid model that employs the strengths of both the Foundation and the Office of Research and Projects (ORP). Our Foundation has great community connections and marketing ability not available to the ORP, but unfortunately has none of the ORP’s accounting structure or compliance and IP monitoring abilities.

Faculty members hoping to use university resources for a project are asked to route a proposal for internal approval as they would other grants or contracts. Required materials include a description of the project, a budget, budget justification, and completion of our grant vs. gift checklist. The routing allows ORP and other administrators to stay abreast of the research activity occurring with their resources, as well as review of the project for important issues related to compliance, budgeting, and IP. The ORP can also be involved in budgeting and setting strategic funding threshold goals. Applicants are asked to include a small administrative fee of 10% for budgets of $10,000 or less and 15% for budgets greater than $10,000 to help recover administrative fees charged by the crowdfunding host and the University’s own F&A costs.
Once the project has received approval, the project director will receive assistance from University Marketing in finding an appropriate portal and in developing a marketing plan with the university brand. Donations will be collected and run through Foundation accounts. This allows the project director access to the networking power of the Foundation and flexibility of a 501(c)(3). Donors receive their tax benefit through the Foundation. However, financial management of the project will be handed over to a grant accountant in the ORP who has the tools and knowledge to keep the project consistent with institutional accounting and reporting practices. Project directors will be asked to provide a final report on the project and proof of its distribution to the donors in order to keep them informed about the project.

Superior Ideas, our second model, is a crowdfunding platform, created and managed by Michigan Technological University, and open to any university to post projects on. Superior Ideas helps bring university research and public service projects that support science, technology, engineering, and math (STEM) to life. The mission is to increase external support for research, innovation, and creative work that promotes sustainable economic and social development.

Superior Ideas is an all-donation based model: every donation goes to the project regardless if the project funding goal is met or not. Projects are submitted online through the Superior Ideas website and then reviewed by the Superior Ideas team. The required materials include pictures, a description of the project, a budget breakdown, and an explanation of how the donations will be used. The team evaluates the proposed project based upon the type of research performed and whether or not it fits into Superior Ideas’ overall mission. If it does not meet the set requirements, the project will not be posted.

Once the project is approved by the Superior Ideas team, it is posted on the site and can accept donations. Since Superior Ideas is an entity of Michigan Tech, donations are processed through the Michigan Tech Fund, which is a not-for-profit, tax exempt corporation [501(c)(3)]. When a donation is made online, a receipt is generated and emailed to the donor acknowledging their contribution.

Figure 2520-14.1. Popular crowdfunding websites & affiliates include:

- Rockethub.com http://www.rockethub.com
- Petridish.org http://www.petridish.org
- Scifundchallenge.org http://scifundchallenge.org
- Innovocracy.org http://www.innovocracy.org
- Indiegogo.com http://www.indiegogo.com
- Artistshare.com http://artistshare.com/v4
- Artspire.org http://artspire.org/home.aspx
- Crowdtile.com https://www.crowdtile.com
- Microryza.com https://www.microryza.com
If the project creator is from Michigan Tech, the donated amount is transferred at the end of the crowdfunding period into a restricted spending account in the Office of the Vice President for Research. If the project creator is from another university, the donated amount is transferred to an appointed liaison at that university. That university will determine the appropriate means to disperse funds to the project creator since every university has their own procedures.

Superior Ideas does subtract 7.5% from the final donated amount to cover the credit card processing fee and administrative costs. Even though the donation is a gift, the money is only allowed to be applied to the project.

As we explore this new frontier in research support on our campuses, the needs of the researchers, the institution, and our donors are sure to catalyze change in our crowdfunding models. In the meantime, we continue to recruit faculty members willing to be pioneers in the practice of opening their research to the crowd.

About the Authors
Natasha Chopp received her BS in Business Administration in 2006 from Michigan Technological University. Natasha is the Research Development & Marketing Manager for the Vice President for Research at Michigan Technological University. She was the lead project manager on developing the Superior Ideas crowdfunding platform, which she now manages. Natasha is currently working on her Master of Business Administration at Michigan Technological University. Natasha can be reached at nichopp@mtu.edu

Patience Graybill Condellone is a Pre-Award Administrator in the Office of Research and Projects at Southern Illinois University Edwardsville. She carries an MA in German Language and Literature from Washington University in St. Louis and a BA in English and German from Hope College. Ms. Graybill Condellone specializes in proposal development and outreach, manages internal funding and limited submission competitions, and edits the ORP’s publications, including the annual research magazine Research & Creative Activities. Patience can be reached at pgraybi@siue.edu

Jerry B. Weinberg is Associate Provost for Research, Dean of the Graduate School and Professor of the Computer Science at Southern Illinois University Edwardsville. He holds a BS in nursing from Indiana State University, a BS in computer science from the University of South Carolina, and MS and PhD degrees in computer science from Vanderbilt University. Dr. Weinberg administers pre- and post-award services as well as ethical compliance. He is responsible for promoting scholarship and external sponsorship across the university. He conducts research in Mobile Robotics, Human-Computer Interaction, and STEM Education. Jerry can be reached at jweinbe@siue.edu
Establishing Efficient Contract Turn-Around Processes
Sarah Lampson, Canadian Association of University Research Administrators, and Katie Porter, Hamilton Health Sciences

Contracts are a necessary step in research collaboration but are often viewed as a hurdle that delays research. In clinical research, institutions and investigators need new medicines for their patients, some of whom have no other treatment options and sponsors are eager to get their drugs to market as every day that delays the drug approval is costing the sponsor money. With both sides highly motivated, why are contract negotiations often so prolonged and what can contract negotiators do about it? Hamilton Health Sciences Corporation has been consistently recognized by sponsors as one of the most efficient sites for contract completion – in the top three in Canada. A contracts coordinator and 1.5 contract negotiators handled over 500 agreements with each initial review completed within 10 days of contract receipt. Here the Hamilton Health Sciences (HHS) Team shares their top 10 tips on how to get agreements to signature more quickly:

1. Try a template.
Template agreements are an excellent investment of time if the parties work together frequently. If one party cannot enter into a template then perhaps you can both agree to use the same contract language repeatedly, even if you cannot officially commit to it for all future agreements.

2. Use a checklist.
A quick scan of the agreement, aided by a checklist of required clauses, will quickly highlight what’s missing so you can focus on those areas first. After proposing appropriate wording, review the remaining wording and align with your institution’s standards.

3. Identify your timelines.
Educate the other party on your timelines and needs. How quickly do you typically complete the initial contract review and send back changes? What are your objectives and what do you need from the other party to achieve them? At HHS the contract timeline is carefully tracked; from the initial review through negotiations and even the circulation for sign-off. The Contracts Team owns the process and is accountable for the total number of days it takes to complete the process. Timeliness on the sponsor side significantly impact HHS’ ability to achieve their goals. When a contracts negotiator is absent she always provides the sponsor with the contact of her back-up whom she has briefed.

4. Start the process promptly.
As soon as HHS receives a contract, the contracts coordinator enters it in the da-

---

1 This article is reprinted from NCURA Magazine, Volume XLV, No. 4, August 2013. It is used with permission of the publisher.
tabase and the clock starts ticking. This ensures all team members have it on their radar as it is captured in our weekly reports. The Contracts Team follows up with sponsors on all agreements at least every 2 weeks to make sure nothing slips through the cracks.

5. Be clear about your expectations.
Stating non-negotiable items up front makes it easier for both parties to see common ground as well as promptly identify which issues need to be escalated for approval. Parties can increase transparency, and therefore negotiation speed, by including a link to their policies on their website. Overhead rates, preferred contract language and institutional signatories can all be identified here and accessed by sponsors as they prepare the draft agreement. HHS follows principles established by the Council of Academic Hospitals of Ontario, which is affirmed by a link on the HHS research webpage. While reviewing the agreement, always propose alternate language for consideration and provide your rationale for the request to educate the other party as to exactly what you need and why.

6. Have a backup plan.
If an issue arises that you are having trouble resolving efficiently, have an alternate plan to implement promptly. Is there a colleague that could help you by providing a different perspective on troublesome wording? HHS contract reviewers established an e-group of peers nationally so they have over a hundred experts to consult in confidence at any time. Can you refer the matter to a more senior administrator for direction or a final decision?

7. Explain the process.
When and if you have to escalate a decision, explain to the other party what the timeline for the decision is and which party will be making the final call. Follow up to make sure the decision is made in a timely manner and communicate back to the other party as soon as you know whether you can move forward or not.

8. Pick up the telephone.
Unfortunately, the opportunity to meet is rare, so connect by telephone. Telephone conversations are the quickest way to negotiate and also help build rapport.

If you are not clear on an explanation, sense frustration in an email or are receiving information about a third party you doubt – verify it. Ask for more information, clarification or confirmation. When HHS contract reviewers are told other sites are accepting terms that it cannot, the contracts specialist calls the third party to confirm and learn how the third party resolved the issue.

10. Invest in long-term solutions.
Continue the dialogue beyond the contract. Solicit feedback annually from your sponsors and researchers. How does your institution rank as an efficient research
partner? What are their frustrations? What hurdles can you jump for them? This will give you a good sense of opportunities to address impediments to research.

Contribute to harmonization efforts. Find out which groups in your field and geographic area are working on standardizing contract negotiation language and get involved. Reducing contract negotiation times is better for everyone! Contract negotiators need not feel threatened by standard language, more efficient administration processes will help attract more research and expand, not eliminate your role. Think big picture and invest your strategic thinking in long-term solutions.

The Contracts Team at HHS is always focused on the main objective – supporting research – which helps us rise above the routine busyness and demands of a typical day. Getting treatments to the bedside more quickly is a very powerful and tangible goal and one we always keep on our radar. By continuously improving our processes and setting ambitious targets we play our part in ensuring accurate contract negotiations.

About the Authors

Sarah Lampson, since this article was written, has left Hamilton Health Sciences to serve as the Executive Director of the Canadian Association of University Research Administrators. Sarah has co-authored 2 books on research administration which are used by research administrators at over 350 institutions globally. Sarah can be reached at executive_director@caura-acaru.ca.

Katie Porter is the Clinical Research Agreements and Contracts Specialist at Hamilton Health Sciences where she also serves on the Research Ethics Board. She has worked in research administration for 15 years, negotiating both clinical and non-clinical research contracts, and overseeing a variety of projects and programs. She is a frequent speaker throughout Canada and the United States, and is a lecturer at McMaster University. A passionate educator, Katie is also the co-author of Steer Your Career: A Research Administrator’s Manual for Mapping Success, the definitive volume on career planning for research administrators and the A to Z Guide to Research Contract Review, a one of a kind manual for research contract professionals. For her contribution to the research management profession internationally, she was thrilled to be awarded the “Excellence Award, Advanced Level” by the Society of Research Administrators International in 2012. Katie can be reached at porter@hhsc.ca.
\subsection*{2520.16 \textbf{New Biographical Sketch Format Required for NIH and AHRQ Grant Applications}}

National Institutes of Health

\textbf{Notice Number:}
NOT-OD-15-032

\textbf{Key Dates}
Release Date: December 5, 2014

\textbf{Related Announcements}

\textbf{Issued by}
National Institutes of Health (NIH)
Agency for Healthcare Research and Quality (AHRQ)

\textbf{Purpose}
This Notice supersedes NOT-OD-15-024 about the NIH and AHRQ requirement for use of a new biosketch format and provides some latitude in the transition for those who have already been compiling biosketches for their large grant applications with deadlines in early 2015.

NIH and AHRQ encourages applicants to use the newly published biosketch format for all grant and cooperative agreement applications submitted for due dates on or after January 25, 2015, and will require use of the new format for applications submitted for due dates on or after May 25, 2015. Applicants may submit using the new biosketch format for due dates before January 25, 2015, if they wish.

\textbf{New Format}
The revised forms and instructions are now available on the SF 424 (R&R) Forms and Applications page and adjustments have been made to improve their usability.

Individual fellowships, R36 dissertation grants, and diversity supplements should use the Fellowship Application Biographical Sketch Format Page and related pre-doc and post-doc instructions and samples, while research grant applications, career development, training grant, and all other application types should use the general Biographical Sketch Format Page and instructions and sample.

The new format extends the page limit for the biosketch from four to five pages, and allows researchers to describe up to five of their most significant contributions to science, along with the historical background that framed their research. Investigators can outline the central findings of prior work and the influence of those findings on the investigator’s field. Investigators involved in Team Science are provided the opportunity to describe their specific role(s) in the work. Each description can be accompanied by a listing of up to four relevant peer-reviewed publications or other non-publication research products, including audio or video products; patents;
data and research materials; databases; educational aids or curricula; instruments or equipment; models; protocols; and software or netware that are relevant to the described contribution. In addition to the descriptions of specific contributions and documentation, researchers will be allowed to include a link to a full list of their published work as found in a publicly available digital database such as MyBibliography or SciENcv.

**Tool to Help Build the New Biosketch**

The Science Experts Network Curriculum Vitae (SciENcv, http://www.ncbi.nlm.nih.gov/sciencv/), which serves as an interagency system designed to create biosketches for multiple federal agencies, will be updated by the end of December to support the new biosketch format and to address some issues found in testing.

SciENcv pulls information from available resources making it easy to develop a repository of information that can be readily updated and modified to prepare future biosketches. A YouTube video (https://www.youtube.com/watch?v=PRWy-3GXhtU&feature=youtu.be) provides instructions for using SciENcv.

**Additional Information**

Note that having a different biosketch format than other applications being reviewed in the same panel is not grounds for appeal.

**Inquiries**

Please direct all inquiries to:

- Grants Information
- Office of Extramural Research (OER)
- National Institutes of Health (NIH)
- Phone: 301-435-0714
- Email: GrantsInfo@nih.gov

Many research administrators want to know what “piece” they play in developing their institution’s large proposal process.

This is the very question we asked ourselves more than a year ago while trying to determine how universities focus and expand their pre-award activities to win the illusive Big ONE.

We’ve all noticed the heavy increase in sponsor demands, a simultaneous trend toward collaborative, large-scale, multi-investigator awards, and the growing phenomenon of “team science.” These are but a few of the puzzle pieces that universities need to fit together when positioning pre-award resources. These trends are leading many major research institutions to consider new avenues to enhance support for multi-investigator teams that have accepted the challenge of developing a complex, interdisciplinary application. To better understand how universities are supporting their faculty and research portfolios, the Pennsylvania State University and Huron Consulting Group teamed up to survey leading research institutions currently supporting large research proposals at their respective institutions.

Our goal was to gather additional puzzle pieces to get a clear picture of what today’s landscape looks like. We were fortunate to have 20 respondents of the 100 invited top-ranked research institutions (NSF, 2014b) participate in our survey. A descriptive profile of these institutions is provided below in Figure 2520.17-1.

Figure 2520.17-1. Profile of survey participants

The Penn State/Huron survey was designed to determine how large proposals are currently supported at different research institutions. The survey objectives were seemingly simple: 1) to characterize the large proposal support models, and 2)

1 This article is reprinted from NCURA Magazine, Vol XLVIII No 3, May / June 2016. It is used with permission of the publisher.
determine a possible correlation between funding success rates and proposal support services and the models themselves. Our support models included LPO (Large Proposal Office) offices, LPO-type activity across different units, and combinations of support elements that can range from fully-centralized to fully-decentralized (See Figure 2520.17-2).

**Figure 2520.17-2. Survey Support Models**

A **key focus** of the study was to better understand whether an institution supports strategic or large (i.e. >$1 million, multi-persons/site) proposals differently than other proposals, and if so, how. Success in our initial base line study was only measured as the percent of submitted proposals that were ultimately funded by the target agency (i.e. funding rates).

As can occur in research, there were no absolute results from our 20 participants that would solve every institution’s large proposal support puzzle, only more questions and theories of missing pieces. Our team hosted follow-up webinars with the survey respondents and presented our findings at conferences. We learned there was no one-size-fits-all model; rather, there are many ways to support a research institution’s growing portfolio and future strategic proposal hit rate. What we did find are some important steps institutions are taking to support large efforts, including:

◆ Establishment of a specialized Large Proposal Office (LPO)
◆ Institutional level commitments for team building and development capacity
◆ Recruitment of partners and key faculty to strategically prepare for future opportunities
◆ Faculty quality surveys to measure institutional support and possibility of repeat attempts
◆ Incentives for faculty: teaching buy-outs, travel support, administrative support

As mentioned above, we set out to investigate three strategic puzzle pieces all research institutions are faced with:

Target Strategic Proposal Puzzle #1: Collaborations across Science Disciplines

As discussed in detail in Mulfinger et al., 2016, there has been an increased emphasis by funding agencies on collaborations across scientific disciplines, evident in the growth of multiple principal investigator (multi-PI) grants and larger average award sizes. This trend is highlighted by new target programs in the most common of federal sponsors such as NSF, NIH, and DOE.

As previously reported (NSF, 2014c), the incidence of multi-PI grants has increased more than 18 percent over the period 2004-2013 which significantly outpaced the increase in single PI awards. One should also note that the NIH has also experienced a massive growth for multi-PI grants over the period 2006 to 2013 (National Research Council Board on Behavioral, Cognitive, and Sensory Sciences Division of Behavioral and Social Sciences and Education, 2015). The NIH growth has directly resulted in a current allocation of multiple PI projects that is approximately one fifth of the external awards (Chronicle Staff, 2014).

So how does a university support these new relationships and collaborative efforts? Our survey suggested a key corner piece to our puzzle - more institutional-level focus on the cross pollination of ideas and interdisciplinary science teams. University endorsed Institutes or Centers can be a breeding ground for such collaborations that need to be cultivated and supported with internal seed funding. These focused units also supply other physical support infrastructure for a team environment such as communication, data management, and user facilities for jointly-used equipment. Team building is not a simple process; it takes time to foster these unique and interdisciplinary relationships. Management of such awards should be a priority as well and may mean non-traditional thinking about budget structures and multi-PI responsibilities in operations and management.

Target Strategic Proposal Puzzle #2: Team Collaborations for High Dollars

As team science continues to evolve, agencies have responded by creating more collaborative high dollar awards. Between 2000 and 2014 (OMB, 2014), a general influx of more awards in either or both the $1-$5M and $5M-$25M ranges has been reported across at least four major agencies: NIH, NSF, USDA, and DoD.

Our survey was designed to dig into the details of these higher funding value awards. After all, these are the strategic investments that create new ideas in our research institutions and are highly sought after by all. We wondered, “Is there a more efficient or unique way to handle these applications? Have some institutions found the optimal set of missing puzzle pieces and increased their hit rates for these larger award values?”

We asked our survey participants to report proposal funding success rates across five dollar ranges defined by $250K steps up to $1M. These results are summarized in Figure 2520.17-3 as below $1M and above $1M. As expected, proposals above $1M had a lower hit rate as an averaged group (25%) than all ranges (48%).
A clear trend is evident for a lower hit rate as proposal values increase. Of interest, however, is the larger range of institutional success rates for proposals above $1M. This uniquely larger range implies that certain institutions may have adjusted their approach to better their odds in winning higher dollar applications.

**Figure 2520.17-3. Proposal Funding Success Rates**

![Bar chart showing proposal funding success rates.](image)

Data adapted from Mulfinger et al., 2016.

Is there enough information to show that more institutional resources seem to be working on larger efforts? It appears that more universities are inviting their institutional experts to join the proposal development team to help with data metrics, cost volumes, facilities, and management structures.

**Target Strategic Proposal Puzzle #3: Collaborative Research Support**

Is it just us, or have sponsors raised the bar to a new level? Have we moved to a more complex 3D puzzle eclipsing our mastery of the more traditional 2D-type? It seems every year more and more changes are implemented under funding opportunities. Some are technical in nature such as data management plans, increasing management requirements with explicit milestone and timeline coordination, outreach, diversity, and education components which require special attention to institutional data and regional, national or even global impacts. Many of these sponsor requirements are non-technical and lean more on the administrative side of proposal preparation. What is an institution to do? Are there better research administrative service support models to assist with large, complex, collaborative, and strategic applications?

Figure 2520.17-4 (below) showcases the results from the 20 participant institutions. The data analysis sought a correlation of proposal success rates with any of the six models for large proposal support reported by institutions.

When analyzed with respect to >$1M funding rates, we found a clear diversity in support model infrastructure among the institutions with 50% employing a combination of models. The College, Departments, and Centers (CDC) support model
was most prevalent and present in 70% of the institutions. Only three institutions reported separate LPO models.

**Figure 2520.17-4. Support Models across Survey Participants**

The study’s conclusive findings were: 1) The decentralized College/Department/Center model is the most commonly used large proposal support model, 2) large proposal offices and units have similar criteria in selecting proposals to be supported, the most common of which is awards equaling or exceeding $1M, and 3) institutional setting is a factor in success rates for larger proposals. The baseline study provided a clear line at $1M but as the value of proposals continues to increase, the next higher class of award values should be defined and studied (e.g., >$5M or greater), as indicated by many respondents during follow-up conversations.

**Piecing It All Together**

Our baseline survey provided valuable information about how research institutions are currently supporting their strategic efforts, but there is more to discover. While there may not be a perfect model for winning, there surely are common support activities that foster these wins.

For all, success metrics are key when evaluating resources. Should success be measured on wins alone? What about sparking and helping to fuel a researcher’s passion? If an institution can alleviate a bulk of the administrative proposal components, it would free our scientists to do what they do best – science. If an interdisciplinary team came together for one effort but several smaller groups spun out other ideas, isn’t that a win? Do we “dare to dream” when a principal investigator of a 20+ person team is excited about resubmitting or leading another collaborative effort for additional funding opportunities?

Another metric that was not measured is faculty response to large proposal support services. Compiling this type of feedback may reveal another piece of how the programmatic and administrative components may perform better when envisioning an institution’s future.

What else can we do? Our baseline survey demonstrated a positive trend when the amount of personnel time spent on large proposals was considered. There may not be one right way to win, but it’s certain that institutions need to think about how
trends towards large-scale collaborative research should influence their strategic planning in its administrative support. What we do know is that one key puzzle piece is an enthusiastic research support office willing to go the extra mile for their team. Will you be the missing piece of the success puzzle for winning large proposals?

Practical Tools

This section includes guidance and tools — flowcharts, checklists, etc. — relating to the functions of pre-award services. These materials are culled from a variety of authoritative sources.

Checklist for Research Collaborations *

Howard Gadlin and Kevin Jessar

The list included below may be a good start in your facilitating the process of collaboration between researchers. In devising any agreement or plan, be sure to consult with your general counsel, as appropriate and particularly when ownership of intellectual property is likely to arise. — Eds

People often assume that since they share an interest in the same research area and have complementary skills and areas of expertise, things will just work out. But scientific collaborations, like other important relationships, take some forethought and some ongoing work to succeed. …

Most often, problems arise in scientific collaborations because the scientists failed to explicitly define their expectations of one another. We believe that framing a partnering agreement at the outset of the research project can help enormously in setting the collaboration on a solid footing. Ideally, the agreement spells out exactly what the roles and contributions of each scientist will be and provides a mechanism for decision making for major issues such as authorship, additional collaborations, and the sharing of biological materials.

Some people prefer written partnering agreements signed by the key collaborators. For others, a written agreement feels too legalistic, too much like a contract. Written agreements may offer the advantage of being less ambiguous than each party’s selective recall of what was agreed to, but we believe that it is most important that collaborators commence their project by anticipating, discussing, and resolving possible areas of disagreement. Moreover, the parties can jointly define a process for constructively handling disputes should they arise in the future.

Although each research project has unique features, certain core issues are common to most of them and can be addressed by collaborators posing the following questions:

* This material is excerpted from Howard Gadlin, NIH Ombudsman and Kevin Jessar, Associate Ombudsman, The NIH Catalyst, “Preempting Discord: Prenuptial Agreements for Scientists,” Vol. 10, No. 3, May–June 2002, www.nih.gov/catalyst/2002/02.05.01/page6.html. The NIH Catalyst is published bimonthly for and by the intramural scientists at NIH. The NIH Office of the Ombudsman (www4.od.nih.gov/ccr), Center for Cooperative Resolution “is a neutral, independent, and confidential resource providing informal assistance to NIH scientists, administrators, and support staff in addressing work-related issues.”
◆ What are the scientific issues, goals, and anticipated outcomes or products of the collaboration? When is the project over? Are all members of the research team on the same wavelength regarding these issues?

◆ What are the expected contributions of each participant?

◆ Who will write any progress reports and final reports?

◆ How will you decide about redirecting the research agenda as discoveries are made?

◆ What will be your mechanism for routine communications among members of the research team (to ensure that all appropriate members of the team are kept fully informed of relevant issues)?

◆ How will you negotiate the development of new collaborations and spin-off projects, if any?

◆ How, and by whom, will personnel decisions be made? How and by whom will personnel be supervised?

◆ What will be the criteria and the process for assigning authorship and credit?

◆ How will credit be attributed to each collaborator’s institution for public presentations, abstracts, and written articles?

◆ How and by whom will public presentations be made?

◆ How and by whom will media inquiries be handled?

◆ When and how will you handle intellectual property and patent applications?

◆ How and by whom will data be managed? How will access to data be managed? How will you handle long-term storage and access to data after the project is complete?

◆ Should one of the principals of the research team move to another institution or leave the project, how will you handle, data, specimens, lab books, and authorship and credit?

Of course, it is easy to imagine that for any particular research project there might be additional specific questions that should be added to this list.

Many potential collaborators can answer these questions simply by getting together and talking things out. For some people a neutral third party, with no involvement in the project, can help facilitate such discussions and maximize their effectiveness.
2530.2 **Sample ‘Biosketch’**

AIS editors

As part of the National Institute of Health’s new application format, changes are being made to the biographical sketch, including the addition of a personal statement and a limit on the number of publications or manuscripts to no more than 15. A sample biosketch demonstrating the new format is included below (and at http://grants.nih.gov/grants/funding/2590/biosketchsample.pdf). For other changes to NIH’s application process, see its Enhancing Peer Review Web site at http://enhancing-peer-review.nih.gov.

A review of this biosketch format may also prove helpful when completing applications for an agency other than NIH.
BIOPGRAPHICAL SKETCH

Provide the following information for the Senior/key personnel and other significant contributors in the order listed on Form Page 2. Follow this format for each person. DO NOT EXCEED FOUR PAGES.

<table>
<thead>
<tr>
<th>NAME</th>
<th>POSITION TITLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>eRA COMMONS USER NAME (credential, e.g., agency login)</td>
<td></td>
</tr>
</tbody>
</table>

EDUCATION/TRAINING (Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable.)

<table>
<thead>
<tr>
<th>INSTITUTION AND LOCATION</th>
<th>DEGREE (if applicable)</th>
<th>MM/YY</th>
<th>FIELD OF STUDY</th>
</tr>
</thead>
</table>

NOTE: The Biographical Sketch may not exceed four pages. Follow the formats and instructions on the attached sample.

A. Personal Statement

Briefly describe why your experience and qualifications make you particularly well-suited for your role (e.g., PD/PI, mentor, participating faculty) in the project that is the subject of the application.

B. Positions and Honors

List in chronological order previous positions, concluding with the present position. List any honors. Include present membership on any Federal Government public advisory committee.

C. Selected Peer-reviewed Publications

NIH encourages applicants to limit the list of selected peer-reviewed publications or manuscripts in press to no more than 15. Do not include manuscripts submitted or in preparation. The individual may choose to include selected publications based on recency, importance to the field, and/or relevance to the proposed research. When citing articles that fall under the Public Access Policy, were authored or co-authored by the applicant and arose from NIH support, provide the NIH Manuscript Submission reference number (e.g., NIHMS97531) or the PubMed Central (PMC) reference number (e.g., PMCID234567) for each article. If the PMCID is not yet available because the Journal submits articles directly to PMC on behalf of their authors, indicate "PMC Journal - In Process." A list of these Journals is posted at: http://publicaccess.nih.gov/submit_process_journals.htm. Citations that are not covered by the Public Access Policy, but are publicly available in a free, online format may include URLs or PMCID numbers along with the full reference (note that copies of publicly available publications are not accepted as appendix material.)

D. Research Support

List both selected ongoing and completed research projects for the past three years (Federal or non-Federally-supported). Begin with the projects that are most relevant to the research proposed in the application. Briefly indicate the overall goals of the projects and responsibilities of the key person identified on the Biographical Sketch. Do not include number of person months or direct costs.
Hunt, Virginia Lively

**A. Personal Statement**

The goal of the proposed research is to investigate the interaction between drug abuse and normal aging processes. Specifically, we plan to measure changes in cognitive ability and mental and physical health across a five-year period in a group of older drug users and matched controls. I have the expertise, leadership and motivation necessary to successfully carry out the proposed work. I have a broad background in psychology, with specific training and expertise in key research areas for this application. As a postdoctoral fellow at Berkeley, I carried out ethnographic and survey research and secondary data analysis on psychological aspects of drug addiction. At the Division of Intramural Research at the National Institute on Drug Abuse (NIDA), I expanded my research to include neuropsychological changes associated with addiction. As PI or co-Investigator on several previous university- and NIH-funded grants, I laid the groundwork for the proposed research by developing effective measures of disability, depression, and other psychosocial factors relevant to the aging substance abuser, and by establishing strong ties with community providers that will make it possible to recruit and track participants over time. In addition, I successfully administered the projects (e.g., staffing, research protections, budget), collaborated with other researchers, and produced several peer-reviewed publications from each project. As a result of these previous experiences, I am aware of the importance of frequent communication among project members and of constructing a realistic research plan, timeline, and budget. The current application builds logically on my prior work, and I have chosen co-investigators (Drs. Gryczynski and Newlin) who provide additional expertise in cognition, gerontology and geriatrics. In summary, I have a demonstrated record of successful and productive research projects in an area of high relevance for our aging population, and my expertise and experience have prepared me to lead the proposed project.

**B. Positions and Honors**

**Positions and Employment**

1998-2000 Fellow, Division of Intramural Research, National Institute of Drug Abuse, Bethesda, MD
2000-2002 Lecturer, Department of Psychology, Middlebury College, Middlebury, VT
2001- Consultant, Coastal Psychological Services, San Francisco, CA
2002-2005 Assistant Professor, Department of Psychology, Washington University, St. Louis, MO
2005- Associate Professor, Department of Psychology, Washington University, St. Louis, MO
Other Experience and Professional Memberships

1995- Member, American Psychological Association
1998- Member, Gerontological Society of America
1998- Member, American Geriatrics Society
2000- Associate Editor, Psychology and Aging
2003- Board of Advisors, Senior Services of Eastern Missouri
2003-04 NIH Peer Review Committee: Psychobiology of Aging, ad hoc reviewer
2005-09 NIH Risk, Adult Addictions Study Section, member

Honors

2003 Outstanding Young Faculty Award, Washington University, St. Louis, MO
2005 Excellence in Teaching, Washington University, St. Louis, MO
2008 Award for Best in Interdisciplinary Ethnography, International Ethnographic Society

C. Selected Peer-reviewed Publications (Selected from 42 peer-reviewed publications)

Most relevant to the current application

Additional recent publications of importance to the field (in chronological order)
Program Director/Principal Investigator (Last, First, Middle):  Hunt, Virginia, L.

D. Research Support

Ongoing Research Support

R01 DA942367-03  Hunt (PI)  09/01/07-08/31/12
Health trajectories and behavioral interventions among older substance abusers
The goal of this study is to compare the effects of two substance abuse interventions on health outcomes in an urban population of older opiate addicts.
Role: PI

R01 MH922731-05  Merryle (PI)  07/15/05-06/30/10
Physical disability, depression and substance abuse in the elderly
The goal of this study is to identify disability and depression trajectories and demographic factors associated with substance abuse in an independently-living elderly population.
Role: Co-Investigator

Faculty Resources Grant, Washington University  08/15/09-09/14/11
Opiate Addiction Database
The goal of this project is to create an integrated database of demographic, social and biomedical information for homeless opiate abusers in two urban Missouri locations, using a number of state and local data sources.

Completed Research Support

K02 AG442898  Hunt (PI)  09/01/06-08/31/09
Drug Abuse in the Elderly
Independent Scientist Award: to develop a drug addiction research program with a focus on substance abuse among the elderly.
Role: PI

R21 AA998075  Hunt (PI)  01/01/04-12/31/06
Community-based intervention for alcohol abuse
The goal of this project was to assess a community-based strategy for reducing alcohol abuse among older individuals.
Role: Co-Investigator
### Postdoctoral Researcher Mentoring Plan

National Science Foundation

Section 7008 of the America COMPETES Act, passed in 2007, requires a principal investigator to include in his or her National Science Foundation grant proposal a postdoc mentoring plan, if postdocs are to be funded under the proposal. The mentoring plan must not exceed one page. The following sample Postdoctoral Researcher Mentoring Plan was prepared by NSF (see www.nsf.gov/eng/iip/sbir/Sample_Postdoc_Mentoring_Plan.doc).

**Sample Plan**

This Postdoctoral Researcher Mentoring Plan has been prepared by <organization name>. The Plan establishes guidelines for work to be performed by a Postdoctoral Researcher in support of the NSF <SBIR or STTR> <Phase I or Phase II> Project Awarded to <company name>, entitled “<title of project>”. The Postdoctoral Researcher assigned to the project will work in <name/university> laboratory and will conduct research on <name tasks>.

1. **Orientation** will include in-depth conversations between <company researcher name> and the Postdoctoral Researcher. Mutual expectations will be discussed and agreed upon in advance. Orientation topics will include (a) the amount of independence the Postdoctoral Researcher requires, (b) interaction with coworkers, (c) productivity including the importance of scientific publications, (d) work habits and laboratory safety, and (e) documentation of research methodologies and experimental details so that the work can be continued by other researchers in the future.

2. **Career Counseling** will be directed at providing the Postdoctoral Researcher with the skills, knowledge, and experience needed to excel in his/her chosen career path. In addition to guidance provided by <post-doc researcher name>, the Postdoctoral Researcher will be encouraged to discuss career options with researchers and managers at <university name> and with former students and colleagues of <post-doc researcher name>.

3. **Experience with Preparation of Grant Proposals** will be gained by direct involvement of the Postdoctoral Researcher in proposals prepared by <company name>. The Postdoctoral Researcher will have an opportunity to learn best practices in proposal preparation including identification of key research questions, definition of objectives, description of approach and rationale, and construction of a work plan, timeline, and budget.

4. **Publications and Presentations** are expected to result from the work supported by the grant. These will be prepared under the direction of <post-doc researcher name> and in collaboration with researchers at <company name> as appropriate. The

---

1 Additional resources can be found at the National Postdoctoral Association (www.national-postdoc.org/mentoring), Federation of American Societies for Experimental Biology (www.faseb.org/portals/0/pdfs/opa/idp.pdf), and Association of American Medical Colleges (www.aamc.org/research/postdoccompact).
Postdoctoral Researcher will receive guidance and training in the preparation of manuscripts for scientific journals and presentations at conferences.

5. **Teaching and Mentoring Skills** will be developed in the context of regular meetings within *<university name>* research group during which graduate students and postdoctoral researchers describe their work to colleagues within the group and assist each other with solutions to challenging research problems, often resulting in cross fertilization of ideas.

6. **Instruction in Professional Practices** will be provided on a regular basis in the context of the research work and will include fundamentals of the scientific method, laboratory safety, and other standards of professional practice. In addition, the Postdoctoral Researcher will be encouraged to affiliate with one or more professional societies in his/her chosen field.

7. **Technology Transfer** activities will include regular contact with researchers at *<company name>*. The Postdoctoral Researcher will be given an opportunity to become familiar with the university-industry relationship including applicable confidentiality requirements and preparation of invention disclosure applications.

8. **Success of the Mentoring Plan** will be assessed by monitoring the personal progress of the Postdoctoral Researcher through a tracking of the Postdoctoral Researcher’s progress toward his/her career goals after finishing the postdoctoral program.
2530.4 Grant Application Tips From NIH
National Institutes of Health, Office of Extramural Research

Most Common Components of NIH-Funded Applications
1. New or original idea with potential for scientific impact
2. Projects of high scientific caliber
3. Solid qualifications for the investigator and key personnel
4. A clear statement of need or problem statement
5. Pilot data (essential for R01s; less critical for Fs and Ks)
6. A focused, incisive research plan
7. A defined budget plan
8. Knowledge of published relevant work
9. Experience in the essential methodology
10. Future direction and contingency plans

Tips for Submitting a Successful Proposal
1. Understand the NIH grant process
2. Begin with a good idea. Ask yourself the following:
   • Will the idea advance scientific knowledge?
   • What do my colleagues think?
   • Did I talk to an NIH program official?
3. Check out funding opportunities, Institute/Center priorities, and currently funded projects
4. Determine your institution’s submission policies. Ensure you complete all registration requirements before applying.
5. Find out if you are a new or Early Stage Investigator (special opportunities available).
6. Learn what works and what doesn’t work in applications, the scope of the project should be reasonable, and the research plan should be well written. Be clear about why the research is important.
7. Develop collaborations to fill in gaps and be explicit about them in your proposal.
8. Determine the appropriate application, review funding opportunity announcements details, and read application guide instructions.
9. Make a good impression by creating a reviewer-friendly proposal. Use text, tables, and headers the help with organization.
10. If at first you don’t success … try, try again. Use your Summary Statement to improve your next grant application, talk to NIH Program Officials for guidance, and review guidelines for resubmitting an amended application.
Helpful links:
RePORT (data on NIH-funded research): www.RePORT.nih.gov
Application Basics: www.grants.nih.gov/grants/grant_basics.htm
To help new and established applicants submit better applications, CSR asked current and recent study section chairs to share their personal insights on producing a highly competitive NIH grant application. They responded with great enthusiasm.

**Don’t jump too fast into writing your application:** Since the most critical parts are the summary and specific aims sections, write a one-page summary page with specific aims first and share it with someone who is experienced, has their own funding or—ideally—someone who has served on a study section. If you can’t wow them, start again and use the time you saved to come up with some fresh ideas.

**Propose something significant:** It is a real turn-off to read an application that is basically a re-hash of a previous project with a new issue. The same goes for “me too” research. Identify an area of current controversy and importance within your field. Make it something that would interest more people than you and your co-workers. Will it be important to clinicians or other investigators? Are you dealing with key questions or controversies in the field?

**Good ideas don’t always sell themselves:** Tell me why it’s important up front in the background section, and I’ll be ready to roll. Tell me what’s known and what isn’t known and how, after you complete your studies, you’ll move the field forward or answer important questions. A lot of people really are unaware of how absolutely important it is to tell the reviewer from the beginning why it’s worth doing. If you’re seeking an incremental advance over what’s known, it’s essential to justify it.

**Make it exciting:** I love to see fresh, well-supported ideas that have a good hypothesis behind them that could really open up an area. And I find it both exciting and intellectually stimulating to encounter new approaches to major problems and research that could advance both clinical and basic science. Even if it’s somewhat high risk, if it comes with a good hypothesis and you can test it, I’d find it very exciting.

**Probe for mechanisms and seek new models.** We need to know how something happens—not just what happens. With this knowledge we can affect outcomes and design something to prevent something from happening. If you don’t know what’s happening on the bench, you’re not going to move to the bedside with any reproducible or knowledgeable treatment.

**Avoid proposing to “collect more data.”** It might help you to set up the system, but if it is not critical to fundamental understanding, do not dwell on it. Although some experiments might take a lot of time to perform, they will not necessarily qualify as specific aims.

**Be very clear** and very concise about what you want to do, why it’s important, and what you expect to get out of it. Keeping it clear doesn’t mean doing away with

---

1 [http://public.csr.nih.gov/ApplicantResources/Pages/Links.aspx](http://public.csr.nih.gov/ApplicantResources/Pages/Links.aspx)
complexity. Just make sure your general sense and key questions come across very clearly throughout your proposal.

Don’t assume too much: Not all reviewers will have the same in-depth, highly expert, knowledge you do. Avoid any unnecessary technical jargon, and write your application assuming it will be reviewed by intelligent scientists who have a breadth of knowledge around your area. So consider getting a researcher at your institution who isn’t an expert in your field to read your application and tell you how well it flows.

Be brief with stuff everyone knows: Lots of people go too far describing routine laboratory methods, which just take up space and really distract reviewers. It gives the message that the applicant is not really as organized as they should be. New investigators, however, should make a little more effort to show that the techniques they proposed to use are within their capabilities.

Let your light shine: Don’t be bashful in telling reviewers your important strengths both in your biosketch and in relevant parts of your application.

Don’t be overly ambitious: Trying to cover too much territory with one application is perhaps the most common mistake applicants make.

Don’t overstate the significance of your research. It’s great if you can say your results could one day have an impact on treating or preventing disease. But don’t promise more than you can deliver. You really need to make more than a general case for significance. Explain the specific significance of the particular question you’re asking and how your results may fill important technical or knowledge gaps or otherwise impact your field.

Aim each aim: Lay out the rationale for each aim. Spend time on the Expected Outcomes, Data Interpretation, Pitfalls, and Contingencies section for each of them. The “expected outcomes” section shows you’ve got a logical strategy. The section on Data Interpretation gives insight into your depth of understanding the problem. The Pitfalls section shows how familiar you are with the proposed techniques and methodologies. Finally, in discussing alternative strategies, you can give us confidence you are able to deal with the problems that arise when experiments don’t work as expected.

Make your aims sing and harmonize: Quickly lay out the broad context, the scientific question to be addressed, including its significance, and exactly how you propose to advance understanding of your problem. Craft your aims carefully so reviewers will see both their individual and synergistic worth.

Pull it together: At the end of your research strategy section, have a succinct, one paragraph summary of what you intend to do, how you intend to do it and what it is going to tell you. Write it like a manuscript abstract. It is really helpful at the very end if I can get the take home message.

Focus your preliminary data: Insert a very succinct paragraph to explain what the preliminary data really tell you and how they show the feasibility of your proposed research. Make your application compelling by citing preliminary or prior work that shows the feasibility of each of your aims. Also, don’t assume your
reviewers will remember all your preliminary data from the significance section. If you have a lot, you may want to briefly refer to a key bit in your research strategy section.

Sleep on it: After you’ve written your application, reflect on the details and the big picture. Shedding unnecessary details and presenting a broader view of your proposed research may make it more exciting, particularly to reviewers who are not over-the-top experts in your field.

Don’t test the waters to see how reviewers like your initial ideas or let them find the limitations for you. Find the limitations yourself and discuss them in the application.

Don’t cram your application like a suitcase: I cringe when I open up an application that is wall-to-wall words. I also have a difficult time with numbered references (because they require readers to constantly flip back to the reference section) and statements such as “See the reprint in the appendix for details.” I love to see spaces between paragraphs, spaces between sections, and figure legends I don’t need to bring up the PDF magnification to 200x to read. Try writing your application without using the maximal margins and smallest allowable font.

Proofread your application. Better yet, have someone else proofread it!

Know your audience and pitch your application to it: Explore CSR’s study sections in your area. After checking out the guidelines and rosters online, request one you think could best review your application. Contact one of CSR’s scientific review officers if you are unsure.

Seek guidance from NIH program directors before and after your reviews. They can help you focus your proposed research, understand your reviews and guide your next steps.

The key word is persistence. Half the applications reviewed are not discussed. So don’t despair. You’re in good company. Go through your critiques with your investigators. If there’s a fatal flaw, stand back and then decide the best route to take next time. But usually the weaknesses are fixable. Make a stronger application, and re-submit.
### 2530.6 Proposal Budget Preparation Under Uniform Guidance Quick Guide

Emory University

The Office of Management and Budget (OMB) has combined many federal circulars into a single guidance document (known as Uniform Guidance, or 2 CFR 200) that can be used by all agencies. The information below is being made available to provide some guidance in preparing budgets for proposals that for awards that are anticipated to be issued under Uniform Guidance. Uniform Guidance is expected to be effective for all awards issued December 26, 2014 or later. Other than NSF, individual agencies have not yet provided individual agency guidance. As those become available, the document below will be updated and further communication will be provided.

#### Uniform Guidance Implementation

<table>
<thead>
<tr>
<th>CHARGING ADMINISTRATIVE/ CLERICAL AND PROGRAMMATIC SALARY COSTS</th>
<th>Administrative and clerical salaries (in certain circumstances) AND programmatic salary costs can be included on competitive and non-competitive proposal budgets.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicable Uniform Guidance (UG) Sections: 200.413 200.430</td>
<td>Administrative and Clerical Salaries: In general, administrative and clerical salaries should still not be direct charged, but the rules governing “major project or activity” exceptions have been dropped and replaced by the following criteria, all of which must be met:</td>
</tr>
<tr>
<td></td>
<td>1. Administrative or clerical services are integral* to a project or activity;</td>
</tr>
<tr>
<td></td>
<td>2. Individuals involved can be specifically identified with the project or activity;</td>
</tr>
<tr>
<td></td>
<td>3. Such costs are explicitly included in the budget or have the prior written approval of the Federal awarding agency; and</td>
</tr>
<tr>
<td></td>
<td>4. The costs are not also recovered as indirect costs.</td>
</tr>
</tbody>
</table>

*Emory University has determined that integral means: (1) the services are essential, vital, or fundamental to the project or activity; AND (2) are currently determining a minimum FTE that will be generally acceptable to budget unless there are documented special circumstances. For current budgeting purposes, please use this option for a minimum of 25% FTE or discuss the special circumstances with OSP for further consideration. (A formal decision regarding this will be announced in January/February after NIH’s guidance is received.)

If all of these requirements are met, PIs/departments must explicitly include these costs in the proposal budget and narrative to facilitate the required agency approval. They must explain why these costs are integral. We recommend including the statement shown in bold in the below example:

**EXAMPLE:** *“This award includes the management of 15 subawards. This volume and the tight timeline of the project mandate more extensive monitoring than the services routinely provided by the department. AXX% time assistant is needed to oversee the subrecipients’ activities, including working with the central office to perform risk assessment and subrecipient monitoring, ensuring timely delivery and review of invoices, acquiring progress reports and ensuring their review, resolving mid-project issues, monitoring compliance approvals, ensuring timely payments, and handling subaward modifications. We are therefore requesting agency approval for a [List% time appointment here] [List position title here] as an administrative cost allowed under 2CFR 200.413.”*
Examples of projects that could meet the definition of “integral”:

- Large, complex programs, such as Clinical and Translational Science Awards, program projects, research centers, and other grants and contracts that entail assembling and managing teams of investigators from a number of institutions.
- Projects which involve extensive data accumulation, analysis and entry, surveying, tabulation, cataloging, searching literature, and reporting (such as epidemiological studies, clinical trials, and retrospective studies of clinical records).
- Projects that require making travel and meeting arrangements for large numbers of participants, such as conferences and seminars.
- Projects where the principal focus is the preparation and production of manuals and large reports, books, or monographs (excluding routine progress and technical reports).
- Projects that are geographically inaccessible to normal departmental administrative services, such as research vessels, and other field research remote from campus.
- Projects requiring significant amounts of project-specific database management; individualized graphics or manuscript preparation; human or animal protocols, and multiple project-related investigator coordination and communications.

NOTE: Programmatic Salary Costs
Costs related to protocol development and maintenance, managing substances/chemicals, managing and securing project-specific data, and coordination of research subjects are allowable direct costs when they are “contributing and directly related to work under an agreement.” Thus, these programmatic costs may be direct charged using the same underlying requirements as other types of direct costs, and are not subject to the extra approval requirements required of administrative and clerical costs. They are still subject to all regular costing requirements (e.g., allocability, reasonableness, allowable by terms of the award, incurred within award period). **Please note that the costs of time spent on proposal preparation, departmental administration or any costs that do not directly benefit the award charged are not allowable.

AT TIME OF AWARD

- If a proposal is submitted with the required statement/justification (as shown above), and an award is subsequently issued by the federal agency without explicitly deleting the administrative cost, the NOGA will reflect approval to charge the requested cost. After award issuance, unless prohibited by the terms of the award, any post-award addition in the percentage of effort that does not exceed 25% of the amount approved by the sponsor may be incurred without additional federal approval. An addition greater than 25% must be requested from the federal sponsor as shown below. Reductions may be incurred without agency approval; however, PIs must recognize that this may still be questioned by auditors since the proposal indicated that such costs were necessary. PIs should be prepared to explain how the function was performed or why it was no longer needed.
- An administrative or clerical employee’s time may be fully or partially charged to sponsored projects with the balance charged to non-sponsored fund sources.
  - For example, an employee’s effort might be direct charged 25% time to one PI’s project, 20% to another PI’s project, and 55% to non-sponsored activities.
- If any portion of the employee’s time is direct-charged to a sponsored project, the employee must certify his or her effort via the effort reporting system.

AGENCY APPROVALS NEEDED DURING THE AWARD

- If new or additional (over 25% of the amount previously approved) administrative or clerical support is needed during the life of the award, PIs must write a letter to their federal program officer or the federal grants officer (as dictated by the federal agency) requesting approval to direct charge the new/additional administrative services. These letters must be signed by the PI, be prospective (not retroactive) and include the following:
  - The percentage of effort, time period needed, and estimated cost to the project (salary, fringe benefits, and associated indirect cost)
  - An explanation from what budget category the funds will be rebudgeted
  - How the services are integral to the project
The letter must be countersigned by OGCA, who will then submit the request to the agency. PIs should allow a minimum of 30 days for an agency response. Upon receipt of an approval, OSP will issue an updated NOA*

* In order to allow OGCA to revise the budget upon receipt of agency approval, a budget should accompany the letter request.
### COMPUTING DEVICES (UNDER $5,000 UNIT COST)

**Applicable UG Sections:**
- 200.33
- 200.48
- 200.89
- 200.439
- 200.453C

**Computing devices can be included on competitive and non-competitive proposal budgets.**

Computing devices under $5,000/unit may be direct charged to the project or activity under the following circumstances:

- The machines are essential* and allocable to the project in that they are necessary to acquire, store, analyze, process, and publish data and other information electronically, including accessories (or “peripherals”) for printing, transmitting and receiving, or storing electronic information.
- The project does not have reasonable access to other devices or equipment that can achieve the same purpose; devices may not be purchased for reasons of convenience or preference.
- Items costing more than $5,000 per unit are considered equipment and follow federal equipment rules for when they can be direct charged. (SEE 200.33, 200.48, 200.89, 200.439)

* PIs are responsible for determining whether or not the device is “essential” and to what extent the cost of the device is allocable to the sponsored project. PIs and departments should maintain documentation that describes how the proposed computing device meets the above requirements.

### PARTICIPANT SUPPORT COSTS

**Applicable UG Sections:**
- 200.75
- 200.456

**Participant support costs can be included for agency approval on competitive and non-competitive proposal budgets.**

After UG implementation, participant support costs (see 200.75) are allowable with agency prior approval. This includes stipends or subsistence allowances, travel allowances, and registration fees paid to or on behalf of participants or trainees (but not employees) in connection with conferences or training projects. Participant support costs are not routinely allowed on research projects but can be charged if the project includes an education or outreach component and the agency approves such costs.

These costs should be explicitly listed in the proposal budget or approved by the funding agency after the award has been made.

### VISA COSTS

**Applicable UG Section:**
- 200.463D

**Short-term, travel visa costs can be included on competitive and non-competitive proposal budgets.**

Since short-term visas are issued for a specific period and purpose, they can be clearly identified as directly connected to work performed on a Federal award and can be directly charged. They must be critical and necessary (directly benefit) the project and be allowable by the agency. Typically, these visas allow employees and students to engage in field research or attend meetings in foreign locations, or allow foreign visitors to visit the University in support of the project. Long-term visa costs, such as those that enable employment at the University (for example “J” and “H1B” visas) are not allowable as direct charges.

### FIXED PRICE/RATE SUBAWARDS

**Applicable UG Section:**
- 200.332

**Agency prior approval is required to enter into fixed price/rate subawards, which may not exceed $150K.**

Agency prior approval is required to enter into a fixed price/rate subaward rather than a cost-reimbursement subaward, and the total value of each fixed price/rate subaward may not exceed $150K. This will mostly impact subawards for clinical trial site agreements, foreign subrecipients, and/or small businesses. To expedite agency approval, PIs/departments should add a new justification statement to proposals contemplating a fixed price/rate subaward. A statement is not needed for other subawards.

**AT TIME OF PROPOSAL**

- The following justification statement should be added to competitive proposals containing subawards that are anticipated to be issued as fixed price and the cumulative estimated cost of the fixed price subaward is expected to be less than $150K:
  
  “The subaward to [Name the subrecipient here] documented in this proposal meets the criteria described in SubpartC-200.201(b) and the Emory University is therefore requesting prior agency approval of this Fixed Price Subaward. The University will consider this subaward approved if an award is made and no contrary guidance from the agency is included in the award notice.”

---

* Practical Tools Page 2530:19

Copyright ©2015 April 2015 National Council of University Research Administrators. All rights reserved.
• General research collaborations are not likely to be issued as fixed price/rate. If you are uncertain about how to set up the subaward, consult your OSP analyst for guidance, or omit the statement – you will be able to do an after-award-issuance request if it is determined that a fixed price/rate subaward is needed.

• OSP will work with the department and PI at time of subaward issuance to determine whether a fixed price/rate or cost-reimbursement subaward is appropriate. This is true regardless of whether a fixed price/rate justification statement was included in the proposal.

• Consult with OSP if you have a situation where you would need multiple fixed price subawards to the same subrecipient to stay under the $150K threshold per subaward.
Helping Faculty Differentiate Between the Good and the Fundable

Michael Preuss and Susan Perri, Hanover Research

The ability to articulate concepts concisely, clearly, and precisely is a necessary skill when providing guidance to others. To aid research administrators in achieving this level of communication when discussing project concepts and to fill an existing gap in the literature, the authors have constructed a table which contrasts the elements of a worthy undertaking (“a good idea”) with the corresponding characteristics of an approach which might receive funding (“a fundable idea”). The descriptive clauses in Figure 2530.7-1 are intended to illustrate differences between concepts that have general merit and those that would be worth pursuing as the basis of a grant application in the humanities, social sciences, education, and for intervention, outreach, or service projects.

**Figure 2530.7-1. A Good versus Fundable Idea**

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>…helps someone, enables improvement</td>
<td>…addresses the funder’s target audience/group</td>
</tr>
<tr>
<td>…advances an important agenda</td>
<td>…advances the funder’s agenda and builds on the funder’s giving history or portfolio</td>
</tr>
<tr>
<td>…serves a wise/substantial purpose.</td>
<td>…serves a wise/substantial purpose while doing something innovative like answering a question or addressing a problem in a new and unique way, proving a concept, or demonstrating scalability</td>
</tr>
<tr>
<td>…aligns with personal/professional interest and experience</td>
<td>…aligns with funder priorities</td>
</tr>
<tr>

<tr>
<td>…can be an untested concept</td>
<td>…has substantiated promise to catalyze positive change</td>
</tr>
<tr>
<td>…can be a first time endeavor</td>
<td>…should be in line with the proposer’s professional credentials and demonstrated skill-set</td>
</tr>
</tbody>
</table>

Propositions that people find appealing often include improving upon something or providing someone needed-assistance. However, enabling improvement or helping people is not enough to render a grant concept fundable (Karsh & Fox, 2009). While advancement and assistance are certainly desirable and essential elements of a proposal, one of the critical concerns of a funder is meeting the needs of the population they target (Bauer, 2009). Often, very little creativity is required to transform a good idea that advocates a helpful practice into one that also addresses the funder’s target audience. Investigating whether the proposed focus can address

---

1 This article is reprinted from the *NCURA Magazine*, December 2014, Volume XLVI, No. 6. It is used with permission of the publisher.
a concern with respect to a funder’s preferred target population, such as Hispanic students, students at risk of attrition, low-income students, and students in STEM disciplines, is a helpful first step.

Grant-making organizations analyze national or regional issues and trends to identify their funding priorities (Ford, 2011) and consider the impact of their investments based on an agenda they have formulated, rather than a myriad of local contexts and interests (Bauer, 2009; Karsh & Fox, 2009). They wish to see an ever expanding set of outputs and outcomes from their portfolio that cumulatively advance the knowledge-generating, social, humanitarian, or other objectives they have established. Return-on-investment for grant makers equates to building the level of evidence for their specific grant making agenda. When formulating and refining a project concept in hopes of submission to an agency or foundation, it is prudent to consider the funding priorities expressed by and the giving history of each potential funder in an effort to delineate what types of activity each sees as advancing their agenda. It is possible that a concern considered important in one’s immediate environment may not, in fact, align with the funders’ priorities and preferences.

The authors have frequently heard that there once was a time when a wise and substantial purpose was sufficient to garner funding. If this was ever really the case, that period is long past. Among the many other requirements for a project idea to be fundable is the extension of the wise or substantial purpose construct to include innovation. Innovation, in this sense, can include unique approaches, extension of understanding, application within new contexts, extension of scope or acuity, or combining known and effective methods to increase breadth, depth, or impact.

Perhaps the most obvious pattern found among “good ideas” is that the proposed undertaking aligns with the personal or professional interests and experience of the proponent. While this is certainly an important characteristic to have in place (e.g., this is one of the purposes behind submission of biosketches), it is an inadequate basis for appealing to a sponsor. Agencies and foundations are interested in supporting people with the capability to complete projects and who have demonstrated experience or expertise but they also desire that the projects address a set of priorities they have established (Bauer, 2009; Karsh & Fox, 2009). The professional expertise and demonstrated involvement through the scholarly activity of the Principal Investigator/Project Director (PI/PD) must fall within the expressed preferences of the funder for them to add merit to the proposal.

Humanists and artists often encounter a “value” issue when seeking grants and fellowships. Their focus is on creating something that is beautiful, thought provoking, innovative, or which provides new insights. Accomplishing one or more of these purposes is, in their context, creating something of value. Yet even major funders of the arts have shifted their focus to include extended impact or community involvement emphases (NEA, 2014). As noted in the table, a general principle of a fundable project in the present context is its potential for replication and scale; its ability to build or expand on something of value; and its impact beyond a single organization or group of people.

A part of the inherent value of the areas of emphasis just noted for humanists and
artists—beauty, provocation, innovation, and insight—is their ability to facilitate or even embody learning, growth, and progress. Demonstrating these three characteristics is foundational to a grant application. However, sponsor interest in advancing an agenda through the combined outcomes of the endeavors they fund means grantees must also be able to measure the learning, growth, or progress achieved. Incorporating assessment of impact, rate of change, or degree of advancement in the project plans is necessary to fulfill this interest on the part of the sponsor.

An idea can be a “good idea” without being immediately attainable, having identified steps, or even being time bound. For example, providing all children a safe and effective educational experience, seeing that everyone in the world has reliable access to clean drinking water, and eliminating deaths from curable disease are all good ideas. Yet as just expressed, none of them are immediately attainable, include identified steps, or have time-to-completion estimates. A characteristic that sets a potentially fundable idea apart from descriptions of worthy undertakings is having a clear progression through specific, timed, and measurable steps (Bauer, 2009; Karsh & Fox, 2009). Asking questions about sequencing and intended outcomes early in the project planning will usually result in a simple but sufficient ordering of operational steps, reasonable estimations of the time required for each step, and the desired outcome or output for each part of process.

The list of good ideas in the preceding paragraph are all expressed on a national or international scale illustrating that the scope of what may be considered a good idea can be very broad. Early-career grant applicants often make project scope/scale mistakes. They see the broad potential impact of their proposal but don’t understand the sliding-scale nature of sponsored projects. Some of the things that limit the scope possible for a proposal are the prior experience of the investigator(s), the demonstrated expertise of the investigator(s), the project cost, and the funding available. These factors combine to establish a funding ladder. An investigator must have some experience and junior-faculty level expertise to request funding in the $25,000 to $75,000 range. Experience that includes prior grant funding and expertise demonstrated through publications from funded activity are necessary to approach the $100,000 to $200,000 funding range, and so on. Sponsors seek demonstrated experience and expertise as well as evidence of success at the preceding level for each step up the funding ladder.

The final three characteristics on the table are related. Concepts that have appeal can be a one-time or unique undertaking, include untested approaches, and be first time endeavors. But, each of these characteristics is a potential flaw in a grant concept. A unique endeavor, something that will done once without concern for future iterations, does not match funder interest in ability to replicate efficacious practices in other contexts or interest in extended return on investment by establishing a process that can be sustained over time. Untested approaches, unless requested or allowed by the funder, present a challenge to the effectiveness of funder investment. The funding agency intends to catalyze positive change, in an identified arena or discipline, in line with a predetermined set of priorities. Untested approaches do not offer assurance of positive change resulting or successful demonstration of an
ability to impact an identified characteristic. There is simply no objectively demonstrable evidence of potential for success. While proof-of-concept funding is available from some organizations, even these proposals should be based, at a minimum, on pilot study data. The experience level of the PI/PD is an important concern in respect to the scale of the project. It is also an important concern in respect to the appropriateness of the proposal. While faculty and staff have many skills and abilities outside those demonstrable through academic credentials, it is the academic credentials and demonstrated skill set (e.g., prior grant leadership experience, experience supervising postdoc researchers, experience leading a project/research team) that marks a request as an appropriate submission from a PI/PD, shows a team member’s ability to contribute to the project, or designates a subcontractor as being an appropriate provider of project support or services.

This advice is based on several decades of experience with grants and a familiarity with the literature of research administration. It is offered here as a potential tool for use with institutional faculty and staff when discussions of the difference between a “good idea” and a “fundable idea” arise.

About the Authors
Michael Preuss, Ed. D., is a grants consultant/thought leader for Hanover Research who works with institutions of higher education and healthcare organizations across the United States. He is broadly experienced in research administration and proposal development, is a member of NCURA, SRA, NORDP, and NGMA and serves as an external evaluator. He can be reached at mpreuss@hanoverresearch.com

Susan Perri, MPA is a grants consultant for Hanover Research specializing in education and health care funding. Susan has served on grant review panels for the U.S. Departments of Education and Health & Human Services. She is a member of the Grant Professionals Association (GPA) and is Acquisitions Manager for its peer-reviewed Journal. She can be reached at sperri@hanoverresearch.com.
### NSF Automated Proposal Compliance Checks

Automated Proposal Compliance Checks Performed by System as of July 25, 2016

- **✓** = The system runs a compliance check and an Error or Warning message will be displayed (as noted in the “Error/Warning” column) if the proposal fails the compliance check.
- **BLANK** = The system does not run a compliance check.
- **≠** N/A = The system does not run a compliance check because the proposal rule doesn’t apply for this funding mechanism.

Notes:
* List provides current checks performed by system as of the July 2016 Release.
Not all NSF policy requirements are currently enforced by automated compliance checks.
Cases which currently do not trigger an Error or Warning may do so in the future as additional automated compliance checks are added to FastLane.
Some checks are not enforced for separately submitted Collaborative Non-Lead Proposals as stated by NSF Policy requirements.
Checks are not enforced for Preliminary Proposals (with the exception of 33 and 34), Award Supplements and Letter of Intent submissions. Compliance checks are triggered when users “Check” the proposal, “Allow SRO access” or “Submit” to NSF.

Error - Checks triggering an error will result in a hard stop and prohibit proposal submission to NSF.

Warning - Checks triggering a warning will allow proposal submission to NSF.
Statistics and Survey Results

This section includes statistics and survey results from reputable sources for sponsored research administrators relating to pre-award services.

Trends in NIH and NSF Proposal Success Rates

AIS editors

Sometimes referred to as “success rate” or “proposal funding rate,” the rate for a given period is generally derived by dividing the number of awards by the number of proposal submissions. Success rates usually are calculated by federal sponsors on a fiscal year (FY) basis. If your principal investigators (PIs) complain to you that they seem to be working harder and failing more in terms of getting awards, it’s not their imagination. Success rates for both NIH and NSF awards have been trending downward in recent years.

Proposal Submissions and Success Rates at NIH

NIH calculates success rates “by dividing the number of applications selected for award by the total number of applications reviewed (note that if an application is unfunded on the first try and an amended application is received in the same fiscal year it is only counted once).” Generally, NIH uses success rates in reference to research grants, research project grants (RPGs) or specific types of grants (like R01s) considered for funding in a particular fiscal year. A number of factors drive the success rate of grant applications. One of the forces behind the lower success rates of NIH applications is the relatively flat budgets experienced by NIH in recent years. A related factor is the relative portion of the federal budget that is available for discretionary spending. (See ¶120.1 for a discussion of discretionary spending.)

Concomitant with the budget factor has been the expansion in the capacity of research institutions and growth in the number of research faculty nationwide. According to one NIH estimate, there were as many applicants in the three-year period 2003–2005 (about 5,200) as there were in the five-year period 1999–2003 (about 5,330). Beginning in 2002, when the number of applications was less than 60,000, the number of applications submitted began to increase dramatically, transcending the historical growth rate, according to NIH.

Thus success rates are highly dependent on the number of applications that are submitted to NIH for review, and may fall significantly in years in which the number of applications increases even if the funds available to fund grants does not. NIH regularly publishes success rate data in a variety of forms. (See historical information on success rates at NIH’s Reports, Data and Analyses Web Site, http://report.nih.gov.) Several slices of trend data on overall success rates for applications for NIH competitive awards are included at Figures 2560.1-1 through 2560.1-7.
Paylines, Percentiles and Success Rates

I have read or heard much about the dilemma of NIH applicants as they struggle to understand their chances of receiving NIH funding. As budgets flatten and tighten, this discussion has heated up. To declare that NIH success rates have hovered around 20% for the past five years does little to calm the storm of concern when we hear about shrinking percentiles and paylines. So how is it possible to have a success rate of 20% but a payline at the 7th percentile? Let’s take a few moments to sort out what these things mean and think about how these numbers are derived and how they can differ.

Impact Score

It all starts with the impact. This score is assigned by reviewers to indicate the scientific and technical merit of an application. Impact scores range between 1 and 9. A score of “1” indicates an exceptionally strong application and “9” indicates an application with substantial weakness. (I always wondered why at NIH low = good and high = bad but that predates me!) In assigning an impact score, reviewers consider each of five scored criteria: significance, investigator, innovation, approach, and environment, along with other factors like protection of human subjects and vertebrate animal care and welfare. (Read more about scoring at http://grants.nih.gov/grants/peer_review_process.htm#scoring2.)

Scoring

The following guidance has been given to reviewers to determine individual review criterion and overall impact/priority scores:

<table>
<thead>
<tr>
<th>Impact</th>
<th>Score</th>
<th>Descriptor</th>
<th>Additional Guidance on Strengths/Weaknesses</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
<td>1</td>
<td>Exceptional</td>
<td>Exceptionally strong with essentially no weaknesses</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>6</td>
<td>Satisfactory</td>
<td>Some strengths but also some moderate weaknesses</td>
</tr>
<tr>
<td>Low</td>
<td>7</td>
<td>Fair</td>
<td>Some strengths but with at least one major weakness</td>
</tr>
<tr>
<td></td>
<td>8</td>
<td>Marginal</td>
<td>A few strengths and a few major weaknesses</td>
</tr>
<tr>
<td></td>
<td>9</td>
<td>Poor</td>
<td>Very few strengths and numerous major weaknesses</td>
</tr>
</tbody>
</table>

Non-numeric score options: NR = Not Recommended for Further Consideration, DF = Deferred, AB = Abstention, CF = Conflict, NP = Not Present, ND = Not Discussed
Minor Weakness: An easily addressable weakness that does not substantially lessen impact
Moderate Weakness: A weakness that lessens impact
Major Weakness: A weakness that severely limits impact
(Source: http://grants.nih.gov/grants/peer_review_process.htm#scoring2.)

Percentile Rank

The percentile rank is based on a ranking of the impact scores assigned by a peer review committee. The percentile rank is normally calculated by ordering the impact score of a particular application against the impact scores of all applications reviewed in the current and the preceding two review rounds. An application that was ranked in the 5th percentile is considered more meritorious than 95% of the applications reviewed by that committee. This kind of ranking permits comparison across committees that may have different scoring behaviors. It is important to note that not all research project grant applications (RPGs) are percentiled. For example, applications submitted in response to a request

1 Source: Posted in “Rock Talk” (a blog) on February 15, 2011, by Sally Rockey, director of the NIH Office of Extramural Research.
Percentiles

- A percentile is the approximate percentage of applications that received a better overall impact/priority score from the study section during the past year.
- All percentiles are reported as whole numbers.
- Only a subset of all applications receive percentiles. Which types of applications are percentiled varies across different NIH Institutes and Centers.
- The summary statement will identify the base that was used to determine the percentile.

Read more about percentiles at http://grants.nih.gov/grants/peer_review_process.htm#Summary.

Payline

Many NIH institutes calculate a percentile rank up to which nearly all R01 applications can be funded. For grant applications that do not receive percentile ranks, the payline may be expressed as an impact score. Institutes that choose to publish paylines in advance calculate the payline based on expectations about the availability of funds, application loads, and the average cost of RPGs during the current fiscal year. Other institutes prefer to describe the process for selecting applications for funding and then report on the number of applications funded within different percentile ranges at the end of the fiscal year. Because the NIH is currently operating on a continuing resolution and funding levels for the remainder of this fiscal year are uncertain, most of the NIH institutes have offered less detail this year than in the past.

But remember, even when an IC establishes a payline, applications outside of the payline can be paid under justified circumstances if these applications are a high priority for the particular institute or center. When these select-pay/out-of-order/priority pay/high priority relevance selections are made, it may result that other applications within in the payline are not paid because funds are no longer available to support them.

Success Rates

The success rate calculation is always carried out after the close of the fiscal year, and it is based on the number of applications funded divided by the number of applications reviewed and expressed as a percent. To better reflect the funding of unique research applications, the number of applications is adjusted by removing revisions and correcting for projects where the resubmission (A1) is submitted in the same year as the original application (A0).
The Answer

Now we are equipped to answer our earlier question. How is it possible to have a success rate of 20% but a payline at the 7th percentile? There are several real-life reasons why paylines (the ones that use percentiles) can be either higher or lower than success rates:

- Applications that are not percentiled are still factored into the success rate calculation. Thus, funding a number of awards that are not assigned percentiles will increase the success rate without changing the payline.

- The success rate for a particular fiscal year is a reflection of the funded applications and can include applications reviewed in the previous fiscal year; whereas, the payline encompasses only applications reviewed in that fiscal year. So awarding applications that were reviewed in the previous year will also increase the success rate.

- The average quality of the applications assigned to an institute will also affect its payline. If an institute happens to receive a set of applications with very good (low) percentile scores, its success rate will be higher than its payline, all else being equal. For example, in fiscal year 2010, the National Institute of General Medical Sciences R01 success rate was about 27% but the midpoint of the funding curve occurred close to the 21st percentile.

Whew, you made it through. The difference between paylines, percentiles and success rates remains a confusing topic because of the compounding factors that rule out a simple linear relationship. You need to consider all the factors when assessing the potential for an individual application to be funded. Your best advisor on this issue, because of the differences in the ICs and programs, is your NIH program official. Give him or her call.

</table>

Proposal Submissions and Success Rates at NSF

NSF receives approximately 40,000 proposals each year for research, education, and training projects, of which approximately 11,000 are funded. In addition, NSF receives several thousand applications for graduate and postdoctoral fellowships.

According to NSF, it is “the only federal agency dedicated to advancing research and education in science and engineering across all fields and disciplines and at all educational levels.” Further, in many fields, “including computer science, mathematics, and the social sciences, NSF is the principal source of federal support.”

NSF provides several ways to research past and current awards including by searching the Award Abstracts database at www.nsf.gov/awardsearch. Data in the statistics area of the NSF site (www.nsf.gov/statistics) help put U.S. investment in research and education through NSF programs in a national and international perspective.

The Impact of Proposal and Award Management Mechanisms (IPAMM) working group was created in 2006 to address best practices to achieve a greater success rate in NSF awards (www.nsf.gov/news/newsmedia/IPAMM_Report_Final.pdf). Significant findings from the group’s final report released in August 2007 include the following:

◆ Research proposal funding rates decreased as NSF budget, average award size, and proposal submission rates increased

◆ PI success rates (percentage of PIs that are funded) decreased as the number of PIs submitting to NSF increased
**NSF by the Numbers**

In “FY 2011 Performance and Financial Highlights,” NSF provides the following snapshot of its 2011 activities:

- Appropriations (does not include special or donated funds): $6.9 billion
- Colleges, universities, and others receiving NSF funding: 1,875 (77% of support went to colleges, universities and academic consortia)
- Proposals evaluated through competitive merit review: 51,600
- Awards funded: 11,200 (90% thru competitive merit review)
- Proposal reviews conducted: 262,000
- Estimated # of people NSF supports directly (researchers, postdoc fellows, trainees, teachers, students): 276,000
- Students supported by NSF Graduate Research Fellowships since 1952: 44,000

◆ Number of proposals submitted per PI to gain one award increased
◆ Directorate level trends show significant variability in rate of change, degree of change, and starting and end points of change
◆ Proportion of highly rated proposals has not declined; however, the funding rate of highly rated proposals has decreased
◆ The decrease in funding rate has not had a disproportionate effect on women, minorities, beginning PIs, or PIs at particular types of institutions

Additional findings include

◆ NSF proposal funding rates declined due to a surge in proposal submissions at the same time NSF was making a concerted effort to increase the average award size. Increases in the overall NSF budget were absorbed by the growth in the average award size, such that the annual number of awards made stayed relatively constant. As a result, funding rates dropped significantly between FY 2000 and FY 2004, leveling off in FY 2005 and FY 2006.
◆ The increase in proposal submissions can be attributed both to an increased applicant pool and to an increased number of proposals per applicant. The expansion of the applicant pool is due in part to an increase in the size and capacity of the research community, loss of funding from other sources, and the increased use by NSF of targeted solicitations in new areas. External institutional pressures, combined with the decreased funding rate, contributed to the growth in the number of proposals submitted per proposer.

Some summary data on NSF proposal and award activity are included at Figures 2560.1-9 through Figure 2560.1-11.

2590  Knowledge Check

AIS editors

The Q&As at §2590.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 2500 has been understood. Note: For the answer key for §2590.1, see §2590.3, which appears on a separate page (page 2590:5) for testing purposes.

Discussion topics at §2590.2 are designed to engender dialogue among staff on general issues of importance in the field.

2590.1  Q&As

1. Functions often performed by pre-award staff typically include all of the following EXCEPT:

(a) Proposal development
(b) Proposal review and approval
(c) Application submission
(d) Audit oversight

2. The consensus among higher education institutions is that pre-award services are best performed by

(a) A central pre-award office
(b) An office that performs cradle-to-grave (pre-award and post-award) grants services
(c) An office that performs pre-award services exclusively for grants from a particular agency
(c) None of the above

3. A pre-award office typically is responsible for

(a) Tracking and reporting submissions and awards
(b) Tracking and reporting audit documents
(c) Tracking and reporting performance reports
(d) Tracking and reporting closeout documents

4. If a pre-award office offers proposal review services, they typically include all of the following services EXCEPT:

(a) Review of its overall quality and completeness
(b) Consideration of the quality of its science
(c) Check on its compliance with university and sponsor policies and regulations
(d) Consideration of its fiscal requirements

5. There are typically three major components to negotiate in an award, including all of the following EXCEPT:
(a) Scope of the research
(b) Terms and conditions
(c) The principal investigator
(d) Budget

6. As discussed in ¶2505, a Budget Specialist typically performs the following services EXCEPT:
(a) Assists faculty in developing proposal budgets
(b) Maintains current knowledge of institutional and sponsor allowable costs
(c) Assists faculty with indirect cost calculations and fringe benefit rates
(d) Assists faculty with proposal editing

7. As discussed in ¶2505, an Information Specialist typically performs the following services EXCEPT:
(a) Maintains current knowledge of sponsor programs, priorities, and funding trends
(b) Assists in the preparation of subawards
(c) Assists faculty in accessing and using automated funding databases
(d) Conducts funding searches for faculty

8. Perhaps the element most essential to success in pre-award offices is a/an
(a) Attitude of service
(b) Large budget
(c) Staff with accounting backgrounds
(d) Effective grant opportunities tracking system

**Discussion Topics**

1. Discuss the concept of internal competition for funding. What is the proper role for the sponsored research office in such situations?

2. Your pre-award office is collecting an array of data. Are you making the best use of this information? For example: With whom are you sharing this data? Is it being presented to each recipient of the data in a format that is most useful to each specific individual? Are there ways of “mining” the data for trends or other information that could prove useful to your institution?

3. Are you doing all you can do to identify and provide to interested faculty — on an ongoing basis — information about nonfederal sponsored funding?

4. What type of performance measures are in place for evaluating pre-award staff? In your opinion, are these effective determinants of performance?

5. A recent Government Accountability Office report (GAO-06-1046) discussed performance accountability measures relating to grants management. According to GAO, “Collectively, five key strategies appear to facilitate the effective design and implementation of performance accountability mechanisms.” They are as follows:

   1. Ensure mechanisms are of sufficient value to motivate desired behaviors,
   2. Periodically renegotiate and revise mechanisms and measures,
   3. Ensure appropriate measurement selection,
   4. Ensure technical capacity,
   5. Allow for phased implementation.

   In addition to these strategies, GAO said that collaboration, oversight, and feedback are also very important to the success of performance accountability mechanisms. Discuss how these techniques are or could be implemented in your office to assess and measure performance of your pre-award staff.

6. What steps, if any, does your institution use to encourage interdisciplinary research and other forms of research collaboration? What role does your office play in this process?

7. The following are sometimes included in a “checklist” for the application process. What role does your office play in the following activities?
   
   - Locating funding opportunities
   - Downloading application, instructions, forms
   - Writing the proposal
     - Defining the project
     - Preparing the research plan
     - Developing a budget
     - Identifying subawardees/subcontractors
—Securing cost share; securing IRB, IACUC, etc. review
—Addressing conflict of interest

• Obtaining necessary signoffs
• Submitting application
12590.3  **Answer Key**
Following are the correct answers to the questions included at ¶2590.1.

1. (d) Audit oversight
2. (d) None of the above
3. (a) Tracking and reporting submissions and awards
4. (b) Consideration of the quality of its science
5. (c) The principal investigator
6. (d) Assists faculty with proposal editing
7. (b) Assists in the preparation of subawards
8. (a) Attitude of service

¶ 2701  Introduction
Richard Seligman, Ed.D. Associate Vice President for Research Administration
California Institute of Technology

This chapter covers topics relating to the effective administration of research contracts.

In a world dominated by grant awards, David Mayo of the California Institute of Technology provides an extremely important discussion of the differences between grants and contracts. There is a tendency for investigators to refer to an award as “my grant,” even when the award is a contract. Mayo explains why the distinction is an important one for investigators and research administrators alike to understand and appreciate. There are profound and fundamental differences between the “procurement” and “financial assistance” mechanisms. Mayo does a thorough job of pointing out such differences in both form and substance that occur throughout the life cycle of a sponsored project, from the proposal submission to the award closeout.

No discussion of federal research contracts could be complete without introducing readers to the Federal Acquisition Regulation (FAR). Mayo provides useful information on the organization, structure, and use of the FAR. This is a concise and particularly helpful description for research administrators of just how the FAR is intended to work and how best to understand and use it.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶ 2705, as appropriate. Content added to other sections of the chapter will provide readers supplementary discussions of related topics (at ¶ 2720), practical tools (at ¶ 2730), case studies (at ¶ 2740), and trends data and other related statistics (at ¶ 2760). A “knowledge check” containing Q&As and discussion topics is included at ¶ 2790.
Administering Research Contracts
David J. Mayo, Director of Sponsored Research, California Institute of Technology

This chapter delves into many of the issues associated with the administration of research contracts. It looks at how contracts differ from grants, from both federal and legal perspectives. It covers the structure of the primary regulation governing federal contracts, the Federal Acquisition Regulation, and how it can be used to a research administrator’s advantage when negotiating federal contracts. It looks at some of the special challenges that can arise when, for example, an office of sponsored programs (OSP) is negotiating contracts with government agencies and with the private sector, including subcontracts of federal funds via the private sector. Lastly it discusses in general terms resources required by an institution that accepts federal contracts.

What Is a ‘Contract’?

It is important to define the key terms used in a discussion of research contracts administration. The word “contract,” as with many terms in research administration, can have different meanings in different contexts. Legally a contract is an agreement between two or more persons or entities that creates a legal obligation between them to do something, or to not do something. Further, to be considered binding, a contract must have the following essential characteristics:

◆ The parties to the contract must be competent to enter into the agreement.
◆ The subject matter of the contract must be explicitly stated.
◆ There must be consideration (something of value) given to the party making the promise(s) by the party receiving the promise(s).
◆ There must be mutuality of agreement (in other words, both parties must agree on all of the terms).
◆ There must be mutuality of obligation (i.e., both parties must be obligated by the contract).

According to the criteria, above grants are legally contracts. In fact the institution could label the agreement a “gift,” a “memorandum of understanding,” or anything else, for that matter, but if it meets the legal definition of a contract, it’s a contract.

On the other hand, the federal government makes a clear distinction between grants and cooperative agreements — which are collectively known as “financial assistance awards”¹ — and contracts, which are “procurement awards.” The primary difference here is that financial assistance awards are intended to transfer something of value to the recipient to carry out a public purpose of “support or stimulation” as

¹ The distinction is so clear as to have been codified in federal statute: Federal Grant and Cooperative Agreement Act (31 USC. 6304 and 6305). The act is available online at www.gpoaccess.gov/uscode/browse.html. See also ¶2905.3.
authorized by U.S. law. Student aid, research grants, and U.S. Department of Education block grants to states are examples of federal financial assistance.

The federal government uses contracts for the purpose of acquiring goods and services for the direct benefit of or use by the U.S. government. In other words, the government has decided what it needs, and then looks for an entity that can provide that service or commodity for the best price. For purposes of this chapter, the term “contract” refers to federal procurement awards and to awards issued by the private sector.

Other terms often encountered when discussing contracts, compared side-by-side with their financial assistance counterparts, are included as Figure 1.

**¶2705.2 Staffing and Communications**

There is no specific organizational model that is better or worse for the administration of contract awards. Proposals that result in contract awards have the same basic characteristics as proposals that result in grant awards: a budget, a statement of work or project description, terms and conditions, etc. Therefore it logically follows that the simplest way of handling contract awards organizationally is to use the same method as is used for grant awards.

As with many other aspects of research administration, the volume of activity in a particular area is the single most important factor in determining staffing needs. Wherever in the institution contract awards are to be reviewed and negotiated, however, that office must have available to it someone familiar with the Federal Acquisition Regulation and with the special issues that make contract awards different from grant awards. In addition if the OSP is entering into contracts with the private sector, then it will need access to expertise in intellectual property issues (including the Bayh-Dole Act and the institution’s intellectual property policies, licensing activity, and patent portfolio). (See Chapter 1900 for an in-depth discussion of data rights and intellectual property.)
Effective Communications
Communication is especially important when administering contract awards. This is primarily because most institutions receive so few contract awards, when compared with grant awards, that institutional personnel responsible for the management of awards are often unaware of the unique requirements of contract awards administration.

There are two highly important elements to communications about the contract:
◆ Those who sign off on contract proposals (if different from those who negotiate contract awards) should understand that their signatures may also represent acceptance at the time of proposal submission of any terms and conditions that are included in the contract solicitation.
◆ After execution of the award, it is vital that the contract’s requirements be communicated clearly and in detail to those responsible for the administration of a contract award.

Both of these issues are addressed in more detail below.

Resources Required
The single most important resource that an institution needs with regard to administering research contracts is actually two-fold: (1) access to a copy of the Federal Acquisition Regulation (FAR), and (2) at least one person who is familiar with its use.2 (Details on the structure of the FAR are discussed on page 2705:7.)

12705.3 Contracts at the Proposal Stage
As discussed above contract awards are just another type of award that an institution receives. The regulations governing contracts, however, are different in many respects from those that govern grants, and this is where an institution can encounter difficulty — in situations where it doesn’t account for these differences in its administration of contract awards.

Individuals on the pre-award side of research administration are familiar with various agency proposal guidelines for those sponsors to which they submit the most proposals. They are accustomed to solicited proposals, where a sponsor has requested applications for a specific program, with a specific deadline, and usually with specific formatting instructions. Further they are familiar with unsolicited proposals, where a sponsor has made it known that it is accepting applications in a general area of interest, but there is usually no deadline, and there may or may not be specific formatting instructions.

2 All financial assistance regulations are codified at Title 2 of the Code of Federal Regulations (CFR). The FAR is codified at Title 48. The CFR is available online at www.access.gpo.gov/nara/cfr/cfr-table-search.html?page1 as well as at the FAR site at http://www.acquisition.gov/far/. Note that effective December 26, 2014, the regulations that apply to financial assistance awards change from the OMB Circulars to the Uniform Guidance (2 CFR 200), as described in the Uniform Guidance; the cost principle, audit and subrecipient monitoring portions of the Uniform Guidance will apply to contract awards issued on or after 12/26/2014.
Most contracts are the result of solicited proposals, where the solicitation includes a statement of work written by the sponsor and very specific instructions as to how the proposal should be prepared and submitted. Contract solicitations often include a proposed set of terms and conditions that the sponsor intends to use if the institution is selected for an award.

While there may not appear to be much difference conceptually between a grant solicitation and a contract solicitation, there is one practical difference: if the contract solicitation includes proposed terms and conditions, it is almost a certainty that the institution must include with the proposal submission any objections it has to those terms and conditions. In other words, when responding to a contract solicitation, contract negotiations begin at the time the institution submits a proposal.

In most cases, the expectation by the sponsor to begin negotiation at the point of proposal submission is explicitly stated in the solicitation. However, in the last-minute rush to get a proposal signed and out the door, this expectation may escape the notice of someone not experienced with contracts. Or the individual may consider the inclusion of proposed award terms in the solicitation as an “FYI” by the sponsor and expect that the post-award people will take care of negotiation, as would normally be the case with a grant.

This is a very basic — but often misunderstood — distinction between grants and contracts. In an institutional model where proposal responsibilities rest with different individuals or offices, communication is vital. Without good communication, an OSP could very easily find itself in a situation where the individual who submitted a contract proposal has unknowingly accepted the contract terms — all with the same signature.

For example, the government tends to use one form, the SF 33 “Solicitation, Offer, and Award” to act as the cover page of the solicitation, the offer (or proposal), and of the contract award. For purposes of the solicitation, the SF 33 identifies which government agency / contracting activity has issued the solicitation; it includes a listing or table of contents of the entire solicitation, including the proposed award terms; and it states the submission deadline, if any.

For purposes of the offer, the SF 33 acts as the cover page, with a place for the proposer to add its identifying / contact information and its signature. Note that signature by the proposer on the SF 33 constitutes acceptance of the entire contents of the solicitation, including any proposed terms and conditions, unless exceptions are submitted with the offer. Finally for purposes of the award, the SF 33 acts as the contract cover page, including a place for the federal contract officer to sign. Therefore, if the proposer signs and submits the SF 33 without including any exceptions to the proposed terms and conditions, all that’s necessary is for the contract officer to countersign the SF 33, and the contract has been fully executed.

**Exceptions to Contract Terms**

Submitting exceptions to proposed contract terms along with a contract proposal is part

---

3 The SF 33 can be found on the Web at http://www.gsa.gov/portal/forms/download/116254
of the normal contracting process. Note that mutual agreement (between parties to the contract) is not necessary at this point, merely the submission of the exceptions (if any). This is usually just the beginning of the negotiation. While it may take several weeks or even months before an institution hears back from the federal contract officer, when it does, it usually will be to discuss the exceptions noted and may include requests for clarification or additional information about the proposal.

Ideally when an institution presents exceptions, it should do so in the greatest detail possible; it should not simply state that some term or condition is “unacceptable.” An institution should state why something is unacceptable and, if appropriate, provide an alternative to the requirement that is acceptable. (An in-depth discussion of contract negotiation and the FAR is included on page 2705:13.)

There can be situations where there is simply no time to prepare a detailed list of exceptions in light of the proposal’s deadline. In these situations, there are options available, but the less detail provided about the exception, the more risk the institution takes that the sponsor will consider it unresponsive to the solicitation. If a sponsor finds an institution unresponsive, it is highly likely that the proposal will be returned without further review.

Following are various ways to address undesirable terms and conditions, if time does not permit provision of a detailed listing:

1. Include a statement in the cover letter to the contract indicating that there was insufficient time to review the terms and conditions, and that the institution reserves the right to comment on them at a later date. This is the least desirable option because the federal contract officer may simply ignore the “reservation” and treat the proposal as nonresponsive. If at all possible, contact the contract officer before deciding on this option to see if he or she will be receptive to this approach.

2. Include a general statement about the types of terms and conditions that are problematic for the institution (such as publication restrictions, export controls, and restrictions on foreign nationals). While not optimal, this approach at least puts the contract officer on notice about what the institution’s issues are.

3. Go through the proposed terms and conditions, identifying the most problematic ones, then address those in detail. Many problematic contract terms are merely undesirable, rather than absolutely unacceptable. In other words, if the institution doesn’t have sufficient time to comment on all of the terms and conditions that may be problematic, it should at least comment on the ones that it absolutely cannot accept. Keep in mind, though, that the contract officer may not be willing to enter into negotiation later regarding those clauses to which the institution did not initially take exception.

These alternative methods of raising exceptions to the proposed terms and conditions have been successful when the institution has had limited time to submit a contract proposal. They are not guaranteed to work in all situations, however, since incorporating them into a solicitation response could be seen as rendering it “not fully responsive.”
Representations and Certifications

There are other differences between grant proposals and contract proposals. For example, if federally funded, a contract solicitation will require the institution to sign and submit a set of “representations and certifications.” This is a multipage document that spells out in great detail all of the federal compliance requirements to which the proposal and/or any resulting contract will be subject. It will include the usual certifications with which an institution likely is already familiar from grant proposals, such as drug-free workplace, lobbying, and debarment/suspension. It also will include several others that are specific to federal procurement actions, such as small/large business declaration, organizational conflicts of interest, and compliance with the Cost Accounting Standards. This document will most likely be part of the solicitation package that the institution must submit, and it will be incorporated by reference into any resulting contract.

Subcontracting Plan

If the contract proposal is $650,000 or more, the institution may be required to submit a “subcontracting plan.” In federal procurement transactions, there are certain minimum requirements regarding the inclusion of minority and disadvantaged businesses that the government imposes on itself and on all those to whom it issues contracts. A subcontracting plan is the proposed plan of action to ensure that as the institution procures goods and services, it is attempting to include a minimum number of minority and/or disadvantaged businesses as vendors.

Preparation of a subcontracting plan requires access to a copy of the proposal budget and to someone who can answer questions about the budget. It also requires a detailed knowledge of the vendors normally used by the institution for acquiring goods and services. Most institutions that do a lot of business with the federal government are familiar with this requirement and will have an identified individual or office that is responsible for preparation of and reporting on subcontracting plans. If this is not the case, the institution will need to identify someone who can perform this function.

The government takes the subcontracting plan very seriously — once accepted
◆ it will be incorporated into the contract by reference;
◆ the institution will be required to report quarterly on its progress towards achieving the stated goals; and
◆ failure to demonstrate a good-faith effort to achieve the subcontracting plan goals will constitute a material breach of the contract.

The subcontracting plan may or may not be required at the proposal stage, but should not be submitted unless the institution is specifically directed to do so, either by the solicitation, or later, by the contract officer.

---

4 The Cost Accounting Standards (CAS) were established by the Cost Accounting Standards Board (CASB) for colleges and universities in 1994. Under CAS universities receiving federal awards totaling $50,000,000 or more must complete a lengthy and detailed Cost Accounting Standards disclosure statement (DS-2).
One last note about submitting a proposal in response to a contract solicitation. It is very important that the institution follow all of the instructions specified in the solicitation. If for some reason the institution finds itself unable to do so, then explicitly state in the cover letter what is missing or what is different, and why an instruction was not followed completely; do not simply ignore a requirement. Technically any deviation from the solicitation requirements could be grounds for the sponsor’s not reviewing the proposal. However by addressing each such instance, the institution is at least demonstrating to the sponsor that it reviewed and considered each requirement, and that it is attempting to be as responsive to the requirements as possible. This rule-of-thumb applies to both federal and nonfederal submissions.

**Contracts and the Federal Acquisition Regulation**

No discussion of contracts would be complete without a look at the Federal Acquisition Regulation (FAR). All government procurement actions are subject to the FAR to some extent. Therefore if a research administrator is administering government contracts or subcontracts under government contracts, he or she will need to be at least familiar with the way in which the FAR works.

The FAR represents the policy and procedure manual for federal contract officers on how to construct a contract; it is written by federal employees for federal employees. Understanding how to look things up in the FAR, and the relationships between the prescriptions and clauses (discussed below), will allow one to determine whether the contracting officer constructed the contract properly for a given situation.

Many people have an aversion to the FAR and would prefer never to have to deal with it. This is often due to a lack of familiarity with the regulation. For most research administrators, contracts represent the minority of federal awards they handle. This section, therefore, provides enough of an overview of how the FAR works so that research administrators should find it less daunting. Of course, as with any set of terms and conditions, once one knows how to look things up, it is still necessary to read and understand the individual requirements.

**Structure of the FAR**

The FAR is divided into several chapters. Chapter 1 is commonly known as the “FAR” or “basic FAR,” and Chapters 2 and higher are the federal agency “supplements” to the basic FAR. There is one chapter for each executive agency. To clarify, when the FAR was originally issued in 1984, the intent was for the majority of federal contract requirements — those that applied to all federal agencies — to be included in Chapter 1. Then, in those situations where a federal agency needed to include a requirement specific to that agency, it could issue that requirement within its FAR supplement (or chapter), without the need to clutter up the basic FAR with agency-specific requirements.
Those who have experience with the Federal Demonstration Partnership\(^5\) likely will already be familiar with this concept. In any FAR-governed contract, one would normally find clauses from no more than two chapters — appropriate clauses from Chapter 1 (since Chapter 1 addresses all of the basic federal procurement requirements), and those from whichever other chapter specifically applies to the executive agency issuing the contract. An exception to this rule is where a branch of the military is issuing the contract. In this case, the institution would have the expected clauses from Chapter 1 (basic FAR), Chapter 2 (U.S. Department of Defense or DoD) and possibly clauses from one of three chapters: 51 (Army), 52 (Navy), or 53 (Air Force).

Each chapter of the FAR is divided into “parts,” with each part addressing a particular procurement topic (termination, intellectual property, inspection, property management, etc.). The titles of each part are consistent across all chapters. For example, Part 27 of Chapter 1 (basic FAR) addresses intellectual property issues, as does Part 27 of Chapter 2 (DoD supplement). The difference is that the former reflects intellectual property issues applicable across all federal agencies, while the latter reflects those additional intellectual property requirements that apply only to the Department of Defense. Figure 2 is a table that will make this structure more clear, using a very small sample of existing chapters and parts.

When looking at any chapter of the FAR, it is easy to group parts into two basic categories: the prescriptions (Parts 1-51), and the provisions and clauses\(^6\) (Part 52). Part 52 is where one finds the full text of all of the clauses referenced in a contract or solicitation; Parts 1-51 include the discussion and instructions as to when particular clauses are to be used.

In putting together a federal contract, the contract officer would start with Part 1 and work his or her way through to Part 51, reading the prescriptions (instructions) as to which clauses from Part 52 should be included in the contract given certain variables, such as purpose of the contract (R&D, supply, service, construction, etc.); nature of the contractor (for-profit, nonprofit, educational, state, etc.); and finance

---

\(^{5}\) For background on the Federal Demonstration Partnership (FDP) visit www.thefdp.org.

\(^{6}\) These terms are often used interchangeably, but correct usage is as follows: a “provision” is a FAR requirement that applies to a proposal or offer, and a “clause” is a FAR requirement that applies to a contract. For practical purposes, this distinction is irrelevant, and the term “clause” will be used throughout the chapter.
type (fixed-price, cost-reimbursement, etc.). All of these variables, and several more, are discussed in Parts 1-51, which then provide, for example, specific instructions as to which termination clause or which intellectual property clause, etc., from Part 52 should be inserted into the contract.

In reviewing the contract, one attempts to “reverse-engineer” this process by identifying the FAR clause(s) referenced in the solicitation or contract document one is reviewing and looking up their full text in Part 52 of the appropriate chapters (or agency supplements). If one found any of the clauses to be unacceptable or problematic, the next step would be to backtrack from each such clause to its instruction or “prescription” somewhere within Parts 1-51. If, after reading the prescription, it turns out that the clause was incorrectly included in the contract, then one could use that very prescription as the argument to the contract officer to have the clause removed or to request a more appropriate version of the clause.

It might seem to be a daunting task to find the correct prescription for a particular clause. However, the designers of the FAR anticipated this by including at the beginning of every FAR clause a specific cross-reference to the originating prescription.

**FAR Numbering System**

The numbering system for the FAR reflects its organizational structure. Any clause contained in the contract can be identified directly back to the FAR chapter and part from whence it came. FAR clauses are numbered in the format outlined in Figure 3.

---

![Figure 3. FAR Clause Numbering Structure](image)

Example A in Figure 3 displays all of the possible placeholders. Example B contains a Department of Defense clause (Chapter 2). Example C shows a Basic FAR clause (Chapter 1). Note the absence of a chapter designator. This is an idiosyncrasy in how the numbering system is used — the chapter designator is rarely if ever used with clauses from Chapter 1.

Sometimes the chapter number is written without the hyphen (e.g., 252.227-7039). This does not mean Part 252. Since there are only two possible placeholders to designate the part, and these are always the two placeholders to the left of the decimal point, once one has reached the third placeholder to the left of the decimal point, one
is looking at the chapter number. Therefore this example refers to Chapter 2, Part 52.

Again, looking at Example C, note that it includes a reference to Subsection 11. This is a reference to the 11th clause, sequentially, in Section 27. Example B references subsection 7039. Contrary to what one might conclude based on what was just described, this is not the 7039th clause in Section 27. Rather it’s the 39th clause. Many of the agency FAR supplements (that is, Chapter 2 and above) add two digits in front of the subsection number, or utilize some other numbering technique to make it more obvious that a particular FAR clause is not from Chapter 1.

**Looking Up FAR Clauses**

In the contract, a FAR clause will take the following form:

<table>
<thead>
<tr>
<th>Clause Number</th>
<th>Clause Title</th>
<th>Clause Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>252.227-7039</td>
<td>Patents Reporting of Subject Inventions</td>
<td>April 1990</td>
</tr>
</tbody>
</table>

These three pieces of information must be indicated in the contract for each FAR clause incorporated, in order for it to be a valid reference. All three are important in looking up the FAR clause as

- the **clause number** gives the institution all of the information necessary to find the clause;
- the **clause title** corroborates the number (they should both be the same in the contract and when the institution looks them up in the FAR); and
- the **clause date** lets the institution know that it is looking at the correct version of that clause.

It is important to note that the FAR is constantly being updated; each clause is subject to modification as federal laws and policy requirements change. When a contract is constructed, the version of the clause incorporated into the contract at the contract’s date of execution is the version of the clause that applies throughout the life of the contract, unless the contract is subsequently updated by formal modification and specific clauses are updated. It is important to note, therefore, for each FAR clause included in the contract, which version it is so that the version that applies to the contract can be located if necessary at some later date. While most of the clauses that a university would see in a research and development (R&D) contract do not change much over time, it is still necessary to know exactly which version of each clause applies to the contract.

The first step in looking up a FAR clause is to have access to the FAR. The next step is to determine from which chapter of the FAR the clause has been drawn: Is it a basic FAR clause (Chapter 1), or is it from one of the agency supplements (Chapters 2 and above)? Once the chapter has been identified, go to Part 52 of that chapter, as that is where all of the clauses of that chapter will be located.

The clauses will be listed in numerical order, by section and then by subsection.

---

[7] See footnote 2. Also, each agency is responsible for making available its own supplement to the FAR and its respective FAR chapter can often be found on the agency’s Web site.
Read the clause and determine if it is acceptable to your institution. If it is not, look to the beginning of the clause to find a statement to the effect that: “As prescribed at [specific FAR reference], insert the following clause.” This is the cross-reference to the prescribing instruction. Then follow the cross-reference to wherever it indicates within the same chapter, read the prescription for that clause, and determine whether the clause should be in the contract given the variables of your situation (e.g., type of contractor, dollar value, contract purpose, etc.).

For example, if looking up the clause 52.249-6, the cross-reference at the beginning of the clause states: “As prescribed at 49.503(a)(1), insert the following clause.” Then, following that cross-reference to Chapter 1, Part 49, Subpart 5, Section 03, Subsection (a)(1) one would find the following:

**FAR 49.503(a)(1)**

(a) Cost-reimbursement contracts—

(1) General use. Insert the clause at 52.249-6, Termination (Cost-Reimbursement), in solicitations and contracts when a cost-reimbursement contract is contemplated, except contracts for research and development with an educational or nonprofit institution on a no-fee basis.

Having read the prescription for this clause, it is easy to see that it is intended for other than educational institutions and nonprofit contractors. This is not an appropriate clause, therefore, to include in a contract with a nonprofit. This does not specifically tell one that there is another clause for nonprofits but, given the fact that nonprofits are specifically excluded from the use of this clause, the implication is that there is another clause that should be used. And, since all of the prescriptions for the various versions of a clause addressing a particular topic are generally grouped together, it is merely a matter of scanning through the other prescriptions under 49.5 to see if there is a clause prescribed for the particular set of variables that apply. As it turns out, the prescription what we need is located at just a bit earlier in the section – 49.502:

**FAR 49.502(d)**

(d) Research and development contracts.

The contracting officer shall insert the clause at 52.249-5, Termination for the Convenience of the Government (Educational and Other Nonprofit Institutions), in solicitations and contracts when either a fixed-price or cost-reimbursement contract is contemplated for research and development work with an educational or nonprofit institution on a nonprofit or no-fee basis.

Please note that not everything is “black-and-white” when dealing with the FAR. Sometimes there can be a difference of opinion between the institution and the contract officer as to just how a prescription should be applied. For example, among the several termination clauses, there is a specific termination-for-convenience clause for use with universities performing basic research. There is also a termination-for-default clause for use in service contracts. If the institution were to find the
service contract version of the termination clause in the R&D contract (52.249-4), it
might be due to a difference in interpretation of the nature of the work the institu-
tion is doing, rather than a mistake on the part of the contract officer. In this situa-
tion, before the institution requests a change to the termination clause, it may first
need to explain to the contracting officer that the institution is performing research
and development. Of course, if the scope of work does not support the assertion by
the institution that the contract is for research and development, the institution may
not be able to convince the contracting officer to modify the contract terms.

Or it could be that not all of the information necessary to evaluate the prescrip-
tion is available within the prescription. Each part of the FAR includes a discussion
of the government’s reasoning behind the need for a particular requirement. This
can often include cross-references to federal laws or other FAR parts. Thus it may be
necessary to review the background policy and procedure statements preceding the
prescription to discover the government’s intent behind different versions of a par-
ticular requirement. This background knowledge can greatly assist the institution in
formulating an argument in getting a clause removed, particularly if the prescrip-
tion doesn’t give the institution the ammunition it needs.

Using the FAR becomes easier and faster with practice; with practice the insti-
tution will get to the point where it will immediately recognize various clauses. A
question that often is raised when discussing the FAR is: “Why hasn’t anyone come
up with a list of clauses that are universally unacceptable to universities, including
the alternate version of the clause that is acceptable?” The reason for this is that it just isn’t
practical. Each contract is different (universities accept R&D contracts, construction
contracts, and supply and service contracts), each university is different (some univer-
sities have more latitude than others as to what terms they can accept; for example,
most universities do not accept publication restricted projects, but some do). Further-
more the FAR is constantly changing. If a list of acceptable/unacceptable terms and
conditions were created, it would have to be maintained or it quickly would become
out of date. This would be very time consuming.⁸ (An institution could, however, do
this for its own purposes and assign someone to keep it up to date.)

¶2705.5 Contracts at the Negotiation/Execution Stage
Regardless of whether contract negotiations begin with submission of the proposal
or afterward, the process is the same as follows:
◆ The proposed contract terms must be reviewed.
◆ Their acceptability must be determined.
◆ Any exceptions must be submitted to the contract officer.

While negotiation techniques and strategies are beyond the scope of this chapter, it
would be useful to discuss some of the issues specific to negotiating research contracts.

⁸ An in-depth discussion of the FAR is beyond the scope of this chapter, but workshops and
other sessions are available at the NCURA annual meetings on various aspects of this topic.
See www.ncura.edu.
Fixed-Price vs. Cost-Reimbursement Contracts

Fixed-price contracts are those in which the value of the contract is determined primarily by whether the overall price of the proposal the institution submitted is a good value compared to the work to be accomplished, or by comparison to other proposals submitted for the same solicitation. In general individual items of cost are not considered. Once the parties have executed a fixed-price contract, the government is obligated to pay, provided the contractor delivers. This is the key point to understand — under a fixed-price contract, payment is usually based upon performance, whether performance is measured by meeting milestones, achieving a percentage of effort, or satisfying a set of deliverables.

If the contractor does not deliver as contractually obligated, the government does not have to pay. And the reverse is also true: If the contractor delivers, the government will pay the full contract price, even if that amount exceeds the contractor’s actual costs. In other words, provided the contractor delivers, it can keep any fixed-price funds that are in excess of its costs. Once delivery of goods or services is accepted by the government, it has basically written off the entire contract price.

The government prefers to do business using fixed-price contracts, as this places most of the financial risk on the contractor. For example, if the contractor’s costs increase beyond the price estimated in its proposal, the government will not increase the amount of the award; yet, the contractor still must deliver as specified in the contract at the originally contracted price. For the most part, only if the government changes the specifications of the contract would the contractor have the opportunity to renegotiate the price. By far the majority of government contracts are fixed price. This is the standard model used by the government when contracting with the private sector; it is also the primary method of contracting by private sector parties.

Cost-reimbursement contracts, on the other hand, are based on expenditures. The contractor is reimbursed for the expenditures it incurs in performing the contract and is not expected to perform once contract funds have been exhausted. Reimbursement is based upon submission of invoices, rather than on performance. The contractor is only expected to deliver what it can accomplish, given the available funds and period of performance stipulated in the contract.

A cost-reimbursement contract is a much riskier proposition for the government than is a fixed-price contract. Under a cost-reimbursement contract, the government may or may not receive everything anticipated in the scope of work, depending on how well the contractor estimated the necessary costs of the scope of work, or how well the contractor controlled its expenditures. But, since payment to the Contractor is based upon expenditures, if the statement of work is accomplished prior to full expenditure of the funds, the unexpended balance must be returned to the government.

The government prefers not to use cost-reimbursement contracts. It does recognize, however, that cost-reimbursement contracts are appropriate in certain situations, such as when the costs to undertake the scope of work cannot be readily determined in advance (for example, in the case of research and development). In fact most federal grants are issued as cost-reimbursement awards (e.g., payment based on expenditures, rather than performance), even though the term “cost-reimburse-
ment” is not generally used with respect to financial assistance awards. Because cost-reimbursement contracts are more risky for the government, it will usually include audit and financial reporting requirements in the contract, requirements that don’t normally appear in fixed-price contracts.

In negotiating a cost-reimbursement contract, the government will usually examine the cost proposal very carefully in an attempt to fully understand each line item and determine if it is necessary for the effort. The contract officer will most likely request back-up documentation for all personnel costs and for any other costs that are either large or inadequately justified in the budget justification. The contract officer’s job in this situation is to negotiate the contract’s total estimated cost downward, to the extent that proposed costs are not supported by adequate justification. The contract officer is attempting to reduce the government’s potential risk by capping the total estimated cost of the contract.

It may take several communications before the contract officer is satisfied with the contractor’s cost estimate. At some point the contract officer will request the institution’s best and final offer. The term “best and final offer” is really more applicable to the commercial sector, where the fee or profit is also part of the negotiation. But, then, the commercial sector is where most federal procurement activity takes place, thus many of the terms used in the FAR are based upon commercial sector concepts. In any case, when the contract officer requests the institution’s best and final offer, this is intended to be the end of the budget negotiation.

Terms and Conditions

When requesting changes to the contract’s terms and conditions, it is important to provide a detailed justification as to why the requirement is problematic for the institution, not just that it is unacceptable. When taking exception to FAR clauses, and using the prescription as the basis for the request change, it’s best to cite the reference number for the prescription for each FAR clause the institution wishes to address. For example:

FAR 52.249-6 Termination (Cost-Reimbursement)

As prescribed at 49.503(a)(1) please replace this clause with “52.249-5 Termination for the Convenience of the Government (Educational and Other Nonprofit Institutions)”, which is the appropriate termination clause for use with educational institutions.

In this example the institution requests the change and guides the contract officer to the exact spot within the FAR necessary to support the request. In so doing, the institution makes it much easier for the contract officer to come to the same conclusion the institution did and likely would generate more goodwill than simply requesting that the clause be changed. Following are some unique features of contracts.

Termination. For the most part, only the federal government may terminate a contract. The concept of mutual, 30-day advance notice of termination, customary in agreements between universities and under many financial assistance awards, does not exist in the procurement world (although it could theoretically be negotiated into the contract terms).

Equipment. By default, title to equipment will vest in the government, unless
specified otherwise in the contract. Most universities would then request title at the end of the contract, at the point at which they request disposition instructions from the government. (Depending upon the circumstances, the government often approves such requests.) All government-owned equipment must be tracked and accounted for in accordance with the property management clause of the contract.

**Cost Principles.** By default the commercial cost principles will apply to cost-reimbursement-type federal contracts; these are detailed in Part 31.2 of the FAR. In order to get the institution’s cost principles to apply, request that the “Allowable Cost and Payment” clause (52.216-7) be modified appropriately. Note that cost principles do not apply to fixed-price contracts, only to those that are cost reimbursement.9

**Administrative Requirements.** That portion of the Uniform Guidance that describes administrative requirements, 2 CFR 200.200 through 200.329, and 200.333 through 200.399, will not apply to Contracts. Note, however, that the subrecipient monitoring requirements of the Uniform Guidance, 2 CFR 200.330 through 200.332, will apply to subcontracts for programmatic effort issued under federal prime contracts. The reason for this is that all of the administrative issues addressed by the Uniform Guidance (property management, procurement, audit, inspection, access to records, reporting, etc.) are already covered by the various clauses of the FAR. This is one of the risks for an educational institution in accepting contracts — the assumption that existing institutional systems, which may be sufficient for compliance with the Uniform Guidance, will also be sufficient to manage the contract’s administrative requirements. They may be, or they may not be. Each contract must be reviewed in light of this risk.

**Subcontracts.** The concept of a subaward (a subcontract for programmatic effort) is not recognized by the FAR. When the government uses the term “subcontract,” within the FAR, it is referring to all contracts, consulting agreements, purchase orders, procurement card transactions, etc., entered into under the contract. It is important to keep this in mind when reviewing the “subcontracts” clause (52.244-2) that is included in most contracts. Further, since the administrative requirements of the Uniform Guidance (2 CFR 200.200 through 200.329 and 200.333 through 200.399) do not apply to contracts, programmatic effort subcontracts are not exempt from the standard federal cost/price analysis and open bid requirements, the way they would be in a financial assistance award. The subrecipient monitoring requirements of the Uniform Guidance (2 CFR 200.330 through 200.332), on the other hand, do apply to programmatic effort subcontracts under federal prime contracts. This means that programmatic effort subcontracts must meet both the procurement standards of the FAR as well as the subrecipient monitoring requirements of the Uniform Guidance. Lastly the inclusion of a subcontract as a line item in the budget does not con-
stitute prior approval of the subcontractor, only of the need to acquire that service or commodity. Prior approval of the transaction, or at least prior notification, may still be required by the contract officer, in accordance with the subcontracts clause.

**Period of Performance.** A contract’s start date, by default, is the date of signature by the government. This can pose a problem for researchers who assume that they will have the freedom to obtain pre-award costs up to 90 days before the official start date. “Expanded authorities” that provide certain flexibility to award terms only apply to financial assistance awards (via the Uniform Guidance). Therefore it is important to educate researchers regarding the *substantially greater risks associated with advance spending in anticipation of contract awards.*

**Audit Requirements.** The Uniform Guidance applies to cost-reimbursement contracts in addition to financial assistance awards. This includes the subrecipient monitoring requirements of the Uniform Guidance, even though the FAR does not recognize the concept of a subaward.

**Negotiations.** One of the most difficult situations that can arise is when the principal investigator (PI) on a contract wants to accept a contract that has terms and conditions that are unacceptable to the institution. PIs often become frustrated as a result of the protracted negotiations that sometimes occur when universities negotiate complex contracts. As with any negotiation, it is important to keep the PI informed of the progress and to include him or her in the process and to explain which clauses are problematic and why. Often the institution can use the PI’s relationship with the federal program officer as leverage when the negotiations reach an impasse. In such a case, ask the PI to contact the program officer and explain the situation. If the PI can obtain the program officer’s support, it may greatly help move the process along, as the contract officer would then receive the same message from both sides.

### 2705.6 Contracts After the Award

PIs and support personnel who are used to working with a particular agency may be accustomed to the reporting and prior-approval requirements of that granting agency, and therefore should be given a heads up that the terms of the contract should be reviewed carefully because *every contract is unique.* Reporting requirements will be detailed in the contract, as will the termination, invoicing, payment, property management, inspection, and other requirements. For most financial assistance awards, these issues are addressed using a commonly applicable, standard set of terms and conditions that are incorporated by reference into the award. With a contract, however, each of the requirements in the contract has been specifically selected for the particular situation.10

Institutions unaccustomed to managing contracts often find themselves in difficulty when those responsible for the administration of a contract make the assump-

---

10 Note that the full text of most of the FAR clauses will not be included in the contract; they would still need to be looked up in the FAR. The point is, however, that the individual clauses were specifically chosen for the contract.
tion that the terms will be the same as with a financial assistance award. The most important action that can be taken at the point of contract award is the clear and detailed dissemination of contract requirements to those responsible for administering the award.

For central and departmental personnel unaccustomed to managing contracts, it is not enough to simply provide a copy of the contract. If any of these individuals are unfamiliar with contracts, they may in all likelihood simply ignore the included FAR clauses, either because they don’t know what they are, or if they are vaguely aware of them, they may assume that they are more of the “representations and certifications-type” requirements that don’t directly affect the day-to-day management of the award. Therefore it is essential that the office that disseminates the award also provide sufficient detail of the contract requirements, especially to those who may not be familiar with how contracts work, such that PIs and support personnel can perform their jobs in accordance with the contracts’ terms.

While it is not practical to provide a list of all possible contract requirements, Figure 4 contains a sampling of FAR clauses often seen in R&D contracts with universities that have some direct impact on project administrators and/or PIs. (For an in-depth discussion of FAR clauses relating to publication rights, data rights, and intellectual property, see Chapter 1900.)

¶2705.7  **Stop-Work Order**

A “stop-work” order is an instruction issued by the government in order to suspend work under a contract but without terminating the contract. The order will specify a date beyond which the contractor may not perform. In other words, any costs incurred after that date become unallowable, except to the extent that they were in some way unavoidable. The most important thing to know about a stop-work order is that if an institution receives one, the institution must in turn issue one to each subcontractor working under the contract at the time of the stop-work, giving them the same date to stop work. If the institution does not issue orders to subcontractors, the institution will likely still be liable for their expenditures, but will not be reimbursed by the government for any of those costs incurred by the subcontractor after the date specified in the stop-work order.

A stop-work order by default can only last for 90 days before the government must do one of the following:

◆ Authorize work to begin
◆ Extend the stop-work period
◆ Terminate the contract

If the stop-work order is lifted, the contractor may submit a proposal to the government to request reimbursement for costs incurred as result of the stop-work order (but not during it). For example, if project employees left because of lack of work, there could be costs associated with hiring and training replacements once work has been reauthorized. If the contract is terminated, then the contractor would submit a termination proposal in accordance with the termination clause.

¶2705.8  **Contracts with the Private Sector**

Contracts with the private sector can present unique challenges for any institution. Often difficulties arise due to differences in organizational “culture.” Academe is nonprofit and supports research and education by the free and open exchange of information. On the other hand, the private sector is for-profit and may conduct or participate in research, but needs to maintain secrecy in such endeavors in order to ensure economic viability over its competitors. The cultures are not mutually exclusive, but a lack of understanding by one party of the other’s viewpoint can make collaborations difficult.

As just mentioned, the private sector approaches research differently than does a university. The types of contract terms and conditions to which universities customarily take exception, such as terms that restrict an institution’s ability to freely disseminate information, are all standard business practices in interactions between private sector entities and even between the private sector and the federal government.

Unlike “collaborations” among universities, business relationships are not generally viewed by the private sector as collaborations; rather there is a buyer and a seller in such relationships. When a company offers a contract to a university, it is usually looking at the arrangement as a purchase, not as a collaboration. So it is
reasonable from the company’s viewpoint to include commercial terms and conditions in the contracts they offer to universities, even when two universities would treat the same scope of work as a collaboration. Unless they have experience with university research culture, often companies simply don’t understand why universities have so many concerns over what to them is standard practice.

There are two primary modes of interaction between universities and the private sector: contracts using the company’s own funds, and subcontracts issued under a federal prime contract. There are many issues that may arise when working with the private sector, such as intellectual property, material transfer, confidentiality, export controls, and publication rights. Depending upon whether the contact involves private or federal funding greatly influences the extent to which these issues raise concerns with universities.

**Private-Sector Contracts under Private Funding**

One of the most useful tools that an institution can have at its disposal when collaborating with private sponsors is a standard research agreement template. The template acts as a starting point for negotiations and should incorporate all of the terms and conditions that the institution feels are necessary, such as right to publish, ownership and licensing of intellectual property, confidentiality, and indemnification.

Providing this template along with the proposal to a company can go a long way toward facilitating the negotiation process. To begin with, the institution is letting the company know up front where it stands. Secondly the institution is, in a sense, preempting the company’s issuance of a purchase order with commercial terms and conditions. Further it is more advantageous for the institution if the negotiation starts by modifying the institution’s agreement, than for the institution to be trying to modify the company’s contract or purchase order.

Many institutions are using such agreement templates successfully with industry. Thus, if an institution is looking to develop a template or update an existing one, it might be helpful to obtain copies from sister institutions and talk to colleagues about their experiences in using such templates.

**Private-Sector Contracts under Federal Funding**

One of the cultural differences between universities and the private sector is how each responds to a federal solicitation. A company looks at a solicitation as a business opportunity — a chance to further its business goals and to generate revenue. If the company decides to respond to the solicitation, it will establish a team dedicated to putting together the cost and technical proposals; it would be almost unthinkable for a company to submit competing applications in response to the same solicitation.

University proposals, on the other hand, tend to be PI driven. A PI decides to which opportunities he or she will apply, and it is not unusual for more than one PI at an institution to submit applications to the same solicitation or opportunity. PIs are usually the lead for their respective proposals, and central administration often does not become involved until requested to do so. As a result, university/industry collaborative submissions can be a learning experience for both parties.
When a company is subcontracting with federal funding, another layer of complexity is added. This is because federal awards normally impose upon the awardee the requirement to flow down certain terms and conditions to any subawardees. So an industry subcontract will include the federal terms that must be flowed down, plus most of the commercial terms and conditions it would normally impose on a supplier.

Many large companies do so much subcontracting that they have developed boilerplate terms and conditions that combine both their commercial terms and the federal flow-down requirements. In the majority of cases, the flowed down FAR clauses will be incorporated into the boilerplate terms in the same format as the institution would have received them directly from the federal government. But the institution will also come across situations where the company will have re-written the federal terms, such that the identifying FAR clause numbers and titles have been removed. The federal requirements are still intact, they are just not as easily identifiable as specific FAR clauses. Having access to an electronic or online version of the FAR is important in these situations, because the best argument to get an undesirable FAR clause modified or removed is to refer back to the clause’s prescription.

As an institution reviews the terms of the subcontract, it still must determine the acceptability of each requirement. When a university receives a private-sector contract that uses the company’s own funds rather than federal funds, the agreement truly represents only what the two parties have agreed upon. Under a federal award a company may be reluctant to negotiate the flow-down terms because it simply does not feel it has the authority to do so. Thus when a university is requesting changes to requirements — such as prior approval of publications — it is important to understand that the company must first be convinced that the requirement should be changed, and that it may then have to convince the federal contract officer of the importance of the issue in order to obtain a deviation from having to flow down the requirement to the institution.

Inventions under Federal Subcontracts
According to federal statute (the Bayh-Dole Act), the government receives a non-exclusive, royalty-free license to any inventions generated with federal dollars, no matter how far down the procurement chain the invention was developed. As a result, in this one situation, there is a direct relationship established between the government and every subcontractor. The government’s rights are known as “government purpose license rights.” Also, according to the Bayh-Dole Act, a contractor may not “take” rights to a subcontractor’s inventions as a condition of issuing the subcontract. The subcontractor can agree to give up those rights by accepting terms to that effect, but the prime contractor cannot force them to do so. (For an in-depth discussion of the Bayh-Dole Act, see Chapter 1900.)

The company with whom the institution is negotiating may justify its need for ownership and/or control of inventions to ensure that it has access to the technology in order to accomplish the prime contract requirements. However, it already receives whatever access it needs to accomplish the government’s objectives by virtue of its prime contract with the government. Because the government already has its
government purpose license rights, the company obtains the rights it needs via this mechanism.

When reviewing subcontracts of federal funds, therefore, be sure to look for wording that gives the company rights to the inventions; the institution will most likely want to remove it. A company can request — but not force — an institution to give up such rights.

¶2705.9 Special Issues for Small Institutions

The challenge for small institutions in administering contracts is that regardless of the institution’s size, all contract requirements must be followed. For example, if an institution accepts a contract that requires submission of a subcontracting plan, then the institution must find a way to comply with the requirement, even though large institutions often have an individual or even an office dedicated to this one compliance function. No allowance is made by the government for lack of resources when it comes to compliance.

Depending upon the sponsor, contracts can impose a greater administrative burden on the institution than do grant awards, sometimes requiring quarterly or even monthly technical reports, quarterly property reports (title to equipment almost always vests in the government with contracts), annual summaries of disclosed inventions, detailed invoicing, etc. It is vital, therefore, when deciding to accept a contract, that the institution determine up front that it has, or can put into place, the systems necessary to comply with contract requirements.

¶2705.10 Conclusion

There are several potential areas of risk for institutions involved in contract administration and ways to mitigate them including

◆ *unknowingly accepting problematic contract terms upon signing a proposal* (Educating those who approve contract proposals regarding the implication of their signatures will help ensure a successful start to contract negotiations.);

◆ *inexperience with essential topics such as the Federal Acquisition Regulation or intellectual property issues under contracts* (Knowledge of the FAR and of patent and licensing issues is critical if an institution is going to accept federal and industry contracts.); and

◆ *distribution of insufficient award information to research administrators* (Detailed communication of contract requirements to administrators is essential for successful completion of the contract.).

In summary while acceptance of contracts by an institution can pose greater risks than are usually associated with financial assistance awards, these risks are manageable with sufficient communication and education. Contracts represent by far the minority of awards received by educational institutions. As a result the necessary expertise to administer them properly may not be easily accessible at every institution. Most research administrators are more than happy to share their knowledge on these and other issues. Colleagues are the best resource.
Supplementary Material

Federal Supplies and Services Contracting with Universities: Risks and Realities

Kathleen Lorenzi, University of Colorado Boulder, and Vincent A. "Bo" Bogdanski, Colorado State University

The ‘cat is out of the bag;’ universities will accept commercial purchase orders from the federal government based on FAR 12, Acquisition of Commercial Items (“FAR 12 POs”). This could be one of the worse kept secrets in higher education second only to the idea that, “universities do not ever accept publication restrictions.” Now that you have gasped with total surprise, have gathered your wits (and, possibly, quit laughing), be assured our intention is not to condemn the practice of FAR 12 POs but to help you identify some of the pitfalls, risks and potential consequences in accepting a FAR 12 PO. We include a few recommendations on how to address FAR 12 terms and work with your federal counterpart.

Let’s start with a few assumptions

First and foremost, the Federal Acquisition Regulation (“FAR”) is a sophisticated and comprehensive document written and modified by a system that continues to produce a usable, understandable, fair and equitable regulation based on many years of experience and case law. Any one of us can criticize or disagree with any part of the FAR based on our own biases or situations but we believe the document does what it represents, providing “uniform policies and procedures for acquisition by all executive agencies” (FAR 1.101).

Second, some may think that universities should have a unique version of the FAR directed at institutions of higher education only. This is clearly impractical. Considering university involvement in the overall federal acquisition scheme, a considerable number of clauses with alternative rules have been developed for our institutions and our research enterprise. Special needs of higher education have been specifically addressed; thus, expecting additional special consideration for higher education is unrealistic.

Third, do not assume that your federal counterpart knows about the FAR alternatives for universities or that they have ever previously worked with a university. The secret is to work with your federal counterpart and educate them on the appropriate clauses. To do so, be prepared to support your discussions with hard facts based on FAR instructions (e.g. prescriptions), understanding the requirements of the statement of work, and being familiar with what has been proposed. One of the issues that will annoy your government counterpart is a university representative’s inability to explain the basis of their arguments on why universities should be treated differently than any other organization. As such, they may hesitate to make

---

1 This article is reprinted from the NCURA Magazine, Volume XLIV, No. 1, January/February 2012. It is used with permission of the publisher.
the changes in the contract as requested. Do not fall into that trap; recognize that a major part of negotiation is the ability to explain to the other side the basis for any request that you make and why it is a good idea.

To understand the purpose of FAR Part 12, one must remember why FAR Part 12 was developed in the first place. At the end of the 1980s the DoD was finding that more and more of their suppliers were leaving the federal marketplace due to the overbearing requirements for cost accounting standards and audits that were creeping from their government units into their commercial units (e.g. selling supplies and services to the general public). If a contractor was involved with any federal contract, the whole company was subject to federal contracting requirements including that commercial unit. These non-traditional requirements added costs that made the commercial units unable to compete in a true commercial (e.g. non-federal) marketplace.

In all fairness, the government’s move to apply cost accounting requirements and audits to all areas of the business of a federal contractor was a result of revelations at the time about $500 hammers and $600 toilet seats. Most companies who were involved in an investigation by the government of overpricing federal contracts also had commercial units. In all the confusion and negative press (plus a couple of election cycles) the government seemed to forget the conceptual differences between: 1) a top-down pricing of the commercial marketplace based on competition of standard items where the risk of performance was on the company (e.g. a fixed price scenario), and, 2) the bottoms-up pricing based on estimating cost elements of an R&D project where the technical approach was the key determinate of award success and the government was willing to share the risk of the project (e.g. a cost reimbursable scenario). As this process progressed, the government recognized that most of their needs were commercially oriented and that they could buy the same goods and services as sold to the general public. With the removal of the cost/pricing and audit requirements, providing for a true competitive marketplace, the cost of goods went down. The result in the early 1990s was FAR 12 to provide the government the ability to use tools as close to a commercial PO as possible in order to benefit from the competitive marketplace.

The phrase “as possible” is used because there are still a number of federal requirements that will apply to any federal PO that cannot be eliminated because the government is a sovereign entity. The US federal government is the largest purchaser of goods and services in the world. As such, the US government uses its buying power to leverage their implementation of federal social, ethical, economic and environmental policies through its procurement system. A list of these laws/policies can be found in FAR 52.212-5, Contract Terms and Conditions Required to Implement Statutes and Executive Orders – Commercial Items, and are applied to each commercial purchase as appropriate.

Outside of research and development (R&D), the writers of the FAR either may not have anticipated that universities would be involved in commercial item contracting, or if involved, universities would be expected to compete against the commercial sector on the same basis as all bidders. Therefore, there are no clauses for
commercial supplies and services that are directed specifically toward the unique nature of universities or nonprofits. On the other hand, there are many agencies that primarily acquire commercial goods and services and do not do much, if any, R&D. In these cases, these agencies only know one tool, the FAR 12 PO (e.g. Standard Form 1449, Solicitation/Contract/Order for Commercial Item), and one way to acquire goods and services. A third reason the writers of the FAR did not anticipate the participation of universities is that, historically, universities receive grants, cooperative agreements and contracts for R&D and are not intended to be involved in service and supply procurement activities that require “unique” rules.

Two things to note: the FAR does not delineate between services and research, nor does it delineate between a PO and contract. In FAR Part 35, Research and Development, services are not mentioned. R&D is divided into only three components and defined at FAR 2.101 for “Basic Research,” at 35.001 for “Applied Research,” and at 35.001 for “Development.” These definitions are short, succinct and are directed toward those kinds of organizations that have the unique capabilities for R&D contracting, including universities. Commercial items are defined separately at FAR 2.101 and the definition, as follows, is long and involved:

(1) Any item, other than real property, that is of a type customarily used by the general public or by non-governmental entities for purposes other than governmental purposes, and—

(i) Has been sold, leased, or licensed to the general public; or

(ii) Has been offered for sale, lease, or license to the general public;

(2) Any item that evolved from an item described in paragraph (1) of this definition through advances in technology or performance and that is not yet available in the commercial marketplace, but will be available in the commercial marketplace in time to satisfy the delivery requirements under a Government solicitation;

(3) Any item that would satisfy a criterion expressed in paragraphs (1) or (2) of this definition, but for—

(i) Modifications of a type customarily available in the commercial marketplace; or

(ii) Minor modifications of a type not customarily available in the commercial marketplace made to meet Federal Government requirements. “Minor modifications” means modifications that do not significantly alter the nongovernmental function or essential physical characteristics of an item or component, or change the purpose of a process. Factors to be considered in determining whether a modification is minor include the value and size of the modification and the comparative value and size of the final product. Dollar values and percentages may be used as guideposts, but are not conclusive evidence that a modification is minor;

(4) Any combination of items meeting the requirements of paragraphs (1), (2), (3), or (5) of this definition that are of a type customarily combined and sold in
combination to the general public;

(5) Installation services, maintenance services, repair services, training services, and other services, if-

   (i) Such services are procured for support of an item referred to in paragraph (1), (2), (3), or (4) of this definition, regardless of whether such services are provided by the same source or at the same time as the item; and

   (ii) The source of such services provides similar services contemporaneously to the general public under terms and conditions similar to those offered to the Federal Government;

(6) Services of a type offered and sold competitively in substantial quantities in the commercial marketplace based on established catalog or market prices for specific tasks performed or specific outcomes to be achieved and under standard commercial terms and conditions. For purposes of these services—

   (i) "Catalog price" means a price included in a catalog, price list, schedule, or other form that is regularly maintained by the manufacturer or vendor, is either published or otherwise available for inspection by customers, and states prices at which sales are currently, or were last, made to a significant number of buyers constituting the general public; and

   (ii) "Market prices" means current prices that are established in the course of ordinary trade between buyers and sellers free to bargain and that can be substantiated through competition or from sources independent of the offerors.

(7) Any item, combination of items, or service referred to in paragraphs (1) through (6) of this definition, notwithstanding the fact that the item, combination of items, or service is transferred between or among separate divisions, subsidiaries, or affiliates of a contractor; or

(8) A non-developmental item, if the procuring agency determines the item was developed exclusively at private expense and sold in substantial quantities, on a competitive basis, to multiple State and local governments.

The chasm between the definitions of R&D and commercial items is very wide. Universities should take advantage of this gap and initially maintain that all contracts through a sponsored project office (SPO) should be considered R&D. On occasion, universities do offer supplies and services that can be identified as supplies (defined at FAR 2.101) or services (defined at FAR 29.401). However, those supplies and services are usually associated with Specialized Service Facilities (OMB Circular A-21, J-47) that are offering their excess capacity for sale to the general public. These transactions are normally not handled by the SPO and are not addressed by this article.

When responding to a FAR 12 solicitation or replying to the award of a FAR 12 PO, the nature (R&D) and type (cost reimbursable or fixed price) of a proposed contract is very important because it will dictate the nature of the clauses to be
used in the procurement. Research administrators negotiating a FAR 12 PO must be prepared and willing to defend their approach to a federal contracting representative. Sometimes the government contracting officer uses the FAR 12 PO as a matter of government convenience which should not be a deterrent from potential negotiations. However, convincing the government contracting officer may be as hard as convincing a PI that there is no such thing as a fixed price grant containing FAR clauses.

One may ask why FAR 52.213-4 Terms and Conditions - Simplified Acquisitions (Other than commercial Items) are not used instead of FAR 52.212-4, Contract Terms and Conditions – Commercial Items. Good question; the reason may vary from agency to agency. FAR 13 procurements are only for procurements of less than $150,000 (e.g. simplified acquisition threshold) with the intent to offer a simplified process for lower dollar acquisitions that do not require a full blown FAR contract, cost and pricing data, or are a true commercial item or service. (FAR 12 dollar thresholds are much higher and may vary depending on the commodity purchased). In addition, the FAR does not define “other than commercial” so there isn’t much, if any, relief from requirements in FAR 13. Further, the terms in FAR 52.213-4 closely mirror those clauses required in federal FAR 12 POs.

**Why the Focus on Definitions?**

Definitions are key to understanding the intent in any contract. The FAR recognizes research as one of the three stated missions for higher education and has written clauses directly related and advantageous to the research mission. R&D contracting carries less risk and affords more benefits to higher education not available in those contracts providing supplies and/or services under federal commercial terms. Admittedly, some FAR clauses meet the definition of cost reimbursement only, but are still an advantage for universities because cost reimbursement is common in R&D contracting while not common for supplies or services. In fact, the current directed policy of Congress (expected to be stated in the pending Defense Authorization Act 2012) and the Office of Federal Procurement Policy (OFPP)(Memorandum of October 27, 2009, “Increasing Competition and Structuring Contracts for the Best Results”) is that fixed price contracts are now the standard for all procurement activities with cost reimbursable contracting being the exception and requiring justification and additional approvals at various levels of management.

An agency can use a number of tools in the acquisition process for commercial items including FAR Part 15, Contracting by Negotiation (as approved in FAR 12.102). The good news for you is FAR Part 15 says “a contract awarded using other than ‘sealed bidding procedures’ is a negotiated contract (15.000).” So you have every right to contact your contracting officer. Sealed bids are about as rare as a PI who likes your F&A rate. If you can use FAR 15, we suggest that the following sample of clauses be added, as they are appropriate for university research and development projects:

- FAR 52.215-2, Audit of Records – Negotiation with Alternate II
- FAR 52.216-7, Allowable Costs and Payment, with a change in reference from
FAR part 31.2 to FAR part 31.3
◆ FAR 52.216-15, Predetermined Indirect Cost Rates
◆ FAR 52.216-11, Cost Contract – No Fee, with alternate 1 (with no hold-back)
◆ FAR 52.227-1, Authorization and Consent
◆ FAR 52.227-2, Notice and Assistance Regarding Patent and Copyright Infringement
◆ FAR 52.227-11, Patent Rights-Ownership by the Contractor
◆ FAR 52.227-14, Rights in Data General – with Alternate IV
◆ FAR 52.230-5, Cost Accounting Educational Institutions (if applicable)
◆ FAR 52.230-6, Administration of Cost Accounting Standards (if applicable)
◆ FAR 52.232-20, Limitation of Costs (if applicable)
◆ FAR 52.232-22, Limitation of Funds (if applicable)
◆ FAR 52.232-5, Prompt Payment
◆ FAR 52.245-1, Government Property with Alt II with the University being the designate owner/title holder of any Government Property acquired or fabricated.

Now focus on the types of clauses typically found in federal commercial contracts. The FAR allows for “tailoring” of certain clauses but does not give any particular guidelines as to what can be tailored and to what extent. However, FAR 12.302(a) specifically states that “The provisions and clauses established in this subpart are intended to address...commercial market practices for a wide range of potential Government acquisitions of commercial items. However, because of the broad range of commercial items acquired by the Government, variations in commercial practices, and the relative volume of Government acquisitions in the specific market, contracting officers may, with the limitations of the subpart, and after conducting appropriate market research, tailor the provisions of at 52.212-1 ... and 52.212-4 to adapt to the market conditions for each acquisition.” Section (c) goes further to state, “the contracting officer shall not tailor any clauses or otherwise include any additional terms or conditions ...in a manner that is inconsistent with customary commercial practice for the item being acquired unless a waiver is approved...” As a good negotiator, you can develop arguments to delete or modify any of these or other objectionable clauses as being customary to a “university market.” Will your arguments hold up during negotiations or during an adverse event? This question is interesting because there is no FAR definition that differentiates a commercial purchase from the “university market.” Your negotiation skills are the key.

FAR 52.212-4 contains the standard terms and conditions for a FAR 12 PO that can be negotiated. The following matrix (Figure 2720.1-1) will help you in recognizing the standard terms and possible alternative terms that a university may be able to negotiate. Please note that the response may need to be addressed differently by different institutions.
## Figure 2720.1-1: Roles of Training Program Committees

<table>
<thead>
<tr>
<th>CLAUSE</th>
<th>FEDERAL STANDARD REQUIREMENT</th>
<th>UNIVERSITY RESPONSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Inspection / Acceptance</td>
<td>Contractor shall only tender for acceptance those items that conform to the requirements of this contract. The government reserves the right to inspect or test any supplies or services that have been tendered for acceptance. The government may require repair or replacement of nonconforming supplies or re-performance of nonconforming services at not increase in contract price.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Please delete.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The University works on a reasonable efforts basis therefore, insert in lieu thereof FAR 52.246-9, Inspection of Research and Development. This clause is more appropriate to the research and development outcomes (e.g. results) of a public university.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In addition, due to constitutional prohibitions on pledging the good faith and credit of the state, the University cannot agree to the repair or replacement, or a reduction in estimated costs.</td>
</tr>
<tr>
<td>b</td>
<td>Assignment</td>
<td>Contractor may assign its rights to receive payment Generally OK</td>
</tr>
<tr>
<td>c</td>
<td>Changes</td>
<td>Changes to terms and conditions may be made only by written agreement. Generally OK</td>
</tr>
<tr>
<td>d</td>
<td>Disputes</td>
<td>Subject to the Contracts Disputes Act of 1978 Generally OK</td>
</tr>
<tr>
<td>e</td>
<td>Definitions</td>
<td>FAR 52.201-1 Definitions is incorporated Generally OK</td>
</tr>
<tr>
<td>f</td>
<td>Excusable Delays</td>
<td>Contractor shall be liable for default unless non-performance is caused by an occurrence beyond the reasonable control of the contractor. Generally OK</td>
</tr>
<tr>
<td>g</td>
<td>Invoice</td>
<td>Provides instructions for invoicing and may implement the Prompt Payment Act Generally OK. However, please note that university research will not fit the requirements as requested in subsections (iv) or (v) nor does a university provide any discounts for prompt payment per (vi).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Please insert FAR 52.232-5, Prompt Payment. The Electronic Funds Transfer information is attached to this letter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Please delete and insert one of the following; 1) If this is a cost reimbursable contract, the University will invoice approximately monthly and will include a breakdown of costs incurred by budget category and a summary of costs incurred to date, 2) If this is a fixed price contract, the University requests that a payment schedule be negotiated commensurate with the scope and schedule of the project to allow for adequate cash flow to support the project.</td>
</tr>
<tr>
<td>h</td>
<td>Patent Indemnity</td>
<td>The Contract shall indemnify the Government... against liability, including costs, for actual or alleged direct or contributory infringement of, or inducement to infringe, any US or foreign patent, trademark or copyright arising out of performance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Please delete. This clause is intended to be used for a company that is a merchant manufacturer and seller of commercial hardware and/or software. The University is not a merchant manufacturer or a commercial enterprise.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Universities do not customarily warrant the results of their research as inventions/patents have not yet been identified and, per the practice of our federal sponsors, our research contracts contain FAR 52.227-1, Authorization and Consent, and 52.227-2, Notice and Assistance Regarding Patent and Copyright Infringement.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>More importantly, the constitution and laws for public universities prohibits the University from providing warranties or indemnifying other parties in relation to the results of their research.</td>
</tr>
<tr>
<td>i</td>
<td>Payment</td>
<td>Based on items accepted</td>
</tr>
<tr>
<td>j</td>
<td>Risk of Loss</td>
<td>Contractor is responsible for risk of loss until passed to the government unless the contract states otherwise.</td>
</tr>
<tr>
<td>k</td>
<td>Taxes</td>
<td>Contract price includes applicable federal, state and local taxes and duties.</td>
</tr>
<tr>
<td>l</td>
<td>Termination for the Government’s Convenience</td>
<td>Government can terminate at will. The contractor shall be paid a percentage of the contract price reflecting the percentage of work performed prior to the notice of termination.</td>
</tr>
<tr>
<td>m</td>
<td>Termination for Cause</td>
<td>Government may terminate in the event of default of the contractor or the failure of the contractor to comply with the T&amp;Cs. Contractor is liable to the Government for any and all rights and remedies provided by law.</td>
</tr>
<tr>
<td>n</td>
<td>Title</td>
<td>The government takes title to items delivered unless the contract says otherwise.</td>
</tr>
<tr>
<td>o</td>
<td>Warranty</td>
<td>The contractor warrants and implies that the items delivered [under the contract] are merchantable and fit for the particular purpose described in the contract.</td>
</tr>
<tr>
<td>p</td>
<td>Limitation of Liability</td>
<td>Except as otherwise provided by an expressed warranty, the Contractor will not be liable to the Government for consequential damages resulting from any defect or deficiencies in accepted items.</td>
</tr>
<tr>
<td>q</td>
<td>Other Compliances</td>
<td>The contractor shall comply with all applicable federal, state and local laws, executive orders, rules and regulations applicable to its performance under this contract.</td>
</tr>
<tr>
<td>r</td>
<td>Compliance with laws unique to Government Contracts</td>
<td>Incorporates clauses such as “Officials not to Benefit,” “Contract work hours,” “Safety Standards Act,” “Anti-Kickback Act of 1986,” “Fly America,” etc.</td>
</tr>
</tbody>
</table>
Order of Precedence

Defines the precedence of the special terms and the general terms including q and r requirements listed above.

Central Contractor Registration

Required for all federal contractors

Generally OK. Be familiar with how changes to a FAR 12 PO are incorporated into the document. A suggested request in a cover letter; If the requested changes are implemented as an attachment to the Purchase Order, please make this letter #2 in the Order of Precedence as it will constitute a change to all other terms and attachments referenced there under.

Should not be a problem. Please note that any and all subcontractors are also required to be registered in CCR.

We also suggest that you include the list of FAR clauses provided in the paragraph above related to FAR 15 in any submittal or exceptions letter. In addition, be sure and define a payment schedule conducive to the work being done. If you do not define a payment schedule, the government may not be obligated to make a payment until such time as the final deliverable is received thereby causing cash flow problems for your university.

So, What Should Be Done?

We recommend that any federal contract which can be reasonably considered R&D should be awarded using R&D clauses regardless of the contract form used. The definitions of R&D versus commercial as mentioned above will help in your proposal and award negotiation. The concept of R&D versus commercial is best developed at the proposal stage with a proposal submittal letter. If the contract comes to your institution as a commercial PO you should open negotiation for a R&D type contract immediately or the government may consider the PO is accepted as is. If this means going back to the “drawing board,” so be it. You can always quote the immortal words of Murray in the play The Odd Couple, “what do you want, speed or accuracy?”

If you feel you are the only responsible/responsive proposer, negotiate the R&D contact with the appropriate clauses prior to submitting a proposal. You are holding “four aces” and it’s a pretty good bet you will win “the hand.”

If the request for quote seems to be directed only toward institutions of higher education in a competitive environment, consider proposing an R&D fixed price contract with the appropriate clauses.

If the request for quote seems to be directed toward a wider source list but still only a limited number of qualified organizations, consider proposing using an R&D fixed price contract with the appropriate clauses.

If the work is clearly commercial in nature or you can’t convince the government that the work is R&D, we suggest you ask questions such as the following before proposing or accepting the agreement:

◆ Is the work specified under this PO appropriate for a research university?

◆ If you negotiate out a warranty clause, is there still an implied warranty as to usefulness toward purpose, form fit and function, and any adverse action associated with your contract?

◆ Do you normally sell this product or service to others; are you providing the
government with your best price (e.g. ‘most favored customer’ pricing)?

◆ Even if you don’t have a stated termination for default clause, will that prohibit the government terminating for default under adverse circumstances (e.g. failure to perform)?

◆ Are you capable of adsorbing re-performance or re-procurement costs if terminated for default since virtually all these contracts are priced on a fixed price basis?

◆ When does the Uniform Commercial Code become a factor?

What is the potential of complete success, partial success or, maybe your institution will just get lucky to complete the work on budget, on schedule and with completed deliverables? Most PIs are very optimistic even if the work is associated with a fixed price contract. But remember the worst possible outcome is debarment of the entire institution.

We think the above suggestions are a good cross section of questions that need to be asked prior to entering into any FAR 12 PO on a case by case basis. Each institution needs to develop its own risk analysis methods and processes. Just because a PI wants the work, the work will help towards your institution’s financial goals, or the institution wants the F&A return, should not be sole reasons for accepting the contract.

However, don’t try to “play the system.” For example, don’t negotiate R&D clauses when the procurement is clearly supplies or services. Doing this only manifests unprofessional behavior on your part. Negotiate the correct clause for the objective of the contract.

**Other Considerations Under a FAR 12 PO**

Are the terms “Performance-based Acquisition (PBA)” or “Performance Work Statement (PWS)” used in the PO (e.g. means an acquisition structured around the results to be achieved as opposed to the manner by which the work is to be performed / means a statement of work for performance-based acquisitions that describes the methods used to obtain the required results in clear, specific and objective terms with measurable milestones and outcomes, respectively)? If so, do you know what these terms mean and their hidden requirements as defined in the clause at 52.232-32, Performance-Based Payments. (Hint – if you do not meet pre-negotiated success criteria, you do not get paid and risk termination.)

Is your public university competing against industry or other nonprofits? Is this legal in your state? Will the federal government consider the issue of an uneven playing field? A university with a predetermined F&A rate supported by institutional resources and no profit incentive will probably have an unfair competitive advantage when competing with industry or even a nonprofit. Some states will not allow this type of competition because of economic policies prohibiting competition with industry. There is also an issue of ownership of intellectual property. If industry is competing, the government may assume that ownership of deliverables will pass to the government with no rights to the provider. Objections to a competitive
procurement based on these issues may result in an award protest by an unsuccess-
ful party with potential negative results such as: 1) termination of the contract with
the successful party; 2) significant delays in contract schedules; 3) a repeat of the
competitive process; or 4) cancellation of the procurement altogether.

“Document, document, document” is the cheer for the contract negotiator but,
in the case of federal commercial contracts, a memo to the file may not be enough to
negate an adverse action. However, the more each party has documented the inter-
actions between the parties, the easier the resolution if the contract is found to be insuffi-
cient in defining the relationship of the parties and the quid pro quo. If a memo
for the record is all you have, that may be sufficient, but it has to be more than a ‘feel
good’ memo written to appease those who will later review the contract.

Conclusion
We recommend that you:
(1) Attempt (starting at the proposal stage) to make the contract R&D;
(2) Do your homework and understand the requirements and implications of
accepting a FAR 12 PO; and
(3) Assure that proper clauses are negotiated for the nature of the procurement and
the contract type is clearly defined.

So, the ‘cat is now really out of the bag.’ Your job, if you choose to accept it, is to
keep the cat in the house. Accepting FAR 12 POs can be an acceptable practice pro-
vided your organization has fully considered the ramifications of going outside the
‘stated’ mission of the institution and is willing to accept the risk of federal commer-
cial contracting methods as a vehicle to increase your sponsored programs portfolio.

About the Authors
Kathleen (Kathy) Reneau Lorenzi, CPCM is the Associate Director, Office of Con-
tracts and Grants at the University of Colorado Boulder. She is a Certified Profes-
sional Contract Manager (CPCM) through the National Contract Management
Association (NCMA) with over 27 years in contract management and research
administration, and a member of NCURA since 2002. Kathy has been a member of
many workshops and panels with both NCURA and NCMA on topics such as FAR,
negotiating agreements, and export controls.

Vincent A. “Bo” Bogdanski is a Senior Research Administrator at Colorado State
University. He has over 20 years of government contracting experience and has been
an NCURA member since 1994. Bo has written several articles for NCURA Maga-
zine, has discussed the FAR on NCURA TV, and has been a member of many work-
shops and panels regarding the FAR.
This section includes guidance and tools — flowcharts, checklists, etc. — relating to administering research contracts. These materials are culled from a variety of authoritative sources.

**E-Verify Required Under Federal Contracts**

AIS editors

Use of the federal E-Verify system (www.dhs.gov/everify) will be required under most federal solicitations issued and contracts awarded, including research contracts. The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council amended the Federal Acquisition Regulation (FAR) to reflect this requirement in the Nov. 14, 2008, Federal Register. In the June 5 Federal Register, NASA, DoD and GSA agreed to delay the effective date of the requirement until Sept. 8, 2009 (http://edocket.access.gpo.gov/2009/pdf/E9-13124.pdf).

Through language inserted into a federal contract, contractors must agree to use E-Verify “to confirm the employment eligibility of all persons hired during a contract term and to confirm the employment eligibility of federal contractors’ current employees who perform contract services for the federal government within the United States.” E-Verify is administered by the Department of Homeland Security (DHS). The requirement is in addition to the required completion by employers of an Employment Eligibility Verification Form (Form I-9).

**Requirements Checklist**

✓ **Who:** In response to criticisms of the applicability and cost of the rule to higher education institutions, the final rule allows colleges and universities to verify only employees and new hires who are actually assigned to a federal. It remains to be seen whether this limitation on applicability will actually lessen the burden on institutions, as many institutions may find it difficult to institute different human resource practices for employees paid from federal contracts and those paid from other sources.

According to E-Verify’s FAQ for contractors, an employee assigned to the federal contract is defined as “any employee hired after November 6, 1986, who is directly performing work in the United States under a contract that includes the clause committing the contractor to use E-Verify. An employee is not considered to be directly performing work under the contract if the employee normally performs support work, such as indirect or overhead functions, and does not perform any substantial duties under the contract.” (See additional discussion of “employees” in Figure 2730.1-1.)

✓ **What:** The requirement affects most federal contracts awarded after Feb. 20, 2009. (There has been some confusion as to whether the requirement also applies to grants and cooperative agreements. The requirement does not appear to do so at this time.)
According to E-Verify’s FAQ for contractors, covered are

- Prime federal contracts with a period of performance longer than 120 days and a value above the $100,000 simplified acquisition threshold.
- Subcontractors if a prime contract includes the clause. For such subcontracts, the rule extends the E-Verify requirement to subcontracts for services or for construction with a value over $3,000.
- Employees working in the United States (currently defined to include the 50 states and the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands).
- Existing indefinite-delivery/indefinite-quantity contracts if modified by a contracting officer. Such contracts will be modified “on a bilateral basis in accordance with FAR 1.108(d)(3) to include the clause for future orders if the remaining period of performance extends at least six months after the final rule effective date and the amount of work or number of orders expected under the remaining performance period is substantial.”

The rule exempts contracts

- that include only commercially available off-the-shelf items (or minor modifications to such items) and related services;
- less than the $100,000 simplified acquisition threshold;
- of less than 120 days; and
- where all work is performed outside the United States.

**When**: When a contractor is awarded a federal contract that contains the E-Verify clause, the contractor and any covered subcontractors on the project are required to enroll in the E-Verify program within 30 calendar days of the contract or subcontract award date. A contractor has 90 calendar days from enrolling in the E-Verify system to begin using the system for new and existing employees.

**Where**: E-Verify is a free, Web-based tool used to verify the employment eligibility of employees and new hires. It is operated as a partnership between the DHS and the Social Security Administration (SSA), with oversight by the U.S. Citizenship and Immigration Services. According to E-Verify, the system electronically compares employee information taken from the Form I-9 (the paper-based employment eligibility verification form used for all new hires) against more than 425 million records in SSA’s database and more than 60 million records in DHS’ immigration databases.

**How**: Before you can start using E-Verify, you need to enroll in the program (at www.vis-dhs.com/employerregistration). At the end of the enrollment process, you will be required to sign a memorandum of understanding (MOU) that provides the
terms of agreement between your institution and DHS. According to the E-Verify Web site, if you have already enrolled in E-Verify and you are awarded a federal contract after the effective date of this requirement, you may need to update your profile once the contract has been awarded. According to E-Verify, your subcontractor cannot verify under your MOU but must separately enroll in the system.

According to E-Verify’s FAQ for contractors, contractors are prohibited from using E-Verify prior to a job offer and acceptance by the applicant. Also, you are required to post the notice provided by DHS indicating your participation in the E-Verify program as well as the anti-discrimination notice issued by the Office of Special Counsel for Immigration-Related Unfair Employment Practices at the Department of Justice.

✓ Why: The new FAR rule implements Executive Order 12989, as amended by President Bush on June 6, 2008, directing federal agencies to require that federal contractors agree to electronically verify the employment eligibility of their employees.

Figure 2730.1-1: Employees Required to Be Verified

The following are excerpts from “Frequently Asked Questions: Federal Contractors and E-Verify” located at www.dhs.gov/everify.

My employee is working on a contract for a minimal amount of time. Is he or she subject to E-Verify? Yes. The rule does not exempt employees based on the intermittent nature of the work or the length of time spent performing the work.

What employees are not considered to be directly performing work under a contract and therefore excluded? Those employees who normally perform support work, such as indirect or overhead functions, and do not perform any substantial duties applicable to the contract, would be excluded.

One of my employees was run through E-Verify by a previous employer. Do I need to run this employee through E-Verify again? Yes. Under the rule, federal contractors are required to enter the worker’s identity and employment eligibility information into the E-Verify system following completion of the Form I-9 at the time of hire.

My employee has been previously confirmed as work authorized through E-Verify but is moving to another contract. Do I need to run him or her through E-Verify again? No. Once an employee has been run through E-Verify and employment authorization has been confirmed, the employee should not be re-verified through E-Verify again by the same employer.

Are there any exceptions to verify employees with certain credentials and security clearances? Yes. The federal contractor is not required to perform employment verification using E-Verify for any employee who has been granted and holds an active federal agency HSPD-12 compliant credential or a U.S. Government security clearance for access to confidential, secret, or top secret information in accordance with the National Industrial Security Program Operating Manual. The employer still must complete the Form I-9 at the time of hire for such employees.
The Q&As at ¶2790.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 2700 has been understood. Note: For the answer key for ¶2790.1, see ¶2790.3, which appears on a separate page (page 2790:5) for testing purposes.

Discussion topics at ¶2790.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶2790.1 Q&As

1. The federal government typically uses contracts for the purpose of
   (a) Acquiring goods and services for the direct benefit of or use by the U.S. government
   (b) Stimulating basic R&D
   (c) Funding postdoctoral work
   (d) Providing proposal incentives to faculty

2. Which of the following terms generally is NOT used in reference to a contract?
   (a) Proposal
   (b) Bid
   (c) Application
   (d) Offer

3. To be considered binding, a contract must have the following essential characteristics EXCEPT:
   (a) The parties to the contract must be competent to enter into the agreement.
   (b) There must be consideration (something of value) given to the party making the promises by the party receiving the promises.
   (c) There must be mutuality of agreement and mutuality of obligation.
   (d) An end date within 90 days of the start date must be explicitly stated in the contract.

4. An institution may be required to submit a “subcontracting plan” if the federal contract proposal reaches what threshold?
   (a) $500,000
   (b) $300,000
(c) $1,000,000
(d) A subcontracting plan is always required regardless of contract’s dollar amount.

5. **All of the following are true with respect to the Federal Acquisition Regulations EXCEPT:**
   (a) Each chapter of the FAR is divided into “parts.”
   (b) It represents the policy and procedure manual for federal contract officers on how to construct a federal contract.
   (c) The titles of each part are not consistent across all chapters.
   (d) Each part of a chapter addresses a particular procurement topic (termination, intellectual property, inspection, property management, etc.).

6. **Submitting exceptions to proposed contract terms along with a contract proposal often is considered**
   (a) A breach of business ethics
   (b) A breach of faith
   (c) An overly burdensome delaying tactic
   (d) Part of the normal contracting process

7. **What types of contracts are based on expenditures, where the contractor typically submits invoices for payment?**
   (a) Fixed-price contracts
   (b) Sole-source contracts
   (c) Cost-reimbursable contracts
   (d) None of the above

8. **Expanded authorities that provide certain flexibility to award terms**
   (a) Apply only with respect to NSF contracts
   (b) Apply only with respect to Department of Defense contracts
   (c) Do not apply to federal contracts
   (d) Apply only with respect to NIH contracts
1. What is the difference between a "grant" and a "contract"? How can you determine under which type of agreement you are operating?

2. What does it mean to "negotiate" a contract? What types or provisions are usually "negotiable" in contracts entered into by your institution? What types of provisions are generally non-negotiable?

3. If an institution objects to a specific term or condition under a federal contract, does any recourse exist for obtaining a modification or elimination of that term or condition or should an institution just "walk away"?

4. What internal system(s) exists at your institution for tracking and monitoring contracts and subcontracts? Are these effective in your opinion?

5. What does it mean for a contract to "go bad"? What procedures are in place at your institution to (1) forestall this from happening, and (2) react if it can't be avoided?

6. Why is it critical that the PI be properly informed about the specifics of a contract throughout its conduct? How can this be done most effectively at your institution?

7. What are your record retention policies for contract-related documents? How are the policies derived? How are they communicated to staff responsible for compliance with the policies? Does the policy address both electronic and paper records?

8. There are new requirements coming into effect relating to the creation of a contractor integrity and performance database. Are you familiar with these requirements? Do they apply to your institution? In general, how do you stay up-to-date on new requirements affecting federal contractors?

9. How does your institution protect against conflict of interest in its contracting practices? Who is in charge of ensuring that no conflicts exist?

10. Do you look for different skill set when hiring a person to perform contract negotiations and oversight versus grants administration? If yes, how do each set of skills differ?

11. Who oversees creation and execute of a material transfer agreement that may be necessary under a contract or subcontract at your institution?
2790.3 Answer Key

Following are the correct answers to the questions included at ¶2790.1.

1. (a) Acquiring goods and services for the direct benefit of or use by the U.S. government
2. (c) Application
3. (d) An end date within 90 days of the start date must be explicitly stated in the contract.
4. (a) $500,000
5. (c) The titles of each part are not consistent across all chapters.
6. (d) Part of the normal contracting process
7. (c) Cost-reimbursable contracts
8. (c) Do not apply to federal contracts

Introduction

John M. Carfora, Ed.D.
Associate Provost for Research Advancement & Compliance
Loyola Marymount University

This chapter, written by James Casey, JD, is an update of the prior version authored by Kathleen Irwin, JD. Here, Mr. Casey adds his own unique stamp to legal considerations in the area of sponsored research.

A central theme Casey brings out in this chapter is that lawyers provide advice and counsel to sponsored research professionals, leaving the business decisions that support research (or not) to be made by sponsored research professionals and/or university leadership. In a very clear way, then, university attorneys are a support unit to research administration professionals and university leadership. As Casey correctly says in his introduction: *there are attorneys that find reasons to say “yes,” and then there are attorneys that find reasons to say “no.”* An accomplished research administrator himself, Casey falls into the former category. This framework finds expression in part of the chapter’s title: *facilitating sponsored research,* which in turn reflects an important viewpoint in the current climate of highly competitive funding streams, populated in large part by colleges, universities and other entities (non-profit and profit in nature).

Completely new additions to this chapter are the sections on the Uniform Guidance (UG) and international research administration. The former is of relatively recent origin, taking effect on December 26, 2014, while the latter has been growing precipitously over the past decade. While the UG is still being implemented at a number of universities and certain aspects of it are still in the process of being clarified by the Office of Management and Budget in collaboration with the higher education community, the international domain provides a truly exciting cross-cultural context for international research collaboration and management to effectively move forward in that realm.

In sum, the purposefulness of this chapter is to introduce the reader to the context of legal considerations and how the latter fits into the world of sponsored research. Indeed, the sponsored research professional will find this chapter to be of great value in better understanding how much of our work encompasses critical legal dimensions. While the field of research administration will change, as it always has, in the coming years, it is important to remember that the law is often “more measured” within the framework of continuity and change. Thus, while research administration will no doubt further evolve with time, the common law basis for much of American jurisprudence – which finds its way into the statutes and regulations impacting research and research administration – will not rapidly change any time soon. For the research administrator, this means they will need to continue to meaningfully navigate two interconnected fields; most definitely, where law and research administration intersect.

This chapter will respond to changes in the legal environment of research administration and the information needs of research managers over time through the addition of new material.
At its very essence, the world of sponsored research has a direct and integral connection with the law and legal documents. The sponsored research ecosystem is supported by legal documents of one form or another. These legal documents may be called grants, contracts, cooperative agreements, sponsored research agreements, other transactions, or whatever the sponsor wishes to call them (though one should always look at the substance of the agreement rather than just the title to ascertain its exact nature). As long as the document conforms to certain formalities, those agreements are legal documents that confer upon the parties to the document obligations and responsibilities.

As an attorney and research administrator for over twenty years, I often like to say that there are two types of attorneys in the sponsored research world: those that find a reason to say “yes” and those that find a reason to say “no.” While I am certainly in agreement that all laws, rules, and regulations, etc., need to be followed, I am also one of those attorneys & research administrators who find a reason to say “yes” as much as possible. For instance, in the area of approving grant applications for submission to external sponsors, it has been extremely rare (less than a dozen times) over 20 years that I’ve said no to a proposal – and when I’ve said no, it is always in consultation and concurrence with other university leaders.

Attorneys in higher education should facilitate as much as possible. And, it is important to note, that universities have different comfort levels with risk and how to mitigate or eliminate such risk. Being overly conservative in terms of eliminating all sponsored research risk – which I think is impossible in many cases except in not pursuing sponsored research – will serve as a disincentive to grow sponsored research at many institutions. That has significant academic implications.

Certain types of legal activities must be conducted under the direction of an attorney licensed to practice law in the jurisdiction; for example, representing a client in a court of law. However, even though sponsored research agreements are legal documents, one doesn’t have to be an attorney to write one, to negotiate one, or to sign one. If you are an attorney by training but your university role is serving as a research administrator, be careful to not give the wrong impression by holding yourself out as a university attorney.

What use are attorneys in the sponsored research world? Why would a research administrator want to let an attorney in on the process? And, if the decision is made to let one become involved, what is his or her role?

This chapter attempts to answer these questions and looks at the ways legal counsel is provided to institutions. It discusses types of laws relating to sponsored
research and examines specific legal constraints that impact a sponsored research agreement. The chapter identifies various types of legal considerations and explains their significance to sponsored research activity, and addresses the new Uniform Guidance and gives due attention to the important area of international research management. Discussing the differences and interplay between federal grants and contracts and industrial funding of research rounds out the chapter. These areas are very complex, so what you will read here is a broad context of these different areas.

By considering these discrete legal dimensions and providing a broader context of the law for sponsored research professionals, it is hoped that all sponsored research professionals will have a better understanding of how attorneys can serve in a variety of roles in the sponsored research ecosystem.

**2905.1 Common Models for Providing Legal Counsel to Institutions**

Any research administrator who needs to interact with legal counsel needs to know whether the institution has in-house counsel and what the protocol is for engaging said counsel. It is also important to know whether or not university counsel has a level of expertise in laws relating to sponsored research or if the research administrator should be prepared to “catch ‘em young and raise ‘em right.”

**In-House Versus Outside Counsel**

Until more recently, most universities retained outside counsel from local or national law firms to provide advice when legal issues arose. In the past several decades, as institutions of higher education have become more complex, large universities now employ one or more attorneys full time as so-called “in-house” attorneys or counsel.

An advantage to using in-house counsel is that the attorney becomes familiar with the culture and organization of the particular institution and can interact with the appropriate decision makers to identify the best position for the university in a particular situation. A disadvantage of in-house counsel is that the legal issues arising at universities are increasingly complex and specialized. Many institutions respond to this challenge by either employing attorneys who specialize in certain major areas — such as intellectual property, tax, purchasing, export controls, and environmental matters — or by maintaining a relationship with a large private firm that can advise in-house counsel in specialized areas.

**Open-Door Versus Closed-Door Policy**

In general, use of outside counsel requires authorization from someone within the institution. With in-house counsel (often called “general counsel, associate general counsel, or assistant general counsel,” and the “Office of General Counsel”), the office may be either a so-called closed-door or open-door operation. Having an open-door policy means that anyone within the institution may contact legal counsel seeking advice about an institutional matter. Only certain individuals within an organization may contact or authorize contact with legal counsel in a closed-door system. The advantage to an open-door office is that generally legal issues come to
the attention of counsel before they become critical. The disadvantage is that legal
counsel must be able to identify matters that are not institutional issues and gently
reject matters that are not truly legal issues or may not be of sufficient importance to
merit the commitment of a relatively scarce resource — legal firepower.

**Sponsored Research Issues**

Until the 1990s, there were few university counsel who specialized in sponsored
research issues, so it was often difficult for the sponsored research administrator to
benefit from legal advice. This, in part, was because the “law” relating to sponsored
research was not something with which most attorneys were familiar. The basis of
the law was scattered among a variety of statutes, regulations, agency documents,
and institutional policies, and, frankly, scared many attorneys to death. There was
no one treatise or hornbook that would teach attorneys everything they needed to
know to competently practice in the area.

Further, in the past, the legal office and institution may not have recognized the
benefit of asking an attorney to invest the substantial time necessary to specialize in
sponsored research issues. That has changed as major research institutions began to
recognize that sponsored research is a major area of potential liability. Attorneys be-
gan to realize that sponsored research is an interesting practice area with challeng-
ing issues, and especially as skilled research administrators were willing to invest
the time to help demystify the area for legal counsel. While the law remains scat-
tered, the combination of a recognition that the research enterprise is a major com-
ponent of the business of many institutions and the willingness of research adminis-
trators to educate legal counsel is beginning to yield a growing number of attorneys
who consider themselves knowledgeable in the area of sponsored research, if not
experts.

For those attorneys fortunate enough to have made this leap, the rewards are
great:
◆ The opportunity to interact with the sponsored research staff in educational
activities.
◆ Appreciate the nuances of the law and institutional policies.
◆ The opportunity to engage with staff in complex negotiations.
◆ The opportunity to participate in policy and process development to make the
sponsored research enterprise better and more vibrant.

These interactions lead to better agreements, more skillful negotiators, and less
adversarial activity. When the process breaks down and leads to legal action, wheth-
er in court or with a funding agency, the attorney can repay the sponsored research
staff by providing a calm and steady hand in the matter.

**12905.2 Overview of the Law of Sponsored Research**

The “law” of sponsored research is a combination of constitutional law, statutes and
regulations, case law, guidance documents, and industry practice. For example, copy-
rights and patents — both important to sponsored research activity — have their foundation in the U.S. Constitution. Many of the laws discussed in this chapter, such as the Bayh-Dole Act, are found in federal statutes and implementing federal regulations. In the area of intellectual property (IP), the more recent America Invents Act informs that specialized area. Case law, law created by courts interpreting cases/controversies, statutes, and documents, is the main source of contract law. Many federal funding agencies have issued voluminous guidance documents and policy manuals relating to sponsored research, and, of course, every institution has its own policies and guidance that often reflect the general practice of the higher education community.

Sources of ‘Law’

The U.S. Constitution, statutes, regulations, and case law create legal rights and obligations. These form a hierarchy of law, with the Constitution prevailing over a statute, which in turn prevails over a regulation. In fact, regulations are often required by the enabling (original) statute in order to provide additional guidance. Case law is law that is developed through the courts either to provide interpretation of the constitution, a statute, or a regulation or to govern relationships that are not addressed by those more formal documents. Case law is also known as common law, where the doctrine of precedent (also known as stare decisis) is paramount. For example, most law relating to clauses in sponsored research agreements arises from the common law.

Industry practice, in this case the normal presumptions that are common to higher education, may serve to provide guidance in interpreting a contract in the absence of other more formal legal documents but are not necessarily legally binding on a court.

Federal guidance documents, as discussed below, may or may not take on a legal aura (see section 2905.8). If the guidance document is couched in such a manner that it becomes a term and condition of the agreement, then it has binding legal significance. Examples of these would be the Uniform Guidance (OMB) and the NIH Grants Policy Statement. Other such documents may function more to define industry practice. Institutional policies may be useful in defining industry practice or may have significance only within the institution.

Key Requirements

There are specific requirements that have a substantial impact on the research enterprise. Some, though not all, of these areas are covered in the sections to follow. Given that this chapter gives the broad context of legal considerations of sponsored research, the reader is invited to seek out information for those sections not covered below:

◆ Funding mechanism
◆ Ownership of federally funded inventions
◆ Facilities financed with tax-exempt bonds
◆ Unrelated business income
Export controls
Federal contracting regulations
Grants administration circulars
Agency-specific grants policy manuals and guidance documents
Institutional policies
Issues in the global and industry sponsored research realms

12905.3 Laws Governing Types of Federal Funding Agreements

The primary statute governing what funding mechanism is used by a federal agency is the Federal Grant and Cooperative Agreement Act.1 The provisions of this law apply to most federal procurement contracts, grants, and cooperative agreements including those with universities.

Major Types of Agreements

The purpose of the act is to make the selection of the type of funding agreement uniform across agencies. An agency’s decision regarding the type of funding agreement used may be appealed, but opinions from the Comptroller General, the office that would hear such an appeal, indicate that the agency’s decision will not be questioned lightly. Nonetheless, it is sometimes possible to negotiate the mechanism with a contracting officer who is attempting to use a contract when the scope of work is more consistent with a grant — especially if the work was begun under a grant and there is nothing to support the decision to change to a procurement contract. Thus it is useful to know what the primary determinants are for use of the three major types of funding agreements:

Procurement contract: A procurement contract is used when the purpose is to acquire property or services for the direct benefit or use of the government. However, the law provides that it is also appropriate to use a procurement contract when the agency decides that its use is appropriate in a specific instance. The decision to use a procurement contract even when the purpose is not to acquire property or services may be driven by the funding source available or may be a personal preference of the federal officer in charge of the contract.

Grant agreement: A grant is appropriate when the purpose is to support or stimulate the carrying out of a public purpose, is not to acquire property or services for the direct benefit or use of the government, and there will not be substantial involvement between the recipient and the federal agency in carrying out the activity. Because the terms and conditions of a grant are much more flexible than those required for a federal contract, grants are the preferred type of award for university research.

1 Federal Grant and Cooperative Agreement Act, 31 USC 6301. In addition, specific agencies have explicit authority to enter into grants and cooperative agreements. See, for example, 15 USC 1540, “Cooperative Agreements” (Department of Commerce). The U.S Code is available online at www.law.cornell.edu/uscode.
Cooperative agreement: The research activity under a cooperative agreement is similar to that of a grant, but with a cooperative agreement there is substantial involvement between the recipient and the federal agency. The National Institutes of Health (NIH) defines cooperative agreements to be: “A support mechanism that will have substantial Federal scientific and/or programmatic involvement. Substantial programmatic involvement means that after award, scientific or program staff will assist, guide, coordinate, or participate in programmatic activities beyond the normal stewardship responsibility in the administration of grants .......”

Other Funding Agreements, Programs

Although the vast majority of funding agreements between the federal government and colleges and universities are grants, contracts, and cooperative agreements, other funding mechanisms are used.

Cooperative Research and Development Agreements (CRADAs)

Increasing interest in the use of CRADAs was, in part, a reaction to the end of the Cold War and government concerns over the fate of the national laboratories. A CRADA is an agreement between a federal laboratory and a nonfederal partner, which may be an educational institution. Los Alamos and Sandia are examples of federal (national) laboratories. The laboratories may be either federally operated or may be government owned and contractor operated, known as GOCOs. The collaborating, nonfederal partner agrees to provide funds, personnel, services, facilities, equipment, or other resources needed to conduct a specific research or development effort, while the federal government agrees to provide similar in-kind resources but not funds. While historically CRADAs didn’t provide federal funds to partner institutions, more recently the author has seen some instances where the Federal Government provided funds to cover costs at the partner institution.

The government may agree to protect any proprietary information brought to the CRADA effort by the other partner, and, if the government partner so chooses, allow the government and the collaborating partner to share patents and patent licenses or may permit one partner to retain exclusive rights to a patent or patent license.

Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) programs

University research may also be funded under the SBIR or STTR programs. These programs set aside a certain amount of the budget of several agencies for research to strengthen the role of small business and increase the commercial application of innovations derived from federally funded research. A primary difference between

---

2 15 USC 3710a, “Cooperative Research and Development Agreements.”
3 Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) programs were established at 15 USC 631. See www.sba.gov/sbir/indexsbir-sttr.html. In addition, participating agencies may have applicable regulations.
the programs is that under the STTR program, researchers at universities or other research institutions must play a significant intellectual role in the conduct of the research. Not less than 40 percent of the work conducted under an STTR award must be performed by the small business concern, and not less than 30 percent of the work must be performed by the nonprofit research institution. For SBIR grants, university participation is not required and tends to be in a consulting or subcontracting role. SBIR and STTR grants may create some interesting situations for universities. Both are common methods of support for faculty start-ups.

Often, under one of the programs, the faculty start-up company wants to contract further research work to the faculty’s laboratory at the institution — leading to a conflict of interest that the institution must address. Research administrators should note, however, that SBIR and STTR grants are specifically excluded from the federal provision governing faculty and staff disclosures of outside interest. In addition, both programs are intended to encourage commercial development of the products of federally sponsored research by the small business. This often leads to the mistaken assumption that any inventions by university researchers vests in the small business. This is incorrect; the provisions of Bayh-Dole apply to the awards and the university has the first right to take title to any invention by its faculty or staff (See discussion of Bayh-Dole in section 2905.4.). Another interesting wrinkle is this: At the STTR Phase I stage, an IP sharing agreement must be agreed to between the parties by the time the project starts.

As some small businesses are often beginners in the SBIR/STTR world, it is important to make sure that the small business understands the IP dimensions of these programs and is given an opportunity to have access to any such invention. For universities working with small businesses, it is critically important to have substantive discussions on IP, programmatic, and ancillary issues at the proposal submission stage. More discussion up front should lead to less work and problems on the back end.

**Transactions Other than Contracts and Grants**

Certain agencies, notably the Department of Defense and more recently the Department of Homeland Security, are authorized to enter into “other transactions.” The authority is given explicitly in addition to the authority to enter into contracts, grants, and cooperative agreements. These “other transactions” are relatively rare types of agreements. It is clear, however, that the federal funding sources that have authority to use them take the position that none of the other rules, regulations, and policies that have grown up around contracts, grants, and cooperative agreements apply to “other transactions.” The institution may attempt to negotiate clauses with the funding agency that more closely resemble the clauses typically used, but the agency is not bound to accept those clauses and may walk away. For example, the institution can attempt to negotiate for ownership of inventions, but the agency is not bound by the provisions of the Bayh-Dole Act (discussed below) and may insist on some other disposition of ownership as a condition for making the award.

---

4 10 USC 2371, “Research Projects: Transactions Other than Contracts and Grants.”
¶2905.4 Some Major Federal Statutes and Regulations Governing Sponsored Research

Each of the laws discussed in this section is extremely complex. Failure to conform to the requirements of these laws or other laws in other chapters of this book (such as in the area of export controls), can lead to institutional and individual criminal penalties, civil penalties, and other serious consequences. Research administrators, therefore, should work closely with legal counsel to determine the impact of these laws and their implementing regulations on the types of research conducted on campus.

Ownership of Federally Funded Inventions

The Bayh-Dole Act, regulating ownership of federally funded inventions, initially became law in 1980. The act, arguably one of the most influential pieces of legislation relating to the research enterprise, establishes a uniform policy for all federal agencies for inventions conceived or reduced to practice under grants or contracts to universities and provides that the university has the first right to elect title to such inventions.

By providing certainty regarding ownership of and title to university inventions arising from federal funding, the act was a watershed provision for university technology transfer offices and encouraged significant increases in the amount of industrial sponsorship of scope-of-work research at universities. As used in this discussion, scope-of-work research is that research in which the goals and objectives of a specific research activity are specified as part of the agreement (in contrast to research conducted under a gift or unrestricted contribution wherein the researcher is free to use the money to accomplish research within a general category at the discretion of the researcher). The goals of Bayh-Dole are identified in the act’s statement of purpose as being to

◆ “use the patent system to promote the utilization of inventions arising from federally supported research or development;

◆ promote collaboration between commercial concerns and nonprofit organizations, including universities; and

◆ promote the commercialization and public availability of inventions made in the United States by United States industry and labor.”

The act provides that a university may retain the patent rights to an invention that is conceived or first reduced to practice in the performance of a federally funded contract, research grant, or cooperative agreement, provided (among other things) that the institution

◆ discloses the invention to the funding agency within a reasonable time after it becomes known to the university;

◆ files with the funding agency a written election to take title to the patent within two years of disclosure to the funding agency and prior to the expiration of any statutory patent filing period;

5 35 USC 200. Regulations implementing the Bayh-Dole provisions are at 37 CFR 401.
◆ shares royalties with the inventor; and
◆ devotes any net revenue from the invention to the support of scientific research or education.

Since the majority of institutional research funding is from federal agencies, the provisions of Bayh-Dole may affect what can be provided to an industrial sponsor of research (see section 2905.10). Certain provisions of the act have direct implications for what may be offered to an industrial sponsor of research, as follows:
◆ If the university declines to take title to the subject invention or fails to follow the provisions of the act, the funding agency may elect to take title to the patent or may agree to vest title in the inventor.
◆ The institution may not unilaterally assign its domestic rights to the invention to anyone except an entity that specializes in the management of inventions.
◆ Research projects entirely funded by a nongovernmental sponsor are exempt from Bayh-Dole but if the invention is funded in part by a federal grant, the act applies. Bayh-Dole’s implementing regulations provide, however, that “[t]o the extent that a non-government sponsor established a project which, although closely related, falls outside the planned and committed activities of a government-funded project and does not diminish or distract from the performance of such activities, inventions made in performance of the non-government sponsored project would not be subject to the” act. Mere use of equipment purchased with federal funds is not sufficient to trigger the provisions of the act.

America Invents Act (2012)
As previously mentioned, the Leahy – Smith America Invents Act, effective September 16, 2012, is the most recent major piece of intellectual property legislation in the United States. Much has been written on this statute over the past 3+ years, so there is a plethora of material for the reader of this chapter.

Unrelated Business Income
In general, income received by a nonprofit institution is not subject to income tax unless it is found to be unrelated business income (UBI). The regulations governing UBI apply to all universities regardless of whether or not the institution takes its tax exemption under Section 501 of the IRC or under the provision relating to income

Reminder

The purpose of the Bayh-Dole Act is:
◆ To promote the use of inventions arising from federally supported research
◆ To promote collaboration between commercial concerns and nonprofit institutions
◆ To ensure that inventions are used to promote free competition and enterprise
of states and their agencies. There is a specific exclusion for income from research. The IRS, however, clearly believes that certain activities that a university might term research, are not research. The further down the line from basic research towards applied research a program is, the more likely that an IRS auditor will find that the payment the institution received for performance of the research is UBI and therefore taxable.

Example

As is the case with tax-exempt bonds, the university exemption from income tax is not popular with the IRS due to past abuses of the exemption. For example, an institution once received a gift of a macaroni factory, proceeded to carry on with the business, and was not required to pay taxes on the income it received from selling the macaroni. The IRS didn’t like this, other macaroni manufacturers didn’t like this, and eventually Congress didn’t like this (and passed legislation taxing unrelated business income). One of the most vocal critics of the exemption for income from research is the contract research organizations that argue that university clinical trial work is no different than the services they provide, and yet they have to pay taxes on the income received and universities don’t.

Export Controls

Federal laws regulating the export of goods and services are not new – existing in some form since the 1940s. They are a significant concern for many universities, but especially for major research universities with significant STEM research imprints and international activities (whether academic or research in nature).

Recent events have raised sensitivities relating to the internal security of the United States, proliferation of weapons of mass destruction, and increasing international competition. As a result, enforcement of export control laws has taken on a new vigor. For a full discussion of export controls, see Chapter 3400.

¶2905.5 The Uniform Guidance (2014)

The Uniform Guidance (UG), formally entitled Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, and located at 2 CFR 200, supercedes the three previous OMB Circulars most applicable to institutions of higher education (A-21, A-110, A-133, see Section 2920.3 for a further discussion of these). This is a new grants management architecture that, quite honestly, is anything but “uniform.” The effective date of the UG was December 26, 2014, though clarifications to it started almost as soon as the ink was dry on the legislation and

7 Export Controls and Universities: Information and Case Studies, Council on Governmental Relations, 2003, www.cogr.edu/docs/export%20controls.pdf. This is a very good discussion of the various export control laws and includes case studies and a list of resources, including Web sites, from various universities that have invested substantial effort in analyzing and applying the export control laws to sponsored research.
continues to this day. This is one significant area where research administrators need to be vigilant in terms of changes.

For purposes of this chapter, the following provisions are pointed out to the reader given the contextual – nature of this chapter. These provisions are either: 1) heavily driven by jurisprudence; 2) cover some of the more controversial issues at the present time; or 3) point out more of the architectural or policy nature of the Uniform Guidance. Given that this listing is somewhat arbitrary, the reader is well advised to read the pertinent provisions that impact his or her work as a research administrator.

200.1 Definitions
200.22 Contract

200.501 Audit Requirements

12905.6 Legal Dimensions at the International Level

The legal dimensions of “international” research, research occurring in different
countries, is one of the most fascinating aspects of research administration. The development of jurisprudence across the globe, coupled with a variety of legal agreements between national, bilateral, multilateral and global organizations (like the United Nations), illustrates perfectly on one level the increasing closeness of countries. While some may argue that we are moving to a day where borders will not exist, current legal, political, social, and cultural events indicate that such a day may be much farther in the future than predicted.

Some of the more important dimensions of international research are on the practical, operational side. Areas such as project management, language, taxation, human resources (hiring and letting go, in particular), safety/security, risk management, and local licenses and permits are highly important in ensuring that projects taking place outside your country occur with a minimum of delay and controversy. Large universities with significant international activities, like Harvard University, have the resources to bring all these areas together in a coordinated fashion, but not all schools are in that position. And, as you probably know, some universities, such as Northwestern University, have campuses operating outside the U.S. Those situations bring legal considerations to an even higher level.

The negotiation of international contracts is a wholly separate, and important, topic that is deserving of its own chapter.

While technically not a legal subject, the role of culture in the international context has a significant bearing on how law is conceived, viewed, and implemented in foreign countries. The Government – University – Industry Research Roundtable (GUIRR) – a subunit of the National Academies – convened workshops in 2010 and 2013 to discuss discrete issues in international research (2010) and then focusing on culture specifically and as it applied to specialized areas (2013). While there is much to commend in American or Western jurisprudence, research, democracy, and culture, it is best to show principles of collegiality, collaboration, and humility when dealing with non–American, non–Western partners in forging long–term relationships.

It is often helpful to consider the topics at professional association meetings to gauge what is going on in a particular area. For the purposes of this chapter, it is useful to consider the topics covered at the American Bar Association (ABA) Section of International Law Spring Meeting in New York City on April 12–15, 2016. The list of conference topics that touched upon international research is telling:

◆ Managing Risk Through the Headlines: General Counsel in News Media

◆ Foreign Law Firms: Is there Something to get Excited About?

◆ How to Avoid Suspension and Debarment: A Potent Government Consumer Remedy and Serious Consequences for Corporations and Individuals

◆ Proof of Foreign Law – A Comparison of the Approaches in the U.S. Courts and

8 http://www.nap.edu/catalog/13192/examining-core-elements-of-international-research-collaboration-summary-of-a

9 http://www.nap.edu/catalog/18849/culture-matters-international-research-collaboration-in-a-changing-world-summary
in International Arbitration
◆ Copyright Reform: Continents Collide?!
◆ Agreed, Vereinbart, Acuerdo – Cross Cultural Negotiation
◆ Future Forward: Change, Transformation, and the Mid-Career Lawyer
◆ Public – Private Partnerships in Infrastructure Projects
◆ The Practice of Foreign Law in the U.S.: Opportunities and Challenges
◆ What Does IP Have to do with Investor State Arbitration?

As the reader can see from this listing, legal considerations become more complex when the overlay of the international dimension is introduced. Skills of collaboration and collegiality are as important, if not more important, when it comes to international – as opposed to domestic – research projects. This also illustrates the point that interpersonal skills are just as important as technical skills in research administration.

¶2905.7 Federal Contract and Grants Administration Requirements

There are a variety of other requirements that are applicable to federally sponsored research. Some are applicable to specific types of agreements and some are agency specific. Some are easy to read and follow; some are so complex they produce severe headaches. Key requirements are discussed below.

Federal Acquisition Regulation

Reading the Federal Acquisition Regulation (the FAR) produces extremely severe, though not permanent, headaches. Since 1984 the FAR applies to all procurement contracts entered into by federal agencies, but it is not applicable to grants, cooperative agreements, or CRADAs. The FAR applicable to all federal agencies is issued jointly by the Government Accountability Office (GAO), the Department of Defense (DoD), and the National Aeronautics and Space Administration (NASA). Federal agencies are authorized to promulgate agency-specific acquisition regulations to “implement or supplement the FAR.”

Supplementary material is issued when there is no counterpart in the FAR sufficient for the “specific needs of the agency.” For a full discussion of the FAR, see Chapter 2700.

¶2905.8 Federal Grant Policy Manuals and Guidance Documents

While not considered “law” to the same extent as statutes and administrative regulations issued in the Code of Federal Regulations (CFR), federal granting agencies have the ability to issue policies of general applicability. These include the equivalent of grant “terms and conditions.” If, for example, a research administrator has a question about rights in data produced under a federal grant, the most likely place to find the answer is in the grant policy of that funding agency. Similarly, federal granting agencies may issue guidance documents that are meant to serve as additional
information and counsel to the awardee/university community.

This section is meant as a brief introduction to the area of policy and guidance by illustrating several examples. The reader is encouraged to seek out specific federal agency policy and guidance, whether that is in the CFR and/or in specific agency publications.

**Grant Policy Manuals**

Policy manuals may constitute terms and conditions of grants. For example, the *NIH Grants Policy Statement* (NIHGPS), revised November 2015, specifically provides that it “is intended to make available to NIH recipients, in a single document, the policy requirements that serve as the terms and conditions of NIH grant awards.” Other manuals, such as the *NSF Proposal & Award Policies & Procedures Guide* (PAPPG, effective January 25, 2016), do not provide that specificity (NSF Grant General Conditions are the other component), but at the least serve as an authoritative statement of the agency’s overall positions and requirements.

**Guidance Documents**

Agencies produce documents that cover specific issues and such documents provide a great deal of information and guidance to the research community. While it is unclear as to the legal status of some of the guides, it is clear that the agencies use them as a bully pulpit, and an institution that routinely ignores the guidance puts its relationship with the agency in peril. In some situations, the guidance is a requirement for agency support and in those cases, the guidance document clearly applies.

The NIH is particularly fond of guidance documents and it is worthwhile noting several, as they provide good insights regarding agreements with other sponsors of research or providers of research materials.

◆ “Principles and Guidelines for Recipients of NIH Research Grants and Contracts on Obtaining and Disseminating Biomedical Research Resources: Final Notice”:12

The guidelines provide recipients of NIH funding with guidance concerning appropriate terms for disseminating and acquiring “unique research resources” developed with federal funds. The term unique research resource is “used in its broadest sense to embrace the full range of tools that scientists use in the laboratory, including cell lines, monoclonal antibodies, reagents, animal models, growth factors, combinatorial chemistry and DNA libraries, clones and cloning tools (such as polymerase chain reaction or PCR, a tool for making copies of a gene to allow analysis), methods, laboratory equipment, and machines. The terms “research tools” and “materials” are used throughout this document interchangeably with “unique research resources.” Databases and materials subject to copyright, such as software, are also research tools in many contexts. Although the information provided here may be applicable to such resources, the NIH recognizes that databases and software “present unique questions that cannot be fully explored in this document.”

---

This area ties into the ancillary discussion of Material Transfer Agreements (MTA) and letter agreements under the Uniform Biological Material Transfer Agreement (UBMTA) regime. This area implicates issues of safe transmission of biological materials, nondisclosure agreements, and intellectual property, and the research administrator working in this realm is well advised to thoroughly consider these dimensions.

◆ “Developing Sponsored Research Agreements: Considerations for Recipients of NIH Research Grants and Contracts”\(^{13}\) As is often the case, this guide was issued as an agency response to congressional concern over a particular agreement between an industry and a research institution that in return for funding gave the industry a first opportunity to license much of the intellectual property generated at the institution. The guide’s purpose is to provide institutions with issues and points to consider in developing sponsored research agreements with industry to ensure consistency with Bayh-Dole and principles of academic freedom.

The “Issues” are identified as follows:

◆ Maintenance of academic freedom
◆ Preserving fair access to information
◆ Assuring timeliness of compliance with the various requirements of Bayh-Dole
◆ “Rational” licensing
◆ Adherence to requirements of Bayh-Dole & requirements of the NIH grant

Within the document’s “Universal Points” discussion, several provisions are worth highlighting. The description of the importance and scope of academic freedom is brief, but well stated. It is helpful in trying to explain the issues to industry. Further it addresses not only publication but also indicates that academic freedom encompasses the right to select the research that will be carried out.

In the “Dissemination of Research Results” section of the document, the NIH recognizes that a delay of publication for up to thirty days is reasonable. (It is interesting to note that in the previously discussed document regarding research tools, the amount of delay that is considered reasonable is greater: 30–60 days.)

Under “Utilization,” the document indicates that granting an exclusive license is not appropriate; an option to pursue licensing rights is much more favored, and “once a sponsor decides not to exercise its option, it should not be given a second opportunity....”

The “Points for Special Consideration” include several interesting provisions as follows:

◆ Heightened scrutiny is required for certain types of agreements identified as those: (1) providing $5 million or more per year or $50 million total over the funding period; (2) where sponsor’s funding exceeds 20 percent of the institution’s research funding; (3) where sponsor’s licensing rights cover all technology by a major group or component; and (4) where the agreement term is

An agreement is suspect if the licensing grant to the sponsor effectively excludes reasonable access to the institution’s technology by others.

Contributions to general operations, rather than to specifically defined research, in return for access rights to technology should be carefully examined.

NIAID/Division of Microbiology and Infectious Diseases (DMID) Data Sharing and Release Guidelines.14

### Institutional Policies

Institutional policies are an important part of the legal framework for sponsored research agreements. The policies often reflect “industry practice,” which in contract law occasionally is used to help frame the intent of the parties. While policies vary among institutions, the most common consistent policies involve rights of publication and treatment of confidential research. Policies become the “law” of the particular institutions and so it is important that they be constructed with great precision and clarity. Often legal counsel is well versed in this type of writing. Additionally, it is important to assure that policies are carefully thought out so that they do indeed reflect the position of the institution. A policy that continually requires ad hoc exceptions may be worse than no policy at all.

#### Publication and Confidentiality

One common area of disagreement between institutions and sponsors is over publication of the results of the research. In general, most institutions will offer the sponsors an opportunity to review material prior to its publication, but will not give the sponsor approval rights. This policy is underpinned by a variety of considerations. Publication is an inherent part of a university’s mission. Distilled to its essence, the mission of an institution of higher education is to create, integrate, transfer, and apply knowledge. Research is one of the primary vehicles for creation of knowledge and publication of the research results is one of the primary vehicles for transfer and application of knowledge (see example below).

#### Example

The University of Wisconsin-Madison (UW), along with many other institutions, has recognized that generally the missions and goals of the sponsor can be served without deviating from the institutional mission. As such, a UW policy states: “The research should have promise of advancing knowledge .... Industrially sponsored research ... must be designed so as to maintain a balance between the UW’s pursuit of research as an integral part of the education process and industry’s search for useful knowledge to be applied toward the development of products, processes and services.”

As discussed earlier, a finding that an activity generates unrelated business

14 [http://www.niaid.nih.gov/LabsAndResources/resources/dmid/Pages/data.aspx](http://www.niaid.nih.gov/LabsAndResources/resources/dmid/Pages/data.aspx)
income (UBI) subjects the proceeds of that activity to an unrelated business income tax, and, for institutions that take their tax exemption under Section 501 of the Internal Revenue Code, excess amounts of UBI may put an institution’s tax-exempt status in jeopardy. There is a specific exclusion for research. Since one of the criteria for exempting research is that it serves the public good, one of the indications that something is research and therefore exempt is that it is freely publishable.

Publication is the coin of the realm for academics and one of the ways in which academic freedom — the right of faculty to publish what and where they choose — is protected. Several cases in which faculty found themselves battling a corporate research sponsor and alleged that their institutions did nothing to support their right to publish resulted in fairly widespread media attention and a conference co-sponsored by the American Association for the Advancement of Science on “Secrecy in Science.” In certain of the cases, the research agreement conferred the right of approval of publication on the sponsor and in at least one case, the faculty member had entered into the agreement without institutional review. Regardless, the failure of the institution to support the right to publish became a much discussed issue and generated some unfavorable press and tension between institutions and their faculty.

A good discussion of the application of academic freedom to the rights of faculty in research results is found in *Dow Chemical v. Allen*. In the Dow case, the company sought and obtained an administrative subpoena requiring every scrap of paper relating to the ongoing animal toxicity research of two University of Wisconsin researchers. The appellate court affirmed the district court’s refusal to enforce the subpoena. The court found that academic freedom interests “may properly figure into the legal calculation of whether forced disclosure would be reasonable.”

On occasion and with increasing frequency, a federal or state agency will include a provision in a funding agreement providing that no publication may occur without the agency’s permission. If an institution is faced with a federal agency taking this position, OSP personnel might want to review *Board of Trustees of the Leland Stanford Junior University v. Sullivan*.

In that case, a grant notice by an NIH institute indicated that the award might contain a confidentiality clause that would require researchers to obtain government approval before publishing or otherwise publicly discussing preliminary research results. The clause would prohibit the issuing of “preliminary invalidated findings” that “could create erroneous conclusions which might threaten public health or safety if acted upon” or that might have “adverse effects on ... the Federal agency.” The government contracting officer would have the ultimate approval powers. A Stanford professor submitted a proposal that included objections to the confidentiality clause.

---

15 *Secrecy in Science: Exploring University, Industry, and Government Relationships*, report of the public colloquium sponsored by the American Association for the Advancement of Science (AAAS) and the Massachusetts Institute of Technology (MIT), Mar. 29, 1999. Information available at www.aaas.org/spp/secracy/AAASMIT.htm.

16 *Dow Chemical v. Allen*, 672 F.2d 1262 (7th Cir. 1982).

iality clause. When Stanford and the government could not agree with respect to the clause, the government withdrew the contract from Stanford and awarded it elsewhere. Stanford sued the agency. The court held that because of the vagueness and breadth of the confidentiality clause’s scope — e.g., “could create erroneous conclusions” that “might threaten public health” — the clause was an unconstitutional prior restraint on speech.

Keeping the results of research confidential also raises similar concerns as well as negates the fundamental research exemption under the export laws. While most institutions will agree to keep information provided by the sponsor confidential within certain parameters, they would not extend this agreement to the results of research unless they have decided to engage in classified-typed research. (See Chapter 1900 for additional discussion of this topic.)

Policy Maintenance

Good institutional policies are those that are carefully considered and written to protect the core mission and principles of the institution. Good policies do not create arbitrary barriers to research, and the institution usually does not waive them at the first sign of trouble. They are not easy to create, and they must be maintained vigilantly. Some general observations about institutional policies are as follows:

◆ The policy to protect the university and its values must be an institutional commitment, not solely the responsibility of one individual or office. All the decision makers of an institution must embrace and uphold the core academic standards related to research.

◆ Research opportunities — whether sponsored by the government or by industry — should not be considered on a case-by-case basis. Instead, a road map should be prepared. The institution should consider its mission and vision to identify principle and guidelines for its research activity and carefully vet them for appropriateness. For example, will the institution accept research that bans participation by certain nationalities? Will it accept any oversight of its right to publish?

◆ Faculty should be involved in creating the road map. After all, it’s their livelihood that is impacted.

◆ Opportunities for university groups to discuss and establish parameters should be provided.

◆ Upholding the core institutional mission should be viewed as a necessary part of encouraging continued strong public support of university research.

◆ Policies should be firmly grounded in advancing the institution’s mission. OSP staff should understand the relationship between the mission and the policy and be able to explain it to outsiders (or even in-house faculty).

◆ Policies should be re-evaluated, not on a case-by-case basis, but on an as-needed basis when situations occur that indicate a policy can be changed without compromising the mission.
◆ OSPs should be careful not to allow institutional policies to change incrementally and without specific intentions to do so.

\[\textbf{2905.10 Industry Sponsorship of Research}\]

Since the late 1980s, the amount of scope-of-work research sponsored by industry has increased dramatically. This increase is due to a variety of reasons, including
◆ the enactment of the Bayh-Dole Act that assured the ability of universities to retain title to inventions funded in whole or in part by federal funds,
◆ the decrease in industrial spending on internal research, and
◆ to a certain degree, the increasing industrial competition from industries outside the United States.

Evaluating and negotiating agreements with industrial sponsors is a challenging, yet rewarding, activity for the research administrator and university counsel. In part this is because educational institutions and industry have differing goals and missions. Additionally, working with industry research agreements requires not only application of contract law principles, but in-depth knowledge of a myriad of diverse rules and regulations, including those discussed earlier that impose certain requirements on research agreements.

Collaboration with industry is a good thing. It brings a real-world perspective to the university. It creates opportunities for students — both while enrolled at institutions and after graduation. It provides direct translation of university research for the good of the public. However, the culture and mission of universities and industries are quite different and the challenge is to locate the areas where the interests are consistent or recognize those situations when there is no area of consistent interest. (See also discussion of industry sponsored research in Chapter 1900.)

The major areas of concern in industry-sponsored agreements are
◆ control of intellectual property,
◆ publication rights,
◆ freedom to research,
◆ confidentiality of results,
◆ ownership of data, and
◆ involvement of students.

In most cases, the ability of a university to collaborate is bounded by the laws discussed above as well as the policies of the institution. At a minimum, the “rules” for the collaboration must comply with the requirements of the various laws and preserve the freedom of the faculty and students to select research areas of interest, publish, and conduct future research.

\textbf{Control of Intellectual Property}

The primary area of contention between universities and industry is usually
over control of intellectual property. The following are points to consider based on the general rules of collaboration discussed above. OSP staff should

◆ be sure to locate and understand the institution’s policies regarding ownership of intellectual property;

◆ understand the funding profile of the research;

◆ be particularly concerned about material transfer agreements (MTAs); and

◆ resist the temptation (or the entreaties/threats of the researcher) to provide ownership of the intellectual property to the industrial sponsor.

Institution’s IP Policies
OSP personnel should be sure to locate and understand the institution’s policies regarding ownership of intellectual property (IP). It is considered very bad form to transfer intellectual property, whether by assignment or by license, when one doesn’t own it.

Research Funding Profile
It is important that OSP staff understand the funding profile of the research. Much research today requires substantial resources for facilities, equipment, supplies, and personnel. A common practice of using funds from more than one source in support of a given research activity, unless carefully evaluated and continuously monitored, may create conflicting positions regarding intellectual property rights among the various sponsors. In any agreement with an extramural research sponsor, the institution must consider the existing contractual obligations of the institution and/or the researcher(s). This is especially important where the agreement under negotiation is for research whose purpose is the same or similar to research conducted using personnel or resources that are funded, however minimally, by another sponsor. Obligations under existing federal or other extramural sponsorship agreements must be identified and reconciled with the agreement under negotiation. Failure to reconcile potentially conflicting claims to ownership of intellectual property may result in a lawsuit for breach of contract against the institution and damage the professional reputation and credibility of the researcher.

Rights to Inventions
When the same or similar research is supported with federal funds, however small the amount, it is better practice to assure that the nonfederal sponsor receives only such rights to an invention as is consistent with the Bayh-Dole Act. For example, providing an industrial sponsor an option to a license to any invention conceived or reduced to practice during the research and patented by the institution would be consistent with Bayh-Dole.

MTA Considerations
Research administrators should be particularly concerned about a material transfer agreement (MTA). Companies generally require that researchers and/or the institu-
tion enter into an MTA when they receive biological or other research materials from the company. Problems can arise when an MTA provides for a grant back to the company of a license or even ownership of new materials or inventions made by the researcher.

Just as with sponsored research agreements, it is essential that the institution and the researcher carefully examine all commitments made in the MTA in light of past and future obligations relating to funding. If materials received from one company and covered by an MTA are to be used in research funded under a grant from another company, access rights to inventions must not conflict.

If an invention covered by an MTA was supported with federal funding and the institution declines to take title, the federal funding agency has the opportunity to take title to inventions declined by the institution. If title to an invention were taken by a federal funding agency, the agency would not be bound by the terms of an MTA. Therefore, the researcher and institution must take care not to make promises in an MTA that the federal funding agency may not be willing to honor.

Ownership of IP

Research administrators should resist the temptation (or the entreaties/threats of the researcher) to provide ownership of the IP to the industrial sponsor. If there is more than one funding source within the research laboratory, the activity would need to be evaluated for the potential for commingling of funding. If the potential for commingling exists, especially if one source of funds is federal, the only sure way to allow transfer of ownership to the industrial sponsor is to take steps to assure that funding and other resources are carefully separated — sometimes referred to as “building a wall.”

In considering whether or not to build a wall, the institution should bear in mind the following:

◆ It is hard to build a wall to prevent commingling and it is resource intensive to maintain the wall.

◆ Conducting research behind a wall is not the most efficient way to do research. Much research benefits from the free exchange of ideas and equipment and shared personnel.

    Even if it appears that there will be no commingling of funding sources, transferring ownership to a sponsor is just not good practice for a variety of reasons including the following:

◆ Sometimes an invention is based on work performed under several different projects. Further, even if the determination has been made that there is no commingling of funds, the institution neither can, nor should, prevent commingling of ideas.

◆ Once the institution has given away ownership, it is unlikely to get it back. The researcher may find that he or she has nothing left to interest prospective sponsors and, in a worst-case scenario, the researcher might be prevented from continuing in that area of research.
Issues Involving Clinical Trials

Clinical trials sponsored by pharmaceutical companies may require a different analysis. Generally, with clinical trials, the scope of work (the protocol) is highly defined and quite different from other research projects, the budget for the trial is usually full cost recovery, any invention that arises is unlikely to have a blocking effect on the researcher’s ongoing work, and it’s almost impossible to negotiate significant changes.

Transfers of Copyright

It is less dangerous to transfer ownership of specified works of authorship, i.e., copyrightable works. However, the type of work and the potential impact must be carefully evaluated. Transferring ownership of the copyright to the written report prepared at the conclusion of the project may be acceptable, especially if a right to use is reserved for the researcher and institution. Computer software takes special evaluation as it is copyrightable, but may also be patentable and therefore, subject to the provisions of Bayh-Dole. A good rule is to transfer the right to use, but not ownership of the software.

12905.11 The Role of University Counsel

As with many matters within the sponsored research enterprise, OSP staff needs to understand the institution’s policies and decision-making model regarding the roles and responsibilities of legal counsel. Is counsel’s role to serve as watch dog over all institutional risk, or is it to advise those who are making those determinations? What if a truly legal question arises? Who has the authority to weigh the matters and chart the institutional course?

The answers to these questions may vary from institution to institution and may even vary from issue to issue. The following discussion is simply the author’s perspective of a good role for counsel — let’s call it “Law in a Box.”

Generally, a law inscribes the boundaries of a box. An organization can wander all around in that box and still be “legal,” i.e., within the law. However, given the nature of the organization, it might be best for the organization to confine its activities to the upper-right corner of the particular box. For another law and another box, the lower-left corner might be the preferred location. Clearly, counsel should play a major role in determining the boundaries of the box as this is very likely a legal decision. Counsel, who understands the organization and its mission well, may also be very helpful in finding the very best place within the box for the organization. While this is not a legal decision, many counsel are well suited to help evaluate the options and alternatives based on their knowledge of both the law and the organizational interests and mission.

On other occasions, decisions may have legal ramifications, for example, potential liabilities, but are not wholly legal decisions. Rather, they are business decisions and the institutional interest might be better served by being willing to accept certain risks. And on a few rare occasions, the institution’s best interests will be served
by being outside the box. Determining whether or not this is possible takes careful coordination between counsel and the individual(s) charged with making the final decision on the matter for the institution. For example, there are some areas where being outside the box may mean the institution faces a higher risk of being in breach of any agreement, something most counsel would view with disfavor, but something that in a few — hopefully very rare — circumstances might be the best choice for an institution. The research administrator needs to understand that if the decision is too far outside the box, legal ethics may come into play and require counsel to ratchet the decision up to a higher authority.

At the beginning of this chapter I mentioned that finding reasons to say yes, not no, is the preferred mode for university counsel in assisting the institution and facilitating sponsored research. However, this immediate discussion also illustrates that there could be situations where counsel’s advice should be heeded. Thus, the professional relationship between a research administrator and a university attorney must be one of a true partnership.

¶2905.12 Conclusion

The area of university sponsored research is home to a number of legal considerations as this chapter points out. These considerations range from the very basic elements of the law to complex topics, as the areas intellectual property, export controls, and international research illustrate. Regardless of the topic and degree of complexity, however, professionals interested in a vibrant and success research administration career need to have a grasp of their considerations.

Secondly, it is most desirable that university sponsored research offices and legal offices have a strong and supportive bond to respond to the ever-changing environment of sponsored research. In its best iteration, their interactions blend the strengths of both to apply the law in a rational way in the best interest of the institution, its faculty, sponsored research, and the public.

One final point. University leadership, whether in sponsored research or law, should keep the “big picture” in mind. That “big picture” is increasing sponsored research in an increasingly competitive funding environment. That is the challenge for the future.
This section includes expanded discussions of legal topics relating to sponsored research administration. These materials are culled from a variety of authoritative sources.

**¶2920.1 IRS Revises ‘Safe Harbors’ for Sponsored Research Agreements**

AIS editors

The Internal Revenue Service (IRS) issued a document, Revenue Procedure (Rev. Proc.) 97-14, providing a safe harbor for sponsored research activities (see ¶2905.4).

Under Rev. Proc. 97-14, if (1) the research sponsor pays a competitive price for the right to use any resulting technology, and (2) the royalty rate was determined at the time that the technology was available for use (not when the research contract was signed), the research agreement would be presumed not to be a private business use arrangement. And, because the federal government is treated in the same manner as a business corporation for purposes of the private business use rules, the Rev. Proc. 97-14 safe harbor applied equally to federally sponsored research agreements. However, it has not been entirely clear how the safe harbor works with the Bayh-Dole requirements because under Bayh-Dole, the federal sponsor receives a non-exclusive, royalty-free license; when the college or university subsequently licenses the technology developed under the federal contract to a third party for a royalty of some amount, the research sponsor (the federal government) will be deemed to have received better than a competitive price for the technology because it paid no royalty. In addition, the federal government’s 0% royalty rate was determined at the time that the federal research contract was entered into, not at the time that the technology was available for use.

Rev. Proc. 2007-47, issued by the IRS last year, modifies and supersedes Rev. Proc. 97-14. Rev. Proc. 2007-47 still contains the provisions applicable to corporate sponsored research agreements, but it adds a separate set of safe harbor rules that apply to federally sponsored research agreements only. Under its provision relating to Bayh-Dole, the safe harbor test for a federally sponsored research agreement is met if all of the following are present:

◆ A single sponsor agrees, or multiple sponsors agree, to fund governmentally performed basic research.

◆ The college or university determines the research and the manner in which it is to be performed (for example, selection of the personnel to perform the research).

◆ Title to any patent or other product incidentally resulting from the basic research lies exclusively with the qualified user.

◆ The sponsor or sponsors are entitled to no more than a nonexclusive, royalty-free license to use the product of any of that research.

In applying the Rev. Proc. 2007-47 guidelines to federally sponsored research agreements, the IRS says, the rights of the federal government mandated by the Bayh-
Dole Act will not cause the research agreement to fail the safe harbor test, provided that the requirements of the second and third conditions above are met, and “the license granted to any party other than the qualified user to use the product of the research is no more than a nonexclusive, royalty-free license.”

Some confusion continues to exist, however. Here is the crux of the confusion: Because the qualified user is the licensor, not the licensee, what is meant by a license “granted … the qualified user?” In addition, does the apparent requirement that no third party can receive a license other than a license that is nonexclusive and royalty-free mean that the college or university cannot subsequently enter into exclusive or royalty-paying licenses with third parties?

These concerns have been expressed to the IRS officials who drafted Rev. Proc. 2007-47 by groups representing the interest of college and university stakeholders, and there may yet be some clarifying language forthcoming from the IRS.

Agreements With Federal Laboratories

Certainly, the majority of sponsored research agreements between the federal government and colleges and universities are grants, contracts and cooperative agreements. However, other funding mechanisms do exist and are used. For example, the Department of Energy’s (DOE) national laboratories “routinely share their technologies, capabilities, and knowledge with outside entities by performing research, licensing the laboratories’ technologies, and making their facilities and personnel available to others.”

The following outlines four types of arrangements, generally considered “technology transfer,” that an institution could have with a DOE laboratories. Figure 2920.2-1, included on page 2920:5, shows the number of agreements associated with the four types of activities during fiscal years 2006–2008.

◆ Cooperative research and development agreements (CRADA): Under these agreements, laboratory employees collaborate with nonfederal partners to carry out research projects that will directly benefit DOE program missions and the partners’ research and development goals. Under a CRADA, a laboratory may contribute personnel, equipment, or other in-kind resources to a project, while its CRADA partners must contribute funds, in-kind resources, or both. For example, in fiscal years 2006 through 2008, all 17 of DOE’s national laboratories entered into CRADAs with private firms, universities, state or local governments, nonprofit organizations, or other nonfederal partners. (For more on CRADAs, see ¶2905.3.)

◆ Nonfederal work-for-others agreements: Under a nonfederal work-for-others agreement, a DOE laboratory agrees to conduct research on behalf of a nonfederal sponsor. Although this research must be consistent with the laboratory’s and DOE’s missions and draw on the laboratory’s unique capabilities, these agreements differ from CRADAs in that the research need not directly benefit DOE’s programs. Consequently, the sponsor must pay the entire cost of a project done under these agreements. In turn, however, the sponsors typically may elect to receive ownership of any new intellectual property, including new inventions by laboratory employees, resulting from the research.

For example, Los Alamos National Laboratory in New Mexico, under a nonfederal work-for-others agreement with the University of California, Los Angeles, is developing key components of a detection and response system for avian flu, which will enable rapid DNA analysis of a large number of biological samples at multiple locations worldwide. Drawing on the laboratory’s expertise in computer modeling and simulation, and using its patented biological analysis technologies, the laboratory will develop computer software and hardware, as well as analysis tools and protocols for detecting and responding to infectious disease outbreaks.

---

1 This discussion is drawn from material included in Technology Transfer: Clearer Priorities and Greater Use of Innovative Approaches Could Increase the Effectiveness of Technology Transfer at Department of Energy Laboratories, GAO-09-548, June 2009, www.gao.gov/docsearch/reandtest.html.
17 of DOE’s national laboratories had work-for-others agreements with nonfederal partners in fiscal years 2006 through 2008. In fiscal year 2008, 35 percent of the agreements were with universities, state or local governments, or other nonfederal sponsors.

◆ **Licensing agreements:** DOE laboratories share their technologies by licensing their patented discoveries, copyrighted software programs, or other intellectual property to nonfederal entities seeking to use or commercialize those technologies. In some cases, the licensee agrees to pay fees or royalties to the laboratory in exchange for the laboratory’s permission to use or commercialize a technology.

◆ **User-facility agreements:** Under a user-facility agreement, scientists from outside organizations can use DOE’s unique scientific equipment for their own research, sometimes in collaboration with laboratory staff. Several of DOE’s national laboratories are home to the department’s user facilities. For example, the Center for Nanoscale Materials — at Argonne National Laboratory in Illinois — makes customized laboratory space and specialized equipment available for research on materials and structures at the atomic, or nano, scale. Some of the center’s users are also allowed to access Argonne’s Advanced Photon Source for nanoscience research. Users may conduct their research at DOE’s facilities for free or a negotiated cost, if the results of their research will be made public.

A Sponsored Research Agreement, Explained
James Casey, American University

[Author’s Note: This section provides some observations of a standard (template) sponsored research agreement (SRA) in order to give the reader insights into contract construction, language, and the relationship of the parts to the whole. This section is for illustrative and educational purposes only, and does not constitute legal advice nor an appropriate agreement for any specific project. Author observations are provided in italics.]

SPONSORED RESEARCH AGREEMENT

This Agreement is made by and between ________________, a _______________ having its business address at ______________________________ (hereinafter “University”) and ______________, having its business address at ____________________ (hereinafter “Sponsor”).

The purpose of this Agreement is to promote the increase of useful knowledge through research relating to

[the title or summary of the project should be placed here].

[Include the following paragraph for federal flow-through subcontracts]

The United States __________ Office (hereinafter “Prime Sponsor”) has awarded to Sponsor under the _________________ Program, Contract No. ______________ entitled “________________________” (hereinafter “Prime Award”). ______________ has proposed this research project, as outlined and detailed in Prime Award, in collaboration with University, which is attached hereto as Appendix D. Sponsor desires to have University conduct work with this research project. Any approvals or communication necessary under this Agreement shall be directed to Sponsor for transmittal to the aforementioned Prime Sponsor. Supplemental Federal Acquisition Regulation clauses (if applicable) shall be attached hereto as Appendix C.

WHEREAS, the research program contemplated by this Agreement is of mutual interest and benefit to University and Sponsor and will further University’s instructional and research objectives in a manner consistent with its status as a non-profit, tax-exempt, educational institution;

NOW, THEREFORE, the parties hereto agree as follows:

1. RESEARCH PROJECT

1.1 University agrees to undertake reasonable efforts to perform the research project entitled “______________________________” (hereinafter “Project”) specifically described in the attached Statement of Work (Appendix A) which by reference is incorporated into this Agreement, and such other work, if any, as may be mutually agreed upon in an executed amendment to this Agreement.

1.2 The Project shall be carried out under the direction of Professor ________________ (hereinafter “Principal Investigator”) while employed by University, and by others as assigned by the Principal Investigator (the Principal Investigator and such others collectively referred to hereinafter as “Personnel”).
1.3 If, for any reason, the Principal Investigator cannot conduct or complete the Project, University will appoint a successor, subject to the written approval of Sponsor, which approval shall not unreasonably be withheld or delayed. If a replacement acceptable to University and Sponsor is not available, this Agreement shall be terminated as provided in Section 9 herein.

2. TERM

[SRAs should always have start and end dates, to provide the ultimate in clarity to all parties concerned.]

This Agreement shall begin _______, 2015, and end _______, 20_ (“Term”), unless completed earlier or terminated in accordance with Section 9 or extended upon written agreement by the parties.

3. FACILITIES

[It is also quite helpful to include facility and equipment within the Statement of Work that should be included in Appendix A.]

University agrees to furnish such laboratory facilities and equipment as it shall determine necessary for the Project. Equipment provided by Sponsor for University’s use in the Project shall be subject to University’s approval. All right and title in and to any equipment purchased or manufactured by University in the performance of the Project shall vest exclusively in University.

4. PAYMENT

[Insert the following clause as appropriate. The type of contract/payment provision is incredibly important to ensure that there are no issues during project implementation, payment, and closeout. Be specific and clear about what type of contract/payment provision is involved. This is not the time to be vague.]

4.1 Cost-Reimbursable Agreement. Sponsor will reimburse University for the cost of conducting the Project. The parties estimate that the total cost to Sponsor to complete the specified Project will be $______________.

Allowable costs eligible for reimbursement to University for performance of the Project under this Agreement shall be determined in accordance with: (1) the terms of this Agreement; and (2) the budget attached hereto and incorporated herein as Appendix B.

Sponsor shall reimburse University’s invoices on a basis no more frequently than monthly for allowable costs. Unexpended balances remaining at the end of any funding period may be carried forward into subsequent budget periods. Adjustments across budget categories, not to exceed 25% of the total costs awarded, shall be at the discretion of the Principal Investigator.

At the end of the Project, if there is a balance owed to Sponsor of $100 or less, University may keep the balance. Any amounts over $100 will be returned to Sponsor unless the parties agree otherwise.

4.2 Fixed-Price Agreement. Sponsor will pay University the amount of _________
for performing the Project. The parties estimate that this price is sufficient
to support the Project. University may submit to Sponsor a revised Budget
requesting additional funds if Sponsor requests a change in the scope of work
of the Project. Sponsor will not be liable for any payment in excess of the Budget
except in the case of Sponsor’s written agreement, nor will Sponsor be entitled
to any reversion of project funding as it relates to any residual balance at the
completion of the Project.

Payment shall be made by Sponsor according to the following schedule:

a. [$_____] / [≥50% of the total fixed price] upon execution of the Agreement by the
   Parties;

b. [$_____] / [≥40% of the total fixed price] upon [fixed date or completion of
   milestone]; and

c. The remaining balance of the fixed price to be paid upon submission of the final
   report.

4.3 Payment. Payments shall be made by check or wire transfer and directed to the

[Confidentiality of information (proprietary information, etc.) during project performance
is one of the major issues in sponsored research administration. Sometimes it is necessary
to sign a confidentiality/nondisclosure agreement prior to signing an SRA, or the terms of

5. REPORTS AND INSPECTIONS

5.1 The Principal Investigator shall furnish Sponsor with written reports on the
   progress of the Project on such dates as are mutually agreed upon and a final
   report on the entire Project within ninety (90) days after termination of this
   Agreement, unless specified otherwise in the Statement of Work.

5.2 In the event representatives of Sponsor wish to inspect a Project site during
   the Project, University agrees to allow such inspections at mutually agreeable
   times, during normal business hours, and if requested, to reasonably assist the
   inspectors and representatives in their activities.

6. CONFIDENTIALITY

[Confidentiality of information (proprietary information, etc.) during project performance
is one of the major issues in sponsored research administration. Sometimes it is necessary
to sign a confidentiality/nondisclosure agreement prior to signing an SRA, or the terms of
a confidentiality/nondisclosure agreement may be built into the SRA. Either way, mutual language ensuring complete coverage is quite important.]

6.1 Confidential Information refers to any confidential or proprietary information which is transferred from one party to the other under this Agreement, providing the information is transferred in writing and marked as Confidential, or to information which is initially disclosed orally, or in any other non-written form, is identified as confidential at time of disclosure and then summarized in writing and confirmed by the disclosing party as Confidential within thirty (30) days of the initial disclosure.

6.2 Confidential Information shall not include information which (a) is known or open to the public or otherwise in the public domain at the time of disclosure; (b) becomes part of the public domain after disclosure by any means except through breach of this Agreement by the recipient; (c) is already known to the recipient at the time of disclosure; (d) is obtained by the recipient from a third party who has a lawful right to disclose it; (e) is independently developed by recipient without use of disclosing party’s Confidential Information as evidenced by recipient’s written records; (f) is disclosed by a third party not under any known obligation of confidentiality; or (g) is required to be disclosed by law or statutory regulation or pursuant to a court order.

6.3 The data, methods and results of the research generated under this Project shall not be considered Confidential and may be used and published by University pursuant to the terms of Sections 7.0 and 11.0.

6.4 The parties agree that for a period of _____ (__) years from the expiration, or early termination date, of this Agreement they will neither disclose to any third party nor use for any purpose other than the purposes of this Agreement any Confidential Information of the other party unless the disclosing party has given its express written consent. Additionally, each party agrees only to disclose the other party’s Confidential Information to those employees, students, affiliates, and/or agents, as necessary to facilitate the performance of obligations under this Agreement.

6.5 The receiving party acknowledges that the disclosing party’s Confidential Information is owned solely by the disclosing party and that the unauthorized disclosure of such information shall entitle the disclosing party to seek injunctive relief as well as any and all other rights and remedies available at law or in equity for such breach. The receiving party may retain copies of all Confidential Information for recordkeeping and regulatory purposes and shall undertake reasonable efforts to maintain their confidentiality.

7. PUBLICATION

[Universities that are non-profit in nature need to maintain open publication policies as part of their tax status with the U.S. Internal Revenue Service (IRS), not to mention that this is reflective of general public policy. Of course, as you will see in the language below, provision to review prior to publication for proprietary or confidential information is part of trans-
7.1 Sponsor recognizes that under University policy, the Project data, methods and results are not Confidential Information. University and its employees shall have the right, at their discretion, to release, present, or publish any data, writings, or material reflecting the methods and results of the Project or to use such in any way for its educational and research purposes.

7.2 Prior to submission for publication or public presentation of a manuscript or abstract describing the results of the Project, the publishing party will send a copy of the proposed manuscript or abstract to the non-publishing party. Within __________ days of receipt of the manuscript, the non-publishing party shall identify, in writing, for the publishing party specific information in the manuscript that is either potentially patentable or constitutes that party’s Confidential Information. Such delay shall not, however, be imposed on the filing of any student thesis or dissertation.

7.3 Upon receipt of the non-publishing party’s written notice the publishing party will redact any identified Confidential Information from the manuscript to be submitted or published. If the non-publishing party has identified potentially patentable information, the publishing party will delay submission or publication for a maximum of an additional __________ days in order to protect the potential patentability of any invention described therein. If the non-publishing party has not identified any potentially patentable information, the publishing party may submit or publish the redacted manuscript without further delay.

7.4 If the __ day review period expires without written notice from the non-publishing party, the publishing party shall be free to submit such manuscript for publication and to publish the disclosed research results in any manner consistent with professional standards.

8. INTELLECTUAL PROPERTY AND LICENSING

[Intellectual Property (IP) is one of the major possible troublesome areas in SRAs. There are different perspectives on how to address this at the SRA stage. Some would prefer to address the topic in a separate agreement that is attached to the agreement; some would prefer to address IP at this stage only if there is a high chance of creating foreground (project) IP, or if background (prior created) IP is being brought into the project; and others may prefer to negotiate general language as you will see below, and then address it more fully later as necessary. And one final point: The creation of jointly owned IP will lead to additional management and financial costs. Be ready to deal with those.]

8.1 For purposes of this Agreement, “Inventions” means potentially patentable inventions and discoveries first conceived and actually reduced to practice solely in performance of the Project. University shall own all right, title and interest in and to any Inventions made solely by Personnel and other University employees, agents, and/or students (“University Inventions”). Sponsor shall own all right, title and interest in and to any Inventions made solely by Sponsor employees (“Sponsor Inventions”). The Parties shall jointly own all right, title and interest
in and to any Inventions made by a combination of one or more employees, agents, and/or students from both University and Sponsor ("Joint Inventions"). Unless otherwise agreed by the parties in writing, this Agreement does not affect ownership of or rights to any Inventions or other intellectual property developed by University or by Sponsor prior to, or outside the scope of, the Project.

8.2 University agrees to notify Sponsor of any University Invention hereunder within thirty (30) days after an invention disclosure. Sponsor shall treat all University invention disclosures as Confidential Information subject to the provisions of Section 6. Each party will promptly notify the other of any Joint Invention.

8.3 Sponsor shall indicate to University in writing, within sixty (60) days of Sponsor’s receipt of a notification of invention from University, whether it wishes for University to file a patent application in the United States on the University Invention, or Joint Invention, or to register copyrightable material pertaining to such invention (excluding works authored by University employees under Section 8 herein). In addition, if Sponsor chooses to seek patent protection for a University Invention or Joint Invention in any foreign countries, Sponsor shall so notify University in writing at least sixty (60) days prior to the applicable filing deadline(s). In the absence of such notification by Sponsor, no foreign patent protection need be secured by University.

8.4 If Sponsor requests that University file one or more patent applications or register copyrightable material as set forth in Section 8.3, Sponsor will reimburse University for all documented expenses incurred to secure and maintain the applications and/or registrations within thirty (30) days of receipt of an invoice. University will keep Sponsor promptly informed regarding the status of any patent application(s) or registration(s) filed at Sponsor’s request and expense and will give Sponsor reasonable opportunity to comment. Sponsor shall bear any maintenance costs for all such issued patents and copyright registrations, if applicable. If Sponsor chooses to directly file at its expense, rather than request University to file, any applications for University Inventions or Joint Inventions or registrations for copyrightable material under this Section, Sponsor shall notify University’s administrative contact in Section 14 prior to such filing. If Sponsor does not request that University file a patent application within a given territory within the 60-day period specified in Section 8.3, University has the right, but not the obligation, to file such an application at its sole expense and for its sole benefit.

8.5 To the extent University has the legal right to do so, University hereby grants to Sponsor (a) a non-exclusive, non-transferable, non-sublicensable, royalty-free license to practice University Inventions for non-commercial purposes and (b) an option to negotiate a limited exclusive, royalty-bearing commercial license under reasonable terms, for the right to make, use and sell, have made and have used, University Inventions or Joint Inventions claimed in patent applications or issued patent(s) filed at Sponsor’s election and expense as set forth in Section 8.3. Such
option shall be in effect and exercisable for six (6) months after Sponsor receives University’s notification of Invention disclosure. If Sponsor does not exercise its option in writing within six (6) months from the date it receives notification of Invention disclosure from University, or if University and Sponsor do not reach an agreement on a royalty-bearing commercial license within six (6) months following the date of notice of election, University retains the right to license the Invention or University’s rights in a Joint Invention to third parties without further obligation to Sponsor.

8.6 In consideration of Sponsor’s support of the Project, and to the extent that University has the right to grant such a license, University shall grant to Sponsor a non-transferable, non-exclusive, irrevocable, worldwide, royalty-free license to use, reproduce, publish, or re-publish, or otherwise disseminate any copyrightable materials that are developed from work supported by Sponsor under this Agreement and assigned to University, for non-commercial purposes. Notwithstanding the foregoing, under University policy, scholarly works (e.g., academic articles or publications) resulting from the Project are not subject to the terms of this Section 8.6 and University Principal Investigators shall own and maintain copyright in such scholarly works.

8.7 University shall retain the right to utilize for non-commercial research and/or educational purposes any patent rights and/or copyrights licensed to Sponsor resulting from this Agreement.

8.8 Each party shall have a non-exclusive right to sublicense Joint Inventions subject to the other party’s written approval, which approval shall not be unreasonably withheld.

8.9 Any inspection or monitoring activities conducted by the Sponsor shall not give rise to a presumption of joint ownership with respect to any inventions developed during the project absent specific documentation regarding joint contributions.

8.10 To the extent that visiting Personnel perform work within the scope of the Project while at the other party’s facilities, the parties may negotiate, but are not so required by this Agreement, a separate agreement denoting each party’s rights to Inventions developed by such Personnel within such scope.

8.11 Sponsor is hereby informed that the United States government, as a matter of statutory rights under the Bayh-Dole Act (35 U.S.C. Section 200 et seq.), may hold a non-exclusive license and certain other rights under 35 U.S.C. 200-212 to patents on inventions made resulting from research conducted by University where funding for such research includes funds supplied by the United States government. In the event the United States government has such rights or in the future is found to have such rights with respect to any or all University Inventions or Joint Inventions, any license contemplated under this Agreement, or ultimately executed, even if termed an “exclusive license,” shall be understood to be subject to such rights of the United States government.
9. TERMINATION

[Termination language is critical in every contract. Make sure to cover every possible contingency that requires termination. Do not leave any gaps for the other party to exploit.]

9.1 Either party may terminate this Agreement prior to the end of the Term set forth in Section 2 hereof or any agreed upon extension of said Term, by giving sixty (60) days written notice to the other.

9.2 Upon early termination of this Agreement, Sponsor shall pay all costs accrued by University as of the date of termination, including non-cancelable obligations for the Term of this Agreement, and obligations for all Personnel appointed before the effective date of termination and appointed specifically to work on the Project.

10. INDEMNIFICATION, LIMITATION OF LIABILITY, AND NEGATION OF WARRANTY

[Indemnification, liability, and warranty are additional areas of importance in sponsored research contracting. The key points here are to address all contingencies that may arise during the project, and make sure that you are not covering the other party’s acts or omissions. Like other areas of sponsored research contracting, being fair and equitable are the key attributes to successful contracting and long term collaboration. This is also an area where public and private universities differ – public universities are often restricted by state statute, regulation, and/or case law as to what liability, indemnification, and warranty language they may accept. Private universities have more flexibility when it comes to contracting language, and then at that point it becomes a business decision.]

10.1 Sponsor agrees to indemnify, hold harmless and defend University and its officers, employees, affiliates, and agents against any and all claims, suits, losses, damages, costs, fees, and expenses resulting from or arising out of (a) either party’s performance of this Agreement, except to the extent caused by University’s gross negligence or willful misconduct; (b) Sponsor’s use of the research data and/or results of the Project; or (c) Sponsor’s use, manufacture, or sale of products or inventions made by use of the results of the Project.

10.2 University makes no representation other than those specified in this Agreement. University makes no express or implied warranties including implied warranties of merchantability or fitness for any particular purpose of data or technical information derived from this research project or of any tangible or intangible property or property right.

10.3 Except for confidentiality and indemnification obligations set forth herein, to the maximum extent permitted by law, in no event will either party be responsible for any incidental, consequential, indirect, special, punitive, or exemplary damages of any kind, lost goodwill, lost profits, lost business or other indirect economic damages, whether such claim is based on contract, negligence, tort (including strict liability) or other legal theory, regardless of whether such party was advised or had reason to know of the possibility of such damages in advance. Additionally, University’s total liability under this Agreement shall not be in excess of the total amount of commitment paid by Sponsor to University under Section 4.
11. PUBLICITY

Publicity sections tend to be governed by common sense and a strong belief in collaboration, but in 11.2 below the issue of reporting grant activity is one that needs to be addressed. What happens if sponsors want their funding to be kept confidential? What can public universities keep out of the public eye? These are questions you may be forced to consider at some point in your career.

11.1 Sponsor shall not use the name of University, nor any University faculty member, employee, or student, or any trademark, service mark, trade name, or symbol of University, in any promotional statement, product, advertising, or news release, unless Sponsor has received University’s prior written consent. Permission may be withheld at University’s sole discretion.

11.2 Sponsor agrees that University and its Personnel may disclose the Project title and duration, name of Sponsor, and total amount awarded to University hereunder, for institutional reporting purposes, including publicly accessible websites, mandatory conflict of interest disclosures, and as required by applicable law or for federal and other funding applications.

12. FORCE MAJEURE

Force majeure – or Acts of God – clauses are common in contracts, period. These are not unique to sponsored research.

Neither party will be responsible for any failure to perform due to unforeseen circumstances or to causes beyond the party’s reasonable control, including but not limited to acts of God, war, riot, embargoes, acts of civil or military authorities, fire, floods, accidents, strikes, shortages of transportation, facilities, fuel, energy, labor or materials, or changes in applicable laws or regulations affecting this Agreement.

13. EXPORT CONTROL REGULATIONS

The area of export control has become increasingly visible and important over the last ten years or so, and it is important that you, at a minimum, put adequate language into the contract to cover this contingency. Of course, if there is absolutely no possibility that export control will arise in a particular project, then it would simplify matters to simply remove such a section from the SRA. That is a business decision, of course.

13.1 University is committed to the principle of “Openness in Research” which precludes acceptance of any research that imposes access, dissemination, or participation restrictions on the conduct, products, or results of its research. University performs only unclassified, non-secret research, openly conducted. Thus, it conforms with both 15 CFR 734.3(b); 734.8 (EAR) and 22 CFR 120.11(8) (ITAR) requirements for public domain “fundamental research” excluded from those regulations (the “Fundamental Research Exclusion” or “FRE”).

13.2 Sponsor acknowledges that the export and/or re-export of certain technology, technical data and information, software, materials, equipment and other commodities may be subject to export control laws, rules, and regulations of the United States (hereinafter “Export Controlled Information”) and that such laws,
rules, and regulations could preclude or delay communications between the parties of research results from this Project. University’s obligations hereunder are contingent on compliance with such applicable laws, rules, and regulations.

13.3 If Export Controlled Information is required to conduct research under this Project, Sponsor will so inform University in writing, directed to both the Administrative Officer and the Director of Export Controls listed in Section 14, prior to any such disclosure, and shall not forward or provide any export controlled information to University without the express written permission of University. The burden shall be on Sponsor to (a) identify the nature of the export controlled item, including, e.g., the appropriate Export Classification Control Number or the item’s inclusion on the United States Munitions List; (b) prevent such export controlled information from being improperly disclosed or exported; (c) to obtain the appropriate license or approval from the relevant federal agency; and/or (d) to invoke an available exception, exemption, or exclusion. University shall have the right to terminate the Agreement under Section 9, if the disclosure of export controlled information under license or otherwise, would jeopardize University’s ability to invoke the fundamental research exclusion regarding the conduct or reporting of its research. In any event, if necessary for the continuation of the research under this Project, upon written notification and subsequent approval, the parties will cooperate to ensure that an appropriate plan is put in place to handle the transfer of any export controlled information. At any time, University may either refuse receipt of any controlled information or it may terminate the Agreement if necessary to protect the Fundamental Research Exclusion.

14. NOTICES

Notices, invoices, payments and other communications hereunder shall be deemed to have been made when delivered, sent by fax or courier, or when mailed first class, postage prepaid, and addressed to the party at the address given below, or such other address as may hereafter be designated by notice in writing:

15. MISCELLANEOUS

[This section is a general catch all section that covers other general aspects of the contract, including areas that bear upon collaboration, general principles of contract interpretation, the survivability of specific clauses, and governing law. In fact, in other sample SRAs, these clauses may be treated to their own separate sections. In other words, when it comes to this section, there is no right way to draft it. Covering all your bases is the order of the day.]

15.1 University and Sponsor agree that the Personnel are acting as agents of University and not as agents or employees of Sponsor with respect to their work on this Project.

15.2 This Agreement may not be assigned by either party without the other party’s prior written consent. This Agreement, and all rights and obligations hereunder, shall be binding upon the respective parties and their respective permitted heirs, successors, licensees, and assignees as permitted herein.

15.3 This Agreement may be executed in counterparts, each of which shall be deemed an original, but each of which shall constitute one and the same instrument. Facsimiles or scanned copies of signatures or electronic images of signatures shall be considered original signatures unless prohibited by applicable law.

15.4 No provision of this Agreement, whether express or implied, shall be construed as establishing, constituting, giving effect to or otherwise recognizing any partnership, joint venture, pooling arrangement, or formal business organization of any kind. No party to this Agreement shall have the authority to represent or bind the other party, or to take binding action or make any statements, representations, or commitments of any kind on behalf of the other party, except as may be expressly provided for herein or authorized in writing by the parties.
15.5 If any provision contained in this Agreement is held invalid, unenforceable, or contrary to law, then the validity of the remaining provisions of this Agreement shall remain in full force. In such instance, the parties shall use their reasonable best efforts to replace the invalid provision(s) with legally valid provisions as similar in terms to such provision as is possible. The provisions of Sections 5, 6, 7, 8, 10, 11, and 13 shall survive the expiration or termination of this Agreement.

15.6 This Agreement shall be governed by and construed according to the internal laws of the State of _______ without reference to its rules concerning choice of law or conflict of laws. In the event of a dispute arising under this agreement, the parties will seek to settle matters amicably between themselves. In the event such a resolution cannot be reached, the parties consent to dispute resolution procedures including, but not limited to, mediation and/or arbitration in accordance with the American Arbitration Association.

15.7 This Agreement represents the entire agreement of the parties with respect to its subject matter and supersedes any prior or contemporaneous agreements, to the extent inconsistent with the terms or conditions herein, relating to the subject matter as between the parties. In the event of an inconsistency or conflict, the terms of this Agreement as printed in full herein shall take precedence over those in any attachments or exhibits to the Agreement, whether or not incorporated by reference. Any amendments must be in writing and signed by both parties. Use of any purchase orders to facilitate issuance of payments under the Project shall be in accordance with the terms of this Agreement, and any terms or conditions contained within such purchase order shall not apply and are hereby disclaimed.

15.8 The headings in this Agreement are solely for convenience of reference and shall not affect interpretation.

The parties hereto have caused this Agreement to be executed by duly authorized representatives effective as of the later date indicated below:

AIS editors

The Q&As at ¶2990.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 2900 has been understood. Note: For the answer key for ¶2990.1, see ¶2990.3, which appears on a separate page (page 2990:5) for testing purposes.

Discussion topics at ¶2990.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶2990.1 Q&As

1. The purpose of the Bayh-Dole Act includes all of the following EXCEPT:
   (a) To promote the use of inventions arising from federal-supported research
   (b) To promote the collaboration between commercial concerns and the general public
   (c) To promote the collaboration between commercial concerns and nonprofit institutions
   (d) To ensure that inventions are used to promote free competition and enterprise

2. Which of the following is TRUE?
   (a) A cooperative agreement is used when the purpose is to acquire property or services for the direct benefit or use of the federal government.
   (b) A cooperative agreement is appropriate when the purpose is to support or stimulate the carrying out of a public purpose, and there will not be substantial involvement between the recipient and the federal agency in carrying out the activity.
   (c) Because the terms and conditions of a federal contract are much more flexible than those required for a cooperative agreement, federal contracts are the usual type of federal funding mechanism for university research.
   (d) The research activity under a cooperative agreement is similar to that of a grant, but with a cooperative agreement there is substantial involvement between the recipient and the federal agency.

3. What is a CRADA?
   (a) Assistance provided to industry-led joint research and development efforts on high risk, high pay-off, emerging and enabling technologies
   (b) A set aside of a certain amount of the budget of several agencies for research to strengthen the role of small business and increase the commercial application of innovations derived from federally funded research
(c) A research agreement between a federal laboratory and a nonfederal partner, which may be an educational institution
(d) All of the above

4. As used in ¶2905, what is UBI?
(a) Unrelated business income
(b) Universal business incubator
(c) Universal basic investigator
(d) Unrelated business investigator

5. SBIR and STTR are programs that aim in part to
(a) Strengthen the role of international contractors
(b) Encourage short-term gains at the expense of long-term goals
(c) Specifically fund humanities projects
(d) Strengthen small business

6. Regulations implemented by which of the following agencies prohibit payments to certain identified individuals and organizations?
(a) OFAC
(b) EAR
(c) ITAR
(d) OMB

7. Which of the following organizations has issued a document regarding obtaining and disseminating biomedical research resources?
(a) National Institutes of Health
(b) OMB
(c) National Institute of Standards and Technology
(d) National Science Foundation

8. Which of the following is NOT recommended for policies regarding institutional research opportunities?
(a) They should uphold the core institutional mission.
(b) They generally should not be considered on a case-by-case basis; instead, a road map should be prepared.
(c) They should not necessarily involve faculty in their development.
(d) They should be re-evaluated on an ongoing, as-needed basis.
9. University collaboration with industry is a good thing because of all of the following EXCEPT:

   (a) It can bring a real-world perspective to the university.

   (b) It can bring together two institutions with similar cultures and missions.

   (c) It can create opportunities for students — both while enrolled at institutions and after graduation.

   (d) It can provide direct translation of university research for the good of the public.

Discussion Topics

1. Many institutions are considering increasing their research activities with industry. Why is this occurring now more than ever, and what unique issues arise in industry collaborations?

2. Discuss appropriate methods to help your legal counsel gain a better understanding of the “law” of sponsored research.

3. Under what circumstances might sponsored research become involved in agreements regarding consulting relationships? What special issues might arise with these types of arrangements?

4. The world of federal sponsored research is increasingly more complex, as there are laws, regulations, circulars, guidance documents, even Grants.gov and federal budget issues. Discuss how you can best stay abreast of changes on all of these fronts.
\subsection{2990.3 Answer Key}

1. (b) To promote the collaboration between commercial concerns and the general public

2. (d) The research activity under a cooperative agreement is similar to that of a grant, but with a cooperative agreement there is substantial involvement between the recipient and the federal agency.

3. (c) A research agreement between a federal laboratory and a nonfederal partner, which may be an educational institution

4. (a) Unrelated business income

5. (d) Strengthen small business

6. (a) OFAC

7. (a) National Institutes of Health

8. (c) They should not necessarily involve faculty in their development.

9. (b) It can bring together two institutions with similar cultures and missions.

§3101 Introduction

The ability to deal effectively with auditors is critical to an institution’s successful management of sponsored research awards, therefore the interaction between sponsored programs administrators and auditors is explored in this chapter.

Audits are an essential and ongoing part of the sponsored research process. In the age of accountability and compliance, it is highly unlikely that they will disappear from the scene. The chapter was originally developed by Denise Clark of the University of Maryland, College Park. The content has recently been refreshed with the help of Evan Bryant who serves as the audit liaison at Texas A&M University. The chapter provides a highly accessible set of guidelines that will assist research administrators in achieving effective interactions with auditors. The chapter makes the case for the importance of research administrators understanding the audit process and their role in it. It provides a very complete description of the audit process from the initiation of the audit letter through audit resolution and closure.

Throughout the discussion it offers very practical advice to research administrators on how to get through an audit in a manner that benefits the institution. It includes a set of deceptively simple, but highly effective, tips for interviewees. The auditor may not be your best friend, but as Clark wisely points out, there is not much to be gained by treating the auditor as “the enemy.”

This chapter will continue to respond to the information needs of research administrators over time through the addition of new material. Future updates will contain revisions, additions, and enhancements to §3105, as appropriate. Content added to other sections of the chapter will provide readers supplementary discussions of related topics (at §3120), practical tools (at §3130), case studies (at §3140), and trends data and other related statistics (at §3160). A “knowledge check” containing Q&As and discussion topics is included at §3190.
Interaction with Auditors
Denise J. Clark
Assistant Vice President for Research Administration and Advancement
University of Maryland, College Park

Technical updates provided by Evan Bryant, Texas A&M University

Audit, auditor, auditee. … Internal, external, program specific, agency specific…. Entrance conference, exit conference. … Scope, population. … Internal controls. …. Extrapolation. … Material weakness, immaterial weakness. … Reportable condition, immaterial finding, material finding.

These are words that are exchanged regularly by research administrators, and all relate to audits. Audits play an essential role in the administration of sponsored programs and serve various, often critical, purposes. For these reasons it is necessary for office of sponsored programs (OSP) personnel to understand the relevant terminology and processes relating to audits and interactions with auditors. This chapter provides such an overview.

Key Terms
Associated audit terms and definitions to make part of one’s vocabulary include the following:

- **Agency-specific audit**: an audit conducted to ensure compliance with guidelines, regulations, and agency goals
- **Audit**: examination of records or financial accounts to verify accuracy
- **Auditee**: organization to be audited
- **Auditor**: person qualified and authorized to examine and verify records (could also be an “audit team”)
- **Entrance conference**: held between auditors and the institution as a means to launch an audit and discuss audit objectives, scope, timing and logistics
- **Exit conference**: held upon completion of an audit to discuss the process, observations, and outcomes
- **External audit**: conducted by auditors external to the institution
- **Extrapolation**: a means of drawing conclusions about an entire population based upon sample testing
- **Fieldwork**: a review of official records and supporting documentation, usually performed on-site
- **Immaterial finding (weakness)**: an instance of noncompliance with applicable laws regulations, or agreement terms and conditions of an inconsequential nature
- **Internal audit**: conducted by auditors employed by the institution
- **Internal controls**: verifiable mechanisms an institution has in place to provide
reasonable assurance of compliance with applicable laws, regulations, and policies
◆ Letter of engagement or audit letter: the letter sent by the audit team officially notifying the institution of an upcoming audit
◆ Material finding (weakness): an instance of noncompliance with applicable laws, regulations, or agreement terms and conditions of a substantive nature
◆ Population: defines the range and type of files associated with the audit
◆ Program-specific audit: conducted to ensure the institution has a system of internal controls to properly manage a particular award in accordance with sponsor guidelines
◆ Questioned cost: level of uncertainty or doubt as to allowability or appropriateness of a cost
◆ Reportable condition: internal control deficiency or condition of noncompliance that is significant enough to be included in the audit report
◆ Scope: defines the purpose and parameters of an audit
◆ Scope document: details in writing the purpose, objectives, and intent of the audit

### 3105.2 Overview of Audits

Does preparing for one audit prepare an institution for all audits? No, each audit differs from the next depending on the auditors, the purpose of the audit, and the scope of the audit. Internal audits differ from external audits and single audits differ from agency audits. (For further discussion of single audits, see Chapter 1300.) Various types of audits and their purposes are discussed below.

◆ Internal audits are conducted by in-house personnel (usually located in the institution’s office of internal audit) for the primary purpose of assuring that policies and procedures are in place, sufficient, and followed effectively and efficiently in order to maintain compliance with associated laws, regulations, and policies. The role of an internal audit office is to work in partnership with management to assess risk and evaluate the effectiveness of associated internal controls and recommend enhancements to procedures and processes. Internal audit offices help facilitate compliance for the institution by assessing the probability and impact of noncompliance and by recommending improvements and enhancements to internal controls. Establishing an internal audit office is, in itself, an internal control. Frequently internal audit offices have a reporting relationship to the institution’s board of trustees.

◆ External audits are conducted by outside audit firms, agency representatives, or representatives of a federal office of inspector general (OIG). One of the most common external audits in research administration occurs in relation to the Office of Management and Budget (OMB) 2 CRF 200 Uniform Guidance Subpart F (UGF) – Audit Requirements. The scope of a UGF audit is to determine an institution’s compliance with federal regulations. The audit is generally
conducted by private audit firms hired by the institution. The frequency and depth of the external audit differs depending upon variables such as the volume of an institution’s total research expenditures, size of the institution, and complexity of the institution’s portfolio. A program or topical area-specific audit is initiated by individual granting agencies and is conducted by personnel within the program area, the grants and agreements or contracts area, or the OIG area. A program-specific audit is a means to evaluate the progress of a particular program or award while also assessing the institution’s related internal controls. A topical area-specific audit may include one or many awards and the evaluation of internal controls is usually focused on adherence to the specific topic or topical area of interest.

Although each audit is separate and distinct from any other, there are common threads that occur with every audit. The purpose of an audit is to determine compliance with program and regulatory requirements. In doing so, audits focus on internal controls and assessments of risk.

The typical audit consists of evaluating the effectiveness of internal controls within key operations and testing compliance with institutional policies and procedures and related adherence to applicable external regulations.

**Internal Controls**

What are internal controls? Internal controls are demonstrated means or methods used to provide reasonable assurance of compliance with applicable laws, regulations, and policies. By establishing and implementing sound internal controls, an institution seeks to create an environment where the primary objectives are compliance, reliability, integrity, and the safeguarding of the institution’s assets. Examples of internal controls include the following:

- Promoting ethics and integrity
- Maintaining adequate knowledge base
- Operating efficient and effective financial systems
- Developing and implementing policies and procedures
- Imposing sanctions for noncompliance
- Providing training and ongoing communication
- Monitoring, observing, and testing daily operations
- Conducting periodic performance reviews

**Preparation for an Audit**

Success in interacting with auditors depends upon how well prepared the institution is. A lack of preparation can cause a perceived atmosphere of uncertainty and inefficiency. OSP personnel can eliminate uncertainty, suspicion, and skepticism by being as prepared as possible and creating an environment of confidence and assurance. Having the knowledge of and ability to discuss the subject matter of the audit
appropriately while providing verifiable documentation of adherence to internal controls is a key, strategic offense. In preparing for an audit, an OSP should consider the following activities:

◆ **Develop a list of acronyms, both institutional and governmentwide.** Consult the standard universal acronym list provided by the Federal Demonstration Partnership (FDP) and supplement it with an internal institutional list (see the FDP Web site at www.thefdp.org). Include in the institutional section, any relevant financial system acronyms.

◆ **Create a list of commonly used terminology and associated definitions as reflected in internal policies, procedures, and systems.** Definitions within financial systems often dictate corresponding terminology cited in internally related policies and procedures. Since vendor-supplied systems may differ from institution to institution, so will the terminology and hence the need to document system-driven terms.

◆ **Review related federal regulations and make sure the institution has internal implementing policies and procedures in place to monitor compliance.** After the initial review, it is a good practice to perform periodic “re-reviews” of those policies and procedures to ensure any updates necessitated by changes in federal regulations or institutional policies have been captured and applied.

◆ **Review all related internal policies and procedures and determine:** Are they current? Do they match the needs of the university? Are they reasonable for the quantity of the work flow? Do they need to be updated to reflect electronic research administration processes? Have they been reviewed, approved, and accepted by the appropriate institutional officials? Have they been communicated to the research community? Are they readily available to all research administration-related parties?

◆ **Maintain a research-related website and determine:** Are links to all federal laws and regulations posted? Are links to all agency websites posted? Are links to all internal policies, procedures, and forms posted? Are links to all associated training opportunities posted? Perform a periodic review to confirm that all links are operational.

◆ **Establish an internal research community listserv.** This will facilitate communication with the institutional representatives responsible for various aspects of research administration. Utilize the listserv to announce new or revised regulations or policies. Establish a procedure to monitor the listserv participant list to ensure all pertinent parties are subscribed.

◆ **Provide ongoing education to the campus community through effective training.** Creating training programs enhances the knowledge and understanding of research-related laws, regulations, and policies and strengthens compliance. Training initiatives can be delivered by utilizing various methods and tools. The means used to communicate the necessary information to the research community should be well documented. To demonstrate delivery of training
programs, retain copies of training announcements, agendas, and presentation and handout material as well as participant attendance sheets. Training opportunities can be internal and external.

- **Gain familiarity with prior audits and their associated processes.** Reviewing prior sponsored program-related audits offers insight into the flow of the audit process. Read all available file documentation. Begin the assessment by reading the notification of audit letter or letter of engagement. Give particular attention to the scope identified in the engagement letter and

  - determine how the population and sample selections were chosen;
  - determine if there was an associated narrative;
  - review the current status of population and sample selections;
  - evaluate the current status of the files involved and look for any connected subsequent events; and
  - find out what institutional representatives were involved.

Read any file notes and correspondence connected to the fieldwork, including information related to any interviews and determine the following:

- Who was interviewed?
- How were they selected?
- What questions were asked?

Focus on the draft report and any subsequent versions of the audit report. Pay close attention to how the versions differ — what came out, what went in. Carefully read all sections of the final report and

- concentrate on the observations, findings, or weaknesses;
- take into account any management responses or corrective action plans;
- follow up to determine the status of the implementation of cited, modified, or enhanced internal controls; and
- confirm that all corrective actions have been implemented.

If there are any outstanding items still pending, obtain status updates, including estimated dates of completion. Continue monitoring all pending actions until final resolution has been achieved.

- **Review other institutions’ single or UGF reports.** A review of the data collection forms and any corresponding reportable conditions, weaknesses, or findings and associated management responses cited within the full report can provide insight into topical areas of national interest.

- **Review the OMB Compliance Supplement.** Each year the OMB publishes a Compliance Supplement to guide auditors in the conduct of single and UGF audits. It identifies important compliance requirements the federal government expects to be considered as part of an audit.
◆ Review other institutions’ sponsored programs administration-related websites. In conducting a review, be sure to consider the ease of navigation, formatting, and placement of related policies and procedures. Peruse the policies and procedures of peer and aspirant institutions. Compare philosophy and strategies and consider possible enhancements.

◆ Keep abreast of agency-specific audits by reviewing agency OIG reports. OIG reports are usually available on agency websites. These audit reports can provide awareness into potential areas of federal agency concerns. After researching audit reports, assess the institution’s strengths and weaknesses associated with the relevant internal controls. (For more on OIG audit reports and OIG audit work plans, see ¶3120.1.)

◆ Conduct a self-assessment. Conducting a self-assessment allows the institution to play “devil’s advocate” by performing an internal evaluation of the effectiveness of oversight and monitoring programs. The purpose of the assessment is to evaluate adherence to procedures to ensure quality levels and efficiency in relation to implementation of policies and procedures. A self-assessment is a self-audit and can be accomplished through various means and at various times. One example is to use system reporting tools to build standard queries that can be published and subsequently executed on demand by central or departmental administrators. Such queries can highlight awards or areas that may necessitate further review or oversight. Sample queries could cover

◆ active projects with expired term dates;
◆ projects in overdraft status;
◆ projects with subrecipients;
◆ projects with cost sharing commitments;
◆ projects with direct charges of a normally indirect nature;
◆ projects with past due or unbilled receivables;
◆ projects with actions pending sponsor approval; and
◆ projects in advance account status.

◆ Conduct a risk assessment. A risk assessment is a proactive approach used to identify unwanted surprises. It is a means to evaluate or gauge potential exposure and related damages the institution would face for a claim of noncompliance. It is a process used to assess and judge possible adverse events by measuring research administration knowledge and the effectiveness of procedural implementations. The degree of risk associated with a given topic is usually defined in financial terms, but damages can be more than monetary and can be based upon real or perceived noncompliance. Risk assessments are the identification and analysis of the probability of something going wrong. Risk priority is measured in terms of the consequence and likelihood of something going wrong. Indicators of risk where risk assessment may be warranted include the following:

◆ Fund balances consistently in overdraft

...
◆ High volume of cost transfers
◆ Inexperienced or ineffective research administrators
◆ High frequency of delinquency in meeting deliverables
◆ Continual delays in negotiating agreements
◆ Staffing constraints or reductions in key positions

When assessing the risk, prioritize the areas needing focus by measuring the likelihood and potential impact of the following due to negative exposure:
◆ Loss of institutional trust
◆ Loss of public trust
◆ Loss of sponsoring agency trust
◆ Loss of current or future funding

13105.4 Start of the Audit
Audits can occur at any time and with little advance notice. The usual means of contact commencing an audit is a notification of audit letter or letter of engagement. (An overview of the audit process is included as Figure 1.)

Audit Letter
The audit letter, sent by the office of internal audit, the authorized representative of the external audit firm, or the federal agency, frequently is addressed to the vice president or vice provost within the institution. The letter should state
◆ the program or topical area to be covered during the audit,
◆ the estimated start and end date,
◆ the anticipated amount of time for fieldwork, and
◆ the date, time, and location for the entrance conference.

The letter also should provide the names and contact information of the auditor representatives.

Audits should be managed by an institution’s central sponsored programs administration. Principal investigators (PI) and departmental administrators should be alerted to the possibility of receiving a request regarding an audit directly and if this occurs, encouraged to engage central administration immediately.

Central File. Receiving an audit letter is the first official notice pertaining to the audit and at this point, a central management file should be established. Copies of documentation produced, reviewed, or tested throughout the audit process should be maintained in the file, as well as other material. The file should be retained for institutional purposes and be readily available for reference during and after the audit.
Figure 1: Audit Process at a Glance

1. Audit Letter
   After receiving the audit letter, the institution should do the following:
   • Appoint a lead individual
   • Glean particulars of audit: scope, start/end dates, etc.
   • Establish central file
   • Prepare for entrance conference
   • Inform all potentially involved parties/offices

2. Entrance Conference
   During the entrance conference, the institution should do the following:
   • Understand scope
   • Discuss overview of audit process
   • Establish audit timetable
   • Establish audit reporting process
   • Begin to respond to data requests
   After the entrance conference, in preparation for the audit fieldwork, the institution should do the following:
   • Assign auditor work space
   • Hold staff meeting
   • Inform all potentially involved parties/offices not previously notified

3. Audit Fieldwork
   During the audit fieldwork phase, the institution should do the following:
   • Initially meet with on-site audit team; introduce lead institutional official
   • Respond to request for assistance package
   • Respond to data requests during sample selection and testing phase
   • Identify, analyze, and maintain copies of all relevant documentation
   • Document all communications
   • Involve internal audit, as appropriate
   • Prepare staff, PIs, others for interviews with auditors
   • Monitor and respond to any possible questioned observations
   • Keep audit on schedule and hold update meetings

4. Draft Audit Report
   After receiving the draft audit report, the institution should do the following:
   • Carefully review the document
   • Meet with auditors to discuss the report’s contents (wording, tone, accuracy, observations, opinions, findings, recommendations, etc.)
   • Prepare management response, including any necessary corrective action plan(s)

5. Exit Conference
   During the exit conference, the institution should do the following:
• Engage in an open discussion with auditors about the entire audit process
• Provide institutional feedback

6. Final Audit Report

After receiving the final audit report, the institution should do the following:
• Carefully review the document
• Review the report with staff members
• Discuss observations/findings/recommendations with affected parties
• Distribute to management
• Review management response and corrective action plan
• Appoint someone to oversee corrective action plan and proceed with implementation
• Periodically monitor corrective action plan progress

7. Follow-Up

Approximately 6 months after receiving the final audit report, the institution should do the following:
• Meet with the person appointed for oversight for follow-up review to verify implementation of correction action plan
• Prepare for the possibility of additional testing or interviews as appropriate
• Communicate with auditors indicating corrective action plan has been completed
• Check all record retention periods
• Update files as needed
• Review corrective plan for necessary updates to policies, procedures, etc.

Lead Individual

Upon receipt of the notification of audit letter, a lead individual responsible for the audit and for serving as the main liaison with the auditors should be appointed. This is one of the most important steps in the audit process. This person should be a topical expert in the area of the audit’s scope and should be knowledgeable regarding internal policies and procedures. Most, if not all, interactions with the auditors should occur through this lead individual. Appointing a lead liaison has many benefits, and therefore careful consideration should be given when determining who this person should be. This individual will be the point person who will not only represent the OSP but also represent the institution.

There are basic characteristics that this individual should possess. Ideally the individual will have been actively involved in previous audits. Experience is an invaluable asset and may be one of the most significant attributes one can bring to the process. This individual should be a subject matter expert and should possess knowledge of the related federal regulations, agency-specific terms and conditions, and associated institutional implementing policies and procedures. Consequently the scope of the audit plays a fundamental role in determining the lead individual.

In addition to subject matter expertise, an institution should consider communication methods, style, and ability as additional factors in selecting the lead individ-
Since most of the interactions with the audit team will be impromptu, frequent, and verbal, strong oral communication and interpersonal skills are vital. Once the individual is identified, he or she should assume immediate day-to-day responsibility for the audit and begin the preparation and strategy development in anticipation of the entrance conference.

**Entrance Conference**

The audit entrance conference serves many purposes. Most notably, it brings together the pertinent parties and provides an opportunity for all involved to review the scope of the audit as well as discuss an overview of the process, the projected timetable, and the reporting expectations. The conference begins with introductions of the main participants and usually is the first face-to-face meeting to occur. The lead responsible parties are identified at this time and it is essential that the institution’s appointed lead representative be present and be an active participant.

At the conference, OSP staff should try to gain an understanding of the auditors’ familiarity with sponsored programs administration by inquiring about their backgrounds and experiences with audits of higher education institutions. The tone, tenor, and demeanor of this initial interaction may set the stage and pace for the entire audit. Composure and self-control are fundamental and crucial attributes to demonstrate at this meeting and will be the foundation for establishing a professional working relationship with the auditors.

**Scope Document.** After the opening introductions, a scope document should be presented and copies made available by the audit team. The scope document should detail the purpose, objectives, and intent of the audit. This document becomes the reference point for any questions and requests for clarification during the audit, and therefore it is very important that any questions regarding the proposed content of the audit be addressed at this time.

In order for the audit to run as smoothly as possible, the scope needs to be well defined and thoroughly discussed at this first meeting. As the scope of the audit is discussed, clarity becomes the key focus. The scope determines the parameters of the audit, and it is essential that all parties clearly understand those parameters. The scope is the broad overview of the intent of the audit, and topical areas are lower-level details within the scope. For instance, cost sharing may be cited as the scope of the audit; topical areas might encompass the following:

- Related policies and procedures
- Tracking and reporting mandatory versus voluntary cost sharing
- Mandatory cost sharing agreement requirements
- Treatment of mandatory and voluntary cost sharing in the facilities and administrative (F&A) proposal
- Subrecipient monitoring of cost sharing commitments
- Related financial systems and controls
These topical areas should contain such detail that both parties understand what areas of internal controls will be evaluated and what source documentation will be tested. If there are questions regarding any topical area, the OSP should ask for clarification and refine the expectations at this point. A clear, comprehensive understanding of the topical areas of focus will help the institution prepare for the on-site fieldwork stage (see page 3105:12).

**Request for Information on Internal Controls.** Once the scope and topical areas have been well defined, the audit team will begin the request for information and data. Before fieldwork testing can commence, documentation of internal controls related to the scope are generally requested and reviewed by the audit team. The information and data request often includes current policies and procedures that are applicable to the scope of the audit as previously defined in the notification of audit letter. This is one of the primary requests for information and data and allows the audit team to become familiar with the related operations of the institution.

In reviewing the documents relating to internal controls, often the organization’s written procedures, the audit team will first identify and analyze the internal controls within processes. The purpose of this evaluation is to determine the adequacy, effectiveness, efficiency, reliability, and credibility of the process the institution has in place to assure compliance with laws and regulations associated with the audit’s scope. Written procedures are the most relevant form of source documentation because they describe the detailed processes the institution has designed and implemented to provide reasonable assurance that the stated objectives of adequacy, effectiveness, efficiency, reliability, and credibility are achieved.

The fieldwork testing is applied to determine the effectiveness of internal controls. The testing of internal controls is the means of validating the institution’s ability to oversee and monitor transactions related to the audit’s scope.

**Project Timetable.** Another detail to be discussed at the entrance conference is the project timetable. The timetable should include

- an indication of when the requests for information and data will be issued,
- when the on-site fieldwork is projected to begin and end,
- when a draft audit report will be available, and
- when a final report is expected to be issued.

Time lines should be established, the estimated milestone dates should be discussed, and outer boundaries should be agreed upon at this point.

It is crucial that the institutional lead pay close attention to the anticipated target dates. In discussing target dates, the lead individual should consider the staffing impact associated with each milestone and allow adequate time for institutional preparation and review while avoiding unnecessary delays. The audit should not be prolonged by establishing long-term time lines. However, an institution should consider how long it will take to do the following:

- Prepare the necessary parties for the audit
- Review the related federal regulations
◆ Review the related internal controls
◆ Pull and review requested sample files
◆ Pull, review, and copy sample transaction selections
◆ Prepare for and conduct potential interviews
◆ Prepare management responses to the draft audit report

**Reporting Process.** The last objective of the entrance meeting is to engage in a discussion pertaining to the reporting process. It is important to emphasize that the first iteration of any observations, recommendations, or findings is a draft report — a preliminary document — and therefore the audit team needs to share it with the lead responsible individual first. There should be a mutual understanding regarding the progression of the reporting process and the drafting of the report as a collaborative process that includes a sharing of and dialogue concerning items of potential concern.

Clear parameters and boundaries surrounding the audit process need to be established, well documented, and thoroughly understood. The entrance conference is an opportunity to discuss any ambiguities and uncertainties pertaining to the method of communicating preliminary observations. Since the draft report may contain issues that could be resolved by the institution’s providing additional explanations or documentation, it is imperative that the lead representative have the opportunity to review and comment on the draft prior to the report being distributed. If any misconceptions, misinterpretations, or misunderstandings occurred during the course of the fieldwork, resolution needs to happen at this early stage in the reporting process.

**Preparing for On-Site Fieldwork**

At the conclusion of the entrance conference and in preparation for the on-site fieldwork, the audit team continues to request data. Preliminary work is furthered by the auditors requesting and obtaining an overview of the institution’s processes for sponsored programs administration and possibly reviewing narratives and flowcharts, conducting interviews with key research administration staff, and examining internal documentation of processes and related policies and procedures.

**Auditor Work Space.** Prior to the onset of the fieldwork, a designated auditor working space needs to be assigned. If possible, it is preferable that this space be located away from the mainstream, day-to-day activities and routine operations of the office. Employees’ working environments should not be impacted, compromised, or disturbed. An audit does not replace, defer, or stop the regular work flow associated with proposal preparation, award negotiation, financial administration, etc. relating to sponsored programs.

To achieve work flow continuity and to sustain the same level of valued customer service to internal and external research community constituents during the audit, it is essential to safeguard against disruptions created by the audit fieldwork process. Preserving the privacy of all employees and their work areas will assist in meeting this objective. Having the audit fieldwork conducted away from the center of the normal office functions and everyday business traffic will reduce interference.
In addition, the space that is assigned to the auditors should be in an area that is equipped with appropriate office functionality including adequate desktop working surfaces, telephone access, and Internet connectivity. It is likely that the audit team will need to reproduce relevant file documentation as part of the fieldwork and, accordingly, easy access to a photocopier/scanner will help to diminish disruptions and distractions.

**Staff Meetings.** Prior to the arrival of the audit team, the OSP should conduct an informational meeting with all staff and

- explain the purpose of the audit and the expected time line;
- describe the fieldwork process and explain staff’s involvement;
- make clear the protocol to be followed while the audit team is on-site;
- reinforce the need and importance for all communications to be channeled through the lead designee and introduce this person;
- emphasize the fact that if staff is approached individually for information, whether oral or written, he or she needs to refer the auditor back to the institutional lead person (Questions and subsequent answers could be taken out of context when staff is approached individually.); and
- remind staff to be mindful of the auditors’ presence in the office while continuing to focus on daily responsibilities.

**Affected Parties/Offices.** The OSP should identify all campus-related parties/offices that are impacted by the scope of the audit and make sure they are aware that an audit has been initiated and understand the potential impact on the organization. All parties/offices should be apprised of the scope of the audit and advised as to the estimated extent of their involvement. For external audits, the OSP should remember to coordinate with the institution’s office of internal audit.

13105.5 **Conduct of the Audit**

On the first day of the fieldwork, the OSP should become acquainted with the on-site audit team and introduce them to the office staff. If there are audit team members present that were not at the entrance conference, the institution’s lead individual should review with them the scope document and timetables so everyone involved with the collection, testing, and evaluation of data is performing under the same principles.

The audit team should be given a general overview of the building that includes the locations of such areas as restrooms, cafeterias, snack bars, and vending machines. Making the audit team aware of the building and surrounding facilities will help eliminate questions and prevent distractions to office employees. Keeping the audit activity as separate, distinct, and independent from the daily work environment as possible will help maintain stability in normal operations and work flow.

The audit team should be supplied with a copy of a list of acronyms and commonly used terminology and associated definitions. Providing such reference materials will assist in decreasing the chances of possible misunderstandings.
Sample Selection and Testing Phase

Using the scope and population as defined in the engagement letter and refined during the entrance conference, the audit team will present a “request for assistance package.” The package contains a listing of documents to be produced including a sample selection as identified by the audit team. The sample selection is an extraction of the total population and becomes the test base. Selecting this sample allows the audit team to examine, on a test-case basis, the institution’s compliance with the requirements and standards applicable to research administration. Depending on the sampling methodology, auditors may draw conclusions about the entire population based on test results of the sample. This is referred to as an “extrapolation.” The sample is a test of the whole population and extrapolation takes the results of the sample and draws conclusions for the entire population.

Once the auditors have selected a sample and requested documentation, the OSP should pull all relevant files. Prior to delivery of the files to the audit team, the OSP should perform an analysis of the files and review the sample selections on behalf of the institution. All files should be in order and maintained in accordance with internal filing procedures, and all papers within the files should be relevant. The files should be well organized and properly structured to help facilitate the review process. Since the files may be in review for weeks or even months, placing an “out” card or other form of notification in the original filing site will serve as a means of communicating to staff the location of the file, should access to it be required for normal daily operations.

The testing phase requires the auditors to examine documents and, when necessary, obtain explanations. The chosen samples serve as illustrations of the effectiveness and adherence to internal controls. A common form of a sample selection is a representation of individual awards. After reviewing the chosen samples, auditors frequently request additional records and/or documentation. Documents often requested include transactional level-based supporting documentation and are used to test adherence to internal controls. Examples of such documentation include journal entries, cost transfer requests, cost sharing documentation, effort certifications, payroll appointment forms and records, purchase orders, and financial and technical reports. These forms of records and documentation are typically maintained in various files.

Oversight of Relevant Files. The OSP should be careful not to allow original source documentation to leave the office; if necessary, a copy of the documentation should be provided to the auditors. In addition a copy of all documentation should be made for the central file. For the record and for future reference, each document should be dated, initialed, and reviewed prior to presentation to the audit team. It is important for OSP staff to understand the applicable federal and institutional policies pertaining to the document selections. Staff should be conscious of what information is requested and what information is being presented; testing provides the evidence necessary for the audit team to draw conclusions and derive subsequent opinions.
Documenting Communications
Throughout the audit, the OSP should
◆ document all communications, written and verbal;
◆ take and date file notes of all verbal communications, including on-site meetings and telephone conversations (Many times, clarifying conversations occur subsequent to the auditors’ evaluation of the transactional level-based records.); and
◆ maintain a reputation for credibility and provide information that is consistent with what was requested, but no more or no less.

The OSP should provide access to evidential material as requested and make sure the request is completely understood by both parties. An OSP should thoroughly analyze the request to make sure all references to federal regulations are current and cited and tested appropriately. For example, upon review of a multiyear grant from the National Institutes of Health (NIH), the auditor might test payroll transactions against an outdated NIH salary limitation and therefore come to an erroneous conclusion. Maintaining an open dialogue and discussion allows issues such as these to be addressed and resolved before they become auditor-documented conclusions.

Interviews
It is not uncommon for audits to include interviews. Interviews should not be impromptu conversations between the auditors and selected institutional personnel. All interviews should be coordinated by the institution’s lead audit person. Prior experience in this area is invaluable. Frequently the audit team will first interview key personnel within the sponsored programs offices to learn more about the operations and gauge management’s knowledge of the topical areas. The interviews further provide the auditors with an understanding of management’s characteristics and influence over the organization.

An OSP should prepare the affected research community by arranging mock interviews to be used as a “dry run.” All key personnel and associated departmental administrative managers should be part of a dry run. Questions should be anticipated and a checklist of potential scope-related inquiries should be developed. Potential interviewees should be told about the purpose of the audit and the intent of the interview process. Instructions on how to craft responses to questions asked during the interview should be provided.

PIs associated with the chosen sample selection are potential interviewees. If the auditor requests an interview with a PI, the PI should be asked to prepare for the interview by reviewing supporting source documentation such as personnel appointment forms, monthly payroll records, labor distribution and redistribution records, and effort certifications. In the review, related documentation such as award budgets, budget justifications and narratives, and financial and progress reports should also be considered. A review of related policies, procedures, and source documentation can help refresh the potential interviewees’ recollections, as some audits may include a review of past years’ activities.
PIs and other potential interviewees should be prepped for the interview and provided some interview tactics as included in Figure 2 (see page 3105:16). It is important to remember that the institutional lead individual should not only be present during interviews, but should intervene when it appears that the interviewer(s) and the interviewee are not effectively communicating and to make sure there is little room for misinterpretations between parties.

Interviews may be conducted with various central and departmental sponsored programs personnel. Interviews can bear heavily on the conclusions and outcome of the audit and since the interviews are verbal, the source documentation is an auditor’s written transcript of the discussion. Misinterpretations potentially can occur on both sides. The interviewee may not understand the background scope of the audit or the intent of the question and may reply out of context. In doing so, the auditor may derive a conclusion based on a partial or nonsubstantive, nonsubject-matter answer. Therefore it is important that the lead individual always be present and take detailed notes during any interview.

At any point, if the lead individual gets the impression the interviewee and the auditor are not on the same wavelength, he or she should request an opportunity for clarification of either the question or the response. This allows for consistency and reliability in the information generated during the interview. For the institution, this will also be beneficial at the management-response stage (see page 3105:18). Interviews become part of the official audit source document and are sometimes referred to in the audit report. To effectively respond to citations regarding interviews and to clarify and/or expound on the institution’s position, every effort should be exhausted to ensure that the interview process is not open to interpretation.

**Ongoing Involvement**

During the course of the fieldwork, the OSP should remain involved by

◆ observing the daily activities of and requesting daily status updates from the audit team;

◆ making a concerted effort to keep the audit on schedule; and

◆ periodically requesting a listing of any potential questioned costs or findings.

Some issues can be cleared up quickly and observations or findings obviated if the auditors ask for follow-up explanations upon preliminary discovery of issues. Sometimes conclusions based on fieldwork are not taken in proper context or are in error, misleading, or trivial in nature. Bringing these to light early in the process allows the institution the opportunity to present additional justification and may subsequently resolve any issues raised.

In addition OSP staff should be mindful of possible “scope creep.” Scope creep occurs when the audit starts to drift away from the original defined parameters, and questions or requests for documentation extend beyond the stated boundaries as agreed upon in the entrance conference. In such an instance, OSP staff should refer back to the entrance conference materials and discuss the defined scope with the audit team. Should the discussions result in an impasse and resolution with the audit...
Figure 2: Tips for Interviewees

Interviewees should be reminded about the following:

- During the interview, listen to the question. To accomplish this, do not interrupt, do not anticipate the question, and do not finish the interviewer’s question. If the question is in relation to hard-copy documentation, ask for time to see and review the documentation prior to responding.

- Think first, speak second. Take as much time as you need to adequately refresh your memory before responding to a question. Suppress the desire to respond immediately.

- Before speaking, relate the question to the applicable federal law or regulation and the institutional implementing policy or procedure.

- Respond honestly and truthfully based on transactional file documentation, personal knowledge, and experience.

- Suppress the inclination to explain everything you know about a topic and to demonstrate to the auditors your vast knowledge base.

- Articulate your answer mentally before verbally responding to the question. Think about the statement you would like to make before you make it. Keep your answers short and concise.

- Remain calm and do not personalize the interview. Set emotions aside.

- If, after responding to a question, clarification is requested, cite the source of the information provided and maintain your confidence.

...
‘Questioned’ Costs
Concerns surrounding any potential “questioned” costs should be addressed as soon as they arise. Questioned costs are those costs that through testing to date leave the auditor with a level of uncertainty or doubt as to their allowability or appropriateness.

Questioned costs can arise due to real or perceived
◆ noncompliance with a federal law or regulation or agency term and condition,
◆ noncompliance with internal controls, or
◆ inadequate supporting documentation.

Should a questioned cost be identified, the OSP should request that the auditor narrow down the rationale for the opinion. The auditor should be asked to supply the reference to the applicable law, regulation, agency guideline, or internal control that was used, and the citation should be reviewed to determine if the most relevant or most recent version is being used.

The audit team should be asked further to cite the area of perceived violation whether it involves a federal regulation, agency term and condition, internal control, or occurrence of inadequate documentation. The OSP should review all source documentation, federal regulations, or agency terms and conditions in order to assess the issue. Any conclusion an OSP comes to should be documented and retained in the file.

The questioned costs should be discussed with the audit team. The OSP should share its conclusions and relevant supporting source documentation with the audit team and ask for the costs in question to be reviewed again. If the institution does not provide the necessary documentation in support of the costs charged to an award, the auditor may consider the cost questionable and disallow the expenditure. Therefore maintaining file documentation — including a written justification supporting decision making for actions taken during the life of an award — is not only prudent management, but also provides the necessary backup to support administrative actions and decisions questioned during an audit.

Draft Audit Report
After analyzing, interpreting, and documenting information obtained during the audit, the audit team will prepare a draft report. The draft may include auditor observations not previously disclosed. Therefore it is imperative that the draft report receive careful review by the institution. Upon review, if any findings, reportable conditions, or questioned costs are cited, the OSP should meet with the auditors and inquire about such items, as follows:
◆ Ask not just what the opinions, findings, or conclusions are but also how they were arrived at.
◆ Question the decisions made leading up to the conclusion.
◆ Inquire as to how the supporting documentation provided leads to the conclusion.
◆ Revisit the original request for and sample selections to formulate an institutional opinion and response.
◆ Review file notes from status meetings.
◆ Open a dialogue with the audit team; deliberate both sides’ positions.
◆ Justify responses with supporting documentation and references to applicable rules, regulations, and/or internal controls.
◆ Be persistent in stating the institution’s position; maintain confidence.
◆ Attempt to resolve identified issues and reach agreed-upon corrective action plans.

**Management Response.** Before a final report is issued, a management response to the draft report is requested by the audit team. A management response is an evaluation and statement of the institution’s position in response to the auditors’ observations, recommendations, and findings. With respect to each issue raised in the report, there generally are three components for consideration when constructing the management response:

1. Does the institution agree or disagree with the issue?
2. What is the corrective action plan to address the issue?
3. What is the target date for implementation of the corrective action plan?

With respect to corrective action plans, the institution should use sound judgment in articulating the management response. It should formulate corrective action plans based on the draft report and ensure that corrective action plans are reasonable and attainable within the time frame cited. The cost of the corrective action plans should not exceed the expected benefit. An institution should be flexible in determining the necessary resources and approach, taking into consideration changing resource availability. A corrective action measure needs to provide reasonable, not absolute, assurance that an objective will be accomplished. A corrective action plan should be an appropriate response to the findings. If during the drafting of the report mutually agreeable conclusions were not arrived at, it is imperative that the institution restate, with supporting details, its position.

**Exit Conference**

The final step in the on-site audit process is an exit conference. The exit conference brings back together personnel from the entrance conference and serves as a means to discuss the entire process, observations, outcomes, and management responses to determine if any follow-up action is necessary or required. A frank, detailed discussion surrounding any issues that arose during the audit should occur and should include any indications or intentions for follow-up actions. Institutional feedback at this point in the process is important and can help facilitate and improve future audit interactions.

**3105.6 Final Audit Report and Follow-Up**

The next phase of the audit is the delivery of the final report. Typical sections of the report are
◆ an executive summary;
◆ a restatement of the scope, objectives, and internal audit procedures;
◆ subsequent observations and recommendations; and
◆ management’s response and action plans.

The final report may also include a summary of the audit process undertaken. The summary of the process includes a listing of the audit procedures performed and the outcome of each, including any observations, findings, or reportable conditions. (After each finding or reportable condition, management’s action plan or corrective action plan is listed, with an anticipated date of completion.) The report is distributed to management.

After the final report has been issued, the institution should do the following:
◆ Review the audit process and the report with staff members and talk about lessons learned.
◆ Discuss any observations, findings, or recommendations with all affected parties.
◆ Review the management response, including corrective action plans and implementation timetables.
◆ Develop a plan for periodic oversight and monitoring of progress towards meeting the management response goals.
◆ Appoint parties responsible for each outstanding observation and assign interim expected completion dates for any corrective action plans, including relevant training to the research community.
◆ Provide a system to track follow-up measures until all corrective action plans have been fully implemented.

Follow-Up Review and Remediation

Typically the audit will include a follow-up review that occurs approximately six months after the issuance of the final report. The review is conducted to verify that the institution has implemented all stated corrective action plans. This follow-on review may include additional testing and/or interviews as a means of verification. A letter indicating whether all corrective action plans have been satisfactorily implemented will be issued by the audit team. If the status of the implementation of the corrective action plans is found to be unsatisfactory, other management responses may be required, as well as another follow-up review. When all plans are found to be implemented satisfactorily, the audit is complete and any findings are considered to be remediated.

Record and File Retention

After remediation, on-site follow-up actions need to be completed. Audits may have an impact on record retention periods. All terms and conditions associated with record retention requirements for all awards should be reviewed. This step is extremely important for any awards in which the term date has expired. It is not uncommon
for a record retention clause to include a statement extending the expiration date of the retention period and access requirements beyond the normal period due to litigation, claims, or audits. File notations and system data elements should be updated accordingly. Since the sample selected files and supporting source and transactional documentation used in the audit are original, official records of the institution, all such files and documents should be returned to their proper locations.

The management-constructed audit file (the “central” audit file) should be reviewed for copies of the following items:

- Letter of engagement
- Notes from the entrance conference
- Notes or narratives from any interviews conducted
- Listing of all policies and procedures reviewed
- Listing of the population and sample selections
- Source documentation requested and/or tested
- Drafts of the audit report
- Drafts of management responses/corrective action plans
- Notes from the exit conference
- Final report
- Follow-up review actions
- Resolution

Corrective action plans should be reviewed for any necessary updates to institutional policies, procedures, or Websites, and all revisions to such that have been implemented should be verified and documented. Confirmation that the institution’s research community at large has received notification of any corresponding updates should be ascertained and placed in the file as appropriate.

### 3105.7 Conclusion

Does the size of the institution impact the audit process? Should different tactics be followed for smaller institutions? Whether the institution is small, mid-sized, or large or public or private, the philosophy behind an audit is still the same — to assess and address any systemic compliance and accounting controls and problems that may exist. Every institution should plan for an audit accordingly — and in the same manner — by assuring that it has adequate internal controls in place and knowledgeable personnel on staff to facilitate the audit.

However, differences in audits do exist from institution to institution. First and foremost the outcome of an audit is heavily dependent on the institution’s preparedness. The control environment established within institutions varies greatly and therefore is a determining factor in the outcome. In addition the audit process and outcome can differ from institution to institution as well as from audit to audit with-
in an institution, depending upon the experience level of the auditor. An institution can proactively evaluate and gauge its preparedness and readiness for an audit by conducting a self-assessment of its internal controls. By establishing, implementing, and periodically testing internal controls for compliance, reliability, and integrity, an institution begins — and continues — the preparation for future interactions with auditors. (For a full discussion of self-assessment activities, see Chapter 3900.)
Supplementary Material

This section includes expanded coverage of topics relating to interactions with auditors — external and internal. These materials are culled from a variety of authoritative sources.

Importance of Offices of Inspector General Audit Reports and Priorities

AIS editors

The concerns about specific compliance requirements that are addressed in Circular A-133 audits often are reinforced by audit work performed by federal Offices of Inspector General (OIG) or by public accounting firms under contract to them (see Figure 3120.1). Like auditors performing the Circular A-133 audit, auditors from the OIGs or independent auditors performing audits under contract to the OIG must follow the Government Auditing Standards (the Yellow Book, available at www.gao.gov/govaud/ybk01.htm).

These reviews are undertaken despite the fact that the covered institutions have undergone the annual Circular A-133 audits. Federal auditors generally point to their broad statutory authority under the Inspector General Act. This is restated in §__.215 of Circular A-133, “Relationship to Other Audit Requirements.” Taken together, those policies permit supplementary audits, as long as they are planned and performed “in such a way to build upon work performed by other auditors.” As the National Science Foundation OIG explains in its semiannual reports, “The findings contained in A-133 reports help to identify potential risks to ... awards and are useful ... in planning site visits, post-award monitoring, and future audits.”

OIG audits are typically post-award and take place after the conclusion of the contract or grant or other assistance agreement and before the end of the required record retention period. In general, the subjects of post-award audits are the costs incurred, and the audits will be conducted either in person or via a desk audit. Documentation of expenses is closely looked at during these audits.

The closeout process is the perfect preparation for a post-award audit. This process is the final review of items such as incurred costs, including effort, cost transfers, and direct charging of clerical and administrative costs before submission of the final financial report. Unallowable costs not previously detected should be removed at this time, and documentation not previously provided should be obtained for costs.

The Targets of OIG Audits

The OIG annual audit plans or work plans provide insight into the areas that the OIG will target for audit in the fiscal year. These plans are issued at the beginning of each fiscal year, usually during October. The audit areas listed in the plan serve as a heads-up for institutions as to what the OIG is looking for.
Audit Reports and Work Plans

As audits are completed, the OIGs generate “audit reports.” Many audit reports are posted on individual agency OIG Web sites (see box below). Reviewing audit reports can be instructive. They can provide awareness into potential areas of federal agencywide concern and serve as a catalyst for conducting an internal assessment of the strengths and weaknesses of an institution’s policies and practices and the extent to which an institution’s policies and practices are being followed. (For a full discussion of self-assessment, see ¶3905.) The Department of Education, NASA, the Energy Department, and the Defense Department, among others, have also been somewhat active in this arena.

The HHS OIG has focused on compliance with cost principles, including cost transfers and cost sharing, how subrecipients manage their costs, administrative and clerical salaries, and salary and effort reporting. In FY 2008 it added financial conflicts of interest to its audit list.

The NSF OIG in its annual audit plan usually lists as a target area review of the adequacy of grantee systems to safeguard and properly account for NSF funds and comply with federal and NSF award requirements. The NSF OIG also initiated a review of labor effort at universities that receive the largest amounts of NSF funding because of the findings of the HHS OIG audits on the issue at major universities.

Although not the only federal funding agencies to conduct audits of awardees, because they are major federal funding agencies, examining the annual audit plans of the HHS and NSF OIGs can be highly instructive.

OIG Audit vs. A-133 Audit

One difference between the OIG audits and the A-133 audits is that the OIG auditor will always review the grantee’s policies and procedures on an audit issue. This is done to determine whether the policies and procedures conform to federal regulations and grant requirements, including the circulars and the grant document, and whether the grantee actually follows its policies and procedures. Many audit findings cite the grantee for unclear policies and procedures or for failing to follow its own policies and procedures.

The OIGs also summarize the results of high-profile audits in a semiannual report to Congress. Under the Inspector General Act of 1978, as amended, each federal OIG is required to issue a semiannual report to Congress providing certain standardized data as well as a narrative summary of the major issues and vulnerabilities experienced in agency programs, functions, and activities. (Agency inspector generals are required to report semiannually on the activities of the office during the 6-month periods ending March 31 and September 30. These reports are “dated” March and September of each year, but they are often published later than the date they carry.) Particularly for those federal agencies that provide significant amounts of federal assistance to higher education institutions or award research and other contracts to such institutions, the semiannual reports of the inspectors general can provide numerous indicators of the areas that are receiving greater scrutiny or that are causing compliance difficulties.

Another resource for identifying OIG audit targets is the audit of the agency grants management programs conducted by the OIG or the Government Accountability Office. Whatever weaknesses are exposed in the audit of the agency is likely to surface in an audit of the grantee as well. For example, if an agency is criticized for not ensuring timely delivery of reports, it is likely that during an audit of the institution, the auditor will review the filing dates of the required reports.

Trend in NIH Cost Recovery under OIG Audits

According to the GAO report, OIG completed an average of three audits per year of NIH grants at universities during this period. OIG conducts its audits at its discretion subject to the availability of its audit resources. (Again, because of the risk of improper payments under the Medicare and Medicaid programs, the majority of OIG funding is used for audit work related to these federal programs.) The OIG audits issued from FYs 2003–2006 that GAO reviewed generally focused on particular grants and the university’s compliance with rules and regulations that pertained to them, rather than providing a broad examination of the university’s internal controls and compliance with laws and regulations pertaining to federal funding. (This is more properly the focus of A-133 single audits, see ¶1305.)

However, focusing on problems in claiming costs for a specific grant can uncover systemic internal control problems that could affect other federal grants, according to GAO. For example, an OIG audit found that a university overcharged $37,780 in direct and indirect costs associated with an NIH grant, which, in turn, revealed a systemic weakness in the university’s procedures intended to ensure proper accounting for the time and activity of individuals working on its grants. Other issues that were identified as a result of OIG and single audits included unallowable costs claimed, incorrect accounting for indirect costs, allocation of costs to the wrong grant, and insufficient monitoring of subrecipients.

GAO found that NIH did not always require universities to reimburse the full amount of costs questioned. Of the seven OIG audit files reviewed by GAO for the period FYs 2003–2006 with monetary findings, GAO found that NIH recovered the full amount of costs questioned in two cases and recovered less than the full amount in five cases. In total, OIG questioned about 12 percent of the funds that it audited. Of the $1.5 million in funds questioned, NIH recovered $864,860. This represents about 56 percent of the OIG’s questioned costs that NIH determined were insufficiently justified (see Figure 3120.1-2).
Awardee Cost Justifications. NIH recovered less than the full questioned costs in the OIG audits, according to GAO, because in reviewing the audits, NIH determined that the costs in five cases were sufficiently justified by information provided by the grantee and input from NIH staff responsible for overseeing scientific progress associated with the grant. NIH staff sometimes accepted documents that OIG did not accept as sufficient evidence to support claimed costs. For example, for one university OIG could not determine who requested certain services and whether the costs were allocable to the grant. Although the university had presented invoices as support, the corresponding purchase requisitions, which contained the necessary information to address OIG’s inquiry, had not been retained. Subsequently, NIH accepted the invoices as support and determined that approximately $119,000 of questioned costs were acceptable and did not need to be reimbursed.

In other cases, universities provided additional documentation to justify the costs that were claimed. For example, in one case, OIG found that costs associated with time and effort spent by summer and part-time labor were unsupported and other costs were incorrectly charged. The university provided alternate documentation for these costs, which OIG did not accept. However, after a review of the facts and internal discussions with NIH staff responsible for overseeing the grant’s scientific progress,
NIH accepted the documentation in conjunction with additional explanatory information from the university and ultimately determined that the approximately $193,000 in costs claimed were acceptable.

*Audit Determination Letter.* NIH officials told GAO that if a university disagrees with its determination of the appropriate audit resolution, the agency issues an audit determination letter. The audit determination letter specifies the amounts to be returned, including accrued interest, and any corrective actions to be taken. Universities have the right to appeal an audit determination letter. NIH told GAO that an audit determination letter is rarely needed because universities and NIH almost always agree on the resolution of audit findings.
What Auditors Look For

Since the mid-1970s, federal grant requirements have imposed a responsibility upon academic institutions to undergo audits on an organizationwide basis and review a sampling of grant transactions. This audit is customarily conducted by an auditor engaged by the institution — usually a certified public accounting firm. In some cases, this external audit is conducted by a governmental organization, such as the state auditor or auditor general. These audits are sometimes viewed as the federal government’s “first line of defense” in determining whether financial information is accurate, internal controls (policies and procedures) are in place and working, and compliance with laws and regulations affecting claims for federal funds is achieved. OMB Circular A-133, Audits of States, Local Governments, and Non-Profit Organizations, prescribes this audit requirement for federal grantees. (Copies of Circular A-133, as well as other OMB circulars, can be found at www.whitehouse.gov/omb/circulars.)

Audit Standards

Understanding the standards and resources an auditor must and will rely upon during the conduct of an audit should enable research administrators to ensure more accurate, efficient, and compliant audits. A critical ingredient to “audit readiness” is an awareness of the types of requirements that will be tested as part of the examination. (For more on preparing for an audit, see ¶3105.3 and ¶1305.14.)

In performing an A-133 audit, auditors must follow the Government Auditing Standards (GAGAS), or “Yellow Book,” which is issued by the federal Government Accountability Office (GAO). (Copies of the Yellow Book are available at www.gao.gov/govaud/ybk01.htm.) GAGAS addresses two kinds of audits — financial and performance. An audit performed under OMB Circular A-133 is a “financial audit” within the meaning of GAGAS.

For financial audits, the Yellow Book incorporates standards established by the American Institute of Certified Public Accountants (AICPA), specifically the three fieldwork and the four reporting standards of the Generally Accepted Auditing Standards (GAAS) and the implementing guidance referred to as Statement of Auditing Standards (SAS) (see www.aicpa.org). For financial audits, GAGAS imposes five additional requirements on auditors, and A-133 adds more requirements with regard to internal control and compliance with laws, regulations, and terms and conditions of federal awards (at §100.500 of Circular A-133).

The feature that distinguishes an A-133 audit from an audit conducted under GAAS or GAGAS is the identification of “major” federal programs. The federal government, as a matter of policy, has determined that certain programs, while not necessarily material to the overall financial statements of an institution, are nevertheless important to awarding agencies.
Circular A-133 reflects the notion that larger, more risky, federal programs should be subjected to mandatory procedures. Determination and auditing of major programs is one of the major problems found in A-133 audits.

**Major Federal Programs**

The component of a Circular A-133 audit that distinguishes it from other GAGAS audits is the determination of major federal programs. Essentially, a major federal program is a program that, based upon a variety of factors, is deemed to be subject to an inherently high risk of material noncompliance. As part of the risk assessment that an auditor undertakes in order to determine the extent of substantive testing that must be accomplished, the auditor uses the risk-based strategy established in §__.520 and §__.525 of Circular A-133.

If an auditor designates a program high-risk, the next audit inquiry is whether the internal controls over the federal program are sufficiently well designed and operational to conclude that the system could prevent or detect material noncompliance. If the internal control system is well designed and placed in operation, the auditor can sample fewer transactions to arrive at the level of evidence needed to make a compliance determination. In the converse, if the internal control system is poorly designed or haphazardly followed, then the auditor would have to review a significantly greater number of transactions to determine whether the organization has complied in all material respects with the applicable laws and regulations.

**Risk-Based Strategy.** The risk-based strategy prescribed in §__.520 and §__.525 of Circular A-133 represents a significant departure from previous federal thinking on the approach to auditing federal programs. Unlike prior approaches that focused exclusively on the size of the award, Circular A-133 uses dollar size as one factor — but not the exclusive factor — in determining major programs. It instructs the auditor to differentiate programs according to whether they are large (Type A) programs or smaller (Type B) programs. The amount of federal awards expended serves as the dividing line between Type A and Type B programs.

Once the auditor has identified Type A and Type B programs, he or she assesses the program’s risk of material noncompliance in accordance with the factors in §__.525 of Circular A-133. None of the factors listed in §__.525 is determinative by itself; the auditor considers all factors and documents the risk assessment process in the working

---

**Reminder**

The American Institute of Certified Public Accountants has posted a number of illustrative auditor’s reports to its Web site. Auditor’s reports under government auditing standards are taken from Appendix A of the recently released 2007 AICPA audit guide, Government Audit Standards and Circular A-133 Audits. Also posted to the site are examples of the report on compliance with requirements applicable to each major program and on internal control over compliance issued under OMB Circular A–133 in various circumstances. Link: [http://gaqc.aicpa.org/Resources/Illustrative+Auditors+Reports](http://gaqc.aicpa.org/Resources/Illustrative+Auditors+Reports).
papers. Circular A-133 states that if the risk assessment is accomplished in the manner prescribed in the circular, the auditor’s judgment with respect to which programs should be deemed major “shall be presumed correct.” However, one additional factor that will influence risk assessment in the future is if a federal agency issues instructions to consider certain types of risk. The circular states that the auditor “shall consider such guidance” in Circular A-133 audits.

The risk assessment will lead to four categories of federal programs:

- High-risk Type A  
- High-risk Type B  
- Low-risk Type A  
- Low-risk Type B

Circular A-133 requires the audit of enough programs to cover at least 25 percent or 50 percent of the federal fund expenditures, depending upon whether the institution is classified as low-risk (25 percent) or high-risk (50 percent). In addition to the risk assessment, the auditor may consider other factors in deciding which programs to include in the audit. Section ___520 sets out certain factors to consider as risk indicators:

1. Current and prior audit experience
2. Oversight by federal agencies and pass-through entities
3. The inherent risk of the federal program

Financial Audit

Under GAGAS, financial audits encompass financial statement audits and other audits, including reports on internal control, compliance with laws and regulations, and provisions of contracts and grant agreements as they relate to financial transactions, systems, and processes.

Financial Statement Audit. The primary purpose of a financial statement audit, according to GAGAS, “is to provide reasonable assurance through an opinion (or disclaim an opinion) about whether an entity’s financial statements are presented fairly in all material respects in conformity with generally accepted accounting principles (GAAP) . . . .”

Circular A-133’s discussion of the scope of the financial statement audit mirrors the objectives of a GAGAS financial statement audit and adds a requirement (see §___500(b)). The auditor is instructed to determine whether the
