Sponsored Research Administration

A Guide to Effective Strategies and Recommended Practices

Marc Schiffman
Editor

Published by the National Council of University Research Administrators (NCURA)
Sponsored Research Administration: A Guide to Effective Strategies and Recommended Practices is a three-part publication that includes

1. A comprehensive two-volume looseleaf Guide
2. Quarterly updates with new and revised content for the Guide
3. A fully searchable CD with all of the contents of the Guide

Other Resources From NCURA

Regulation and Compliance, a 200-page compendium of regulations and certifications applicable to sponsored programs, with one-two page summaries of more than 100 separate laws and regulations

Acknowledgments

Editorial Advisors

During the creation and initial publication of the Guide between 2005-2008, the following individuals served on the Editorial Advisory Board:

Richard Seligman
Editorial Director and Chair, Editorial Advisory Panel
Associate Vice President for Research Administration
California Institute of Technology

Michele M. Codd
Associate Director
George Washington University

Christina K. Hansen
Assistant Vice Chancellor (retired),
Office of Research Administration
University of California, Irvine

Stephen Hansen
Associate Provost for Research and
Dean, Graduate School
Southern Illinois University
Edwards ville

Marti L. Dunne
Associate Vice Provost for Research
Compliance and Administration
New York University

Principal Authors

John M. Carfora
Associate Director for Research
Advancement and Compliance
Loyola Marymount University

Marti L. Dunne
Associate Vice Provost for Research
Compliance and Administration
New York University

Stephen Erickson
Director, Research Integrity and
Compliance
Boston College

Denise J. Clark
Associate Vice President for
Administration and Chief of Staff,
Division of Research
University of Maryland, College
Park

Patrick Fitzgerald
Associate Dean for Research
Administration, Faculty of Arts &
Sciences
Harvard University

Julie Cole
Director of Research Costing
Compliance
Duke University

Kenneth G. Forstmeier
Director, Office of Research
Information Systems
Pennsylvania State University

Stephen D. Dowdy
Director, Assistant Director, Office of
Sponsored Programs
Massachusetts Institute of
Technology

Milton T. Cole
Assistant Vice President, Academic
Affairs
Villanova University
Acknowledgments

Stephen Hansen
Associate Provost for Research and Dean, Graduate School
Southern Illinois University
Edwardsville

Ann M. Holmes
Assistant Dean, Finance & Administration
University of Maryland, College Park

Kathleen S. Irwin
Distinguished University Legal Counsel
University of Wisconsin, Madison

Robert A. Killoren, Jr.
Associate Vice President for Research (former)
The Ohio State University & Executive Director of the Research Foundation

Gunta J. Liders
Associate Vice President, Research Administration
University of Rochester

Peggy S. Lowry
Director (retired), Office of Sponsored Programs and Research Compliance
Oregon State University

David J. Mayo
Director of Sponsored Research
California Institute of Technology

Elizabeth Mora
Acting Vice President for Finance, Associate Vice President for Research Administration (former)
Harvard University

Kim Moreland
Associate Vice Chancellor for Research Administration and Director, Research and Sponsored Programs
University of Wisconsin, Madison

Julie T. Norris
Director Emeritus, Office of Sponsored Programs
Massachusetts Institute of Technology

Susan Wyatt Sedwick
Associate Vice President and Director, Office of Sponsored Projects
University of Texas at Austin

Mary Ellen Sheridan
Associate Vice President for Research (retired)
University of Chicago

Alice Tangredi-Hannon
University Research Compliance Officer
Yale University

Denise Wallen
Director, Research Officer and Senior Fellow, Research Assistant Professor
The University of New Mexico

Jane A. Youngers
Assistant Vice President, Research and Sponsored Programs
University of Texas Health Science Center, San Antonio

Additional Contributors

Foreword

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

Sponsored research administration as a profession is only slightly more than a half-century old. It arose largely as a result of significant government investment in basic research in the sciences and engineering at colleges and universities, which began during World War II and expanded in the post-war years. In the early years of research administration at universities, it was hardly a full-time job, let alone a profession. The duties were relatively simple and straightforward: Help those relatively few faculty members interested in obtaining research grants get their proposals submitted on time; then when the award comes in, make sure that it gets to the right people on the campus—including the accountants who have to submit the bills and keep track of the payments.

The emergence of research administration as a profession has occurred within my lifetime. The National Council of University Research Administrators (NCURA) was formed in 1959, the year in which I graduated from high school. It was not until 1965 that the University of California, Los Angeles (UCLA) established its Office of Extramural Support, where I was to begin my career in research administration in 1975. Prior to 1965, the responsibilities for research administration at UCLA were handled by an administrator in the business office who also had many other duties and responsibilities.

Turning to the first decade of the 21st century, we find that virtually every college and university has a sponsored research, or sponsored programs, office and that NCURA has grown to an organization with more than 5,000 members. The fundamental responsibilities of the research administration office, however, have not changed—assist faculty members to get their proposals submitted on time and the awards received and processed. There is very little else about research administration, however, that hasn’t changed since the humble origins of the profession.

The world of research administration has become complex and specialized, and thus the motivation for this publication, Sponsored Research Administration: A Guide to Effective Strategies and Recommended Practices. Today it is extremely difficult, if not impossible, for one individual to know all there is to know about research administration. Whether one works in a central administrative office or at the school, college, or departmental level, the world of research administration encompasses a variety of topics about which the research administrator needs to be knowledgeable.

With the assistance of a highly creative Editorial Advisory Panel, we have identified an initial set of topics that are critical to the field of research administration. On an ongoing basis, we will continue to identify important topics and add to the initial set. In every case, we seek out the leading practitioners in each of these fields and invite them to write a chapter on the topic that is their particular specialty. What a wonderful opportunity this provides. Think of it as a series of mini-appren-
ticeships with the very best and brightest research administrators in the country. A journey of a thousand miles begins with but a single step. Our journey through the world of sponsored research administration begins with coverage of some fundamental and critically important aspects of this profession. Future updates to the Guide will contain revisions, additions, and enhancements to existing chapters and include additional chapters, where appropriate.

Index
Index:1-Index:11 (October 2017)
How to Use the Guide

Tabs and Chapters

*Sponsored Research Administration: A Guide to Effective Strategies and Recommended Practices* (the *Guide*) uses tabs (dividers) to designate chapters. Tabs for chapters contain the beginning paragraph numbers for information contained therein (e.g., ¶1200). References to entire chapters cite initial paragraph numbers (e.g., Chapter 300). As more chapters are added to the book, correspondingly new tabs with new paragraph numbers will be added.

Within each chapter, readers will find different types of material — narrative content, supplementary materials, practical tools, case studies, policies, resources, etc. — that will be added to the *Guide* and updated over time. As more content is added to each chapter, correspondingly new paragraph numbers within each chapter will be added (e.g., ¶720).

Contents Listing

The *Guide* is a two-volume information service. A Master Table of Contents for both Volumes 1 and 2 of the *Guide* appears as the first tab and precedes this section on “How to Use the Guide.” The first page in Volume 2 is a contents page for the material in that volume. In both volumes, the page that immediately follows each tab (divider) is a detailed contents listing for the information contained therein.

Page/Date Listing

A Page/Date Listing is located behind the Master Table of Contents. It lists the most current date for all pages in the *Guide*, allowing users to verify that they have the most recent version of any individual page and that their copy of the *Guide* is updated completely. The Page/Date Listing is revised with each update to the *Guide*.

Paragraph Numbers

All references in the *Guide* are to chapters or paragraph numbers, which appear within the text of chapter material. Skips in paragraph numbers — between chapters or within chapters — allow for orderly growth of the *Guide* in the future.

Page Numbers

Page numbers, which appear in the upper right corners of all pages in the *Guide*, are used solely for the insertion of new (and deletion of old) pages when quarterly updates are received. The “Add/Delete” instructions that accompany updates refer to page numbers. All substantive references in the *Guide* are to paragraph numbers, not page numbers. Page numbers have a prefix that corresponds to the beginning paragraph number of the chapter. (For example, Page 105:2 is the second page of Chapter 100, ¶105.) Within chapters, skips in page numbers allow for the expansion of existing paragraphs, or the addition of new paragraphs in the future.
Index
The last tab in the Guide includes a comprehensive multiple-entry Index to all information in the chapters. The Index is updated once a year, in October.

Quarterly Updates
Four times each year, new pages for insertion in the Guide arrive with easy-to-follow “Add/Delete” instructions. Quarterly updates — dated January, April, July, and October — permit the addition of new materials and new chapters to the Guide, as well as revisions to existing chapters, the Page/Date Listing, and the Index.

CD ROM
Annually, in October, a searchable CD version of the Guide is sent to current subscribers as part of the update.

Users’ Aids
Acronyms. As is true for many professions, the use of acronyms is ubiquitous in sponsored research administration. In the Guide, acronyms are defined as they appear in the text, but as an additional user aid, a comprehensive list can be found beginning on page 31 of this “How to Use” section.

Knowledge Check
A set of Q&As will be added to each core chapter that is intended to be used in the training of new staff and others who may be less familiar with sponsored research administration (see, for example, ¶1390). The Q&As are designed to measure how accurately the material contained in each chapter has been understood. An answer key is separately included for testing purposes for each set of questions. Topics for discussion will be added also. These materials will be updated regularly.

Answer Key
Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

The world of research administration has become ever more complex, specialized, and continues to change at an ever-increasing pace. As such, *Sponsored Research Administration: A Guide to Effective Strategies and Recommended Practices* is published to provide college and university research administrators — and others involved in sponsored programs on campus — with a “living textbook” on the wide range of research administration challenges they face each day.

Chapter 100: Overview of Sponsored Research Administration provides readers a general perspective on the profession and functions of research administration. The chapter also discusses the role of the office of sponsored programs in an institution’s overall research enterprise and includes different types of material addressing topics of general relevance to sponsored research administrators.

The chapter begins with an overview of the profession of research administration written by Julie T. Norris, Director Emeritus of the Office of Sponsored Programs at the Massachusetts Institute of Technology (see ¶105). Norris has long been recognized as one of the leading thinkers and practitioners in the field of research administration. She begins her overview by providing some historical perspective on the growth and development of the field. She goes on to discuss how over the last half century offices of sponsored research have evolved into highly complex business management centers that deal with a variety of issues ranging from electronic proposal submission to research subject protection, conformance with regulatory compliance requirements, and upholding the sanctity of the open-and-free dissemination of research results without a sponsor’s undue restriction or interference.

Norris highlights the characteristics of a successful modern sponsored research administration office. She cites the work of Raymond Woodrow, a pioneer research administrator at Princeton University, and his early admonition that the function of the research administrator is to provide management for research, not management of research. She makes it clear that the sentiment continues to be relevant for today’s professional. Norris concludes her chapter with a discussion of President Bush’s “American Competitiveness Initiative” and its implications for the future of research administration.

As part of a “living textbook,” Chapter 100 — and all other chapters — will continue to respond to the information needs of research administrators through the addition of new material. Future quarterly updates to the *Guide* will contain revisions, additions, and enhancements to ¶105, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶120), practical tools (at ¶130), and statistics and survey results (at ¶160). A “knowledge check” containing Q&As and discussion topics is included at ¶190.
¶105 Overview of Sponsored Research Administration

Julie T. Norris
Director Emeritus, Office of Sponsored Programs
Massachusetts Institute of Technology

Managing a sponsored programs office can be frustrating, nerve wracking, and fraught with perils — but it can also be exhilarating, rewarding, and filled with satisfaction. Sponsored program office management involves working with dedicated and brilliant investigators and scholars who often are on the cutting edges of their fields, carrying out research such as curing diseases, identifying early warning systems for hurricanes and other natural disasters, developing computer hardware and software, and creating products to make lives more comfortable and enjoyable. Sponsored program management also involves working with government and private sponsors that demand timely and adequate stewardship for the funding they provide.

The office of sponsored programs (OSP) sits between the researcher and the sponsor and has responsibilities to both entities. This is not an easy place to be. Each entity — while desiring the same outcome — takes different routes to its achievement. The researcher generally wants to be left alone to do his or her research; the sponsor wants ongoing assurance that progress toward the goal is being made. A key role for a sponsored programs office is to respond to the expectations of both the researcher and the sponsor.

¶105.1 Early Days of Research Administration

It may be helpful to look back at more than 50 years of research administration and see how sponsored programs offices evolved during that time in meeting needs and expectations. In the grand scheme, the creation of offices to handle sponsored programs is a relatively recent phenomenon and — for most institutions — can be closely linked to the rapid influx of funding from the federal government for research at colleges and universities after the Soviet launch of Sputnik.¹

As an example of this growth, federal research funding at colleges and universities grew from approximately $15 million at the outbreak of World War II to $1.3 billion by 1966. (See ¶160.1.) The number of research offices grew also. (See ¶160.2.) In fact, there were almost three times as many such offices established during 1961–1970 (97) than in the period 1945–1960 (34). At the same time, higher education came to recognize the need for “the establishment of wide and stable policies … for the management of research.”²

As federal funding to higher education institutions for basic research was relatively new, the post-war focus at most institutions was on the acquisition of funds, with

¹ Prior to the Cold War and the space race, only a few institutions had established separate sponsored research offices, and these primarily handled industrial contracting activities.

relatively little consideration of ways to manage the funds once they were received. Even the process was far simpler than today — most agencies did not specify formats, page limitations, or type sizes. What has become commonplace in the last twenty years (formats for budgets, representations and certifications, designated proposal structures, etc.) was either nonexistent or minimal at that time. In general, faculty members regarded sponsored programs offices as sources to identify potential sponsors and prepare budgets. Rarely was it acknowledged that the sponsored programs director had a role in the creation and implementation of research policies, and there was no emphasis on any type of compliance other than fiscal compliance.

This laissez-faire attitude disappeared in the 1960s as federal funds for research and training flooded colleges and universities. Sponsored programs offices were expected to collect and disseminate funding information and provide substantive support in the development, preparation, and production of proposals. Fiscal accountability in all its forms was expected from the institution’s general financial system and was rarely handled in a separate office charged with financial research management. The era of increased regulation, however, was on its way as indicated by a Bureau of the Budget Report in 1966, which stated: “This report was undertaken in response to the executive branch’s continuing concern that its research programs be well managed. Specifically, it attempts to identify those administrative procedures which will foster excellent research, assist in strengthening the institutions engaged in federally funded research, and guarantee prudent stewardship of public funds.”

Increased Regulations, Focus on Compliance
The next two decades (the 1970s and 1980s) saw the period of greatest growth in regulations and compliance activity in the research enterprise. The fact that OMB Circular A-21, Cost Principles for Educational Institutions, was initially issued in 1958, reissued in 1979, and revised three times in the 1980s, clearly indicates the federal government’s attention to increased regulation. Also significant was the issuance of the initial version of OMB Circular A-110, Uniform Administrative Requirements for Grants and Other Agreements with Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations, in 1976, which was designed to provide standardized administration of research programs funded by grants and cooperative agreements, and the 1984 passage of the Single Audit Act (P.L. 98-502) and its implementation in 1985 via OMB Circular A-128, Audits of State and Local Governments. Not only did the government specify requirements for financial audits in A-128, the circular also addressed requirements for compliance with a host of administrative regulations by stating that the auditor shall determine whether “the organization has internal accounting and other control systems [emphasis added] to provide reasonable assurance that it is managing federal financial assistance programs in compliance with applicable laws and regulations.”

---

Woodrow’s landmark publication, *Management for Research in U.S. Universities*, illustrates this change.

Woodrow points out that prior to the 1970s the sponsored programs officer’s principal role was that of identifying funding sources and processing proposals. By the mid-1970s, according to Woodrow, that role had expanded to include negotiations with potential sponsors on terms and conditions of awards, officially accepting awards on behalf of the institution, ensuring implementation of all sponsor requirements, and helping with the closeout activities necessary to bring a project to successful completion. The compliance work was primarily in three areas: individual rights and responsibilities; protection of the environment and living organisms; and fraud, waste, and abuse.

The common thread in all these regulations was a requirement for the institution to provide a certification or assurance of compliance with the regulations and to have institutional policies and processes in place to ensure that compliance. It was the breadth, number, and diversity of these regulations and the fact that compliance responsibilities were often distributed among several offices that propelled the development of research administration offices at many institutions. In virtually all major research colleges and universities, the sponsored programs director was officially identified as the individual responsible for coordinating and ensuring that the institution met all these requirements.⁵

‘Unfunded Mandates’

The growth and complexity of federal regulations continued into the 1990s. The key feature of this decade, however, was the number of requirements imposed on institutions whose associated costs were not recoverable through facilities and administrative (F&A) rates because of the federal cap on the administrative portion of the rate. These so-called “unfunded mandates,” grounded in legislative requirements, greatly impacted research administration activities. Conflict of interest, misconduct in science, and cost accounting standards are just three examples of such mandates. As a result of these federal initiatives, the roles of sponsored program officers continued to shift from pure service functions to control and compliance as a primary raison d’etre. For many in the field of research administration, this was a profound, and not always welcome, change.⁶

---

105.2 Today’s Challenges

So far during the first decade of this century research administration has been characterized by emphasis in two areas: compliance and electronic research administration. Each of these has significantly impacted the organization of sponsored programs offices and the means by which the offices provide services to their clients. For example, faculty and researchers are accessing research opportunities via the Internet, downloading proposal guidelines, and completing proposals electronically. Research administrators are submitting proposals electronically, requesting approvals from sponsors electronically, and (in the research office or the research finance office) preparing and submitting invoices and financial reports electronically.

These examples simply provide evidence that sponsored programs administrators — in responding to these challenges — will have to adapt. Critical will be the ability to use technology — to understand how to develop and implement systems using technological tools. One example is research administrators’ teaching researchers how to do focused and effective searches themselves. Another is the electronic capability to calculate F&A rates, track Institutional Review Board (IRB) and Institutional Animal Care and Use Committee (IACUC) activities, monitor subcontractors, and access a host of other systems that make research administration more effective.

With these challenges facing research administrators, it is important to distinguish, as Raymond Woodrow aptly said in his book, between management of research and management for research. As Woodrow so insightfully pointed out, the difference between management of research and management for research is not only syntactic but also symbolic. Management for research, Woodrow writes, covers “the provision of a nourishing climate, sound policies, supporting services of various kinds, financial systems, and organizational arrangements that will help research to flourish in a university.” Woodrow’s purpose is to provide advice with regard to management that will facilitate, rather than direct, research.

Written almost thirty years ago, the concept of managing for research is as valid today as it was then. But the challenge is greater. It is easy to succumb to the “management-of-research” trap, particularly as the complexity and volume of research administrative requirements has increased and the penalties on the institution for noncompliance range from mild to catastrophic. One purpose of this Guide is to provide strategic insights into how to develop sound principles and effective practices for managing sponsored programs offices in this ever increasingly complex and challenging environment.

Managing the Challenges

Recognizing the difference between “management of” and “management for” research highlights the elements of a successful modern sponsored programs administration office. Characteristics of such an office include the following:

◆ Flexibility — the capacity to change or adjust in response to new conditions, demands, or circumstances

---

7 Woodrow, p. xiii.
◆ Nimbleness — mental capacity characterized by speed and adroitness
◆ Responsiveness — readily reacting to suggestions, requests, or appeals
◆ Patience — tolerance over a period of time; restraint, usually in the face of considerable provocation
◆ Knowledge — familiarity, awareness, or understanding gained through experience or study
◆ Attention to detail — the act of dealing with things item by item
◆ Communication skills — the exchange of information, both orally and in writing
◆ Timeliness — the ability to act within a suitable or opportune time
◆ Pro-activity — causing or initiating change

Anyone in a sponsored programs office can readily and personally identify situations where each of these characteristics has been essential. At meetings and workshops sponsored programs officers sometimes exchange anecdotes that required them to call upon these attributes. An example of a scenario where these skills are essential appears below.

**Example**

Western University received a copy of an agreement for carrying out research in environmental protection strategies and for developing a master's degree program in environmental engineering at Foreign University. The agreement was for several million dollars over a five-year period.

The sponsored programs director realized that Western University had never submitted a proposal to any sponsor for this work, and the institution had no agreement with Foreign University for developing this project. In addition, upon reviewing the agreement, it appeared that (i) there was substantial cost sharing required (more than 25 percent), (ii) payment terms were unacceptable, (iii) no funding was provided for monitoring subrecipients, and (iv) the agreement had been signed on behalf of the institution by the principal investigator. This last issue was particularly troublesome to the sponsored program director, since the award was from a federal agency that should have been aware that an institutional — rather than principal investigator — signature was required to bind the institution. To compound the situation, the principal investigator had acted this way before and was fully cognizant of the necessity to have an institutional signature on both the proposal and the award.

A first reaction to this scenario might simply be to reject the award out of hand. Although this might resolve the problem, it certainly would not advance the goals of the institution toward increased international activity, nor would it maintain good relations among the sponsored programs office, the investigator, and the sponsor. The challenge, then, is how to proceed. How would each of the characteristics described above help to develop an approach to the problem? For example, patience with the
errant activities of the principal investigator is critical so as not to cause the situation to
deteriorate more than necessary. Knowledge and communication skills are essential in
dealing with the sponsor. It is important to change the terms of the agreement to be in
line with the policies of the institution, to ascertain that Foreign University is a full
participant in the project, and to examine in detail all elements of the budget to assure
that funds are in the categories necessary for performance. These actions need to be
done in a timely and responsive manner, since the project was supposed to have started a
month before the receipt of the agreement. Negotiation with the sponsor and with
Foreign University must be approached with an understanding that flexibility is essen-
tial, as compromises will inevitably have to be made. Not dealing effectively with the
elements presented by this scenario could (and probably would) result in an impasse.

Policy Development, Implementation
Responding positively to such situations as described in the above example is only one
of the current challenges facing today’s research administration offices and their
leadership. In this new century, policy development and implementation have become
one major focus of directors in sponsored programs offices. There are a number of
issues confronting the office leadership:
(1) How to respond to any proposed policy change
(2) Once adopted, the development of institutional policies and procedures to
implement the change
(3) The cost of such implementation and how the costs might be covered by
institutional funds
(4) The method and extent of such compliance (e.g., whether institutional compliance
policies and procedures should be more inclusive and comprehensive than the
requirement)
(5) How to provide the necessary training on the requirement to the necessary
institutional audience

Other challenges (or opportunities for change) that research administrators should
be prepared to handle include the following:
◆ Compliance
◆ Electronic research administration
◆ Training and education
◆ Organization, structure, and staffing
◆ Dealing with auditors and attorneys
◆ F&A (indirect) costs
◆ Intellectual property
◆ The myriad (often conflicting) rules and regulations
◆ International collaborations and contacts, including export controls and embargoes
Each of these challenges provides opportunities for the OSP and its leadership to support the investigators and the institution by developing strategies to manage the research enterprise successfully. The chapters in this Guide provide descriptions of and approaches to developing strategies for managing sponsored programs offices to meet this objective.

105.3 Sharing Information, Gathering Feedback

It is clear that there is no lack of opportunity for challenging and rewarding work in the area of sponsored programs. What is unique about sponsored programs personnel is the way they cooperate with their peers at other institutions, even though the faculty at the institutions may be competing for the same award. Many people outside the profession, including faculty members, are surprised by the degree of interaction and cooperation that is evident in these relationships. Opportunities to develop strong professional relationships abound and are one of the rewards of working in this exciting field. Providing service to one’s community is a true reward of working in and directing an effective sponsored programs office. A successful research administrator learns from senior colleagues and, therefore, often avoids significant problems. One way of doing so is to become involved in regional and national research administration organizations. Another reward comes, through this membership, in giving back to the profession (for example, by leading workshops on specialized topics).

Within the institution, experience shows that the absence of criticism generally means a job well done. Sometimes, a researcher even provides thanks in person for extra effort by a sponsored programs administrator in meeting a deadline or completing negotiation of a particularly difficult award.

105.4 Looking Ahead

Concern about America’s leadership in science has surfaced in both Republican and Democratic administrations. The response to this concern could significantly impact a sponsored programs office. The future does, indeed, appear to be increasingly demanding.

To address these challenges, this Guide will become a “living textbook” on managing an office of sponsored programs at an institution. It provides research administrators, campus business managers, faculty research leaders, and departmental and school administrators with effective strategies to meet the challenges of the present and the future.
Supplementary Material

This section includes expanded coverage of topics of general relevance to sponsored research administrators. The material included here is culled from a variety of authoritative sources.

Overview of the Congressional Budget Process

The largest sponsor of externally funded programs at colleges and universities, by far, is the federal government (see ¶160.3). As such, provided here is a simplified overview of the congressional budget and appropriations processes, as it may be of interest to research administrators who wish to provide input into the decision making (see Figure 120.1-3, page 120:5, for a listing of congressional contacts).

Data that also may be of interest to research administrators is being complied by the Your Congress-Your Health group, which has invited all members of Congress to complete a questionnaire about where they stand on a range of research and other health-related issues. The group, an initiative of Research!America, the Albert and Mary Lasker Foundation, and other partners including the American Association of Medical Colleges, is making the answers to the questionnaire available in an online, searchable database at www.yourcongressyourhealth.org.

Current Activity. Two good sources for institutions of higher education to keep abreast of research and development funding activity throughout the federal budget process are (1) the American Association for the Advancement of Science (AAAS) (www.aas.org/spp/rd), and (2) the American Association of Universities (www.aau.edu/budget).

Reminder

The congressional appropriations process includes the rules and practices that Congress has developed for the annual consideration of appropriations measures, which provide funding for numerous activities—including, for example, national defense, education, and homeland security. These measures also fund general government operations such as the administration of federal agencies.

Spending Trends

While the size of the annual federal budget has increased in dollar terms (reflecting inflation and an increased population and economy) over the years, the proportion available for common government services has shrunk dramatically. Competition among federal agencies for funding is heating up, and over the last few decades, discretionary spending — covering everything from road building to police protection to national defense to medical research — has been cut significantly. It now makes up only about one third of all federal expenditures — to accommodate rapid growths in other expenses (entitlements such as Social Security and Medicare and the yearly interest the United States must pay to finance the national debt). (See Figure 120.1-1.)

Continuing Resolution. When discussing spending trends and the federal budget, two other concepts are important. When a budget has not been passed prior to the start of the federal fiscal year (October 1), a continuing resolution (CR) must be enacted to allow the government to remain open for business. A CR is a type of appropriations legislation enacted by Congress to provide temporary budget authority for federal agencies to keep them in operation when their regular appropriation bill has not been enacted by the start of the fiscal year. It is a joint resolution, which has the same legal status as a bill.

A CR frequently specifies a maximum rate at which obligations may be incurred, based on the rate of the prior year, the president’s budget request, or an appropriation bill passed by either or both chambers of Congress. There have been times, however, when Congress has used a continuing resolution as an omnibus measure to enact a number of appropriation bills. A continuing resolution is a type of appropriation act and should not be confused
Deficits. The other concept that frequently arises when the federal budget is discussed is that of deficit. The budget deficit is the amount by which the government’s total budget outlays exceed its total receipts for a fiscal year (which gives rise to deficit spending).

Budget Authority

“Budget authority” represents the legal authority for federal agencies to make “obligations” requiring either immediate or future expenditures (or “outlays,” which are payments from the U.S. Treasury). Annually, the president recommends spending levels for the various programs and agencies of the federal government in the form of budget authority, as Congress provides budget authority instead of cash to agencies.

Congress divides budget authority and the resulting outlays into two categories: discretionary spending and mandatory spending (including net interest). Discretionary spending provides funds for a wide variety of activities, while mandatory spending funds entitlement programs and other mandatory spending programs.

Discretionary spending is controlled by the annual appropriations acts, which are under the jurisdiction of the House and Senate Committees on Appropriations. Mandatory spending is controlled by authorization acts under the jurisdiction of the legislative committees (principally the House Committee on Ways and Means and Senate Committee on Finance).

Appropriations measures include all the discretionary spending and some of the mandatory spending. The mandatory spending provided in appropriations measures is predominantly for entitlement programs, referred to as “appropriated entitlements.”

Background: Authorizations and Appropriations

Congress has established an authorization-appropriation process that provides for two separate types of measures — authorization measures and appropriation measures, which serve different functions.

Reminder

The Congressional Budget Office defines entitlement as: “A legal obligation of the federal government to make payments to a person, group of people, business, unit of government, or similar entity that meets the eligibility criteria set in law and for which the budget authority is not provided in advance in an appropriation act. Spending for entitlement programs is controlled through the eligibility criteria and benefit or payment rules.”

Reminder

An appropriation is a type of budget authority that not only provides the authority to make obligations, but also gives the federal agency authority to make the subsequent payments from the Treasury. Appropriations measures provide new budget authority for the program, activity, or agency previously authorized.

An authorization act establishes, continues, or modifies an agency or program. An authorization act also authorizes subsequent appropriations for specific agencies and programs, frequently setting spending ceilings (limits) for them. The authorization of appropriations provisions may be permanent, annual, or multiyear.

* There are two minor exceptions: Due to congressional comity, the House committee does not recommend funding levels for Senate activities and the Senate subcommittee does not recommend funding levels for House activities.

Authorization laws have two basic purposes. They establish, continue, or modify federal programs, and they are a prerequisite under House and Senate rules (and sometimes under statute) for Congress to appropriate budget authority for programs.

Some authorization laws provide spending directly. In fact, well over half of federal spending now goes to programs for which the authorizing legislation itself creates budget authority. Such spending is referred to as direct, or mandatory, spending. It includes funding for most major entitlement programs. (Some entitlements are funded in annual appropriation acts, but the amounts provided are controlled by the authorization law that established the entitlement.)

The authorization laws that provide direct spending are typically permanent, but some major direct spending programs, such as the Food Stamp program, require periodic renewal.

**Appropriations Acts and Discretionary Spending.** Discretionary spending is provided in approximately a dozen appropriation acts. For discretionary spending, the role of the authorizing committees is to enact legislation that serves as the basis for operating a program and that provides guidance to
the Appropriations Committees as to an appropriate level of funding for the program. That guidance typically is expressed in terms of an authorization of appropriations. Such authorizations are provided either as specific dollar amounts (definite authorizations) or “such sums as are necessary” (indefinite authorizations).

In addition, authorizations may be permanent and remain in effect until changed by Congress, or they may cover only specific fiscal years. Authorizations that are limited in duration may be annual (pertaining to one fiscal year) or multiyear (pertaining to two, five, or any number of specific fiscal years). When such an authorization expires, Congress may choose to extend the life of a program by passing legislation commonly referred to as a reauthorization. Unless the underlying law expressly prohibits it, Congress may also extend a program simply by providing new appropriations. Appropriations made available for a program after its authorization has expired are called “unauthorized appropriations.”

The U.S. House of Representatives by precedent generally originates appropriation bills.

Basic Stages of the Congressional Budget Process

The framework of the budget process can be divided up into five stages, each of which is governed by its own procedures outlined in the Budget Act, the rules of the House and Senate, and other relevant statutes. The last three stages often occur simultaneously. The five budget stages are as follows.

◆ President’s Budget Submission. The president submits a comprehensive budget request to Congress in early February that outlines the administration’s policy and funding priorities and the economic outlook for the coming fiscal year. This budget, which estimates spending, revenue, and borrowing levels, is compiled by the Office of Management and Budget (OMB) from input by the various federal agencies, with funding broken down into 20 budget function categories.

◆ Adoption of the Budget Resolution. House and Senate committees hold hearings on the president’s budget and the Budget committees report a “concurrent resolution” on the budget that sets each committee’s allocation of spending authority for the next fiscal year and aggregate spending and revenue levels for five years. The budget resolution also establishes aggregate totals with respect to revenues and spending for the entire federal budget. This resolution, once adopted, is not law, as it is not signed by the president. The allocations, enforceable through points of order, establish the framework to consider spending and revenue bills on the House and Senate floor.

◆ Passage of Appropriation Bills. In May the House begins consideration of the 13 annual appropriation bills for the next fiscal year based on the discretionary spending allocation in the budget resolution. As these bills move through hearings, markups, Floor consideration, and conference, they

are constrained by the levels and allocations in the budget resolution and the enforcement of the Budget Act and through House and Senate rules.

◆ **Consideration of Reconciliation Legislation.** If the spending and revenue levels in the budget resolution require changes in existing law, the resolution would contain instructions to committees to report legislation containing such statutory changes.

◆ **Consideration of Authorization Legislation.** Congress considers numerous measures authorizing the appropriation of funds on a myriad of programs each fiscal year. This decision making is constrained by the Budget Act and through House and Senate rules.

An annual time line for the budget process is provided at Figure 120.1-3.
Budget Mysteries Revealed (and why you should care)*
Kelsey Cook, National Science Foundation

Where does the money come from? How is it allocated?

Establishing a budget for the NSF Chemistry Division programs is a complex and convoluted process. It begins each January, roughly 21 months before the start of the relevant fiscal year (FY). Phase 1 entails Divisional development and assessment of ideas for consideration within the Mathematics and Physical Sciences Directorate (MPS). Inputs include various community priorities, as outlined in workshop reports, program reviews, and other sources. This process continues through the spring … . [See Budget Time Line in Figure 120.1-3.]

The head of MPS (an NSF Assistant Director) creates a Directorate draft request which then is folded into priorities across the Foundation, with input as appropriate from the National Science Board (NSB). A complete NSF budget request for a given fiscal year, enumerating priorities and illustrated with Highlights provided by our Principal Investigators (we really do use these to help make the case for funding!) is sent to the Office of Management and Budget (OMB, a part of the Executive Branch) in the first week of September, about 13 months before the start of the relevant FY. Typically in late November, OMB provides feedback (called a “passback”) to the NSF request, enumerating questions, priorities, and required changes to better fit the Administration’s priorities. The Foundation then has a few days to discuss the passback with OMB and come to agreement. The final request is prepared during December and January, again with NSB input, as appropriate.

After final OMB approval, the “NSF Budget Request to Congress” is submitted to Congress during the first week in February, at which point it becomes public as part of the overall Presidential budget request. Congress may then pass a non-binding Concurrent Resolution which outlines total levels of spending and revenues, and broad spending priorities. Various sections of the request are next discussed in hearings by appropriate Congressional subcommittees and/or committees, “marking up” (modifying) the requests and ultimately creating twelve detailed appropriation bills for passage by the House and Senate, ideally in time for expenditures to commence with the start of the fiscal year on October 1. During this process, the Foundation may receive and respond to numerous “questions for the record” — questions from the Hill requiring written answers.

In many years, the appropriations bills do not pass by October 1; in such cases, bills called Continuing Resolutions are needed to extend spending authority in the absence of specific appropriations. Full-year Continuing Resolutions occasionally

* This article is reprinted from National Science Foundation, Division of Chemistry, Newsletter, July 2009, No. 14.
happen, freezing spending at prior year levels or assigning a fixed increment or cut across all agencies.

The process isn't quite finished even once an appropriation is passed. Since appropriations rarely match requests, NSF must prepare an OMB-approved “current plan letter” to Senate and House Appropriation Committees, outlining how appropriated funds will be allocated across the agency. Since a year or more may have passed since the request was initially assembled, priorities have sometimes shifted by this stage. The final allocations require OMB and Congressional approval; it therefore can take a while even after passage of an appropriations bill for individual Programs to know what funds they have available to invest. Within the Chemistry Division, ultimate allocations reflect a combination of proposal pressure, technical priorities, and portfolio balance.

Note that at any given time, there is work under way involving at least three different fiscal years – we began developing the FY 2011 plan while we were spending FY 2009 funds and shepherding the FY 2010 budget through the appropriations process.

As most people know, FY 2009 and FY 2010 have been highly atypical years, in part because of the Presidential transition, and in part because of the “stimulus” package (the American Recovery and Reinvestment Act — Public Law 111-5 — a parallel process superimposed on the “usual” process).

Statistics describing the end results delivered to our Division are generally reported at our town hall meetings … .

**Why Should You Care?**

There are several points in this process where individuals can have an influence. At the earliest stages, you can help develop Divisional priorities simply by communicating with us or by participating in and organizing workshops. Your highlights help us make the case for why our priorities should be the Directorate’s, the Foundation’s, and the Government’s priorities as the process moves forward. As a citizen, you may also make your opinions known to your legislators, who ultimately determine what gets appropriated.
120.2 Recovery Act Funds Come With Strings Attached
AIS editors

Some of the excitement over the $789 billion in research funding included in the American Recovery & Reinvestment Act of 2009 (Pub. L. No. 111-5, ARRA) gave way to a bit of panic, as the money came with unprecedented oversight — so-called “accountability and transparency” — including a quarterly reporting requirement. Complying with ARRA requirements requires the tracking and reporting of information that institutions have never tracked before, such as the number of jobs created.

It is clear that the reporting is less about funding information and more about what is accomplished with the funds; in other words, it is all about transparency. Although all grant funds under the Recovery Act were to have been awarded by the close of the federal fiscal year 2010 (October 1, 2010), reporting under the act will continue until all monies have been expended and reports are “final.”

Now that the Recovery Act research funding is “out the door,” grantees are reminded that the act contained specific funding, including for offices of inspectors general (OIG), to ensure accountability. Also, if an institution receives Recovery Act money, it is considered a high-risk grantee and A-133 auditors will be testing for section 1512 reporting compliance.

In a recent “Chairman’s Corner” blog posting at www.recovery.gov, Recovery Accountability and Transparency Board Chairman Earl Devaney wrote that “Recipient reporting is at the heart of the Board’s accountability program.”

Funds Must Be Spent by October 2013

In M-11-34, guidance issued September 15, 2011, OMB directs federal agencies, with a few exceptions, “to accelerate the spending of remaining Recovery Act funds in discretionary grant programs.” OMB warns that if those funds have not been spent by September 30, 2013, “agencies shall reclaim them.” According to the memo, agencies should communicate this requirement to grantees “through adding these

---

**FederalReporting.gov Service Desk — (877) 508-7386**

Hours of operation as of May 2, 2011:

8 AM to 6 PM ET, Mon–Fri during reporting months; 9 AM to 5 PM ET, Mon–Fri during other months

It is suggested that you have the following info at hand before calling the Service Desk:

- User ID (e-mail address) (Is this the email address registered with CCR?)
- Information on who the POC is, if it isn’t you
- Name of agency that gave you the award and whether you are a prime or a sub
- Specific problems you are experiencing and any error messages you received
requirements to new grant agreements, modifying terms and conditions of existing grant agreements, or other appropriate written means.”

In mid-December 2011, the National Science Foundation issued a notice of its intent to revise American Recovery and Reinvestment Act award general terms and conditions “to ensure project completion by September 30, 2013.”

This notice applies to all NSF grantees with active awards that were issued pursuant to the American Recovery and Reinvestment Act of 2009 (ARRA). (The notice does not apply to cooperative agreements, which will be handled separately.) According to NSF, the purposes of the notice are to do the following:

1. Notify grantee organizations, principal investigators and co-PIs that NSF will be amending the terms and conditions of active ARRA awards. These amendments will revise the current automatic no-cost extension authority by eliminating the ability of awardees to extend the expiration date beyond September 30, 2013, without prior NSF approval.

2. Establish a procedure for grantees to request prior NSF approval for extensions beyond September 30, 2013.

3. Provide options for those grantees that are unable to accept the terms and conditions, as revised.

**Link:** www.nsf.gov/recovery/acceleration.pdf.

NIH proceeded similarly in NOT-OD-12-014, dated December 13, 2011. The notice (1) notified institutions and program directors/principal investigators that NIH is revising the terms and conditions on some active Recovery Act awards to amend the current automatic no-cost extension authority by limiting the ability for awardees to extend the final budget period of a project period to no later than September...
30, 2013, without prior NIH approval; (2) established a procedure for recipients to request prior NIH approval for extensions beyond September 30, 2013; and (3) provided options for those recipients unable to accept the revised terms of award.

Other agencies indicated they would be proceeding in a manner similar to NSF and NIH.

### Recovery Act and Single Audits

One of the main vehicles for ensuring accountability for ARRA funds is the Circular A-133 single audit. The 2009 Compliance Supplement, in Appendix VII: Other OMB Circular A-133 Advisories, contains an advisory devoted to the Recovery Act and how it will impact the single audit process. OMB issued the first addendum to the 2009 Compliance Supplement to address programs affected by ARRA in mid-August 2009 (although it was dated June 30, 2009) (see [www.whitehouse.gov/omb/assets/a133_compliance/arra_addendum_1.pdf](http://www.whitehouse.gov/omb/assets/a133_compliance/arra_addendum_1.pdf)).

OMB asked the Governmental Audit Quality Center of the American Institute of Certified Public Accountants to relay a clarification concerning when a program with both ARRA funding and other funding should be considered major for single audit purposes. The clarification is presented in GAQC Alert #123, available at the AICPA Web site, [www.aicpa.org](http://www.aicpa.org).

Buried in OMB guidance M-09-15 is a statement that “For fiscal years ending September 30, 2009, and later, all Single Audit reports filed with the Federal Audit Clearinghouse (FAC) will be made publicly available on the internet.” Single audits are currently available to the public under the Freedom of Information Act (FOIA), but FAC’s policy has been to refer such FOIA requests to the cognizant agency responsible for the report, so that the agency can remove any personally identifiable information in the report before release. A footnote in the OMB guidance justifies this public release requirement and suggests ways for the FAC to avoid disclosure of any PII. (Link to FAC: [http://harvester.census.gov/sac](http://harvester.census.gov/sac).)

In March 2010, OMB issued M-10-14, Updated Guidance on the American Recovery and Reinvestment Act. Question 7 in the guidance, which is directed primarily to federal agencies, impacts all A-133 audits as follows:

- Agencies may not grant extensions for late single audit report filings for fiscal years 2009–2011, even if the audit does not include ARRA funding.
- If a single audit report has been late in one of the two prior audit years, the grantee may lose its low-risk status.
- Agencies are instructed to resolve within 6 months all single audit findings for Recovery Act programs.

### Role of the OIGs

OIGs at federal agencies are instructed to provide technical assistance and training for the auditing profession. They must also provide follow-up reviews of single
audit quality with emphasis on Recovery Act funds and prepare a synopsis of any audit findings related to those funds. OIGs are instructed to identify high-risk programs and non-federal entities using risk-assessment techniques and to target them for priority audits, inspections, and investigations, which can have quicker turnaround times than single audits.

No institution that received Recovery Act funds is immune from government review and possible audit, and the act contained specific funding, including for OIGs, to ensure accountability. The results of OIG reviews posted thus far reveal that, among other things, agencies are double-checking the accuracy of the data universities and others are reporting, comparing the information to what the auditors find.

In various recent Recovery Act “limited scope reviews,” the OIG at the Department of Health and Human Services found few or no problems (see Figure 120.2-2, page 120:18). Similar to the HHS OIG, the National science Foundation OIG refers to its Recovery Act funds activities as “limited scope reviews” and has conducted a number of these reviews (see Figure 120.2-3, page 120:20). OIG at the U.S. Department of Education also has issued a number of audits that look at states’ spending of funds under the American Recovery and Reinvestment Act, including State Fiscal Stabilization Fund awards to public institutions of higher education (see Figure 120.2-4, page 120:22).

Other Risks of Noncompliance

Part 1 of the M-10-08 ARRA guidance instructs federal agencies how to handle entities that fail to report or fail to report accurately and “when, and in what format” to report the entities to OMB. According to OMB, “federal agencies will be required to continuously evaluate recipient and sub-recipient efforts to meet” all relevant requirements. OMB warns recipients that noncompliance, including being persistently late or negligent in reporting, is subject to federal action, “up to and including the termination of federal funding or the ability to receive federal funds in the future.” In some cases, intentional reporting of false information could result in civil and/or criminal penalties.

Grantees: What and How to Report

Reporting entities (federal agencies, prime recipients, and delegated subrecipients) must register at FederalReporting.gov before they can submit reports. Before registering, institutions must already be registered in the Central Contracting Registration (CCR) database and have a Dun and Bradstreet Universal Number System (DUNS) number.

Reminder

Many state colleges and universities may have to comply with their individual state ARRA reporting requirements in addition to the special quarterly federal reporting. Such requirements have been imposed despite a request from OMB that states not issue additional ARRA reporting requirements. For information on state ARRA developments and contacts, go to www.staterecovery.org/state-responses.
Reports are submitted to FederalReporting.gov, where recipients and subrecipients enter data directly into the site following registration. Each report will be cumulative (except for jobs data). The reporting period quarters are based on a calendar year.

FederalReporting.gov provides a helpful visual of the reporting timeline, which is reproduced at page 120:25.

Recipient reporting data will be provided for download by federal agency and program officials. These files may be used to automate data quality reviews or create reports by federal agencies. Although the intent of the recipient reporting is primarily reporting as opposed to management, OMB says in its M-09-21 guidance (at Sec. 3.14) that federal agencies may use recipient reports to help assess compliance with the terms and conditions of the individual award agreements.

**Reviewing and Correcting Reports.** After submission of a report on the use and impact of funds received under ARRA, prime recipients still must ensure the data quality of the submission. Corrections can only be made for the reporting quarter (i.e., the most recent quarter), and recipients will have the ability to make corrections up until the start of the next reporting period.

Users of FederalReporting.gov have the ability to append a comment to a given report and respond to that comment. This is the process whereby the prime recipient informs delegated subrecipients of any data quality issues it sees in the sub’s data, and the subrecipient corrects the data. Similarly, an agency might comment on the data submitted, and the prime will respond to the comment.

**Jobs Created and Retained.** On December 18, 2009, the Office of Management and Budget released “M-10-08: Updated Guidance on the American Recovery and Reinvestment Act – Data Quality, Non-Reporting Recipients, and Reporting of Job Estimates.” The guidance updated OMB’s guidance issued in June 2009 (M-09-21.). The guidance (at Sec. 5.2) contains an overview of the key principles for reporting the estimated employment impact of Recovery Act-funded work and method of calculating jobs created or retained. Research administrators are reminded to review this guidance carefully, as this has been a finding in recent reviews of ARRA reporting (see previous discussion).

Jobs are reported on a quarterly, rather than cumulative, basis. Jobs partially funded by ARRA will only be counted based on the proportion funded. Also, a job that is paid initially with non-ARRA monies may be reported as created or retained as long as such dollars eventually will be reimbursed with ARRA funds.

According to Sec. 5.3 of the December 18, 2009 (M-10-08) guidance, the requirement for reporting estimates of the number of jobs is based on a calculation used to
avoid overstating the number of other than full-time permanent jobs. The requirement for reporting jobs is based on a calculation that converts part-time or temporary jobs into “full-time equivalent” (FTE) jobs. In order to perform the calculation, a recipient will need the total number of hours worked by employees in the most recent quarter (the quarter being reported) in jobs that meet the definition of a job created or a job retained by the Recovery Act. The recipient will also need the number of hours in a full-time schedule for a quarter.

For instance, if a full-time schedule is 2,080 hours/year, the number of hours in a full-time schedule for a quarter is 520 (2,080 hours/4 quarters = 520).

The guidance also presents a clarification specifically for higher education institutions that must comply with OMB Circular A-21 as follows:

For recipients of assistance agreements that must comply with OMB Circular A-21 … an alternative calculation based upon the allocable and allowable portion of activities expressed as a percentage is acceptable to estimate jobs created and retained. OMB Circular A-21 recognizes that practices vary among educational institutions as to the activity constituting a full workload. Compensation charged to sponsored projects must conform to the institution's established policies and reasonably reflect the activity for which the employee is compensated. Charges to sponsored projects may be expressed as a percentage of their total activities. Therefore, for purposes of ARRA reporting of jobs created or retained, colleges and universities may count, proportionately, the percentage of effort directly charged to ARRA awards as an FTE equivalent.

The guidance then presents two examples:

(1) Based on the total available time in the reporting period, regardless of when the grant period or employment period begins. For example, if a lab technician charges 100% effort on a project for only one month in the quarter being reported (but zero effort the other two months because no work was performed or the grant was not yet awarded), then the recipient report should reflect 0.33 FTE for that individual.

(2) For all reporting periods during which the grant is active. For example, if a researcher provides 100% effort in the grant’s first quarter and 50% effort in the grant’s second quarter, the recipient report for the first quarter will reflect 1 FTE and the second will reflect 0.5 FTE.

According to Sec. 5.8 of the December 18, 2009 (M-10-08) guidance, once a job is reported by a recipient as created or retained by the Recovery Act, the recipient shall continue to report this job as created or retained in subsequent quarters as long as the job continues to be funded by the Recovery Act. Also, a job that is paid initially with non-Recovery Act dollars may be reported as created or retained as long as such dollars eventually will be reimbursed with Recovery Act funds for the jobs being reported (see Sec. 5.8 of the guidance).

Subaward Reporting. According to OMB, prime recipients are responsible for submitting the reports required by ARRA and must include data for first-tier subrecipients if the subaward is greater than $25,000. For all first-tier subawards
that are less than $25,000, the awards are reported in the aggregate. The reporting requirements with respect to subawards of $25,000 or more in government funding are substantially the same requirements as for prime awards.

Although prime recipients are responsible for reporting the detailed data on subawards and vendor payments, different data is required for subrecipients than for vendors.

Sec. 2.3 of OMB’s M-09-21 guidance allows prime recipients to delegate to sub-recipients reporting responsibility for the subrecipient data elements, which are also required by the Federal Funding Accountability and Transparency Act (§3720.2); OMB often refers to these as FFATA data elements. While it may be enticing to delegate such reporting, it is clear that the prime recipient will be responsible for all of its data and, during the verification period, must verify subrecipient data as well. Also, the data elements that can be delegated are limited; reporting on percent of project completion and jobs retained/completed must still be reported as part of the prime recipient’s reporting.

Recipients must report jobs estimates for all subawarded funds. Recipients must include an estimate of jobs created and retained on projects and activities managed by their funding recipients in their aggregate number and their narrative description. This information will be provided for each project and activity funded by ARRA.
Figure 120.2-2: HHS OIG Reviews Under the Recovery

- Rutgers University received a grant under the NIH Challenge Grants in Health and Science Research initiative totaling $996,415 in Recovery Act funds. The purpose of the grant was for genome research. The grant budget period was March 24, 2010, through February 28, 2012. On December 6, 2011, Rutgers requested, and received, a no-cost extension through August 30, 2012. As of February 28, 2012, the university claimed $931,230 under the grant. OIG found no “discrepancies that would indicate” that the claimed costs were not allowable. It made no recommendations. Link: http://oig.hhs.gov/oas/reports/region2/21102010.pdf.

- A review of Georgetown University found that costs claimed were allowable under a Recovery Act award made by NIH in the amount of $3,907,801 for comparative effectiveness research. The budget period for the grant was September 30, 2009, through August 31, 2011. As of June 30, 2011, Georgetown had claimed $2,565,673 under the grant. OIG reviewed these costs, which consisted $2,361,075 for direct costs and $204,598 for indirect costs. It made no recommendations. Link: http://oig.hhs.gov/oas/reports/region3/31103302.pdf.

- In a Recovery Act review of the University of Utah, Salt Lake City, OIG auditors found, “Based on our review of judgmentally selected costs claimed under the grants, we determined that the grantee’s claimed costs of $1,359,814 were allowable under the terms of the grants and applicable federal regulations.” The review looked at grantee costs claimed through Sept. 29, 2011, for two NIH grants. During the review period, the grantee claimed $1,359,814. We reviewed $1,356,578 of these claimed costs. (Less than 100% of costs claimed were examined, due to materiality.) Link: http://oig.hhs.gov/oas/reports/region7/71106025.pdf.

- An audit of Northwestern University tested $199,657 of the $854,884 claimed by the university between Sept. 25, 2009, and July 31, 2011, under a $997,581 American Recovery and Reinvestment Act award from NIH for challenge grants in health and science research. According to the audit, all costs were allowable under the terms of the grant and applicable federal regulations. Link: http://oig.hhs.gov/oas/reports/region5/51100106.pdf.

- All ARRA grant costs claimed by the University of Central Florida were allowable. Auditors reviewed the college’s $1,310,749 NIH grant funded under the Recovery Act to enhance physically active lifestyles among urban older adults and low-income ethnic minorities. As of June 30, 2011, the grantee had claimed $705,541 ($486,760 direct and $218,781 F&A) costs. The audit had no findings or recommendations. Link: http://oig.hhs.gov/oas/reports/region4/41101006.pdf.

- There were no findings or recommendations in a review of Wayne State University of the Recovery Act grant it received from NIH from September 2009 through August 2011. According to OIG, “The $39,530 in grant costs covered by our review was allowable under the terms of the grant and applicable federal regulations.” No recommendations were made. Link: http://oig.hhs.gov/oas/reports/region5/51100097.pdf.

- Under the Recovery Act, the college Claremont McKenna College received an NIH $191,867 academic research enhancement grant for the period Sept. 1, 2009, through Aug. 31, 2012. As of June 30, 2011, Claremont had claimed $113,006 in costs: $38,600 for
salaries and wages, $37,394 in equipment costs, $19,647 in indirect costs, $8,843 in fringe benefits, and supply costs of $8,522. In a brief report, auditors concluded that the costs were “allowable under the terms of the grant and in accordance with applicable federal requirements.” Link: http://oig.hhs.gov/oas/reports/region9/91101008.pdf.

• According to the report of a review of The University of Texas Health Science Center, which looked at $1.5 million in Recovery Act funds the university received between July 1, 2009, and June 30, 2011, all expenditures were allowable, allocable, and reasonable, and there were no findings or recommendations. The funds were for genome-wide association studies. The university collaborated with four other universities and one hospital, “awarding them cost-reimbursable subawards totaling $568,274,” OIG said in the report. Link: http://oig.hhs.gov/oas/reports/region6/61100054.pdf.
• In one recent review, OIG found significant problems. Of 29 grants totaling $12.8 million awarded by NSF to the University of Alaska – Anchorage as of March 31, 2010, eight awards totaling $3.4 million (27%) were ARRA-funded. OIG previously released a report of its review of the university’s processes for quarterly ARRA reporting. The inappropriate expenditures cited in the report stemmed primarily from the withdrawal of two subrecipients that were approved in the award. See “Limited Scope Review: Improvements in Grant Management Needed at the University of Alaska – Anchorage,” 11-1-017 (Aug. 31, 2011).

• In this University of Alaska-Anchorage report auditors said the university properly segregated $3.4 million of NSF funds for eight Recovery Act grants, submitted quarterly reports timely, had sound written policies and procedures for the reporting and developed centralized Recovery Act reporting. But they also identified some issues, including reporting vendor jobs, checking debarment and suspension status of vendors and lack of a data quality review process to catch clerical and/or posting errors. Three data elements were incorrect — jobs, expenditures and vendor payments. The review also found that “the university had not established adequate processes to accurately report the number of jobs, expenditures and vendor payments” and did not have a process in place to assess whether a subrecipient had ever been debarred or was facing such action. The university concurred with the findings and recommendations and was making changes to address the areas of concern, the review said. See “Limited Scope Review of Recovery Act Quarterly Reporting Processes– University of Alaska – Anchorage,” 11-1-003 (March 10, 2011).

• West Virginia University Research Corporation properly segregated $3.1 million in ARRA funds for nine NSF grants, timely submitted the quarterly reports and centralized ARRA reporting. However, the OIG found that the institution’s “data quality review process did not preclude clerical posting and other human-related type errors” (for example, two NSF awards were reported twice), and it did not report Recovery Act jobs on payments of less than $25,000 to vendors. Four data elements reviewed were incorrectly reported: number of jobs, expenditures, funds received/invoiced and subawards. The university stated that it has already taken steps to implement the report recommendations. See “Limited Scope Review of Recovery Act Data Quality – West Virginia University Research Corporation,” 11-1-005 (March 10, 2011).

• New Jersey Institute of Technology properly segregated $6.7 million of ARRA funds for 10 grants, timely submitted ARRA reports and centralized ARRA reporting. OIG found, however, that NJIT had not established formal ARRA reporting guidance or a comprehensive data quality review process. As a result, NJIT did not correctly report three data elements: number of jobs, vendor payments and subaward data. For example, NJIT did not use a uniform methodology for estimating jobs, consultant charges were reported as both vendor and subaward payments, and there were no job estimates for a vendor payment of $18,000. The university generally concurred with OIG’s findings and recommendation. See “Limited Scope Review of Recovery Act Data Quality - New Jersey Institute of Technology,” 11-1-004 (March 10, 2011).
• The University of Washington properly segregated $42 million of ARRA funds for 80 NSF grants, timely submitted quarterly ARRA reports, had written ARRA reporting policies and procedures and centralized its ARRA reporting. OIG found, however, that UW needs to improve its processes and oversight for the reporting of project status and jobs created/retained for sub recipients and vendors. Six data elements were reported correctly, but project status was incorrectly reported for two grants, and there was no process for reporting jobs estimates for payments to sub recipients or vendors of less than $25,000. The university concurred with the findings and recommendations. See “Recovery Act Quarterly Reporting Processes at the University of Washington,” 11-1-015 (March 31, 2011).

• NSF released a memorandum dated June 18, 2010, summarizing the findings from five ARRA reviews (www.nsf.gov/oig/10_6_008_ARRA_Reporting.pdf). The reviews were conducted at California Institute of Technology, California State University Fresno Foundation, George Mason University, University of Colorado-Boulder, and University of Kentucky. The reviews focused primarily on the institution’s December 30, 2009, Recovery Act report OIG looked at the following data elements: number of jobs, job descriptions, expenditures, funds received/invoiced, vendor payments, subaward amounts, quarterly activities/project description, project status and final report status. In conducting its reviews, OIG looked at whether the auditee has an adequate system of internal controls to provide reasonable assurance that Recovery Act funds were segregated and separately tracked and whether quarterly reports were timely, accurate and compliant with Recovery Act and NSF reporting requirements.

   OIG did a follow-up review at Fresno and found it needed to “implement an effective labor effort reporting system for confirming the reasonableness of salary charges to sponsored projects and appropriately document NSF cost sharing commitments” (www.nsf.gov/oig/11-6-004-Fresno.pdf).

   Link: http://www.nsf.gov/oig/auditpubs.jsp
Figure 120.2-4: ED OIG Reviews Under the Recovery Act

- The University of South Carolina aced its ARRA audit. The audit, which looked at State Fiscal Stabilization Fund expenditures and ARRA reporting at USC and the South Carolina Department of Corrections, did not show any findings related to USC. The report did find that the jobs created or retained information reported by the state did not accurately reflect the jobs data reported to it by its grantees, which included those at Clemson University. See South Carolina Governor’s Office: Use of Funds and Data Quality for Selected American Recovery and Reinvestment Act Programs, A04K0006 (Aug. 23, 2011).

- In an audit of the state of Oklahoma’s use of Recovery Act funds, the OIG concluded that a state university used an incorrect method of calculating jobs retained or created with Recovery Act funds, resulting in an underreporting (see ARRA Alert). The audit spanned the period from February 17 through December 31, 2009. The state agreed with this finding and said it would instruct all institutions of higher education receiving Recovery Act funds to use the calculations required in OMB guidance. The audit also found that a community college used Recovery Act funds to maintain its computer system, an unallowable use of funds that the state agreed to return. The audit cited the state for inaccurate reporting related to $68 million in State Fiscal Stabilization Fund awards that were distributed to institutions but not reported as subawards in quarterly reports. The state agreed with the auditors to report subrecipient payments and said it would ensure that these relationships were properly delineated in the next quarterly report. See Oklahoma: Use of Funds and Data Quality for Selected American Recovery and Reinvestment Act Programs, A06K0002 (Feb. 18, 2011).

- ED OIG looked at the state of Utah’s use of Recovery Act funds. The review covered four education-related Recovery Act grants. It looked at selected costs charged to the grants from February 17 to December 31, 2009, and data reported for the quarterly reporting period ending December 31, 2009. Among the findings, OIG cited a state university as a subrecipient of SFSF funds for “improperly charging $55,000 to the SFSF-Government Services grant for an annual maintenance service agreement.” Sec. 14004(c)(1) of the Recovery Act and the state’s contract with the university “specifically prohibit the use of SFSF funds for maintenance expenditures, as well as equipment or facilities.” Neither the university nor Utah Science Technology and Research officials, the prime recipient, contested the finding. The university said it “would offset a future reimbursement claim by the amount of the improper charge.” USTAR added procedures “requiring in-depth reviews of subrecipients’ reimbursement claims,” according to the audit. The audit also found that jobs data was underreported at the university because of confusing guidance from the prime and at a community college, another subrecipient, because it was using incorrect data. Utah: Use of Funds and Data Quality for Selected American Recovery and Reinvestment Act Programs, A09K0001 (May 13, 2011).

- An audit of Illinois concluded that the state’s subrecipients generally expended ARRA funds properly, but one of the findings indicated that the University of Illinois reported incorrect data concerning the number of jobs created or retained as a result of its ARRA funds. According to the audit, the university over-reported the number of jobs created because it did not figure full-time equivalents (FTEs) correctly. The audit analyzed the university’s FTE calculations for 5,564 UI employees at Urbana-Champaign and Chicago who were paid with either SFSF-Education or SFSF-

- OIG found that the University of Missouri transferred its SFSF funds into its general revenue pool (as did local educational agencies with their funds), which included funds from other sources, and did not establish specific accounting codes to identify SFSF expenditures. Without specific codes, it was not possible to identify which expenditures were attributable to SFSF funds. The auditors noted that all of the expenditures were the types that would be allowable under SFSF, but “because the identified expenditures were not reflected in the University’s accounting records as being funded by SFSF, we cannot be assured that they are the actual expenditures paid with SFSF funds.” As a result, it was not possible to verify that salaries paid were justified by the number of hours worked, were similar to salaries of other employees paid with non-SFSF funds, and were not paid more than once for the same work. The auditors also noted that it was impossible to check the accuracy of jobs reporting for these funds because they were not tied to identifiable positions. OIG also found that the university did not adequately monitor its SFSF accounts for excess cash. The Missouri Department of Higher Education and the university both considered its payments to be on a reimbursement basis because the SFSF funds were divided into 12 monthly disbursements, and the first disbursement was made in September 2009, which included the monthly disbursements for July and August. Disbursements after September, however, were received at the beginning of the month and expended during the month, which the audit said could result in cash balances on hand before the university received subsequent disbursements. Because they were considered reimbursement funds, however, the university did not assign accounting codes for SFSF expenditures, and it neither monitored cash balances on hand before receiving disbursements nor calculated interest on excess cash. See Missouri: Use of and Reporting on Selected American Recovery and Reinvestment Act of 2009 Program Funds, A07K0002 (June 7, 2011).

In Fiscal 2009, NSF’s ARRA Research and Related Activities program funded 4,599 awards that supported 6,762 investigators. More than one-third (2,352) were new investigators or new co-investigators; however, NSF had hoped to support 2,400. “ARRA enabled the funding of more than 300 proposals that had been declined earlier in the year due to budgetary constraints even though they were rated very good to excellent,” NSF said. These numbers and other ARRA and non-ARRA data are included in NSF’s “FY 2009 Performance and Financial Highlights.” Link: www.nsf.gov/pubs/2010/nsf10002/nsf10002.pdf

ScienceWorksForUS, a joint effort of the Association of American Universities, the Association of Public and Land-grant Universities, and The Science Coalition, issued American Recovery and Reinvestment Act One Year Later: Recovery Act-Funded Research Advancing Science, Aiding the Economy and Contributing to America’s Prosperous Future. The February 2010 report describes approximately 100 projects, including “research on diseases, energy, climate, science education, and a host of other areas that are sustaining or creating new jobs in the short run and hold the promise of breakthroughs that can lay the foundation for long-term prosperity.” Link: www.scienceworksforus.org/press-releases/universities-highlight-benefits-of-stimulus-research-funding

NIH has posted a “collection of Recovery Act Investment Reports highlighting investments in biomedical research topics all made possible” by the Recovery Act. “While these investment reports describe work being supported through approximately 2,000 ARRA grants, this is only a subset of the more than 12,000 grants that have been awarded through ARRA,” according to NIH. Link: http://report.nih.gov/newsupdates.aspx

The Association of American Medical Colleges has prepared a report “detailing how the nation’s medical schools and teaching hospitals are advancing science, improving health, and stimulating economic growth with funding provided to NIH” under ARRA. The report, From Recovery to Discovery – ARRA Funding and Medical Research, was released in February 2010. Link: www.aamc.org.

§120.3 What Is an FFRDC?
AIS editors

A federally funded research and development center (FFRDC) is an organization that helps the federal government conduct scientific research and development, analysis, acquisition, and systems engineering and integration. “The missions and core competencies of the nation’s FFRDCs support the diverse research and development requirements of their sponsors, which provide guidance and oversight of the FFRDCs’ work.”1

The contractors that manage and operate FFRDCs include universities, private companies, nonprofit organizations, or consortia thereof. Technology transfer is a federal priority at FFRDCs (see ¶1930.3). There are basically three types of FFRDCs, as defined by the Department of Defense:

◆ **Research and development laboratories** fill voids where in-house and private sector research and development centers are unable to meet agency core area needs. Specific objectives for these FFRDCs are to (1) maintain over the long-term a competency in technology areas where the government cannot rely on in-house or private sector capabilities, and (2) develop and transfer important new technology to the private sector so the government can benefit from a wider, broader base of expertise. R&D laboratories engage in research programs that emphasize the evolution and demonstration of advanced concepts and technology, and the transfer or transition of technology.

◆ **Study and analysis centers** deliver independent and objective analyses and advise in core areas important to their sponsors in support of policy development, decision making, alternative approaches, and new ideas on issues of significance.

◆ **System engineering and integration centers** provide required support in core areas not available from sponsor’s in-house technical and engineering capabilities to ensure that complex systems meet operational requirements. The centers assist with the creation and choice of system concepts and architectures, the specification of technical system and subsystem requirements and interfaces, the development and acquisition of system hardware and software, the testing and verification of performance, the integration of new capabilities, and continuous improvement of system operations and logistics. They often play a critical role in assisting their sponsors in technically formulating, initiating, and evaluating programs and activities undertaken by firms in the for-profit sector.

**Amount of Funding**

The National Science Foundation report, *FFRDC Research and Development Expenditures: Fiscal Year 2009* (www.nsf.gov/statistics/ffrdc), contains the most recent funding statistics on research and development expenditures at the nation’s 39 FFRDCs. According to Fiscal Year 2009 data from NSF’s Survey of Research and Development Expenditures at FFRDCs, annual spending increased in FY 2009 to $15.2 billion (see Figure 120.3-1).

In FY 2009 basic research activities accounted for 38.5% of total FFRDC R&D expenditures; applied research, 30.5%; and development, 31.0% (see Figure 120.3-1). University-administered FFRDCs were the least likely of the three types of institutions conducting federally funded research to conduct applied research (26%) but the most likely to conduct development (38%).

NSF reports additional types of FFRDCs expenditure data, including by federal agency, at www.nsf.gov/statistics/fedsupport.

\section*{120.4 Compliance Costs Continue to Increase}

AIS editors

The compliance burdens and costs associated with federal sponsored research are increasing, difficult to measure, and spread out among various departments on a campus, according to a recent document jointly compiled by the Council on Governmental Relations, Association of American Universities, and Association of Public and Land-grant Universities. They said that “the current regulatory climate has become dysfunctional.” (Link to document: www.aau.edu/WorkArea/Download-Asset.aspx?id=11660.)

They wrote, “It is important to note that there are caveats associated with this information and usually, it is difficult to answer the seemingly simple question, ‘How much does it cost universities to comply with any particular regulation?’ with a precise number.” Reflected also as lost productivity, the costs are rising much faster than are other expenditures. Universities, out of fear, may overdo their compliance efforts, adding to costs, the organizations said.

The organizations recommend that the federal government, in cooperation with universities, undertake a “serious” effort “to better account for, track, and reduce regulatory costs.” Assistance is needed now, the groups concluded.

\textbf{Examples of Costs Burdens Presented}

The document includes examples of challenges with compliance costs from their memberships, such as the following:

\begin{itemize}
  \item “An environmental health and safety office at one private university in the West reported that they spend approximately 70\% of its total general fund budget in support of research safety and compliance in research.
  
  \item “One public university in the Northeast noted that the costs of managing its Sponsored Project Administration cost pool increased from $3.5 million in fiscal 2005 to nearly $6 million in fiscal year 2010. Another, a private institution in the Midwest, estimated that its costs had increased from $4.2 million in 2002 to $7.3 million in 2008.
  
  \item “A prominent medical school in the Southeast saw its compliance and quality assurance costs increase from approximately $3 million in 2000 to $12.5 million in 2010.
  
  \item “An urban public university in the West reported that its Sponsored Project Administration costs allocated to the administrative component of its facilities and administrative rate increased 86\% from 2001 to 2009, while its direct expenditures increased only 53\% during the same time period.
  
  \item “A private university in the South told us that its research-related administrative costs increased by nearly 120\% between fiscal year 2002 and 2010, whereas its direct expenditures had increased by less than 100%.
\end{itemize}
◆ “A public university in the Midwest reported that the last estimate to purchase necessary software from an external vendor was over $500,000, exclusive of all the implementation and training costs devoted to it. A public university in the West estimated the cost of its system at $435,000 annually. System implementation for a private university in the South cost $443,000.

◆ “One private university in the Midwest estimated that on its campus there are over 6,000 effort reports completed three times per year, resulting in more than 18,000 effort reports processed per year overall. Estimating that 60–90 minutes were spent on each effort report — including issuing instructions, completion by faculty and staff, administrative review, tracking, and storing — yields a conservative estimate of 20,000 hours per year spent on this process. Several universities reported that overall they spent in the range of $500,000 to nearly $1 million annually on effort reporting alone.”

The examples of burdens and costs was included in a paper containing recommendations submitted to the National Research Council to answer the question NRC posed, “What are the top ten actions that Congress, the federal government, state governments, research universities, and others could take to assure the ability of the American research university to maintain the excellence in research and doctoral education needed to help the United States compete, prosper, and achieve national goals for health, energy, the environment, and security in the global community of the 21st century?” (Link to NRC project: www8.nationalacademies.org/cp/project-view.aspx?key=49219.)

In a parallel effort, COGR also tallied “Federal Regulatory Changes Since 1991” that “affect the conduct and management of research under federal grants and contracts.” (Link to document: www.cogr.edu/viewDoc.cfm?DocID=151793.)

For another look at the costs and burdens of research, see the results of the Faculty Burden Survey conducted under the auspices of the Federal Demonstration Partnership (¶3360.1).
120.5 Turnover and Retention: Why Do So Many Leave, But Some of Us Stay?

Lauren Magruder, Virginia Tech

Like most of you in research administration, I constantly dread the latest e-mail announcement that one of our teammates is leaving our office and our field. It happens too often. While we are happy for their future plans, our thoughts tend to focus on who will take on their duties, how long will the interview process take, and when will we find time to train the new employee.

The focus of my MPA Professional Paper was on career ladders as a method to reduce turnover in sponsored programs offices. I wanted to share some of the information I found with you and also open a discussion about this issue. Several of the sources I used examined why people stay instead of the more studied issue of why people leave. This made me wonder why those of us who have been doing this for a while continue within research administration. I also wanted to learn more about what we can do as managers to improve employee retention.

Employee turnover or retention in research administration has been an issue for many years. It is becoming more of a problem as the information needed to become a successful administrator continues to grow and become more complex. Our jobs often require a greater level of experience and confidence as the learning curve becomes steeper and gray areas increase.

As research administrator positions turn over, providing good support to departments and faculty members becomes more difficult. Remaining administrators are often over-burdened with additional work and training duties. They may become less engaged and start to look for new opportunities. This can lead to multiple administrators leaving at once. I personally refer to this as the snowball effect.

Mitchell, Holtom, Lee, Sablynski, and Erez examined job “embeddedness” (2001, pp. 1102–1121). Job embeddedness is the sum of all internal and external components that influence an individual to remain at his or her current job, or to leave that job. Understanding these components allows managers to influence them in positive ways that will help their employees feel more attached to the organization. Mitchell et al., argue that by measuring job embeddedness as a causal indicator, an organization can predict turnover (2001, pp. 1102).

The components of job embeddedness they examined are links, fit, and sacrifice. They see links as the important relationships that workers have with the environment around them, including family, friends, and co-workers. There are pressures from these linkages to continue to work. Leaving a position could diminish these links or reduce them entirely (Mitchell et al., 2001, pp. 1104-1105). Fit is related to how well a person’s values fit within the goals and culture of the organization, as

---

1 This article is reprinted from the *NCURA Magazine*, Vol. XLIII, No. 3, May-June 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
well as the community as a whole. A good fit may result in an increased attachment to the organization (Mitchell et al., 2001, pp. 1104-1105).

Finally, sacrifice is made up of the costs and loss of benefits beyond money that are associated with leaving a job. One may have to give up interesting projects and co-workers. If the benefits of leaving are greater than the benefits of staying, turnover is likely. Keeping employees engaged and excited about their work could improve retention (Mitchell, et al., 2001, pp. 1104-1105).

Although it would be difficult to measure every employee’s embeddedness level, being aware of these components gives managers the opportunity to address related issues and encourage attachment. Links could be strengthened by social activities at work such as monthly birthday celebrations and recognition of life events like wedding showers or employment anniversaries. Fit could be increased by evaluating administrators’ strengths and focusing their efforts in areas that interest them when available. Providing access to training and mentoring may also be beneficial to increasing one’s fit. Reducing sacrifice may include educating staff about long term employment benefits or introducing a career ladder with clear steps for advancement.

Oscar Grusky also studied a related concept of employee commitment (1966, pp. 488-503). In his article, “Career Mobility and Organizational Commitment,” Grusky hypothesized that “(1) the greater the rewards received, the greater the degree of the person’s commitment, and (2) the greater the obstacles the person has to overcome in order to obtain the organization’s rewards, the greater his commitment. (Grusky, 1966, p. 488)”

Grusky studied four areas of commitment. These included seniority, identification with the company, attitude toward management, and general satisfaction. His conclusions revealed that the first hypothesis above was not supported, but the second hypothesis was supported (Grusky, 1966, p. 488). These studies were applicable to research administration because they address the issue of why people stay and provide opportunities to encourage administrators to stay beyond pay increase or flex time that are often unavailable. It seems that it is not always what a person gets out of a job, but what they have personally invested that creates commitment to the organization.

Long-term research administrators may stay because we have personally invested in the field of research administration. This investment may be in the form of advanced training, certification, or internal office processes and involvement. As managers, we should provide opportunities for our new employees to become more engaged with research administration. They need to see it as a career and not simply a job at the university.

Research administrators and management must often be reactive to retention issues, and have difficulty creating proactive solutions. Some research administration organizations may have developed specific programs to curb turnover, but there is no one fix for every situation. Ways of analyzing and reducing turnover vary within professions, but good comparisons, such as with teachers and nurses, are available.
Continuing to share experiences with each other through such organizations as NCURA will also help universities to see what each are doing and adapt models to their needs. The future for sponsored research is busy, but bright, if research administration managers can be proactive in their efforts to retain administrators.

About the Author

Lauren Magruder is an Associate Director of Pre Award in the Office of Sponsored Programs at Virginia Tech. Her responsibilities include the management of a Pre Award Team of five administrators, drafting budgets, reviewing and submitting proposals as well as the negotiation of research awards. Lauren received a BS in Sociology from Frostburg State University and a Masters in Public Administration from Virginia Tech. She is also a Certified Research Administrator.
Nine Things Successful Research Administrators Do Differently
Denise Moody, Princeton University, Robyn Remotigue, Mississippi State University and Kevin Stewart, University of California, Santa Barbara

University research administrators will once again enter a new year filled with the anticipation of the release of new federal regulations and the fulfillment of our institutions’ obligations to existing regulations. As a primary example, all institutions must address the requirements of the National Institutes of Health’s (NIH) new financial conflicts of interest (FCOI) regulations within 365 days after its original release date in the Federal Register (August 2011). The complexity and breadth of the requirements prove once again that the research administration world is continuously evolving and challenging, so we must establish individual resolutions and professional goals for ourselves in order to be successful.

Dr. Heidi Grant Halvorson, a Harvard Business Review writer, recently described Nine Things Successful People Do Differently, which can easily translate to Nine Things Successful Research Administrators Do Differently.

1. Get specific
A successful research administrator is a multi-tasker who provides prompt customer service to their colleagues, faculty, and sponsors. In addition to our routine responsibilities and special projects, we constantly encounter unexpected inquiries, requests, and urgent deadlines at any time throughout our work day. At the start of each day, we should set specific daily goals for ourselves for those tasks we believe we can realistically accomplish, while still allowing flexibility and room for the unexpected events. If you are working on a long-term project, you should break down the task into smaller increments which can be part of the list of daily goals. In addition to establishing specific goals, pre-award research administrators must pay specific attention to detail in all aspects of our jobs, such as a thorough proposal review prior to submission to the sponsor and a careful review of award terms and conditions.

2. Seize the moment to act on your goals
A successful research administrator can never procrastinate; you must seize the moment. Dr. Halvorson states, “To seize the moment, decide when and where you will take each action you want to take, in advance” which results in “increasing your chances of success by roughly 300%.” Once you set your specific goals for the day, don’t delay. As soon as you have any opportunity during the day, take advantage of it. As we have all learned many times in our role, there’s never a “quieter” or “slow-
er” time to do something. There will always be more proposals, awards, e-mail messages, and phone calls in which we must respond to as quickly as possible. Another way to seize the moment is to complete those least desirable tasks first, whether it is to respond to a disgruntled faculty member, address a difficult personnel issue with a colleague, or review a very complex contract award.

3. Know exactly how far you have left to go

Part of creating and achieving your goals is to be realistic when establishing the list of goals and to constantly monitor your progress. As a research administrator, it’s easier to set and achieve goals that have hard deadlines in which everyone is working together towards the same result, such as a proposal submission date or a new federal regulation requirement. However, we face many responsibilities that require us to individually establish, review, revise, and perhaps even eliminate our goals. Coordinate closely with your supervisor and/or your colleagues if you find your goals a constantly moving target. According to Dr. Halvorson, “If you don’t know how well you are doing, you can’t adjust your behavior or your strategies accordingly.”

4. Be a realistic optimist

To be successful, research administrators must be confident in their ability to achieve their goals. Be a positive thinker when setting personal goals in order to increase your level of creativity and sustain your motivation. Be a realist and don’t underestimate the amount of time it will take to achieve your goal. Achieving goals takes time, patience, and persistence, which can all be driven by your optimism. Dr. Halvorson states, “Studies show that thinking things will come to you easily and effortlessly leaves you ill-prepared for the journey ahead, and insignificantly increases the odds of failure.”

5. Focus on getting better, rather than being good

As research administrators, we routinely find ourselves stepping outside of the four corners of our job descriptions to tackle a problem. Successful research administrators recognize the need to be more than just proficient in core job duties; we must adopt the mindset of lifelong learners as we continually refine our knowledge, skills and abilities. As James Casey noted in his article Observations on Building Offices of Opportunity, “any research administrator worth his or her salt knows that staying current in the field is a professional necessity.” This translates not only to the need to stay current on emerging policies and regulations that affect the research community, but to continually grow and evolve in our skills and abilities to address situations, solve problems, and better facilitate the forward movement of research. Additionally, the lifelong learner approach proves to be beneficial even on a more holistic level, as Dr. Halvorson notes that “people whose goals are about getting better, rather than being good, take difficulty in stride, and appreciate the journey as much as the destination.”

6. Have grit

Dr. Halvorson defines grit as “a willingness to commit to long-term goals and to persist in the face of difficulty.” Researchers are subjected to change on a daily basis. At the same time, this is a profession that experiences frequent turnover. Many of us spend time training new staff only to lose them to another office on campus or to another institution. As a result, this leaves the remaining staff filled in the gaps and feeling overburdened with the additional workload. Then, we hire new staff and begin the training process all over again. Do you ever ask yourself why you continue to stay, when so many others are making career changes, either by moving up the ladder or out of the profession altogether? In Lauren Magruder’s recent article entitled Turnover and Retention: Why Do Many Leave, But Some of Us Stay?, she shared an article written by Oscar Grusky that studies employee commitment. It seems that investment plays a major role in the life of a research administrator. According to Magruder, “it is not always what a person gets out of a job, but what they have personally invested that creates commitment... long-term research administrators may stay because we have personally invested in the field and it may be in the form of advanced training and certifications.” If this describes you, then you possess the characteristic of having grit.

7. Build your willpower muscle

A successful research administrator is a master of multi-tasking and juggling multiple (and at many times conflicting) priorities. As we continually reassess and reprioritize the tasks at hand on any given day, we can on occasion fall into the habit of pushing that one task that we’d rather not do further down our priority list. Before we know it, that low-priority task that we’ve been avoiding has become our top pressing issue that needs immediate attention. Tying in to the principle to Seize the Moment in (2) above, it turns out that by doing exactly those tasks that we don’t want to do, we are not only achieving greater efficiency in our work, but we are making it easier for ourselves in the future when faced with similar circumstances. In other words, we are strengthening our willpower “muscle.” Dr. Halvorson defines the concept of willpower as a muscle, and confirms this idea for building willpower by instructing us to “take on a challenge that requires [us] to do something that [we’d] honestly rather not do,” and notes that “it will be hard in the beginning, but it will get easier, and that’s the whole point.”

8. Don’t tempt fate

Regardless of the level of our dedication to a task and strength of our willpower “muscle”, we must, as research administrators, recognize that even our willpower is a finite resource, and there are instances where no amount of individual willpower alone will fully address the pending inquiry, the last-minute request, or the same-day deadline. It is important for us to have the perspective to recognize when we

---

need to ask for additional time and/or resources, and/or enlist the assistance of our colleagues and/or supervisors.

9. Focus on what you will do, not what you won’t do
In research administration, it is easier to focus on what you won’t do or can’t do rather than what you will do or can do. As research administrators, when you are working with your faculty, try focusing on what you will do for them versus what you won’t or can’t do. Admittedly, it is sometimes very difficult to do this. Too often, we spend a great amount of energy focusing on what we won’t or can’t do, such as change a policy or federal regulation. We should use this energy and focus on what we will do for them. In other words, look for a more creative or outside-the-box opportunity to demonstrate what you will do for your faculty and not the other way around. In the end, it becomes a win-win for both you and faculty.

Conclusion
Whether it’s a new federal regulation, a revision to an institutional policy, or even just a problem issue on your desk — there will always be some looming responsibility on the horizon that a research administrator must prepare for while handling all of the day-to-day tasks. But we should take heart in and draw from Dr. Halvorson’s message that “decades of research on achievement suggests that successful people reach their goals not simply because of who they are, but more often because of what they do.” There are undoubtedly additional tools, tips, and techniques out there that keep successful research administrators current, proficient, and diligent. Let these nine “things” be your baseline guide for your approach to what you “do” in 2012 – and let us all celebrate our successes!

About the Authors
Denise Moody is the Assistant Director of Grants and Contracts in the Office of Research and Project Administration at Princeton University. She serves on NCURA’s Professional Development Committee, Pre-Award Neighborhood Committee, and Region II’s Steering Committee. Denise is also a graduate of NCURA’s 2007 Leadership Development Institute.

Robyn B. Remotigue is the Assistant Director of Sponsored Programs Administration at Mississippi State University. She serves as the NCURA Magazine Contributing Editor for the Preaward Corner and past chair of the Neighborhood Program Committee. She is also the Volunteer Coordinator for Region III. Robyn is a graduate of NCURA’s 2010 Leadership Development Institute.

Kevin S. Stewart is the Senior Sponsored Projects Officer in the Office of Research at the University of California, Santa Barbara. He serves on NCURA’s Pre-Award Neighborhood Committee and is currently Chair of the Region VI Awards & Recognition Committee.
Managing Risk and Uncertainty in Large-Scale University Research Projects
Sharlissa Moore and R. F. Shangraw, Jr., Arizona State University

The number of large, complex research projects managed by universities is growing in size and scope. Additionally, industries are shifting more research projects to universities (Hall, Link, & Scott, 2003). At Arizona State University (ASU), for example, the amount of annual funding for sponsored projects over $5 million has risen from $10 million to $40 million over the past twenty years (Raudenbush, 2011). Large-scale research projects (over $50 million) pose management challenges and risks because they are often complex and unpredictable, involve new technologies, involve a large number of stakeholders and institutions, and extend over a long time scale (Bonnal, Jonghe & Ferguson, 2006). The traditional project management (PM) literature offers a number of methodologies for managing risk and uncertainty in large-scale projects, with a focus on minimizing cost and schedule overruns. However, universities are not known for the implementation of sophisticated project management systems and the management methodologies may fall by the wayside of ‘getting the science right.’ The relatively new field of research project management (RPM) is still developing its professional identity and gaining legitimacy, and scientists have resisted managers’ attempts to engage in research project management (Sapienza, 2004; Schuetzenmeister, 2010).

As the scope and size of research projects expand, universities have become major players, and sometimes leaders, in multi-million dollar research and development (R&D) projects. For example, in 2009, the National Science Foundation (NSF) awarded over $200 million to the University of Wisconsin-Madison to construct a deep-ice neutrino detector, called IceCube, in Antarctica. In 2007, the National Institutes of Health (NIH) awarded over $63 million over three years to George Washington University to develop a Diabetes Prevention Program. Over the past decade, NASA has granted several dozen awards over $100 million to universities for first-of-a-kind spacecraft research and development, including Genesis, Deep Impact, and Galex. These research projects are often: (1) extremely complex; and (2) decentralized, with work occurring at multiple institutions and across disciplines; and (3) may change dramatically in scope. All of these risk factors contribute to cost and schedule overruns in large-scale projects.

This paper explores the current population of completed or nearly completed large-scale university-run research projects and then examines the relationship between university management techniques and project success. We demonstrate that a significant amount of funding is spent on university-led projects larger than $50 million and argue that large-scale research project management techniques should be improved in order to increase project success. We begin by discussing how large-scale projects are defined and characterized in the literature and how we apply these characteristics to large-scale university-run research projects. Next, we discuss

a number of challenges facing university research project managers. We then offer an overview of project outcome measures, primarily cost, schedule, and technical performance, and discuss how these apply specifically to R&D. Next, we describe our methodology for developing a sample of large-scale university-run projects, which we believe is the total population minus U.S. Department of Defense projects. We describe the attributes of this population, finding a median university total project cost expenditure of $93,586,025 and an average project timescale of seven years. Finally, we share some preliminary findings from our survey of managers of these projects. While many university projects meet their overall technical objectives, many do so by overrunning the original cost and by slipping the initial schedule.

**What Is a Large-Scale Research Project?**

The large-scale project and its even larger counterpart, the megaproject, are often defined based on cost ranges, though these cost ranges vary throughout the literature. For example, Flyvbjerg (2007) defined large-scale projects as those that cost between $100 million and several billion dollars. He defined megaprojects as projects over $1 billion with a lifetime of 50 years or more (Flyvbjerg, 2005). Merrow (1988) defined large-scale projects as those over $500 million, and he defined projects over $1 billion as “very large projects.” Large-scale research projects, however, are generally lower in cost than the large-scale infrastructure projects on which much of the literature on large-scale projects focuses. Further, projects on which the university is the lead manager are typically on the lower end of the large-scale research project cost range.

For the purposes of this study, we used a cost threshold of over $50 million in total project costs to characterize large-scale research projects, of which there are roughly 58 U.S. university-led projects in the United States (as of 2010). This choice was empirically driven. If we had used the $100 million cut-off from the literature described above, the sample would have been limited to 21 projects and skewed toward National Aeronautics and Space Administration (NASA) and U.S. Department of Energy (DOE) projects led by California Institute of Technology (Caltech) and Stanford University. Types of scientific and technical research projects over $50 million include the construction of complex scientific instrumentation; the construction of first-of-a-kind spacecraft; the design of innovative weapons systems; the construction of large-scale, first-of-a-kind computing infrastructure; longitudinal clinical trials; and bioscience research projects with a singular objective. Due to our focus on university management, we did not address scientific megaprojects, which are typically over $1 billion and international in scope, and extend over decades (Cross, 2009). Scientific megaprojects are often managed by one or more government agencies rather than universities. Examples of megaprojects include the International Space Station, the Human Genome Project ($3 billion), and the Superconducting Super Collider (expected cost of $8 billion, but cancelled in 1993). While these “Big Science” projects garner much attention, guidance and program evalua-

3 This excludes the U.S. Department of Defense projects, for which data were unavailable.
tion are also needed on middle-range university-led projects, which also represent significant research expenditure.

We defined a project as having a clear objective and timescale and a definable outcome. In contrast, many large-budget scientific operations are research programs with components at multiple universities, across scientific domains, and sometimes representing several countries. Basic research at this funding scale tends to be conducted at dozens of universities working to fulfill a research center’s typically broad mission. NIH funds a number of research programs distributed across multiple universities, such as the Center for AIDS research, national/regional primate research centers, and the general clinical research center. These did not fall under our definition of a project.

Basing the definition on a range of total project costs is likely not the only, and perhaps not the most useful, metric for characterizing these large-scale research projects in a way that facilitates understanding of the management challenges they pose. Large-scale research projects are also often highly complex and uncertain, extend over long time scales, and involve a large number of stakeholders and researchers. Bonnal et al. (2006) characterized large-scale projects based upon the following factors: number of contributors to the project; number of activities the project seeks to perform and the relative complexity of these activities; number of intermediate deliverables that are produced throughout the project’s execution; number of activities outsourced to external contractors; and project duration that can span over a decade, making it difficult to define the long-term objectives of the project at the project’s conception. In fact, these characteristics are more relevant to research projects, which may have smaller budgets than construction projects but be extremely complex in terms of the number of involved actors and institutions; the number of experiments and activities; the long time periods, particularly until the science is translated into a societal benefit; and the number of stakeholders ranging from human subjects to the policymakers and taxpayers funding the research. In summary, large-scale research projects, for the purposes of this study, have a clear and achievable research goal, are very complex, often involving uncertain technologies, typically involve a large number of actors and institutions, often involve relatively long time scales, and cost over $50 million in total project costs.

**The Challenges of Managing Large Projects at Universities: Management Knowledge and the Research Management Profession**

Universities are being called upon to manage increasingly large research and technology development projects, but there has been a surprisingly small subsequent gain in the systematic knowledge of the challenges and risks involved with university research project management (RPM). Universities face challenges in each stage of managing large-scale projects: winning the project, defining the project, and managing the project. Universities face two key conceptual issues when managing large-scale projects. First, universities are not designed as project management organizations and therefore are not necessarily equipped to manage these behemoth projects in an efficient manner. Second, research does not progress in a linear fashion in the way that construction projects often do. Research project managers face
the discovery paradox, meaning that discovery occurs in serendipitous ways, but existing management techniques are typically linear and prescribed.

To address these challenges, 1) knowledge of university project management is needed, and 2) experienced research project managers are needed. We will address the need for RPM knowledge first. The traditional project management profession has developed a set of project management tools based initially on experience with construction and infrastructure projects. These tools have been refined for large-scale weapons systems, environmental clean-up and restoration projects, and large-scale information technology projects. This experience and research have even been synthesized in a number of publications, including the Project Management Body of Knowledge published by the Project Management Institute. However, higher education institutions are often the slowest adopters of project management (Kralevich, 2008). While there is some synergy with traditional project management techniques and research project management, PM techniques designed specifically for university are lacking (Austin, 2002; Erno-Kjolhede, Husted, Monsted, & Wenneberg, 2001; Powers & Kerr, 2009). This is a gap in need of further research.

As mentioned above, these research project managers face the scientific discovery paradox. Geles et al. (2000) argued that most project management strategies were designed for business, not science; further, this literature is not rigorous. Geles et al. outlined some of the project management strategies they believe would be suitable for use in the laboratory, including using a work breakdown structure for planning, charting the overall resource inputs required for the project, planning for risks and contingency, scheduling using Gantt Charts and project milestones, and using a costing scheme that converts resources into a common unit, e.g., U.S. dollars. Others feel more strongly that a completely new set of methods should be developed. Austin (2002) argued that the project management literature is too uniform and is not adaptive enough to be applied to science where there is “genuine discovery” that cannot be anticipated and planned for. Conventional project management strategies are better suited for construction because it is more predictable. Instead of spending a lot of time planning, research projects will require some learning-by-doing. Therefore, Austin argued, dynamic research project management methods with adaptive approaches are needed for innovative projects. This discovery paradox is a key challenge facing research project managers moving forward.

Also needed are experienced research project managers. A National Research Council report argued that Ph.D. scientists have not been trained in management, so large-scale research projects will require a research project manager who should be hired based on management skills, not scientific credentials (Nass & Stillman, 2003). These research project managers fulfill an important role in managing a growing amount of external funding for the university and their level of experience is thought to contribute to keeping projects on schedule and budget. This unique profession interweaves academic, managerial, and public service training and skills (Schuetzenmeister, 2010). It works at the boundary between science and society.

---

4 For a discussion of scientific research and serendipity, see Hackett, Parker, Conz, Rhoten, and Parker (2006).
managing and negotiating with multiple stakeholders both in and outside of the academy (ibid.).

However, the research management profession is still forming its professional identity, struggling to delineate itself from university administration (ibid.). It is also working to prove that it possesses legitimate expertise and a credible identity in laboratories that have traditionally seen themselves as self-governing. There is a stigma that managing science is not as good as doing science, and large-scale research project managers must work to develop an interactional form of expertise even though they are often not trained in the particular field of study and are often less eminent than the scientists they are managing (Collins & Sanders, 2007). Research project managers face the following challenges in the lab: forces that pull research teams apart, anti-management (i.e., resistance to being managed), goal conflict between scientists and managers, difficulty with performance evaluation, and anti-organization because following the scientific method is viewed as providing sufficient organization (Smith & Tuttle, 1988). Further, large-scale research projects often require management across multiple disciplines and communications barriers may increase the project risk (Sapienza, 2004).

Managing Cost, Schedule, and Technical Risks in Large-Scale Research Projects

All large-scale projects entail a unique set of management challenges. These include the following: the technology involved is often not standard, the decision-making process includes multiple actors with conflicting interests, the project scope and ambition level change over time, contingency estimates are usually inadequate despite statistical forecasts, and misinformation about costs and benefits is the norm (Flyvbjerg, 2005). These factors may result in cost overruns and performance shortfalls in a majority of projects (ibid.). Project management is geared toward increasing planning to reduce project uncertainty and risk. Project risk is a function of complexity, innovativeness, project definition, management experience, regulatory environment, budget certainty, and error (Cash, McFarlan, & McKenney, 1992; Merrrow, 1988; Myers et al., 1986; Weil, 1992).

Schedule Slip. Changing project scope and poor project definition are key contributors to schedule slippage. Defining the project includes mapping out the project tasks, task relationships, project environment, and outcomes. Poor project definition has been shown to be a key contributing factor to cost and schedule overruns (Myers et al., 1986). Myers et al. (1986) also found that slippage in the project’s total startup time could be explained by the number of process steps that were not commercially proven and by dispersed project responsibility. It is also widely acknowledged in the literature that project scope change is a major contributor to risk and uncertainty and drives schedule slippage. For instance, Samid (1994) found that one of the biggest challenges in R&D projects is that there are so many late-planned changes that the project bears little resemblance to the original plan (a reflection of the discovery paradox).
**Managing Cost Uncertainty and Overruns.** Cost growth, or cost escalation, is the difference between the estimated cost and the actual cost of the project (Merrow, 1988). In large-scale projects, technical goals usually take priority over time and cost goals (Grun, 2004). Therefore, cost growth in large government-funded construction and infrastructure projects has been a major focus in the PM literature. Unsurprisingly, cost escalation is identified as a major problem in these larger projects, with overruns of 50–100% being common (Skamris & Flyvbjerg, 1997). It seems that cost overruns are determined early in a project’s lifespan; Christensen (1993) found that defense contracts are highly unlikely to recover from cost overruns incurred in the first 15% of the project.

Cost overruns are also often blamed on mis-estimation. In one study of infrastructure projects, underestimation was found to occur in nine out of ten cases (Flyvbjerg, Bruzelius, & Rothengatter, 2003). Priemus et al. (2008) analyzed cost estimates in megaprojects and found that they have not improved in the past 70 years, and Ramachandran (1989) found that while cost-estimating methodology has become much more sophisticated, the level of accuracy has not improved. There is disagreement in the literature about the reasons for mis-estimation. Sometimes it is attributed to appraisal optimism. Samid (1994) found that in construction projects contingency is often just used to pad cost estimates, rather than being thoroughly analyzed. Bruzelius et al. (2002) found that in megaprojects of $1 billion or more, the difference between the cost forecast and actual costs could not be attributed to inability to predict the future alone. They concluded that project proponents are intentionally biasing the forecasts, leading to poor decision-making by policymakers who are unable to rigorously evaluate the costs and benefits of a project because of these biased forecasts. They assert that technical error is actually a minor part of the cost overrun. Flyvbjerg (2007) recommended subjecting project forecasts for publicly funded projects to rigorous peer review.

**R&D and Risk.** One of the main risk factors addressed in the literature is technological complexity, also referred to as the level of innovation in the project or the use of ‘unproven technologies’ (Parker, Benson, & Trainor, 1988; Sadeh, Dvir, & Shenhard, 2000; Shenhard & Dvir, 1996). The level of technological innovation in the project contributes to uncertainty and can result in cost escalation (Melamed, Skokan, Zenkowich, & Kocher, 2008; Merrow, 1988). The three measures of the level of innovation are whether 1) the project used a first-of-a-kind technology, 2) it employed new materials or methods, and 3) it was the largest project of its kind when it was constructed.

R&D brings with it uncertainty that is difficult to quantify. Pinto and Covin (1989) drew distinctions between R&D projects and construction projects due in part to overt risk. Rigorous, yet flexible, techniques are needed (Samid, 1994). Previous knowledge is required for effective statistical analysis, yet in R&D projects the assumption that previous knowledge can be used to predict outcomes often fails (ibid.). Austin (2002) argued that risk management for highly uncertain R&D projects might need to be different from the risk and uncertainty methodology that has been well developed in the construction industry. In a survey about the usefulness
of risk management strategies, Galway (2004) found that construction managers are wedded to risk management, but high technology practitioners are ambivalent toward it.

Large-Scale University Research Project Management Survey Results

Methodology. We developed a sample of recently completed or nearly complete research projects over $50 million in which a U.S. university was the primary leader. Our sample size was 58, which we believe is the total population minus U.S. Department of Defense (DoD) projects. We faced several challenges developing this sample. First, there was little freely available information on the number and manager of large-scale research projects funded in the United States. Second, grant money was often distributed over multiple years or even through multiple grants and thus difficult to aggregate. We obtained project lists from the NIH, Centers for Disease Control (CDC), NSF, DOE, and NASA. Only NSF hosts a publicly available online database that may be searched by project cost. NASA and DOE staff provided us with information from internal databases. DOE maintains an online research and development database, but it is not searchable by cost. The NIH hosts a publicly available database with grant information, but it also cannot be searched by project cost. NIH and CDC required us to submit Freedom of Information Act (FOIA) requests in order to obtain the data. We were unable to obtain data from the DoD; the DoD officials we contacted were unaware of any DoD-funded university-run projects over $50 million. We also contacted the sponsored projects office at major universities, but most were unable to provide us with a list of their large-scale projects.

We designed a 28-page survey instrument that addressed the characteristics of the project, information about the project manager and project team, whether the project experienced cost overruns or schedule slip, what factors contributed to a successful project, the management and planning techniques used, and demographics. We asked the respondents to report on their initial cost and schedule estimates and their final cost and schedule outcomes to correlate these outcomes with a variety of risk factors. The development of the questions was theory-driven, drawing on factors in the literature thought to contribute to project success.

The survey was administered to project managers online through SurveyMonkey. If the project did not have an RPM or the RPM could not be reached, the survey was sent to the project’s Principal Investigator. We sent an alert letter to both the university’s office of research and to the head of the project prior to sending the survey invitation. We also sent multiple email requests and made follow-up calls aimed at boosting the response rate.

Characteristics of the Project Sample. Our development of the sample offers a unique overview of the characteristics of university-run large-scale research projects. The median university total project cost expenditure for the sample was $93,586,025. The average timescale for these projects was roughly seven years
The federal government is the main funder of projects of this magnitude. There was no systematic method for searching for state-funded projects, and only one was uncovered through internet and database searches. The sample consisted of three CDC projects, 11 DOE projects, 24 NASA projects, 15 NIH projects, six NSF projects, and one Ohio Department of Transportation project (see Figure 120.7-1).

Even though NIH is the largest overall government funder of university research (AAAS, 2012), it does not fund the greatest number of large-scale university-run projects. This is because much of NIH’s research funding is dispersed across universities and is not project-based. For instance, much of NIH’s expenditures are spent on basic research that is expected to one day translate into societal outcomes. NASA is the biggest funder of university-run large-scale research projects. Government funding for large-scale research projects consists of large NASA space contracts, complex large-scale scientific instrumentation and research using this instrumentation funded by DOE and NSF, and longitudinal clinical trials and other project-based biomedical research funded by NIH.

Four universities stand out as leaders in winning large-scale project contracts: California Institute of Technology (six projects plus one in partnership with Colorado State University, one in partnership with Hampton University, two in partnership with the Southwest Research Institute, and two in partnership with the University of California, Los Angeles), MIT (three projects), Stanford University (five projects), and the University of California, Berkeley (three projects).

As illustrated by Crow and Bozeman (2001), national laboratories provide leverage for universities to win large-scale projects. For example, Caltech’s leadership may be attributed to its close partnership with JPL and its history of leadership in space projects. Many of the universities in the sample have partnerships with national laboratories, including Fermi National Laboratory (University of Chicago), Princeton Plasma Physics Laboratory (Princeton University), Jet Propulsion Laboratory (JPL) (California Institute of Technology), and Lawrence Berkeley National Laboratory (University of California, Berkeley). Further, NASA provides an experienced project manager through one of its labs—e.g., NASA JPL, NASA Goddard, or NASA Langley—for all projects on which the university is the Principal Investigator. In other cases, a novel university hybrid organization managed the projects. For example, the construction of the High-Performance Airborne Platform for Environmental Research (HIAPER) was managed by a university research consortium, the University Corporation for Atmospheric Research. The project took five-years and

---

5 Project duration data and total university expenditures were available for 48 of 58 projects. The data gaps for cost were for NASA projects; the agency told us that the university contract was above $50 million for the list of projects they provided, but they did not provide us with the exact amount. We were unable to locate this information in the public domain for 10 projects. If data were available for the missing 10 projects, it would likely increase the median cost because NASA total project costs were generally higher. Note that cost expenditure and project duration data, where available, were provided by agency databases, except for NASA. NASA cost/duration data were obtained from govbudgets.com NASA edition or from project websites.
Figure 120.7-1: Funding Agencies for Large-Scale University-Run Projects Based on the Number of Recently Completed or Almost Completed Projects (through 2010)

- DOE 18%
- NASA 39%
- NIH 11%
- NSF 25%
- O'H Dept. of Transport 2%
- CDC 5%

Note that this describes the survey sample, not survey respondents.

was completed in 2006 for a total project cost of $80 million. It was funded by NSF.

These projects were diverse, including construction of complex scientific instrumentation, construction of first-of-a-kind spacecraft, fundamental research, and clinical trials (see Figure 120.7-2). Twenty-four of the projects involved first-of-a-kind space missions. For example, Deep Impact was a mission to impact and take samples of a comet. It was headed by University of Maryland (providing the Principal Investigator and scientific team) with the JPL (providing the project management) and Ball Aerospace & Technologies Corporation (providing the flight hardware). The construction and mission took six years at a total project cost of $330 million, $66 million of which went to the university. In another example, the NASA Wide-Field Infrared Survey Explorer (WISE) mission mapped the sky at four different infrared wavelengths with greater sensitivity than past maps. It was a $320 million mission in total project costs—with $220 million going to Caltech—over 11 years. The Principal Investigator was provided through the University of California, Los Angeles; NASA's JPL provided the project manager.

The NIH-funded biomedical projects ranged from clinical trials to genetic sequencing. One example is the $156 million Health and Retirement Study by the University of Michigan—a longitudinal in-depth interview study of senior citizens living in the United States. The researchers are interviewing 22,000 Americans over age 50 every two years. Another example is the sequence of the yeast genome by Stanford University at a total project cost of $97.5 million. A third is the BARI II trial.
at the University of Pittsburgh, which was a multi-country clinical trial on type II diabetes and coronary artery disease funded at a total project cost of $55 million.

NSF and DOE funded a number of complex scientific instrumentation construction projects. For example, the Ice Cube project, run by the University of Wisconsin-Madison and funded by NSF, entailed the construction of a deep ice neutrino detector at the South Pole. The project required drilling 86 holes and installing 5,160 sensors for a total expenditure of $200 million. Another example is the Earthscope project funded by NSF and managed by Stanford University. It consists of 400 portable seismometers covering the entire United States, global positioning instruments positioned to observe fault zones in North America, and strainmeter instruments for observing and studying plate boundary processes and volcanic events. Other projects in the sample were large-scale research projects conducted on recently constructed complex scientific instrumentation such as the Alcator C-Mod Fusion Research Program funded by the DOE, the National Compact Stellarator Experiment, and the Stanford Linear Collider Research and Development.

**Survey Results.** We received 18 partial responses and 12 complete responses from a sample of 58. Unfortunately, this was not a high enough response rate for statistical significance, but we were able to make some observations, outlined below. The dependent variable was project success, defined by whether the project met technical performance, cost, and schedule goals. Independent variables included key factors that the literature suggested would drive cost and schedule overruns,

![Figure 120.7-2: Type of Project Based on the Number of Recently Completed or Almost Completed Projects (through 2010)](image)

As categorized by the authors.
such as years of experience of the project manager; adequacy of project planning, particularly cost and risk estimation methods; changes in the scope of the project; inadequate project definition; sufficiency of the cost estimate; and interdisciplinary communication barriers.

Project success, defined as meeting technical performance, schedule, and cost goals, was mixed. The response rate for the cost and schedule slippage questions was low. Only project managers who met their technical performance goals responded to these questions, biasing the results toward successful projects. The response rate for the project cost estimate and actual expenditure was particularly low (n=5), perhaps due to the sensitivity of the question. Only one project manager reported meeting the project budget, while two experienced moderate overruns (5–10% of the estimate) and one experienced a significant overrun (15% of the estimate, or $15 million). Forty-two percent of projects came in on time or ahead, 29% were somewhat behind (i.e., 25–50% over schedule), and 29% were very behind (i.e., 25–50% over schedule) (n=8). Therefore, while all of the projects delivered on their technical promises, many did so well over schedule. Figure 120.7-3 outlines project success, which we defined based upon the significance of the cost overrun, the significance of the schedule overrun, and whether technical performance goals were met. Sixty-seven percent of projects were somewhat successful, 11% were successful, and 22% were very successful.6 Surprisingly, only half of the projects (n=18) conducted a project risk assessment in the planning phases, suggesting planning for risk and contingency was insufficient.

Based on findings from the literature, the project manager’s experience level was expected to affect project success. The majority of all managers who responded were highly experienced, with about 85% having five or more years of experience on projects over $50 million. Sixty-four percent had master’s degrees in science, technology, or medicine, and 22% had Ph.D.s. (see Figure 120.7-4). Additionally, 61% had training in the scientific sub-discipline related to the project. In 77.8% of cases, project managers reported that the experience of the project staff was also critical to meeting technical performance goals.

Fifty-seven percent of the projects experienced turnover in the lead project manager during the project. While we expected to find that turnover in the lead project manager negatively affected the project, two managers stated that the change was positive because the initial project manager was either inexperienced in large-scale project management or was inexperienced in the scientific domain. Several others stated that there was a negative impact at the time of the change, but overall the change turned out to be positive, or even very positive, because they gained a more experienced manager.

The project managers’ qualitative responses revealed challenges with anti-management and university-specific management techniques, reinforcing the findings from the literature on research management outlined above. One of the project managers reported that many of the PM techniques NASA suggested they use were irrelevant to a university setting. Another pointed out that university clocks oper-

6 These data were only available for nine projects.
ate on different schedules than those of the aerospace contractors. Several managers reported that ‘managing by walking around and speaking informally with people’ was the most important technique. S/he stated, “people working on the mission need to know that you know them and that their contribution is important.” In summary, project communication is important to success.

Five shared frank comments about their experiences with anti-management, with one stating:

... many of the individuals assigned to work on the project were unfamiliar with, and resistant to, the implementation of formal project management processes. This resistance often led to a hesitance (and in some cases a refusal) to work with me and others on the project team to perform appropriate cost, schedule, and status reporting.

This finding reinforces the findings from the literature that research project managers face significant anti-management challenges and adds to it the possibility that these challenges may lead to cost and schedule overruns. One RPM reported significant staff turnover in the project due to anti-management.

Other RPMs reported struggling with scientists who believed management and science were mutually contradictory, with one stating that:

Some scientists within the organization firmly believed that management of the project was contrary to scientific discovery; that managing to a budget, schedule, and scope were ‘anti-science.’
This experience reflects the scientific discovery paradox.

**Discussion And Conclusions**

These preliminary findings suggest that there is much more to be learned about managing university projects. Research managers will continue to face challenges with anti-management, the discovery paradox, and university design. Developing project management methods that are tailored to the university setting and to risk factors specific to large-scale research projects is necessary for moving universities toward even greater success in completing research projects on time and on budget.

We discovered throughout the research process that federal agencies and universities lack data and data transparency about their large-scale projects. This makes it difficult to systematically develop a profile of the large-scale university-run research funded by the U.S. government. It also suggests a lack of coordination in this research profile. Additionally, most major research universities were unable to provide us with data, with one sponsored projects office lamenting that such data were very difficult to collect in their decentralized institution. The NSF has taken an excellent first step with its online database of projects searchable by cost. Other agencies may consider developing such databases, adding cost parameters to their existing databases, or making data available through databases like data.gov.

While rigorous project evaluation may improve future project success rates, it is difficult to execute. Barriers to effective project evaluation include: difficulty tracking evolving projects; concern over disclosure of proprietary information; and a
lack of incentive for managers to participate, particularly if the project was unsuccessful (Galway, 2004). While the key objective of our survey was to determine the significance of cost and schedule overruns in these projects, the response rate in that section of the survey was particularly low. Further, several project managers reported to us that they were not allowed to participate in such a survey. The length of the survey also contributed to the low response rate, particularly since there are few incentives for extremely busy managers to devote time to program evaluation. The research management profession and funders should consider counteracting these barriers, perhaps with incentives offered for participating in program evaluation. As management methodologies improve, research project managers will likely benefit from focusing on and improving project definition and structuring projects to reduce their complexity. Conducting a project risk assessment at the initiation of the project is also likely to aid in success. Universities may also consider opening a project management office to aid in winning these projects and successfully managing them.

About the Authors

Sharlissa Moore is a Ph.D. student in the Human and Social Dimensions of Science and Technology program at Arizona State University (ASU). Her research explores project management of large-scale research and the policy and societal aspects of energy innovation and renewable energy development. She is a Research Associate in ASU’s Consortium for Science, Policy and Outcomes. She also is engaged in the professional science and technology policy domain, having worked for the White House Office of Science and Technology Policy and the Science and Technology Policy Institute. She is the President of Student Pugwash USA, a non-profit organization that engages students in issues of social responsibility in science and technology. She earned her B.A. in astronomy with a minor in physics from Smith College.

Rick Shangraw is the chief executive officer of the ASU Foundation for A New American University. Prior to joining the foundation in November 2011, he served as ASU’s Senior Vice President for Knowledge Enterprise Development and Director of the Global Institute of Sustainability. He was responsible for ASU’s growing annual $350 million research portfolio, which placed ASU among the top 20 research institutions in the country without a medical school. Before joining ASU, Rick was the founder and CEO of Project Performance Corporation, a research and technology consulting firm specializing in environmental, energy and information management issues. He has a B.A., magna cum laude, in political science and a certificate in environmental studies from Dickinson College in Pennsylvania; a Master of Public Administration from the Maxwell School at Syracuse University; and a Ph.D. from the Maxwell School with a specialization in technology and information policy and organization design. He also currently holds a Professor of Practice appointment with ASU’s School of Public Affairs within the College of Public Programs and the School of Sustainability.

Submission of a $20 Million Proposal
David Smelser, The University of Tennessee–Knoxville

Recently there has been a shift in sponsored research towards interdisciplinary programs emphasizing collaborative research efforts. Bringing researchers from a variety of disciplines together to examine an issue is the academic equivalent of moving away from the “great minds think alike” mentality towards a “two heads are better than one” approach. Sponsors are dedicating enormous sums of money to these types of cross-cutting programs, often specifically for the formations of new centers, and in turn are soliciting proposals that require a tremendous amount of effort to prepare. As someone who has conducted research of my own, I appreciate the new emphasis on collaborative research and welcome the contributions that will be made to science as a result. As a university employee, I also welcome the countless benefits to the institutions involved with these projects, such as millions of dollars in funding, more faculty lines, higher quality graduate students and postdoctoral researchers, and maybe even a little fame.

Over the past year, I have had the opportunity to work with faculty to submit both a Science and Technology Center (STC) proposal and Engineering Research Center (ERC) proposal to the National Science Foundation (NSF). The STC and ERC programs issue some of the largest awards made by NSF annually. These awards are very prestigious, extremely competitive and worth a lot of money ($43.5 million combined). Consequently, the proposals to these programs are quite complex and require both great attention to detail and a significant amount of time to prepare.

To give you an idea of the complexity of these proposals, our STC proposal had 33 researchers identified by name, 16 subcontractors and four other affiliated institutions, 19 postdoctoral researchers, 14 new graduate students, 10 technicians and a 96-page budget to explain the $25 million request. The ERC proposal had 99 letters of commitment from private industry partners, state government, pre-college schools, national laboratories and affiliated and partner universities, as well as 37 researchers identified from six countries. I was very fortunate because I was able to work with the faculty for about four months on each of these proposals – and trust me, I needed every minute.

While researchers and institutions gain so much from these awards, the question must be asked, what does preparing mega-proposals mean to research administrators, especially to those of us working in pre-award services? Does it mean longer hours, an extra cup of coffee each day and a bottle of Excedrin in your desk drawer? It could, but it does not have to. As it turns out, submitting a mega-proposal can be pretty easy. After preparing these mega-proposals, I have learned some valuable lessons, which can be used not only on the largest of proposals, but also in our day-to-day work as well.

“Stay Organized, Stay Stress-Free”

1. **Take Pride in Your Contribution:** We all work in research administration, so we are fully aware that we will not be the one with our picture on the cover of the university newspaper when the proposal gets funded. But that should not stop us from being proud of the role we play. It is very important to keep in mind that the science in all of these mega-proposals will be rock solid, so it is the little things that can determine whether or not the proposal will be funded. Catching a minor oversight by the PI could make a major difference to the review panel. When working on these proposals I always tell my PIs, “you do what you do best, and let me do what I do best.” Never forget that you are an expert in your field, just as they are in theirs, so take pride in your contribution to the proposal.

2. **Get to Know Your Counterparts:** When was the last time you received a proposal that was due at the last minute? If your answer is “earlier this week,” you are in the same boat as the rest of us. This is why it is vital to touch base with your fellow research administrators at collaborating institutions early in the process. We all welcome the chance to get ahead of the game and not get stuck with a million-dollar subcontract with 20% mandatory cost-share that is due in two days. Also, when working on proposals, it is inevitable that something will change at the very end. By establishing a relationship with your colleagues at other institutions, you will have an ally in your corner. With a few days left until the deadline, having confidence that your new friend will come through for you provides great peace of mind.

3. **Understand Your Time Frame:** All too frequently, researchers are four months away from a deadline and feel they have all the time in the world, but we all know that is not true. It is very important that we, as research administrators, discuss time constraints and the realities of proposal preparation with the PIs we will be working with. Those of us in research administration have seen nearly every road bump imaginable, and it is important for the PIs to understand how long the process really takes and the common things that tend to cause delays. When working on a mega-proposal, it is beneficial to create a timeline that includes milestones for different points in the proposal process. Also, having regular “status check” meetings tend to keep the proposal on track. When PIs have to show up at a meeting and report on their progress, they often feel more accountable for completing the tasks they have been assigned. Do not be surprised if the PI is hesitant to accept a timeline at first, but they will thank you for it in the end.

4. **Invest Some Time Up Front:** It is also important to know what the research team is trying to do. No, I do not mean becoming an astrophysicist or expert in smart grid technology overnight, but it is good to understand the overall theme of the proposal. Does the proposal primarily consist of research activities, or is it focused on educational outreach? The central theme of a proposal can have a dramatic effect on the types of documentation you need to obtain, how the budget should be prepared and which institutional officials should be involved. Understanding what the PI is proposing will allow you to organize better and
save yourself some valuable time in the days before submission.

5. **Gather Static Documents Early:** How long does it take to get a CV, in the proper format, from a PI? I can see the grin on your face. How can such a trivial thing possibly be so difficult? Documents such as a researcher’s CV, Current & Pending support, or the institution’s Facilities & Equipment form generally do not change very often and can be gathered very early in the proposal preparation. While preparing our STC and ERC proposals, even after weeks of requesting and reminding, some individuals did not submit their CVs until the week the proposal was due. Can you imagine how hectic life would have been if I had not started gathering them early? Beyond helping yourself, collecting these documents early will make the PI’s life easier as well, because as the deadline approaches, they want to concentrate on their science and not on formatting their CVs. Gathering the static documents before the researchers are stressed out will certainly make your job much easier.

**“Sitting Behind the PIs Desk”**

Working on our STC and ERC proposals gave me the unique opportunity to see what proposal development is like from the other side of the fence. Many people who work in research administration never get the chance to see a proposal come to life, from the original idea all the way through the proposal development process. We generally only see a proposal a few days before the deadline and do not tend to examine the efforts required to get the proposal to our desk. By working with these PIs for several months, I gained a new perspective on how they felt during different stages in the process and have begun to better understand their mindset. It might be hard to believe, but they do not try to make our lives difficult; they just see things in a different way. I truly believe that in the field of research administration, we can all become more effective if we take the time to understand the PI’s point of view.

**Under enormous pressure:** In the final days before submission, the PIs are focused entirely on their work. For most PIs, having a proposal funded could be the difference between gaining tenure and losing their job. In the case of the mega-proposal, this may be a career-defining moment: the culmination of years of dedicated work. Either way, PIs feel an enormous amount of pressure during proposal development. While this proposal might be just one in a giant stack for you, submitting a proposal is not just another day at the office for the PI.

**PIs are people, too:** PIs do not get release time to write their proposals. They still have to teach classes, grade student papers, publish articles, manage their labs, mentor post-doctoral researchers and graduate students and even to squeeze a personal life in there somewhere. While research administrators are not “clock punchers,” researchers, especially those ambitious enough to apply for sponsored funding, are doing so on their personal time. Often we see PIs as robots, but they are people, too.

**Their mindset:** PIs are researchers, not research administrators, therefore they do not have the same level of understanding of administrative issues that we do. Their job is to conduct world-class research, educate future generations and bring
in research funding, not necessarily to understand every policy and regulation of every sponsor. We see proposals day-in and day-out while most PIs usually do not work on them more than once or twice a year. An example of an administrative issue that PIs frequently do not realize is that proposals consist of much more than the page limit of the project narrative. PIs tend to focus on their research, which is completely understandable because that is their expertise and comfort zone. But we know that there is more that goes into submitting any proposal than just the project narrative. The STC and ERC proposals I worked on were about 88% documents that went beyond the project narrative. We should always keep in mind that a PI’s skill set is different from our own. If we take the time to recognize and understand that PIs have a different outlook on sponsored research, we can help them understand all of the additional details that they are not aware of, do not understand or just do not want to worry about.

By keeping the proposal organized, encouraging the PI to stay on track, staying cool under pressure, understanding the PI’s mindset and, most importantly, taking pride in your role in the proposal process, submitting any proposal, even a mega-proposal, can be easy!

About the Author

David Smelser is a Sponsored Programs Administrator at The University of Tennessee–Knoxville and has worked for 7 years in various university research settings, from the laboratory to the University’s Office of Research. His primary roles within the Office of Research include representing sponsored programs on the proposal developing team, serving as the University’s Responsible Conduct of Research coordinator, and administering the University’s awards from the National Science Foundation, UT-Battelle, Department of Justice and Homeland Security.
Where Do I Send this Check – The Gift or Grant Office?

Bruce Morgan, University of California, Irvine; and Anthony (Tony) F. Ventimiglia, Auburn University

While the goal of increasing extramural funding for our institutions has become more imperative in recent years, achieving consensus on how this funding is classified and processed within an institution sometimes is more challenging than completing a Rubik’s Cube. However, many institutions have been working diligently toward bridging the gap between Sponsored Programs Offices and offices of advancement/corporate and foundation relations and building or repairing relationships through collaborative efforts. Before discussing the advances made in this regard, it is important to understand some of the underlying issues and challenges. With that in mind, please note that the intent of this article is not to examine the IRS definition of “charitable contribution”, but rather to discuss the institutional landscape in which extramural funding classifications are made. As the authors, it is our position that it is up to each institution to determine whether its extramural funding classification policies and procedures account for or consider the IRS definition of a “charitable contribution”. Likewise, it is not our intent to advocate for, or against, an institution’s role in advising a donor/sponsor whether the funds they are providing constitute a “charitable contribution” as defined by the IRS.

Gifts v. Grants: Exchange and Non-exchange Transactions

Appropriate classification of funding is important to institutions; it determines how to account for the funds, recover costs, monitor activities, and report on the use of the funds to internal and external constituents. Most institutions classify extramural funding as non-exchange transactions (i.e., gifts) or exchange transactions (e.g., grants, contracts, cooperative agreements, sales and service agreements, etc.). For public institutions, the appropriate classification of funding takes on additional importance as they are charged with the stewardship of public assets and misclassification of funding may lead to the misuse, mismanagement or abuse of the assets entrusted to them.

In non-exchange transactions, the intent of the giving party (donor) is to make a charitable contribution (typically cash, cash equivalents or property). The donor neither receives nor expects to receive anything of material value in return for the contribution. Typically the donor seeks only to ensure that the disposition of the gift is carried out in accordance with their wishes and that the gift is appropriately recognized. Such transactions are generally processed by an institution’s advancement/corporate and foundation relations unit. In contrast, an exchange transaction is one in which the sponsor receives something of material value in return for giving something that the parties perceive to be of equitable value – a quid pro quo arrangement. These reciprocal transactions usually take the form of a contract, agreement, grant, or letter of understanding and breaching the agreement usually...

This article is reprinted from NCURA Magazine, Volume XLV, No. 1, January/February 2013. It is used with permission of the publisher.
triggers consequences for the breaching party. Exchange transactions are generally handled and processed by an institution’s Sponsored Programs Office.

A critical aspect of the extramural funding classification process is conducting an analysis that examines the intent of the party providing the funding. The intent of donors in the context of non-exchange transactions is characterized as charitable and philanthropic in nature. During the analysis, the intent of the donor should receive significantly more consideration than the label used by the donor and others to describe the transaction. A donor may provide a gift, but call it a “grant”. This designation alone is not sufficient to classify and process the funding as an exchange transaction.

It is not unusual for donors to provide “grants.” Likewise, it is not unusual for an institution to determine that such funding is most appropriately accepted as a gift, as defined by the institution in its policies, and administered by its advancement/corporate and foundation relations unit. Consider the example of a company that provides a grant to support student scholarships where the company wants the scholarships to carry its name (e.g., VentMor, Inc. Scholars), as well as receive a report highlighting the scholarship recipients and the amount of each scholarship. Such an arrangement does not convey something of significant value to the donor; thus, a quid pro quo does not exist. In this example, the institution’s advancement/corporate and foundation relations unit would normally process the funding as a gift.

While the intent of the party providing the funding is very important, it is not the only factor and institutions should ask additional questions during classification analysis, such as:

◆ Does the funding support an activity or project with a defined period of performance?
◆ Does the donor/sponsor reserve the right to revoke the funding at its own discretion?
◆ Will the donor/sponsor acquire patent and/or other intellectual property (IP) rights?
◆ Does the donor/sponsor require the return of unexpended funds?
◆ Does the donor/sponsor reserve the right to conduct a detailed audit of the program or activity?
◆ Are detailed financial reports and/or detailed programmatic progress reports required by the donor/sponsor?
◆ Does the activity involve the testing, analysis or use of the donor/sponsor’s proprietary information, materials, or products?
◆ Does the donor/sponsor have material transfer agreements or IP exchange agreements in place with the institution where the materials or IP will be used in the performance of the activity or project?

The above questions are not all inclusive – each transaction is different and careful judgment should be exercised during the classification analysis. It is criti-
cally important to consider all factors prior to making a classification decision. For example, consider the situation where a non-profit foundation provides a gift to an institution accompanied by the following requirements:

- The funding may only be used for the purpose of advancing the institution’s nanotechnology research programs;
- The institution must provide annual reports of how the funds are utilized;
- The institution is required to return all or part of the funds if it loses its tax-exempt status under Section 501(c)(3) of the IRS Code;

In light of these requirements, and without careful analysis, this funding may appear to be an exchange transaction. However, when one considers that the foundation’s mission is to advance nano-science and the public’s understanding of it, the requirement to use the funding only to advance the institution’s nanotechnology research programs is a reasonable and necessary requirement. Likewise, the annual report requirement is necessary to enable the foundation to fulfill its mission-based obligation of increasing the general public’s understanding of nano-science. Most institutions consider such reports to be an appropriate stewardship activity, especially when the reports are written at a summary level and lack the detail usually found in the progress and financial reports associated with exchange transactions. Regarding the requirement to return funds if the institution’s tax-exempt status is lost, the foundation is also tax-exempt under Section 501(c)(3) of the IRS Code and as such it operates exclusively for exempt purposes as defined by that Section. Therefore, if the institution lost its tax-exemption prior to expending all of the foundation’s funds, the foundation’s tax-exempt status could be at risk.

**Who Cares? – Motivations for Classification and the Differing Perspectives of Key Players**

Understanding the motivations, perspectives, and the roles and responsibilities of key players in extramural funding classification and processing is key to fostering collaboration amongst these players. These key players will differ between institutions, but in general they include:

- The advancement and/or corporate and foundation relations unit
- Development Officers
- The Sponsored Programs Office
- Researchers/program directors
- Donors/sponsors

Other individuals and/or institutional organizations may be involved in the processing of extramural funding and may have their own motivations for having funding classified as an exchange or non-exchange transaction. However, those listed above are key stakeholders within the classification process at most institutions. As such, they may have the opportunity and/or political capital to influence the classification decisions.

An institution’s advancement/corporate and foundation relations unit tends
to have an external focus aimed at establishing, nurturing and expanding broad relationships on the institution’s behalf with individual and family donors, alumni, corporations, charities, and foundations. They foster these relationships over time and typically with extensive efforts, which result in contributions and donations to support the furtherance of an institution’s mission. Donor stewardship and recognition efforts are part of this unit’s activities. Such activities are essential to the continued development and nurturing of institution/donor relations.

At some institutions, Development Officers (usually employees of the advancement/corporate and foundation relations unit) are embedded in schools, academic departments and research centers. These individuals are responsible for the fundraising activities of the units to which they are attached, and they work closely with faculty researchers. Often they report to both the head of the academic/research unit and the advancement/corporate and foundation relations unit. These individuals are often compensated and evaluated based on several performance factors, including how much money they raise for the academic/research unit. Therefore, they have a strong motivation to ensure that such funding is classified as a gift so that they may receive credit for it.

Sponsored Programs Offices (SPO) tend to focus on internal constituents (primarily faculty/researchers) to prepare and submit proposals to federal, state, corporate, and private entities (for-profit and non-profit), in addition to other responsibilities related to compliance and award management. SPOs interact with sponsors on exchange transactions regularly. As a result, if a proposal submitted to a non-profit through an institution’s SPO is funded, the resulting award may be processed as a grant or other exchange transaction purely out of habit or routine.

Researchers and program directors/managers also play a critical role in non-exchange and exchange transactions. They are responsible for ensuring that their programs have sufficient funds to continue their planned activities. The competition for funding can be, and often is, very fierce. Researchers and program directors/managers generally strive to maximize the funding for their programs. Sometimes, the interests of these individuals and their programs conflict with the interests of the institution. For example, a researcher might verbally agree to conduct a specific scope of work and provide the sponsor with exclusive access to research results in exchange for the sponsor’s “gift” to the researcher’s lab. A common motivation for such an arrangement is the avoidance of facilities and administrative (F&A) costs. The researcher may not understand that such costs are essential for supporting the institution’s research enterprise and may consider such costs to be a tax or penalty that should be avoided whenever possible.

Of course, donors and sponsors play a key role as well – without them, there would be much less funding available for our institutions’ research programs. While they are motivated to provide funding to our institutions for reasons that span a broad spectrum, they do not have unlimited resources to support their funding programs. Consequently, they often seek to leverage their funding to the greatest extent possible. For example, a startup company without its own research facilities may have a verbal understanding with a researcher related to a “gift” pro-
vided in exchange for services that directly benefit the company and advances their research interests or moves their product closer to market. In such a situation, the company is usually motivated by a desire to minimize costs while maximizing the value received for their funding. Disguising an exchange transaction as a gift avoids the additional charge of institutional F&A costs.

**Effective Extramural Funding Classification – Three Proven Models**

The organizational model for extramural funding classification varies across institutions. Successful models have at least one thing in common – open and collegial communication and collaboration between most or all of the individuals involved in the classification process. Collectively, we have worked at institutions where all three models described below have been successfully used.

**The Team Model**

In this model, the SPO and advancement/corporate and foundation relations offices work together as a team, often times in conjunction with other offices and individuals. This is the model currently in place at Auburn University where the offices of Sponsored Programs, Contracts and Grants Accounting, Corporate and Foundation Relations, Development Accounting and Vice President for Business and Finance meet on a monthly basis.

The team’s goals are to: foster a collaborative environment; increase extramural funding; create common definitions and understandings for gifts, grants, contracts and exchange transactions; create a common understanding for soliciting, administering, and counting extramural funding; create common definitions and understanding of the role of each office; and ensure compliance with all applicable policies, guidelines and procedures. Some of the outcomes of this collaboration have included the development of a new policy and associated checklist, discussions on specific solicitations (wherein the team will review a proposal request and/or award documents to determine the appropriate treatment), joint presentations across campus (representing a united front), as well as open more lines of communication between the offices (including the inclusion of Corporate and Foundation Relations in the dissemination of Sponsored Programs bi-monthly Funding Opportunities Newsletter). Even though there are still challenges and issues to face, this model enables the team to work closely and collegially to address them.

**The Committee Model**

This model is similar to the Team Model, but is more formal in its structure, authority and procedures. The committee is usually constituted and charged by a senior level institutional official, such as a Provost or Executive Vice Chancellor. The membership of the committee is defined in policy, as is the committee’s scope of authority. Membership often consists of one or two knowledgeable representatives from the Sponsored Programs Office, the University Advancement Office (which typically includes the Foundation Relations and Corporate Relations offices) and the Accounting/Financial Services Office. In some implementations of this model, additional representatives are added from units such as the Budget Office, Purchasing/
Business Contracts and Risk Management. The committee is usually charged with conducting reviews and making decisions for the institution regarding the classification of extramural funding. The goals and activities of the committee are typically very similar to those described in the Team Model above.

*The Flexible Model*

Unlike the other two models, which bring key offices and individuals together on a regularly scheduled basis, this model functions in a less formal way and relies on ad hoc groupings to address issues related to extramural funding classification, as well as the goals and activities discussed above in the Team Model. This is the model currently in place at the University of California, Irvine (UCI).

In this model, policy typically vests the responsibility for reviewing extramural funding and making classification decisions in one individual or an office (institutional reviewer). When questions arise regarding the appropriate classification of funding, the institutional reviewer coordinates with a variety of key constituents from across the institution based on the nature of and circumstances surrounding the funding. The Flexible Model helps secure additional information from researchers and/or program directors/managers by engaging them in discussions regarding the purpose of the funding and the intent of the sponsor/donor. Their involvement in the classification process opens up lines of communication that are necessary to ensure that all of the facts and information available are considered prior to making a classification decision. Involving them in the process also creates opportunities to educate and orient them on the importance of appropriate extramural funds classification.

*Summary*

Classification analysis is critical to ensuring the proper handling of extramural funding and the methods to achieve this will vary across institutions. However, equally important is that the stakeholders within an institution understand each other – their roles and their motives – and build an extramural funding classification process upon a foundation of collegial collaboration and open communication.

*About the Authors*

Bruce Morgan is the Assistant Vice Chancellor for Research Administration at the University of California, Irvine. His responsibilities include Sponsored Projects Administration (pre-award and non-financial post-award), Research Protections (human and animal research subjects and the use of human stem cells and radioactive drugs in research) and Conflict of Interest in Research. Bruce started his career in research administration in 1987 and has worked at three of the University of California’s ten campuses. He is an active volunteer for NCURA and currently serves as Co-Chair of the 55th Annual Meeting, Vice Chair of the Professional Development Committee, and as a member of the Board of Directors. He can be reached at bruce.morgan@research.uci.edu.

Anthony (Tony) F. Ventimiglia is the Associate Director for Education and Com-
munication in the Auburn University Office of Sponsored Programs where his responsibilities include the development and implementation of education programs for both faculty and staff at Auburn University. Tony has been working in research administration since 1999 and has volunteered in various capacities at both the regional and national level. He is a graduate of the 2005 class of the NCURA Leadership Development Institute and currently serves on the NCURA Board of Directors. He can be reached at VENTIAF@auburn.edu.
Improving the Efficiency of the Research Award Setup Process

Mike Daniel, University of Chicago, and Rob Rubens, Huron Consulting Group

The setup of a research award is a high profile, outward facing, linchpin process in the award lifecycle. There are several key stakeholders, including academic and department leadership, principal investigators (PIs), and local research administrative support, all of them cognizant of the time required to set up a research award. These various groups’ perceptions of the efficiency of the award setup process greatly affects their overall impression of the customer service level provided by central research administration offices.

The setup process often involves several personnel handoffs, from the pre and post-award functions, and can also include various compliance offices (COI, IRB, IACUC, IBC), general counsel, technology transfer, and sometimes offices outside of the research administration infrastructure, such as information technology. Each step provides an opportunity for hiccups in an award’s progression, but consequently each identifies areas to streamline. Fortunately, setup is one of the easier research administration areas to quantifiably measure and improve via metrics, as there are myriad defined checkpoints. This paper will address key roles and responsibilities surrounding award setup as well as valuable metrics to motivate staff, identify bottlenecks, and ultimately improve the efficiency and effectiveness of the overall process.

Award setup often forms the bridge between pre-award and post-award within a research administration organization. At a high level, all new awards or award modifications, once received, must be entered into the institution’s various internal systems, including the pre-award tracking and post-award financial system. Communication of award receipt and basic award requirements (reporting requirements, budgetary terms) to PIs and local administrators must also occur.

Award setup also establishes the foundation for effective future management of the award, including meeting technical and financial reporting requirements, determining allowable costs, and tracking other salient milestones. Accurately recording data points during award setup is critical to effective and compliant award monitoring, as well as efficient cash management. Many prominent research administrators have recognized the importance of award setup to the smooth operation of their organizations. An example of a recent process improvement initiative at the University of Wisconsin Madison (UW-Madison) centered on effectively employing metrics to improve the speed of award setup times: “Using data to capture processing times for key steps in the award setup process, UW-Madison was able to quantify its baseline performance and identify ways to improve the process through workflow, IT, and training enhancements. The outcome of the initiative was an overall reduction in award setup times by over 60 percent. On an ongoing basis, UW-Madison has been able to maintain fast award setup times as a direct result of monitoring goal vs. actual performance data in this area on a monthly basis.” — Kim Moreland, Assoc.

Vice Chancellor for Research Administration, and Director, Research and Sponsored Programs, University of Wisconsin.

Initial data entry errors create the potential for a butterfly effect downstream, ultimately increasing audit risk. Many other research administration functions rely on accurate award setup including invoicing of research accounts, financial reporting, Facilities & Administration (F&A) rate negotiation, effort reporting, and institutional budgeting. Data points such as F&A rate, F&A base, and overall budget, including personnel effort, must be accurately captured.

Figure 120.10-1.

Data Points Captured:
- F&A rate
- F&A base
- Overall budget
- Personnel effort

Technical Reporting Requirements
- Milestones
- Financial Reporting Requirements
- Allowable Cost Determinations

Effective Cash Management
- Reduced Audit Risk
- Accurate Award Monitoring
- Compliant

It is important that award setup proceeds as smoothly and efficiently as possible. Take cash flow, for example. If process holdups delay establishing the award account in the institution’s financial system, the expensing of project costs and possibly reimbursement for costs already incurred are delayed. Many institutions allow investigators to utilize a “pre-award” or “advance” account for project expenses in anticipation of the official award. This holding account houses expenditures prior to the negotiation or receipt of formal award documentation. However, until the award has been received by the institution and fully set up in all applicable pre-award and post-award systems, the institution cannot bill the sponsor for research expenditures incurred. From a cash management perspective, timely conversion from a pre-award or advance account to an executed grant or contract is crucial in order to optimize cash flow at an institution.

Exact roles and responsibilities in the process can vary greatly among institutions due to differences in the sizes and structures of research administration offices as well as approaches utilized. Examples of different organizational approaches to award setup include:
- Separate personnel in both the pre-award and post-award offices, each having a unique role in the process
- Award setup as its own unit within either the pre-award or post-award office
- A cradle-to-grave approach where a single research administration unit manages the process from proposal to award, including setting up awards in all systems
One common theme found across institutions, however, is that the PI and/or the PI’s administrative support often play a key role in the process. For example, the PI may be responsible for acknowledging the terms and conditions of the award before the award is accepted by the institution and research costs incurred. While each of the above approaches is valid, coordination of tasks among the different roles in the process remains critical.

Researchers value a high level of efficiency and accuracy in award setup, as they need the ability to incur expenses as quickly as possible upon award execution. Additionally, the ability to pay research staff salaries, purchase equipment and supplies, book travel, etc. is dependent on this cycle time. Delays in award setup will result in decreased customer satisfaction, with PIs often not hesitating to communicate their dissatisfaction and frustration to university leadership. Essentially award setup is a gate-keeping step for beginning research: spending and progress can only occur as fast as awards are set up.

To further understand the importance of the award setup process, it is useful to take a look at key steps in the process in more depth, including personnel responsible for proper execution, pitfalls to avoid, and key metrics related to each phase.

Figure 120.10-2.

1. Receipt of the Award Document

Award setup begins when the award document, e.g. a fully executed contract or notice of grant award, is received by the institution. An intake staff member matches the award document to its associated proposal and records receipt of the award document in an internal tracking system. Typically, notification of award receipt is then electronically sent to the PI/department. At this point, it is imperative to begin tracking cycle times. Certain documents are time sensitive, requiring a signature and quick turnaround to the sponsor after receipt. Using the initial award receipt date as the starting data point of an award setup cycle makes sense as (i) it is the reasonable starting point from which administrative action can occur, (ii) it allows for tracking as process steps take place across various roles, and (iii) the receipt date will likely be viewed by the PI as the starting point upon which action is expected of central research administration.

Pitfalls at this phase can be avoided with the following steps:

◆ Avoid communication breakdowns: Award documents and related information sometimes may not flow between the central research administration office and departments efficiently, causing dissatisfaction for PIs and their staff.

◆ Identify and associate award documents with corresponding proposal file(s), which requires additional due diligence upon award receipt, depending on both the clarity of data on the award document as well as the strength of the
institutions’s proposal tracking system.

Two key metrics to begin tracking in this phase:

1. The receipt date of an award as the starting point for an award setup processing time metric

2. The type of award received (new, modification, subcontract) to enable a comparison of cycle times by type

2. Review and Negotiation of the Award Document

Next, staff will review the award document, identifying troublesome clauses, conducting compliance reviews, comparing the document against the corresponding proposal, negotiating with the sponsor if necessary, then accepting and entering the relevant data in the pre-award system.

Review of award documents will vary depending on complexity of the terms and conditions of the award, as well as the staff member’s familiarity with the sponsor. This research administrator holds responsibility for noting special requirements and questioning non-standard terms. If issues are identified and fall outside his or her immediate realm of expertise, the administrator should bring in additional resources within the office or elsewhere in the institution, e.g. the technology transfer, general counsel, or human resources departments, to resolve outstanding questions. Subsequently, applicable compliance checks related to conflict of interest (COI), humans subjects research (IRB), animal research (IACUC), and hazardous materials (IBC) should be completed at this stage.

It is at this point in the overall process that central research administration must verify the PI has taken comprehensive and necessary actions to gain all applicable compliance-related approvals. These compliance checks are a regulatory responsibility for the institution and comprise a critical step of the overall award setup process. If necessary, the award is then formally accepted by returning an executed contract or award document to the sponsor.

Pitfalls at this phase can be avoided with the following steps:

◆ Communicate necessary forms and procedures related to open compliance issues with the PI/department prior to award receipt, so award setup is not delayed. Award setup personnel should continue to follow up with compliance offices and the PI to ensure a smooth flow through the applicable compliance approval processes.

◆ Establish clearly defined issue escalation procedures to address problematic award terms and conditions. For example, an institution could automatically escalate award negotiations that have gone on for more than 30 days since award receipt. Any delays and causes thereof should be tracked for future process improvement.

Two key metrics to begin tracking in this phase:

1. Time to review an award document. This could be defined as total pre-award review time for those institutions with separate pre-award and post-award
offices. There is a benefit in tracking total review time for each administrative role in the process; leadership will gain a deeper understanding of the different components of overall process cycle time.

2. Number of awards put on compliance “holds,” length of compliance holds, and process time utilized in waiting for information from other offices (PI, departments, and compliance offices).

3. Award Setup in the Institution’s Financial System
At this juncture staff reviews the award’s reporting and financial requirements to determine payment schedule and disbursement method, e.g. letter of credit, invoicing, or fixed payments. In addition, it may be the case that the sponsor has awarded a reduced budget versus what was originally proposed. If this occurs many institutions will require the PI to provide an updated budget to reflect the awarded amount before proceeding with award setup. Some institutions will only require an updated budget if the reduction crosses a certain threshold, such as 20% of the total proposed budget. Using clearly communicated budget reduction threshold will send a clear signal to campus when a revised budget will be required.

Special reporting requirements should also be identified and noted, e.g. FFATA, cost sharing, and the frequency of sponsor financial reporting. The administrator should then establish this information in the institution’s financial system as well as any additional “shadow” system being utilized to track award data. This step establishes the research account and creates the unique account number.

Pitfalls at this phase can be avoided with the following steps:

◆ Communicate the need to revise the project budget either internally (PI/Department) or externally (consultants/subrecipients) without delay.

◆ Ensure all award information is consistently and accurately transferred to post-award from pre-award.

◆ Completely capture award attributes in the financial post-award system; downstream financial processes and reporting can be affected.

Four key metrics to begin tracking in this phase:
1. Total number of award setups over a specified period of time, e.g. annually, quarterly, etc.

2. Cycle time from end of pre-award setup to end of post-award setup

3. Administrative award setup cycle time, or time from award receipt to completion of post-award setup

4. Cycle time to set up new awards vs. award modifications as well as various types of awards, e.g. contract vs. grants, federal grants vs. nonfederal grants

4. Award Account Distribution to PI and Department
One final step that cannot be overlooked in the award setup process is the final communication to the PI. After an award is established in the post-award financial
system, documents and account information must be communicated to PIs and key department representatives in a timely manner. Any special or unusual terms or conditions should be noted. It then becomes the PI’s and department’s responsibility to review all award documents and understand all award attributes before beginning the research project.

Succinct and articulate communication to the PI and department is imperative. Research administration should send only relevant material in an easy-to-read format, and ensure atypical terms and conditions receive the necessary emphasis and explanation.

Total award setup cycle time — from award receipt to final communication to the PI granting allowance to spend — can now be captured. This metric measures overall process cycle time as well as interim cycle time (pre, post, department, and ancillary compliance offices) and allows for an assessment of the process efficiency.

Pitfalls at this phase can be avoided with the following step:

◆ Prompt, concise communication to the PI and research team once award setup is complete: although the need for clear communication is uniform throughout the process, it is especially critical at this stage as there are no additional administrative hurdles present that would inhibit the PI from beginning to spend funds awarded from the sponsor.

Two key metrics to begin tracking in this phase:

1. Total award setup cycle time – from award receipt to communication to the PI that he or she may begin spending award funds
2. Percentage of awards with corresponding “pre-award accounts,” as well as the average time before pre-award accounts are converted to effective grant revenue accounts

Frequent communication during the award setup process among all stakeholders is critical to process success. Especially within and across pre-award and post-award offices, free and open exchange of award information is vital for teams and individuals. In larger offices where award setup is supported by a variety of roles, it is crucial that key players remain in constant communication when trying to resolve award setup issues. Also worth highlighting once more for central research administration offices is the importance of communicating with and seeking feedback from its customers, i.e. the PIs and their local administrative support.

It is also important to measure performance metrics, and utilize them to drive process improvement. The benefit derived from capturing and analyzing these metrics will depend on multiple factors, including:

1. Recognizing staff for strong performance when warranted
2. Identifying where additional resources may be needed or where processes can be reviewed and changed to enhance efficiency
3. Detecting process bottlenecks both inside and outside of central pre and post-award offices, e.g. departments, compliance offices, problem sponsors
4. Setting goals for processing times to motivate staff as well as provide detail behind Service Level Agreement with the research community

5. Prioritizing workloads and reducing backlogs, e.g. redeploying staff to focus on awards held up for compliance reasons

6. Transparent reporting to leadership and campus to improve customer service and perception

In summary, optimizing the award setup process will lead to a plethora of tangible benefits for a research institution. A smooth, timely, and informative award setup process, evaluated by well-considered metrics, will boost customer service and satisfaction, improve cash management through the quick conversion of awards received into active research accounts, and enhance institutional compliance.

About the Authors

Mike Daniel is the Assistant Director of Contracts Management in University Research Administration at the University of Chicago. He has served in roles in pre and post-award research administration at various universities and as a consultant for five years. In addition, he is an attorney and a member of the State Bar of Illinois. He can be reached at mbdaniel@uchicago.edu.

Rob Rubens, CPA, CFF (IL) has experience leading and working collaboratively with teams in areas related to process redesign, compliance, and finance. He has developed project frameworks, assisted with central office reorganizations, and conducted trainings for multiple higher education institutions. In addition, he is a member of NCURA and the AICPA. He can be reached at rrubens@huronconsultinggroup.com
Successful Management of Multi-Project Programs
Pamela S. Foster, University of California, Irvine

Over the past two decades, the federal government has increased financial resources allocated to the creation of multi-project programs, many of which involve hundreds of scientists working together from a wide range of different fields across a multitude of institutions and states (Stokols et al, 2010). These programs are expected to increase the rate at which research moves from basic science into clinical practice. These large-scale team research projects challenge research administrators’ ability to efficiently manage their infrastructure. However, by employing strategic planning, developing the proper tools, and efficiently communicating, administrators can be successful in the management of multi-project programs. What, then, are the elements of managing a multi-project program? They include:

1. Creating special terms and conditions.
2. Managing multiple sub-awards and projects.
3. Communicating with Principal Investigators and their administrative staff.
4. Accounting for institutional differences.
5. Tracking information.

In this article, we explore each in turn.

1. Creating special terms and conditions

Sub-awardees are typically held to the terms and conditions of both the funding agency and the prime award institution. Moreover, some federally funded large-scale research projects include special terms and conditions specific to that award. It is advisable to create an appendix to include with the sub-award documentation that outlines each of these terms and conditions. Based on the structure and complexity of your award, developing additional internal policies and procedures may assist you in the management and organization of the program. Consider the following when developing your specific terms and conditions document:

   Compliance Requirements – Human subjects, animal subjects, and any associated biosafety protocols require oversight and compliance. You should define how new protocols involving humans and/or animals will be processed for approval by the prime award institution. Consideration should be given to oversight of protocols, since it is the Principal Investigator and prime institution that are held accountable to the sponsor for compliance. You may want to require investigators to provide you with copies of protocol narratives, consent forms, and letters of approval issued by their IRB, IACUC, or IBC. Additionally, the prime award institution is responsible for ensuring each protocol matches the work as described in the research plan. Decide how this accuracy will be accomplished by asking the following questions: Does your institution delegate this responsibility? Will the funding agency require

---

1 This article is reprinted from NCURA Magazine, Volume XLIV, No. 1, Jan/Feb 2012. It is used with permission of the publisher.
any certifications from the prime institution? If so, how will these certifications be reviewed at the prime institution?

**Financial** – For federally funded grants and agreements, OMB Circular A-110 sets forth standards for obtaining consistency and uniformity. OMB Circular A-21, on the other hand, establishes the principles for determining costs applicable to grants, contracts, and other agreements with educational institutions. In order to monitor expenditures on sub-awards, consider requiring sub-awardees to provide a cost category breakdown on their invoices. Cost category breakdowns provide the prime institution with a mechanism for monitoring sub-award spending without requiring line item detail for every expense. Include language regarding the prime institution’s right to audit expenses if needed.

**Intellectual Property** – Establish timely reporting milestones for the disclosure of intellectual property conceived and brought to practice under the grant award or contract. Anticipate in your terms and conditions the possibility that inventions may be jointly owned by the prime and the sub-awardee and will need to be reported in a timely manner to the federal sponsor.

**Reporting** – Language regarding the requirement for scientific and administrative reporting to the prime institution should be included. Reports from the prime institution are generally due within 90 days of the termination of a project period or budget period and data is needed from the sub-awardees to accurately compile the scientific and administrative reports.

**Communicating** – It is advisable to spell out what will be required, who will be communicating with the funding agency, and how the process will go forward. You may want to reemphasize some of the funding agency’s terms and conditions in this section (e.g., restrictions on carry over balances).

2. **Managing multiple sub-awards and projects**

Set up a separate internal account structure to manage the internal projects and the sub-award projects. For instance, administrative core, core facilities, and research projects should each have their own account. Some accounting systems have project/cost center coding, which can be helpful for tracking cost category expenditures for internal projects. Project/cost center coding can also help you to isolate various expenditure categories and can be quite useful when developing future year budgets.

Require sub-awardees to include a cost category breakdown on all invoices. A cost category breakdown will assist in monitoring costs and ensure compliance with allowable expenses. Additionally, developing a system to track invoice activity by sub-award and internal projects can assist in the process of managing individual project activity. Invoices are typically generated from a central accounting office and not within the investigator’s department. The development of a project fund summary report sent to investigators on some regular basis (e.g., quarterly) can improve spending patterns and avoid issues with carry over funding from one budget period to the next.

Sometimes there is a lag between the time when an institution receives final
sub-award documentation and when the department is informed they can begin re-
search. Forwarding a copy of the finalized award documentation to both the investi-
gator and project fund manager can assist them in getting their institution to set up
an account in a timely manner.

3. Communicating with investigators and their staff
Clear and concise communications are critical to the long-term success of multi-
project programs and require research administrators to know who is involved in
performing the research and overseeing the research projects. Get to know your
own campus partners because they can help develop the proper tools for manage-
ment. Find out the players at the sub-award institutions: Who is responsible for
pre-award preparation and post-award management? Who is the primary contact in
the pre-award sponsored project office? Who will prepare and submit the invoices
from the post-award office? This list of individuals at the sub-award institution and
their contact information can significantly improve communications. Make sure to
collect both email and phone numbers as some individuals may respond better via
one over the other.

Once contact information is collected, any communication sent to the investiga-
tor should also be copied to the appropriate research administration personnel in
order to ensure that all individuals are adequately informed.

If possible, an initial face-to-face meeting with the investigator and his or her
staff can be extremely beneficial to getting the appropriate buy-in on adherence of
the program policies and procedures. Take time at these sessions to review special
terms and conditions, annual report criteria, and any other guidelines or issues that
are contained in the award documentation but may be overlooked and/or those
that apply specifically to your award and are not typically included in a notice of
grant award. Make sure it is a two-way conversation; find out what you can do as a
research administrator to assist the investigator and his or her team.

4. Accounting for institutional differences
Take stock of whatever institutional differences that may exist. What do you need
to do to overcome these differences in managing the award? It may take some time
before the institutional differences are discovered. Be prepared to work coopera-
tively with the other institutions to resolve differences to the mutual benefit of both
parties. For example, terms and conditions regarding intellectual property can dif-
fer from institution to institution. By pre-negotiating this language you can avoid
delays in the execution of the sub-award agreement. As soon as a new institution’s
project has been approved for funding it is advisable to begin this pre-negotiation
process. Your sponsored projects and technology transfer offices can assist you in
this pre-negotiation activity. As another example, some institutions (such as federal
laboratories) have very different accounting structures that may negatively impact
their ability to provide the desired type of cost category breakdown on invoices.
Make sure you understand this structure and work with the account manager to
come to some mutual agreement about how invoices will be issued.
5. Tracking information

A useful relational database is an effective management tool. The first step to developing such a database is to identify the elements you will need to track. Contact information, compliance data (such as protocols and export controls), and foreign site samples can be easily maintained in a database. You may also want to include publications, patents, disclosures, and project-generated resources.

Before you begin to develop a database, be sure you have analyzed the process thoroughly. Keep in mind that you may want to add, modify, or change the database as the program grows. Consider what reports you will need to produce: Will you need to sort information in a variety of ways? Will the program enable you to import and export data to provide further flexibility? Development of a flexible database can reduce redundancy, improve accuracy, and assist in the creation of standard forms populated from the data maintained in the database, saving time and ensuring better overall accuracy.

As the federal government continues to increase financial resources to large-scale multi-project programs, keep these key ideas in mind. Set the stage for success by clearly defining all terms and conditions. Common definitions ensure that all parties understand and agree to the criteria. Establish an accounting structure to assist in the management of project expenses; this organization will help ensure efficiency. Build relationships with clear and concise communications and be sure to include the appropriate administrative personnel in the communication string. Work cooperatively and flexibly to develop systems that work to the mutual benefit of all parties. To save time and reduce redundancy, develop a database for tracking information, managing reports, and creating templates. Any size multi-project program can be successfully managed using strategic planning, good organizational skills, and excellent communications.

¶120.12 Managing Grant Funds: How to Spend to Zero
Beth Doiron and Minessa Konecky, Beth Israel Deaconess Medical Center

Introduction
Managing sponsored research funding is unique compared to managing funds in other situations, and does not often follow the established expectations of financial management. Whether managing a business or a personal budget, having extra funds at the end of a budget period is usually viewed favorably. In such cases, a surplus allows for additional investments such as savings, equipment, additional staff, or for something unplanned like a vacation or bonus back to employees. On the other hand, if most businesses or individuals go over budget, there are often options available to cover the expenses such as savings, loans, or credit. In sponsored research, when extra funds remain at the end of a budget period, it usually means the sponsor will reclaim the funds and the awardee loses the money. Conversely, if a project is overspent, there may be no way to pay for the deficit, except a bad debt write off for the organization. Keeping this in mind, the ideal scenario is one where a project spends down to zero perfectly by the end of the grant. Thus begins the Research Administrator’s (RAs) journey to find the path to zero. This process can be difficult when the RAs are receiving pressure from the organization to avoid any amount of deficit and from the investigator who refuses to consider any surplus. Learning to spend grant funds to zero starts with setting up realistic budgets, understanding sponsor spending rules, monitoring daily expenses, and finally results in accurately projecting for the long term.

Realistic Budgets
Preparation and proper budgeting are the keys to ensuring that one is spending in accordance with the sponsor’s guidelines and spending on target.

In principle, spending an awarded budget appropriately down to zero by the end of the project period is a simple process. During grant submission, the budget is developed according to expected expenses and acts as a blueprint for spending during the post-award period. Unfortunately, the carefully constructed blueprint frequently becomes more of a soft guide for spending rather than a concrete path to zero. The unpredictability of circumstances often results in grant expenses fluctuating and leads to a potential surplus or deficit at the end of the budget period. After the grant is submitted, an employee could leave the institution and be replaced by someone with a higher or lower salary, or inflation costs could have resulted in supplies being more expensive than expected. In addition, though it is expected that newer investigators may struggle with the budget development process, even seasoned awardees can approach RAs with unrealistic budgets. Many times investigators do not think in terms of what’s practical, they think in terms of their ideals. They rely on their administrative staff to advise them on fiscally irresponsible or impractical budgets. This task can be difficult when RAs often lack the contextual knowledge to identify an unrealistic budget.

While having appropriate subject understanding can be valuable, RAs do not
need to be technically astute to recognize some of the common warning signs of an unrealistic budget. Figure 120-12.1 illustrates some of the frequent mistakes investigators make when constructing budgets for submission. Though the list is not exhaustive, it provides a helpful overview and starting point for RAs during the initial budget review process.

**Figure 120.12-1. Unrealistic Budget Warning Signs**

- Generic amounts
- No effort budgeted for investigator
- Arbitrary salary and/or fringe rates
- Disproportionate salary to effort
- Basic items are not budgeted for (i.e. no personnel, no subcontract but a subcontract is mentioned)
- Items listed that are not allowed per budget/sponsor rules
- Indirect cost is not considered or calculated incorrectly
- Too many people on the budget
- Not enough people on the budget
- Unrealistic estimates
- Math is wrong

As RAs familiarize themselves with their portfolios and investigators, they often find that each researcher has his/her own idiosyncrasies when it comes to budgeting. For example, some investigators will develop a budget perfectly with minimal input from their RA. Others make the same mistakes over and over. Some of the tips in Figure 120-12.2 can help new RAs advise their investigators to set up realistic budgets.

**Figure 120.12-2. Tips for setting up realistic budgets**

- Project for salary increases (if appropriate)
- Call things what they are
- Get price estimates
- Get approval on pricing agreements
- Read the grant
- Be specific but generic
- Project for cost of living increase (if allowable)
Call things what they are

As a result of increased regulations on sponsored research, including the more detailed financial conflict of interest policies, it is especially important to identify items appropriately. For example, investigators are often under the impression that a subcontract, a collaborator, and a consultant are identical. They label someone a consultant to avoid the cumbersome paperwork that comes with adding a subcontract to a grant. However, the implications of mislabeling a scientific contributor are greater than merely misfiled paperwork. Potential compliance issues could include incorrect calculation of indirect cost or failure to document conflict of interest. Though it may seem easier to the investigator, mislabeling usually creates more work for everyone involved and runs the risk of submitting a non-compliant application.

Multi-Principal Investigator (PI) (Is this shared and separate cost centers or just one?)

In the last few years we have seen more investigators submitting Multi-PI grants, in which each investigator holds equal control over the scientific development and fiscal management of the grant. These collaborations usually include a leadership plan which details how investigators will manage any disagreements. However, when the grant is funded and one investigator has concerns about how the other is spending, the conflict can be difficult to manage even with a leadership plan in place. This situation can be avoided by creating internal budgets for each investigator, resulting in two separate internal accounts for the same project. Though investigators may not deem this necessary during time of submission, separate budgets will provide more clarity in the long run.

8 Spending Rules

Finding a way to identify, document, and track spending rules is vital to ensuring that one is spending on target and according to sponsor guidelines.

One of the principle aspects of managing grant funds is spending to zero compliantly. Since spending guidelines may be anywhere from a few to hundreds of pages and may use different terminology, the challenge for RAs is learning all of the guidelines for all of the different sponsors’ awards they manage. One way to approach this daunting task is to break down the guidelines into the eight common areas of spending rules: cost principles, pre-award spending, fellowship awards, carryover, no cost extension, rebudgeting, invoicing/reporting, and salary/effort cost share. While all policies governing spending are important, being aware of these common topics can focus RAs on what portion of the guidelines should be reviewed for each award.

- Think about the little things
- Multi-PI
- Know your investigators
Cost Principles

Cost principles refer to expenditures which a sponsor considers allowable, allocable, reasonable, and consistently treated. (NIH, 2013) There are certain expenses in research funding that are generally unallowable among different sponsors, such as alcohol, books, office/computer equipment, membership/association fees and administrative salaries. For example, a request for a computer on an unfamiliar small foundation grant may be a red flag to stop and refer to expenditure guidelines, whereas reagents for the same project might be more obviously allowable.

The key to identifying allocable expenses is familiarity with the basics of the study such as knowing if the research includes human or animal experiments, building equipment, or analyzing data. For example, if the study involves computer analysis, then the purchase of animals would clearly not be allocable for the project.

When evaluating the reasonableness of an expense, start by building the justification for an auditor. For instance, it may be justifiable to charge a significant portion of expenses during the last month of the project because the invoices came in late, whereas it would not be reasonable to charge those same expenses because the lab wants to stock up on supplies for a different project.

Lastly, consistency of how expenses are allowed can be often be problematic across an institution because of the nature of different research projects, inadequate systems, or the volume of staff involved in these decisions. Consistency can also be an issue on one project. For instance, if all supplies for a lab serve three projects, it would not be consistent to charge all supplies to the project for a few months, then to split cost across all projects for a few months, then to alternate monthly which project is charged. Consistency can, of course, be improved by implementing good training and auditing programs. But RAs should also be cognizant of applying the same methods consistently and engaging in discussions about questionable expenses with peers or managers as necessary.

Pre-Award Spending

Pre-Award Spending refers to spending before an award letter is received from the sponsor or primary institution. While the National Institute for Health and some federal sponsors generally allow pre-award spending, this is a less common practice among other sponsors. (NIH, 2013) Even if the sponsor allows this type of spending, there is a level of risk that must be assessed before the institution should allow it. Some key items to consider: What if the award letter is never issued, or issued with an even later start date than was anticipated? What is the impact on the overall budget to expend funds before the project start date? Will there be enough funds remaining later in the project period? Frequently, pre-award spending may be necessary during transfer grant situations (when an investigator moves to new institution and there may be delays in transferring grants to that new institution).

Stipend/Fellowship Awards

Although fellowships are a type of award and not a spending rule, they often have special rules governing fringe, the allowed stipend amount, and/or health insur-
ance. In some cases, receipt of a fellowship award may necessitate a change in salary to match the stipend awarded, or the institution may be required to make a fringe adjustment or apply a special code so that systems do not charge fringe.

**Carryover/No Cost Extension**

Carryover and no cost extension are important mechanisms that give RAs room to breathe if the project is not proceeding as expected. Projects frequently have late starts due to delays in staffing, ordering supplies, and waiting for award letters and accounts to be set up. It can be a necessity to know that work can continue and funds can still be spent when too much money remains at the end of a period. While some sponsors allow carryover and/or no cost extensions automatically without their approval, these are also available options even if sponsor approval is required. Investigators who make timely carryover and/or no cost extension requests and those who focus on genuine scientific delays are usually the ones who can successfully obtain sponsor approval. RAs can assist in this process by evaluating remaining balances regularly, or at least no later than three months prior to budget or project end, and by having proactive discussions with investigators to measure the scientific status of the project against remaining funds.

**Rebudgeting**

Rebudgeting refers to taking funds designated for one portion of the budget (i.e. salary) and spending on another (i.e. supplies). (NIH, 2013) Ironically, investigators often think that small foundations give them great flexibility with their grant funds, and yet those very foundations are the ones that require exact financial reporting and explanations for any deviation from the original budget. Sometimes expenditure guidelines may be vague with these foundations. One tip is to preview the actual financial report forms which may bring more clarity to spending expectations. Categories that are exempt from indirect cost need to be closely evaluated with rebudgeting. For example, if money was budgeted for equipment exempt from indirect cost and those funds were used on salary instead, there could be a loss of actual direct cost dollars.

**Invoicing/Financial Reporting**

Most sponsored awards require some form of financial reporting during or after the funded period. Their financial reporting schedule may not run on same the fiscal year of one’s organization and may be required on an annual, bi annual or intermittent basis. Some sponsors only require reporting at the end of the project and allow automatic carry-forward between periods. In such cases a final reconciliation may only be required at the end of the project period. However, annual reporting and carry-forward approval may require that expenses are reconciled at the end of each year.

**Effort/Salary Cost Share**

Cost sharing refers to a portion of a project cost that is not assumed by the sponsor. There are two types of cost sharing: mandatory and voluntary. Mandatory cost sharing is when a sponsor requires that the institution share some of the project
cost, and voluntary cost sharing is when the investigator or institution volunteers to cover some of the project cost from a discretionary source. (NIH, 2013) This discussion will focus on voluntary cost sharing of effort. This mechanism can sometimes be used to save money on an award, since funds that were allocated to salaries can now be reallocated to other expenses. Before utilizing cost sharing as a tool to spend down to zero, consider the following: Does the sponsor allow a cost sharing? Does the institution allow it? What source is covering the cost shared amount?

Learning how the 8 spending rules apply to each award/sponsor is part organization and part knowledge and experience. Finding a process to quickly identify or access the spending rules for each award can help to create efficiency. One option is to track these items on a spreadsheet for each sponsor or grant. Another option is to highlight the 8 spending rules in sponsor guidelines at time of submission. Consider storing sponsor rules in easily accessible places such as electronic folders, grant management systems, browser favorites or on portal pages. Utilizing the 8 spending areas creatively and compliantly can assist RAs reach the goal of spending the grants to zero by the end of the project.

Monitoring Expenses

Monitoring expenses on a daily basis against sponsor rules and remaining budget balance ensures spending on target.

Once a realistic budget is set and the spending rules are determined, the next step to spending to zero is to monitor expenses on a daily basis. Among other things, monitoring includes evaluating whether the expense is allocable, if funds remain, if the correct budget code was used, and if the project is active. Of all the challenges in making these decisions, there are three to think about related to spending on target: knowing the amount left in the budget, assessing the risk and communicating about expenses that can’t be charged to a grant.

Knowing the amount left in the budget

Due to the technology available for post award management, some RAs are able to simultaneously view the current amount left in a project and the expense that is about to be charged. If it was truly that easy and computers handled it all, and handled it all correctly every time, then this chapter would not need to discuss how to spend to zero when managing grant funds. In practice however, there are often unknown expenses: the invoice that is presented for payment a year after the service was performed, or animal colonies that multiplied at a higher rate with a higher cost than in previous months. While RAs can’t account for all the unknowns, they can project for expenses that they do know about, such as subcontract or consultant agreements and salary costs. They can also plan to leave room in the budget for last minute expenses, and talk to the investigator about remaining experiments and the associated costs.

Communicating that an expense cannot be charged to a project

Many RAs say they have no issue explaining to a PI that an expense is not allowable
for some reason or another. They feel secure with the sponsor back-up and docu-
mentation of institutional policies. While there is evidence to support that some
investigators fraudulently and intentionally misuse funds, most investigators either
spend appropriately or do not realize that an item cannot be charged to a grant.
If RAs learn to ask first without judgment, it can actually save time later. It is not
efficient to build a case against an expense and engage in a time consuming email
war as a first step. That is not to say that all situations about appropriate spending
can be collaborative – there will be times when RAs have to communicate unpopular
decisions. However starting out from a cooperative perspective can mitigate the
fallout from those decisions.

Assessing the risk
In a perfect world, there would be time to evaluate every expense and to look up
the budget, dates, amount remaining, sponsor rules and determine if each and
every expense is appropriate to the project. In reality, organizations and the indi-
viduals they employ have to look at the big picture and focus on the highest risk
areas. Some monitoring expense standards are set by the organization, like, using a
purchasing system to track orders and building in approver rules or implementing
dollar amount threshold restrictions. Even with those restrictions in place, many
RAs have human decisions to make: such as if the ice or subject parking is allocable,
able, reasonable and consistently treated. When making those decisions, each
RA has to find the balance between risk, time and efficiency. Finding that balance is
a challenge and the tips in Figure 120-12.3 can help to focus on some of the higher
risk areas.

Figure 120.12-3. Tips for Monitoring Expenses
- When approving an expense, make sure the project is active,
  has funds and that it meets spending requirements
- Pay attention to equipment, software, office supplies and
  consultant invoices
- Pay attention to high dollar expenses
- Pay more attention a few months prior to grant or year end
- Pay attention to the basics of the research study

Accurate Projections
It is not enough to know where the grant finances stand at this moment; one needs to know
what the grant finances are going to look like at the end of the budget and/or project period.

After setting up realistic budgets, adhering to spending rules and monitoring
expenses appropriately, the culmination to spending down to zero is to complete
accurate projections. Monthly budget reconciliation is the process of reviewing
expenses that post to an account against the supporting documentation available,
ensuring that each transaction is compliant with grant cost principles, and resolving any inconsistencies. Projections are used to forecast future expenditures on a project to anticipate the final balance on the award. Knowing in advance whether a grant is projecting a surplus or a deficit allows the investigator and RA to plan and adjust expenses accordingly and to ensure appropriate spending down to zero consistent with the scientific objectives. However, sometimes the challenge for RAs is to ensure that the information contained within the projection is accurate and up to date. Accurate projections can be achieved by reconciling on a monthly basis, minimizing human error and communicating with the investigator regularly.

Reconciling on a monthly basis
Though monthly reconciliation is one of the primary functions of post-award management, RAs are constantly torn between competing deadline-oriented priorities including grant deadlines, large workloads, reduced staff, and increased compliance requirements. Consequently, reconciliations can easily be postponed. However, missing even a month can change projections wildly. For example, experiments change, staff leaves, subcontracts do not complete the work or equipment breaks. Any of these incidents can alter the original grant projections towards a surplus or a deficit. Figure 120.12-4 illustrates the items that should be reviewed during the monthly reconciliation process to ensure an accurate forecast of the final grant balance by the end of the budget or project period.

Figure 120.12-4. Tips for accurate projections
- Review Total Budget (DC/IDC)
- Review Monthly Expenses
- Review Key Payroll Projection/Effort
- Check Total Expense
- Check for any Re-Budgeting
- Cross check numbers
- Overall projection review
- Deficit
- Meet with PI
- Carry-forward
- End Date
- Progress Report
- No Cost Extension
Human Error

Some RAs have an online system that automatically tracks current and expected expenses in real time. However, many RAs are still operating with systems that provide accurate information only up until the previous month’s financial closing date. Consequently, projections must be calculated manually using spreadsheets and complicated tracking systems which provide a prime opportunity for human error. RAs must find a way to mitigate these errors that can and will happen. Some helpful ways to avoid mistakes are: create formulas within spreadsheets that double check other formulas; use reality checks every few months for each grant by doing the math separately from the spreadsheet on paper or a calculator; do not always recycle your spreadsheets and input new data, sometimes it’s important to start from scratch. Finally, perhaps the most important is that each RA has some errors that he/she is prone to making. One must identify what those errors are and implement internal controls to avoid making them.

Knowing what is actually happening in the lab

Managing grant funds and ensuring that awards are appropriately spent down to zero is a collaborative process between the investigator and the RA. The person who knows the most about the progress made on an award and the resources that will be needed to accomplish the goals set forth in the initial submission is the PI. Frequently the PI is aware of upcoming staffing changes, adjustments in subcontracts, equipment replacements, etc. and may not think to tell the RA in a timely manner even though these changes impact grant projections. This is how RAs do not find out that a PI has committed to bringing on a new employee, or that the fellow in their lab is leaving until right before it happens. The consequences of this are that when an RA is asked what the final balance on a grant is expected to be, the numbers that they provide will be incorrect without this information from the PI. Meeting with investigators and identifying changes in staff or large purchases is fundamental to mitigating some of the unpredictability of grant management and ensuring that the data disseminated to stakeholders is accurate.

Conclusion

The information provided in this article is by no means exhaustive, but it does provide a starting point for RAs when thinking about spending down to zero. It is vital for the RA to start with a realistic budget to act as a blueprint for future spending, while keeping a lookout for red flags during the submission process. Once the grant has been funded, paying attention to the 8 spending rules for the sponsor will create efficiency in award management, and ensure that financial decisions are being made proactively instead of reactively. Monitoring expenses ensures that RAs know the amount left in the budget, can assess risk, and communicate about expenses that cannot be charged to a grant. Finally, maintaining an accurate projection spreadsheet for each grant provides the RA with the tools necessary to work with the investigator to assess the fiscal health of the entire research enterprise.

Minessa Konecky has worked in financial administration and project management for 14 years, and in research administration since 2007. Currently she is a Research Administrative Supervisor at the Beth Israel Deaconess Medical Center in Boston, MA. Her goal as an RA is to collaborate with investigators to manage the business aspects of conducting research, ensuring appropriate spending down to zero, and on target. Minessa has participated in many initiatives aimed at improving practices research wide at the BIDMC and completed the Associate’s Leadership Program at The Partnership, Inc in 2013. She finds teaching and sharing information the most rewarding aspects of her position, and has trained and mentored numerous research administrators over the years. She has also presented at NCURA and SRA meetings on a variety of topics including managing grant funds, eRA Commons, and customer service. She can be reached at mkonecky@bidmc.harvard.edu
Using a Client Survey to Support Continuous Improvement: An Australian Case Study in Managing Change

Janice Besch, Western Sydney University

Abstract
With the arrival of online survey tools that are low-cost, readily available and easy to administer, all organizations have access to one of the most effective mechanisms for determining quality improvement priorities and measuring progress towards achieving those priorities over time. This case study outlines the use made of this simple tool by a research office in one of Australia’s most research-intensive universities during a substantial change management exercise over the period 2008–2011. The rationale for reaching out to the University’s researchers as clients; basic principles followed to ensure high response rates and robust results; uses made of the data; and contribution to the change process are described, with a view to assisting research management professionals who are setting in place similar monitoring systems as an alternative to, or complementing, process-related (time and effort on task) performance data.

Context
The research office that is the subject of this case study was substantially restructured in 2008 with the specific and simple objective of improving researchers’ satisfaction with the University’s research management services. The objective was not a gratuitous one. Researchers require robust management systems to support their activities in a funding environment that is highly competitive and carrying a significant compliance burden. If they are not well supported, they are likely to scale down, or fail in, their grant seeking activities; funding will diminish; and there is a risk that whole research programs could be shut down due to compliance breaches. An effective barometer for excellent research management will undoubtedly be how it is perceived by those who rely on it.

Over the period covered by this case study, the research office managed significant volumes of applications (around 1,200 annually), grants (upwards of 1,500 under management), accounts (over 5,000 individual research accounts), and upwards of $200 million AUD in external research funding. As are all research offices of this size and scale, it was a high pressure environment where deadlines were externally driven, workloads had significant peaks at certain times of year, and a great deal was at stake for individual researchers and the university.

The office’s restructure represented the second significant restructure of research management delivery at the university in a three-year period. The first restructure had caused significant disruption to existing workflows and disquiet among the grants management staff. A quite complex matrix structure had been set in place, with dual reporting lines leading to a lack of clarity as to where actual responsibility

for actions lay.

The first restructure had been operationalized via an external consultancy with no continuity through early stage implementation. Unsurprisingly there was little ownership of the arrangements among office staff and external stakeholders. During one-to-one conversations, researchers reported “not knowing who to talk to anymore” and provided numerous instances of grant management issues having arisen and been left unresolved. The unfortunate consequence was that the staff who could have made a positive difference were firmly entrenched in ‘bunker mode’. From their perspective, the fault lay with the restructure. Past arrangements were better and it was unfair that the perceptions of poor service delivery were being seen as ‘their fault’.

**Rationale for Using the Online Survey Tool**

Sharon Cole, in her article “Reframing research administration” (Cole, 2010) concluded that a co-operative approach involving faculty and administrators and attention to organizational culture are vital ingredients for successful improvement in research services delivery. The situation was evidence of this and the survey tool was directed at both of these imperatives. It would provide an avenue for broad stakeholder input and engagement in the change process and demonstrate the office was listening and responding in a proactive way.

The 2007 restructure had adopted a hierarchical approach with a twist—a small Operations Unit was established alongside the customer-focused Grants and Ethics Teams, to ensure consistency of process, deal with generic activities (creation of ‘shell’ records; file establishment; system-driven communications), manage and continuously improve systems (including database management), and conduct quality assurance. The customer-focused teams, on the other hand would have a firm focus on researchers, with service and relationship-building as key drivers for their work.

The structure was very different from anything in place in the larger Australian universities; it introduced high levels of accountability and challenged the formerly very autonomous management culture. Low morale among the staff, weary of change, meant that over the first twelve months most positions were re-filled. This led to further controversy and unease amongst stakeholders.

Given the climate of discontent and the major change agenda, the client survey tool was going to provide a ‘line in the sand’. Researchers would be able to rate all services provided by the office and remark on whether they perceived any improvements, as well as provide comments and suggestions and endorse particular members of staff whom they had found helpful over the last 12 months. The responses would provide the office with clear direction on what areas of the business to prioritize in order to achieve positive outcomes. As importantly, the survey would ensure that those involved in and impacted by the change management process focused on the relevant time period. Researchers had hitherto been demonstrating long memories—quoting poor service or an instance of bad practice from several years prior if canvassed for their opinion of the Office. The survey would lock down those obser-
vations and relegate them to history.

All the same, the exercise was met with scepticism from some quarters, not least a number of key staff who expressed such reasons as ‘you will never make some researchers happy’ and ‘the ones that like us won’t respond’ to argue the futility of the exercise.

**Basic Principles Followed**

The survey was voluntary and more in the nature of a conversation than a quantitative tool to test particular assumptions. All researchers who had applied for a research grant received an email invitation to provide feedback (rather than complete a survey) on the office’s services, so that issues could be addressed and future service delivery could be improved. The information collected did not include personal information. However, the respondent was given the option of providing an email address if they wanted a staff member to contact them to discuss an issue they had raised. The purpose of the exercise was clearly described—the office was committed to continuous improvement and feedback would be used to develop and improve services over time. People who participated would be informed of findings and the progress that was being made to address issues raised.

All of the office’s stakeholders, including other university professional staff, were individually contacted and invited to provide their views. This amounted to around 1,100 individuals who had interacted with the office in any one year, rising over time. In later years, a friendly invitation to complete the survey was also added to staff email signatures. This re-enforced the message that the office was looking for input on how to improve services, created impetus (the invitation was connected with their experience of service delivery), and led to much higher response rates (rising from just over 20% in the first survey to more than 35% in 2011). The consistency in the responses received suggested this return rate was adequate for good judgment at the outset, and more than enough by 2011.

Only a few questions were asked. Respondent burden was kept low and the invitation alerted respondents to the fact that the survey would be a quick 5-minute exercise. Every question was neutral, with a view to simply covering all service delivery aspects. The wording of questions was simple and unambiguous so as to provide clear guidance on quality improvement opportunities.

The questions were a mix of ratings and open-ended opportunities to elaborate on service delivery and never failed to produce a rich set of responses and a real sense of how the office was performing. The questions looked back—“do you think we’ve improved or gone backwards?” They also looked forward—“what would you like to see us change for next year...?”

The ratings scale was a 6-point scale ranging from very high to very low, and did not allow respondents to ‘fence sit’. The middle rankings had the descriptors ‘better than average’ and ‘worse than average’. This would force respondents to put forward a considered view even if they had not thought a great deal about the office’s services in the past. The underlying message was ‘tell us what you really and reasonably think we should be achieving’. 
The seven standard annual questions were neutral in the sense that they did not try to focus on any particular known issue or concern, and covered:

- Respondent role (stage of career, researcher, executive, administrator, new to UNSWA, new to the office). Respondents could indicate that they had multiple roles. This allowed us to analyze the rankings by stakeholder group.
- How they rated the office’s services. This was presented as a table of services, from pre-award support to legal and ethics clearances, provision of research data, communications, and training. Opportunity for an open-ended comment was provided at the bottom of this table. Interestingly, a not uncommon open-ended comment was “I didn’t know you did all of those things”, suggesting the survey was raising awareness of the comprehensive nature of the office’s pre-and post-award service delivery.
- What they liked about the office’s services in the year
- What they would like to see changed in the following year
- Whether they thought services had improved, stayed the same, or gone backwards (or had no view)
- Whether they would like to commend any particular staff members
- Whether they would like to make any further comments

Sometimes other ‘omnibus’ questions were cautiously added about particular management issues—for example, in 2011 two questions were added about perceptions of training delivery and whether researchers would like to receive communications via new media (Twitter; Facebook, etc.). The importance of maintaining a balance between survey burden and opportunity to learn more was a foremost consideration.

**Uses Made of the Data**

Initial concerns that the exercise might provide a vehicle for a minority of disgruntled people to unreasonably criticize the office were quickly dispelled. The feedback was always remarkably consistent across the respondent pool and, as many a market research professional will say, they had a commonsense ‘feel’ to them, confirming in the main what staff already knew about service delivery weaknesses and providing a mandate for addressing issues raised.

Those staff who expected the worst were pleasantly surprised to find that the number of people who rated their services on the positive side of the scale outnumbered those who expressed dissatisfaction, and that only a very few researchers had extremely negative views. What emerged was a sense that the office’s clients were equally and reasonably invested in service improvement. They became, in a very real sense, part of the quality improvement team through having aired their views.

The results were reported back to stakeholders after analysis and the actions that had been taken to respond to issues raised formed a brief preamble to the next year’s call for feedback. Year-on-year comparisons were reported to the Committee on Research and the Vice Chancellor’s Advisory Council, ensuring that senior man-
agement were as well informed as those close to the coalface, and aware of the continuous improvement efforts and achievements being made. Individual staff used examples from actions arising when preparing their documentation for their annual performance appraisal, creating grassroots buy-in both to hearing what people had to say about service delivery and doing something about it.

**Contribution to the Change Process**

The results were a primary input for the annual research office staff retreat. As themes emerged, staff became active in contributing to addressing identified needs not just during the planning day but throughout the year. For example, the main concerns expressed one year were around an apparent lack of consistency in advice given at the pre-award stage. The grants teams responded by leading a comprehensive recruitment and training strategy for the casually appointed compliance advisers and introducing checklists and in-round debriefs that ensured consistency of advice.

The following year, the scales tipped further into the positive and the feedback from researchers then focused on a desire for personal attention and value-added strategic counselling, over and above the (now consistently provided) basic compliance advice.

Similarly, a concern regarding phone responsiveness was met with the appropriate technical and team response, and with due acknowledgment to the changing nature of office communications.

Over time the only difficult-to-address issues became those for which the office’s operations were reliant on the input of other departments. In those instances, the customer feedback was a primary, objective driver for the negotiation of service-level agreements that had quality assurance at their core.

Commendations were passed on and successes from year to year celebrated. The office developed a continuous improvement culture and its stakeholders continued to demonstrate their willingness to articulate room for improvement, in a positive way, by providing constructive input and taking the time to provide praise where praise was due.

**Future Directions**

At the time this case study was prepared, the office was relying primarily on the annual customer satisfaction survey and a handful of other high-level indicators to measure its annual service effectiveness. Transaction times were being used only in the area of ethics application review, where deadlines tend not to be set by funding agency grant rounds, making internal tracking more important. However, the electronic grants management system in use at the office provides for load reporting as well as transaction time reporting and the workflows are well-documented, allowing case-by-case consideration of staff resourcing, process effectiveness, and staff responsiveness.

While the annual call for feedback provided an important catalyst for positive change and responsive service delivery, a next step in optimizing efficiency and ef-
fectediveness might lie in seeking improvements at a more granular level and taking a more comprehensive approach. Smith and Gronseth (2011) outlined a comprehensive Quality Management Systems approach to improving research administration at the Mayo Clinic as one way forward. Its RISE initiative includes guidance on structuring a team-driven change exercise that captures key performance data on system efficiencies that can be analyzed at regular intervals and such supporting initiatives as the designation of particular staff as Research Quality Coordinators who look for continuous improvement over time.

**Conclusion**

The office’s annual call for feedback using an online tool was a simple and effective means of addressing a number of pressing change imperatives. In providing an annual opportunity for everyone involved in the research enterprise to pause and reflect on how things had gone that year and to quickly and easily engage in a basic conversation about service provision, it built a culture supporting change. It allowed those who wanted change to articulate exactly what kind of change they were seeking, across any and all aspects of service. It allowed staff to respond and report back on how they were addressing issues over time. And it allowed those who wanted to acknowledge good service to do so, ‘on the record’. It put everyone on the same page, and kept people focused on, and rewarded for, continuous improvement. Importantly, news of performance and progress was incorporated in whole-of-university reporting at the senior executive level. Past perceptions of faculty as impossible to please, and administrators as only interested in getting the rules right, were able to be seen for what they were—a mythology with little foundation and without justice to all concerned.

This section includes practical tools — flowcharts, checklists, etc. — relating to topics of general relevance to sponsored research administrators. These materials are culled from a variety of authoritative sources.

130.1  **Grant Award Life Cycle Flow Chart**

Sponsored research administrators support the research mission of the university. The role of a research administrator is often viewed as “sitting” between the principal investigator/researcher and the sponsor throughout an award’s “life cycle,” as depicted in Figure 130.1-1. (For an in-depth discussion of pre-award services and post-award administration, see Chapters 2500 and 3300, respectively.)

continued
**Figure 130.1-1** (continued)

**Find/Explore**
- Principal investigator (PI) has an idea for a sponsored project
- PI needs source of funding (“sponsor”)
- Application guidelines/instructions reviewed

**Apply**
- Application prepared (both technical and financial)
- Application reviewed within school/unit
- Application reviewed by institutional official and submitted to sponsor
- Institutional approval documentation for animal use and/or use of human subjects (note: could happen before application review)
- If required, revised budgets, other documents, and supporting documentation are submitted to sponsor

**Award**
- Award notice received from sponsor
- Award notice matched to application packet and transferred to Post-Award Office

**Administer/Monitor** (Post-Award Office)
- Award packet received from Pre-Award Office
- Award information set up in accounting system
- PI receives account set-up notice and account number
- Subawards to collaborating institutions are prepared and issued
- Review accounts and approve expenditure documents
- Fulfill sponsor financial reporting requirements by preparing financial reports and managing cash receipts on awards
- Manage effort reporting system
- Monitor and/or review budget revisions/program plan changes and enter into financial system

**Perform** (Principal Investigator)
- Conduct work on sponsored project
- Review/approve expenditures and account balances
- Review/approve effort report certification for project employees
- Fulfill sponsor requirements for technical reporting
- Prepare any budget revision/program plan changes for institutional and/or sponsor approval
- Prepare noncompeting applications (if required by sponsor)
Financial Close (Post-Award Office)
- Review accounts and ensure financial reporting deadlines are met
- Maintain cash flow and ensure that amounts of cash received match expenditures reported
- Submit interim and financial reports to sponsor
- Manage record retention
- Acts as a point of contact for audits of sponsored projects

Technical Close (Principal Investigator)
- Fulfill all final technical reporting requirements, including patent disclosure, invention statements, or equipment inventory
- Ensure that all expenses are appropriate for the project and that all obligations have been liquidated prior to the submission of the final financial report
- Inform Post-Award Office of submission of final technical report
- Participate in any audit interviews, as required
Although Figure 130.1-2 presents the “life cycle” of a grant from a different perspective, it still makes it clear that the research administrator, below represented as part of the “grantee organization,” does indeed “sit” between the principal investor and the sponsor.

\[\textbf{130.2 Federal Requirements Relating to Sponsored Research}\]
AIS editors

The following is a simple, straight-forward listing of the panoply of regulations and certifications applicable to institutions of higher education, as appropriate, with respect to the administration of federal grants, cooperative agreements, and contracts. These requirements — the number and complexity of which has grown over the years — stem from laws passed to achieve social, economic, and research-related goals. Given the number and range of these requirements, it is no wonder “compliance” is consistently chosen as a top priority of sponsored research administrators.

(For an overview of research compliance, see Chapter 1500. For a discussion of the regulatory environment and legal considerations, see Chapters 1300 and 2900, respectively.)

§130.3 Sources of Federal Funding
AIS Editors

More than 1,000 grant programs are offered by 26 federal grant-making agencies, in 21 main categories (see box, this page). Information about grant opportunities typically can be obtained from Grants.gov using its FIND function or at individual agency Web sites (see Figure 130.3-6, page 130:14).

Research administrators should remind faculty, when completing applications, to review carefully and individually each application and relevant reporting forms (and relevant version of forms) and administrative requirements pertaining to the application, as agency-specific requirements may vary. When receiving an award, the award document lists terms and conditions (see §1320.4), applicable Office of Management and Budget (OMB) circulars, agency regulations, and implementing governmentwide requirements (see §1305).

Figures 130.3-1 through 130.3-5 provide interesting snapshots of trends in federal research support to institutions of higher education. (For additional, overall trends in federal support, see §160.1.)

**Categories of Federal Grant Support**

Department of State — www.state.gov
Grants information: www.exchanges.state.gov
Strives to create a more secure, democratic and prosperous world for the benefit of the American people and the international community.

Department of Transportation — www.dot.gov
Mission is to ensure fast, safe, efficient, accessible and convenient transportation that meets vital national interests and enhances the quality of life of the American people, today and into the future.

Department of the Treasury — www.ustreas.gov
Grants information: http://fms.treas.gov/faq/grants.html
The Department of Treasury is a steward of U.S. economic and financial systems, and promotes conditions for prosperity and stability in the U.S., and encourages prosperity and stability in the rest of the world.

Department of Veterans Affairs — www.va.gov
Offers a number of programs to further the goal of delivering high-quality services to U.S. veterans

Environmental Protection Agency — www.epa.gov
Grants information: www.epa.gov/ogd/grants/information.htm
Offers a number of grants and fellowship programs

Institute of Museum and Library Services — www.imls.gov
Primary source of federal support for the nation’s libraries and museums

National Aeronautics and Space Administration — www.nasa.gov
Grants information: http://www.nasa.gov/about/research/index.html
Partners with many groups, including college and university researchers to perform breakthrough research, develop cutting-edge technology, and incorporate them into commercially viable products

National Archives and Records Administration — www.archives.gov
Grants information: www.archives.gov/nhprc/apply/index.html
National Historical Publications and Records Commission supports a wide range of activities to preserve, publish, and encourage the use of documentary sources relating to U.S. history

National Endowment for the Arts — www.nea.gov
Grants information: www.nea.gov/grants/index.html
Largest national source of funds for the arts

National Endowment for the Humanities — www.neh.gov
Grants information: www.neh.gov/manage/index.html
Supports research, education, preservation, and public programs in the humanities

National Science Foundation — www.nsf.gov
Grants information: www.nsf.gov/awards/about.jsp
Annually funds approximately 20% of basic, federally supported college and university research

Small Business Administration — www.sba.gov
Grants information: www.sba.gov/services/financialassistance/grants/index.html
See also the SBIR/STTR programs

Social Security Administration — www.ssa.gov
Grants information: www.socialsecurity.gov/oag/grants/ssagrant.htm
Office of Acquisition and Grants supports research and demonstration efforts involving the Old-Age Survivors and Disability Insurance and the Supplemental Security Income programs

¶130.4 End-to-End Process for Grant Oversight

AIS editors

The NSF OIG’s Office of Audit identifies an awardee’s risk by using data analytics, which OA says are useful in identifying risk at all stages of a grant. For example, NSF analyzes information in its awards database, searching for selected factors known to indicate “high risk.” Once the audit risk of awardees has been assessed, OA taps into an awardee’s NSF-related accounting records. OA identifies awardee transactions that need further analysis to determine whether evidence indicates the misuse of federal funds.

The goal of this analysis is to identify, at the outset of the audit, the transactions most likely to be unallowable, unrelated to the award, or unreasonable. Knowing how NSF identifies risk could help a grantee avoid being placed in a high risk category, which could increase its chances of being audited. The chart, which follows, illustrates how NSF uses data analytics. Grantee institutions also could use the chart to identify risk with respect to subawardees throughout the lifecycle of a subaward. (For more on subawards, see ¶3700.)

Grant Oversight

Practical Tools Page 130:19

130.5 Preventing Fraud in Sponsored Research Activities

Raina Rose Tagle, Monica Modi Dalwadi, and Ashley Deihr, Baker Tilly

Imagine that you are working through a typical day, which may include answering questions from researchers on pre-award and post-award issues, reviewing costs charged to grants, and preparing sponsor reports. But in the midst of this particular day, you’re suddenly asked to join General Counsel, your supervisor, Internal Audit, and a Dean for a confidential meeting. You learn that there has been an allegation of financial research misconduct in an area where you provide support. This allegation could dramatically affect you and your workload. You may be called upon to help gather and interpret data, attend ongoing investigation and status meetings, and even implement and monitor a corrective action plan if issues are discovered. And you’re expected to do all of this on top of your normal job activities!

But wait. What if you could wind back the clock and put a stop to these issues before they occurred? Below we detail some typical areas of fraud, key warning signs of potential fraudulent activity, and what you, as a research administrator, can look for to help mitigate the risk of fraud at your institution.

Of course, it isn’t always possible to catch a fraudster before or at the beginning of a fraud scheme. For that reason, please tune in to the next NCURA Magazine issue for the second part of this two part series on fraud, entitled: “How You Can Help: Responding to Allegations of Fraud,” where we will describe the phases of a typical fraud investigation and how you can best help at each stage.

Where Fraud Can Occur in Your Institution and How You Can Help to Recognize It

One of the most important things that you can do as a research administrator is simply to be aware of some common signs of fraud. Rarely is there a masked villain or a valiant, shield-donning superhero: the perpetrators and/or the tipsters can be tough to notice. Don’t be surprised if either party is wearing a lab coat and safety goggles. And what constitutes misconduct might also not be what you’re expecting. Committing fraud doesn’t necessarily mean that perpetrators are pilfering dollars directly out of the university’s bank account. Fraudsters at your institution could be violating any one of a myriad of sponsored research regulations, such as Office of Management and Budget (OMB) Circular A-21 or Institutional Review Board requirements.

In your position, you can note potential fraud in a number of different ways. A research assistant may raise concerns with you, you may note suspicious charges coming through your office, or you may note behavioral or lifestyle changes that can be indicative of fraud. While all allegations should be considered, there are tell-tale warning signals, both behavioral and documentation-based, that can alert you to fraud at your institution. The following illustrates a continuum of potential fraud warning signs, shown from left to right as least concrete to most concrete.

As you go about your day-to-day activities, be alert for some of these signs in those around you. Some examples of each warning sign are as follows:

---

1 This article is reprinted from the NCURA Magazine, January/February 2011, Volume XLIII No. 1. It is used with permission of the publisher.
Figure 130.5-1. What Fraud Is and How It Can Impact Your Institution

The term “fraud” can refer to any false representation of a matter of fact. In the research world, this can take many forms, both financial and nonfinancial. Common types of fraud in research administration and examples of each include:

<table>
<thead>
<tr>
<th>Types of Fraud</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inappropriate conflicts of interest</td>
<td>Hiring a brother as a subcontractor against policy and/or without proper disclosure</td>
</tr>
<tr>
<td>Theft</td>
<td>Permanently “borrowing” an expensive laptop from a laboratory</td>
</tr>
<tr>
<td>Embezzlement</td>
<td>Using research money to fund personal purchases</td>
</tr>
<tr>
<td>Improper use of Federal funds</td>
<td>Using money from one project to fund another project that has gone over budget</td>
</tr>
<tr>
<td>Inaccurate effort reporting</td>
<td>Claiming a researcher spent 50% of her effort on a well-funded project, when in reality she spent much of that time working on “pet projects”</td>
</tr>
<tr>
<td>Falsification of research</td>
<td>Recording incorrect data to make the research fit the thesis</td>
</tr>
</tbody>
</table>

Fraud in the research arena can result in decreased federal funding, lengthy litigation, and ruined reputations and credibility. Learning how you, as a research administrator, can help to recognize and act upon potential fraud schemes can mitigate these risks to your institution and allow you to focus on mission-critical activities.

Figure 130.5-2. Warning Signs of Fraud

- **Unusual Behavior**
  - Refusing to take vacation
  - Irritability or defensiveness
  - Complaining about the institution (e.g., inadequate pay, organizational pressure to obtain funding) to a greater extent than typical
  - Control issues or an unwillingness to share duties or information

- **Uncommon Relationships**
  - Close or personal association with a vendor or subcontractor
  - Unusually close or personal relationship with an employee
  - Close relationship with a private funding group
  - Undisclosed conflicts of interest
Motivating Factors for Fraud
◆ High personal debt
◆ Divorce or family problems

Lifestyle Changes
◆ Change in schedule (e.g., arriving early and leaving late when the individual previously worked a steady eight-hour day)
◆ Sudden alteration of or maintaining a standard of living that does not match the individual’s position (e.g., simultaneous purchases of expensive items)

Employee complaints
◆ Bullying behavior by a principal investigator
◆ Claims of unfair pay or uncompensated overtime
◆ Accusations of favoritism

Irregular or Inaccurate Documentation
The most concrete set of signs involves the documentation that you likely review in the course of your work. The following are specific areas where fraud frequently occurs, and some signals that may warn you to dig deeper:

Subcontracts, Independent Contractors, and Consultants
◆ Executed agreements without workplans, budgets, or budget justifications
◆ Large payment amounts to individuals, with or without a contract
◆ Questionable methods of payment (e.g., wiring payments, unusual billing addresses)
◆ Familial ties or other potential conflicts of interest (e.g., a researcher who subcontracts work to a biotech company he happens to invest in or own)

Procurement Cards, Procurement, and Purchasing
◆ Purchases of a personal nature
◆ Changes in spending patterns
◆ Lack of segregation of duties (e.g., a procurement cardholder is also the reviewer and approver of expenses)
◆ Lack of documentation or business support for purchases (e.g., missing receipts, copied or scanned documents, handwritten receipts)

Research Subject Payments (e.g., Petty Cash, Gift Cards)
◆ Poor documentation of research subject payments (e.g., questionable or missing receipts from subjects, payments made to individuals not otherwise documented
as part of the research)
◆ Subjects paid in cash when standard institutional practice is to pay with gift cards or vice versa
◆ Large amount of cash on hand with weak physical safeguards
◆ Petty cash box that does not match log of receipts, or that requires replenishment more frequently than normal

Travel Advances, Travel, and Expense Reimbursements
◆ Unauthorized travel or deviations in authorized travel plans
◆ Travel expenses in excess of authorized amounts
◆ Expenses or activities that violate university policy
◆ Missing, copied, or handwritten receipts
◆ Lack of segregation of duties (e.g., the individual traveling is also approving his/her travel and expense reimbursements)

Stipends, Salaries, and “Ghost” Employees (e.g., student, Part Time, and Temporary Workers)
◆ Wages paid not supported by time sheets
◆ Hours clocked in excess of agreed or approved work schedules
◆ Number of workers in excess of budget justification or scope
◆ Student employees working greater than expected number of hours
◆ Signs of inaccurate effort reporting (e.g., salary charged not commensurate with research completed per technical reports, 100% of salary charged to sponsored projects when the individual also performs teaching or administrative duties)

You may notice that certain key controls can impact several common areas of fraud. For example, requiring expenses to be well-documented will decrease the opportunity for fraud in your organization. This means that expenses should include original receipts and a clear explanation of the business purpose for the expense. Second, segregation of duties is important in many of these areas. There should be separate personnel completing tasks and performing reviews as described above. Third, conflicts of interest should be evaluated. Researchers who hire, contract to, or receive money from related parties have an inherently greater opportunity to commit fraud by inappropriately dealing with those parties. Of course, not all of these areas will apply to your job position and duties. However, being aware of the warning signs can help you to identify issues in your own job, as well as to see “the big picture” of risk areas at your institution.

No matter what warning sign or signal you see, the most important thing is to speak up when you see something. Know who within your organization you can go to with concerns (e.g., your supervisor, the Compliance Officer, or the Internal Audit department). Or, if you don’t know what else to do, consider calling your institution’s anonymous hotline with the information that you want to share. Escalating
issues early can help to prevent a lengthy, costly investigation later. It can also stem abusive or wasteful practices early on and contribute to an ethical culture.

**Conclusion**

As a research administrator, you are the first line of defense when it comes to identifying and preventing fraud in the sponsored research arena. Understanding the warning signs and key actions that you can take is extremely important to protect your institution and decrease the risk of fraud.

Investigator Financial Conflicts of Interest: What Every Good Research Administrator Should Know
Amy L. Spicer, University of Michigan Medical School

Picture this: A major NIH grant deadline is approaching and everything seems to be going smoothly, perhaps a bit too smoothly. Until...Screeching Halt! The sponsored projects office discovers that a key investigator has not disclosed his outside interests since 2011.

Or, picture this: a new industry-sponsored clinical trial is ready to open with patients waiting to enroll, but ...Screeching Halt! The PI has a financial conflict of interest (FCOI), and the IRB cannot review the human subjects research application until the COI Committee approves a conflict management plan at their next meeting...in a month! The perplexed research administrators are left wondering what to do.

Although these two scenarios might seem extreme, they are, unfortunately, not uncommon in the world of biomedical research. But do not fear, there are some things that intrepid research administrators can do to help avoid these kinds of delays. Here are some tips from the trenches:

**Disclose, disclose, disclose!**
Do you have any procrastinators in your group? Reminding investigators to maintain updated disclosures of outside activities in your institution’s disclosure system, will help to avoid a last-minute nightmare of a grant deadline crisis. If you know the potential financial conflicts of interest (FCOI) of your “frequent flyers,” you can remind them to disclose interests related to their research in the grant application and the IRB application. This will help to ensure a speedy grand submission and release of awards. We cannot say this enough, “Disclose, baby, disclose!”

Of course, this can be a challenge at large institutions where one administrator handles pre-award work, another post-award, and still another handles the IRB application. If you’re pre-award only, you may never come into contact with a conflict management plan. If you’re post-award, you may wonder what went wrong up front that is making you wait so long to get the dollars flowing to the department.

**Respond early and often.**
Occasionally, the grants office or COI office may request more information or clarification from an investigator. If they do not receive a timely response, they may ask you for help. Getting an answer from the investigator quickly will help them finish their review so that they do not hold up the research.

**Study coordinators — your first line of defense.**
Since study coordinators are often the closest to the clinical investigators and research subjects, they should be informed of any investigator FCOI on studies for which they are responsible. They should also be informed of any elements of a conflict management plan that will affect the investigator’s duties on the study.

---

1 This article is reprinted from the *NCURA Magazine*, March/April 2015, Volume XVLI, No. 2. It is used with permission of the publisher.
For example, one of the most important elements of a conflict management plan prohibits the investigator from participation in the informed consent process for human subjects. On large clinical trials, more than one investigator may have a FCOI management plan, and therefore may not be allowed to consent subjects. Ensuring that your study coordinators are aware of these restrictions will help avoid possible non-compliance with a conflict management plan, forcing a situation in which subjects may need to be re-consented.

Another very important tenet of a conflict management plan is disclosure of the FCOI to human subjects in the informed consent document (ICD). Study coordinators can help ensure that the disclosure language is inserted in the ICD and that it remains there through all of the various revisions of the ICD over the course of the study. If a study coordinator inadvertently drops the disclosure language while revising the ICD, or does not understand why the disclosure language is required and thus purposely deletes it from the ICD, this could also force subjects to be re-consented. Ahhh... the power of a study coordinator.

**Know the PHS Rule.**

What is it? “Responsibility of Applicants for Promoting Objectivity in Research for which Public Health Service Funding is Sought,” 42 CFR Part 50, Subpart F, aka “the PHS Rule.” In simple terms (non-Federal-ese), this rule outlines the disclosure, training, and oversight requirements related to investigators who have an FCOI, for institutions accepting Public Health Service (PHS) funding for research. The most recent version of the rule went into effect on August 24, 2012. According to the rule, some key responsibilities for institutions are: to ensure that all investigators are trained regarding the rule; to require up-to-date outside interest disclosures for all investigators at the time of grant submission; to review all outside interest disclosures for all key investigators at the time of award; and to develop and implement a management plan for each FCOI prior to the expenditure of funds. (For more information on COI management, see Nadia Wong’s article, “Conflict of Interest: The Balance between Protecting and Encouraging Research” in the August 2014 issue of NCURA Magazine, page 64.)

Why is it important? Of course, the most important reasons for the rule are to reduce bias (or the perception of bias) in research, and to help protect the human subjects involved in the research. Other reasons to pay attention to the rule: the potential to miss a grant deadline because investigators have not made their required outside interest disclosures; the potential delay in grant funding or the start of research due to FCOI reviews or missing disclosures; and the possibility of suspension or termination of grant funding for non-compliance.

**Know your institutional policies.**

Most institutions have policies related to FCOIs available on their website or from their office of research or grants office. For example, the University of Michigan Office of Research web page has a very comprehensive list of state and federal requirements, along with University policies. It is a good idea for research administrators to be familiar with these policies and know where to get information should inves-
tigators ask. Be aware that some institutions have FCOI policies that are more restrictive than the PHS rule.

**Ask questions!**

There are many resources available for investigators or research administrators at their own institutions and beyond. If you think something does not look right, or you do not understand an FCOI issue, reach out to your grants office or COI office for help. We love spreading the word!

There are also resources available from the government, and from the Association of American Medical Colleges (AAMC). Some good websites to check out are:

- NIH Financial Conflicts of Interest and the associated Frequently Asked Questions page.
- AAMC Forum on Conflict of Interest in Academe.
- Now picture this: A major NIH grant deadline is approaching. Because of your knowledge and expertise in the FCOI arena, you’ve done your homework and your PI and all key investigators have disclosed their outside interests promptly. The COI review has been completed. Your proposal flies through the approval process and the research begins on time. Life is good...until the next deadline.

130.7  **Tackling the Administrative Burden – One Institution’s Plan**

Gary Smith, Massachusetts General Hospital; Harry Orf, Massachusetts Hospital; and Alan Robinson, UMass Amherst

Listening to their research “customers” is something every research support department should do well. It is especially important in an environment of ever-increasing regulation and bureaucracy. Yet few research support departments have implemented formal programs to gather and implement process improvement ideas from the people they serve. This article describes one institution’s approach to better support its research enterprise by becoming an idea-driven organization.

**Don’t Just Blame the Sponsor**

“If Bob thinks everyone else is the problem, Bob’s usually the problem”

*The Bob Principle*

It’s easy to blame outside regulations for all of our inefficient processes, but a closer look reveals that many problems start from within. For example, new conflict of interest regulations require investigators to disclose potential financial conflicts, but do the regulations require institutions to set up electronic systems that require investigators to click “no” more than 100 times just to indicate that they don’t have a conflict? We can all agree that new vendors servicing our organizations need to be vetted and approved, but do we need vendors to complete a 26 page form where much of the information requested is not applicable to the research side of the business? Do new research fellows that do not interact with patients need to go through the same rigorous credentialing process that is required for new physicians?

We are all familiar with the recent Federal Demonstration Project (FDP) survey that found investigators spend 42% of their time on administrative activities. How much of this burden is created by our own institutions as a result of setting up inefficient processes that are onerous or confusing to the end-user? How often do organizations look at their existing policies and processes to see if they have become outdated or could be streamlined? As a matter of fact, a recent report by the National Science Board on reducing the administrative burden for investigators, found that 77% of those that responded to a request for information to the NSB Task Force created to study this issue, perceived their institution as a source of the administrative burden.1

**Controlling our Destiny**

Massachusetts General Hospital (MGH) is no different than other academic institutions – our investigators and support staff believe they spend too much valuable time on administrative activities. While sponsor regulations to ensure public trust in the research we conduct are extremely important and needed, have we created the most efficient processes to manage our research enterprise? From the perspective of our research customers, the answer is clearly “no.”

---

1This article is reprinted from *NCURA Magazine*, Volume XVLI, October / November 2014, No. 5. It is used with permission of the publisher.
The research leadership at MGH recognized the frustration within our research community and decided to take the bold step of looking within for a solution. We realized that organizations like FDP and Council on Governmental Relations were already partnering with our federal sponsors to reduce administrative burdens at a policy level. It was time to stop worrying about things we did not control and change the things we could. Our response was to create an “Idea-Driven Organization.”

**What is an Idea-Driven Organization?**

Many of us are familiar with the terms “Six Sigma,” “the Toyota Way,” or “Lean.” These tools, which got their start in the manufacturing industry, are focused on improving organizational efficiency. Their general principle is to quantitatively analyze each step in a process, identify waste, and implement improvements. While effective, this method is often top-down and driven by management and, consequently, does not take into account small ideas that, collectively, can lead to big impacts within an organization.

The central concept of an idea-driven organization is that the front-line employees see a great deal of problems and opportunities that their managers don’t. They are full of ideas to save time and/or money and to improve productivity, quality, and the customer experience. An idea-driven organization is designed and led to systematically seek and implement large numbers of ideas from everyone, but particularly from the people on the front line.2

**MGH Continuous Research Operations Improvement (CROI)**

In 2012, MGH Research took the first step to become an idea-driven organization. We rolled out a Continuous Research Operations Improvement (CROI) program based on the principles in two books; “Ideas are Free” and the “Idea-Driven Organization” by Alan G. Robinson and Dean M. Schroeder. CROI is driven by our “Prime Directive” (thank you Star Trek): Focus on the researcher. *Further the research mission and bring value to it. Maximize the researcher’s time at the bench by eliminating or maximizing the efficiency of their ancillary obligations.*

All employees who see a problem or opportunity for improvement can submit an idea/suggestion by email or phone. The ideas/suggestions are registered into an electronic tracking system and then triaged to one of 15 working groups (see chart) based on the type of suggestion. Each working group is co-led by an investigator and an administrator. The group is then charged with vetting suggestions, recommending and implementing solutions.

Transparency and open communication to both the suggester and entire research community are keys to the success of the program. Suggesters receive an initial email when their idea has been assigned to a working group, and again every time their suggestion has a change in status. A website visible to all employees displays all suggestions and their current status.
Results and Successes

Since the roll out of CROI, we have received almost 400 suggestions; 148 have been resolved (implemented), 65 were closed (no change made), and 178 are open and currently being discussed by working groups. Figure 320.7-1 shows the break out of suggestions by working group and their current status:

The following are examples of a few ideas that have been implemented (resolved) to date.

◆ Our electronic conflict of interest system required investigators with no conflicts to repeatedly answer numerous non-applicable questions. A simple enhancement to our system allows these types of questions to be skipped, collectively saving hundreds of hours of researchers’ time.

◆ The electronic grant submission system would time out without warning causing instances where unsaved information would be lost. A “time out warning” feature was added, saving 2-3 hours of re-entry work per instance.

◆ The MGH Research Intranet, which was only available inside the firewall, did not allow employee access to valuable institutional information when not at work. The Intranet is now securely available outside the firewall, giving employees greater flexibility to work outside the hospital.

◆ The IS HelpDesk phone number was not included in email correspondence to employees requesting IT support, even though the automated email asks people to call the HelpDesk if they have further questions. We were able to track an example of an investigator trying to locate the number for over an hour. The phone number is now listed in automated email correspondence, saving
thousands of hours of employees’ time.

**Lessons Learned and Moving Forward**

Has our implementation of CROI been perfect? Certainly not. But we are proud of the steps we have taken to move MGH research towards becoming an idea-driven organization. The program has improved accountability, helped restore trust between the research community and those who serve it, and created a forum for open and honest dialogue about the issues that frustrate us and impede research. It was a bold step, and to be honest, has not been easy. There is still work to be done. Just like the title of our program suggests, we will “continuously” reassess and improve our CROI program. We have asked our research community to help us better the program through retreats and brain-storming sessions. We’ve even brought in an expert from the outside, who also graciously agreed to co-author this article, to evaluate and give recommendations for improving our program.

We have already acted on some suggestions and plan on implementing others in the coming months. Some of these key suggestions and recommendations for moving forward include:

◆ Gain senior leadership buy-in across MGH and our healthcare system (Partners). This buy-in is the most critical element for program sustainability and success

◆ Foster a culture of change. Everyone needs to realize that continuously improving our organization is part of their everyday job

◆ Establish a better process to prioritize ideas. All ideas must be vetted but not all can or should be implemented

◆ Train and educate. Senior leadership must understand the importance of CROI, the research community must continuously identify opportunities for improvement, and our support and management staff must learn how to efficiently implement solutions

**Take the Plunge – Become an Idea-Driven Organization**

If you have not already done so, we challenge you to consider becoming an idea-driven organization, or if you are a department administrator, becoming an idea-driven department. Research administration is a service business and all service businesses have customers. The best businesses listen to their customers and work with them to improve service and the customer experience. We should do no less for our researchers. It’s not the easy thing to do, but it is the right thing to do. It brings researchers together with those who support them to improve the work environment, increase efficiency, and contribute in a very tangible way to advance science.

About the Authors

Gary Smith is the Sr. Administrative Director for Research at Massachusetts General Hospital. Gary has been in research administration for over 25 years and involved with NCURA for many of those years. His past service includes Chair and Treasurer of Region I. Gary is happy to speak with anyone wishing to learn more about the MGH CROI program. He can be reached at smith.gary@mgh.harvard.edu

Harry W. Orf, PhD is the Sr. Vice President for Research at Massachusetts Hospital. He has had a 35-year career in science and administration, including scientific research, research administration, teaching and education outreach, and biotechnology start-ups. He can be reached at horf@mgh.harvard.edu

Alan Robinson, PhD is a professor at the Isenberg School of Management at UMass Amherst and an expert in corporate creativity and managing ideas within organizations. He co-authored the books “Ideas are Free” and the “Idea-Driven Organization”. He can be reached at agr@isenberg.umass.edu
Research Administration: Strategies and Recommendations
Randi Wasik, Washington State University

Some of us did not set out on a straight path to hold the positions we now have. Rather, it has been an adventure with a myriad of twists and turns which while at times painful, have been essential to our current positions. I myself have moved from a bachelor’s degree in performance, to a MBA to an in-process master’s in Education. I have (and still do) play music, teach and use my business training. In reflecting on my life’s journey thus far for this article, there are two overarching themes. The first is stay dynamic and learn from all experiences and people you encounter. The second is to be passionate in the profession you have chosen. As Steve Jobs said: “Your work is going to fill a large part of your life, and the only way to be truly satisfied is to do what you believe is magnificent work. And the only way to do great work is to love what you do.” I love what I do, I am inspired by those I work with and I feel truly blest to be a part of the world of research.

Research administration is truly an exciting and dynamic career which when fully embraced will lend itself to an exciting and fulfilling work life. It takes a diverse toolbox to successfully partner and navigate the administrative side of this book of business at our institutions. Here are some suggestions on what to have in your toolbox to be successful.

Understand, appreciate and embrace the roles and responsibilities of the distinct aspects of research administration – it takes a village. An administrator at the department level will have to be a jack of all trades and is a partner in the trenches. We are the partner or facilitator supporting our faculty as well as the bridge to leadership both locally, centrally and sometimes with our sponsors. Our faculty (aka Principal Investigator) are responsible for the research. They are our incredibly creative people who are our partner/customer. There are supervisors/managers at the departmental/college/school level whose role is should be to teach, mediator and mentor. The supervisor can be our faculty or an institutional official depending on our role. Institutional officials are responsible for ensuring compliance and are a partner to the administrator and faculty. Within each of these components of the team there are a variety of talents which will fold in and out of the support team based on the research need. We need to not only understand each of the players, but also appreciate and involve one another to ensure success. Throughout your career, I strongly encourage you to experience both department and central roles.

Once you know the players, the next important skill is communication. I cannot stress enough the importance of communication in all its forms – written, verbal, physical and silent. Be present every day and in every conversation. I advise staff to pay attention to the full conversation: what is said, how it is said, the physical presence and what is not said. When someone comes into your office, stop typing or hang up the phone and physically turn to the person in front of you. This is a sign of respect, curtesy and that you are present with them. Understand the roles and responsibilities of those with whom you are communicating. For example, in advising the preparation of standard reports, I work with each person on the
physical report being the same for all, but adjusting the conversation on the report content to match the audience you are working with. When conversations derail, recognize the derailment, and then get back on track. This can be accomplished by setting expectations at the start of a meeting (agenda) and recognizing the need for follow-up discussions. When heading into a crucial conversation, take the time to define the roles of those involved in a conversation – who will be the good cop and who will be the bad cop for instance. Finally, do not be afraid to put a conversation on hold and come back to it after the parties involved have had time to reflect, digest, regroup, or to get the right players at the table.

In support of effective communication, you must maintain clear documentation. Strive to create documentation in a way that is intuitive. Take the time to build a shared understanding with your team for your file architecture – both physical and digital. Know your institution’s policies are on records retention, if at a state institution understand your state’s public records policy and so on. Be consistent both in maintenance and accessibility as well as sharing of your records as related to your role. For example, if you manage post award operations, you should reconcile and report out monthly. Do not over document and when compliant, delete records which you no longer need.

Manage your workspace. Organize by tasks/actions. Create areas around workflows such as proposals/pending agreements to follow-up to award establishment to post award to closing. Use a system that works for you whether that is compartmentalizing your workspace physically or digitally, using alpha-numeric identifications, color coding, etc. If a task is pending, keep it visible. Remember out of sight does mean out of mind. Set up a standard time for housekeeping. I go through my pending emails every Monday and Friday religiously. Simultaneously I set-up files for the week’s meetings to ensure I am on time and present in the week’s meetings.

Time management is an essential component of career success. Our electronic calendars can be powerful tools as well as hold notes and remind us who was at a meeting. Set time not only for meetings with others, but also yourself. When you set time for yourself include a subject line and stick to these meetings just as you adhere to meetings with others. Prioritize – not only for yourself but also for others who you are meeting with (respect each other’s time). Don’t be afraid to recognize if you are in the middle of a task/priority and ask if the request can be discussed at another time and/or offer to set-up a meeting if you cannot give the other person your full attention. When time is up, push back from the table, get up, or politely bring the discussion to an end. Appropriate time management respects you and as well as all on your team and/or your support network.

Build your network. My most valuable resource are the partners in my current institution, at my past institutions and through NCURA. Anytime I have started in a new position, I spend a good portion of the first few months asking who is in all the areas which impact my work and then go meet them in person. Then I ask them who else I should meet with – I know two friends, who know two friends and so on. I meet peers and those I support in their workspace. This makes the person you are meeting with comfortable and in the case of a lab for instance, if you ask for
a tour, it shows partnership. I stay in contact with past co-workers as much as possible. I mentor as this stretches me and builds my network. Most importantly, I use NCURA. Throughout my career NCURA has served as my most valuable resource and support net.

**Continue to grow.** Depending on your institution, you may have a professional development group, a chance to take courses either at your institution or at local community college. Take advantage of these opportunities – regularly. Ask to be on committees. Don’t sit back a be at the effect of change – be the change – shape your world and be a dynamic partner for development and growth. Belong to a professional organization, go to meetings, meet people and reach out. Volunteer at your institution, with your professional organization and in your community. As I said at the start, the faculty we support are dynamic and creative therefore you must stay equally as dynamic and accepting of the challenges and changes we face daily. In short, stay active in your profession.

**Reach out/get up. Don’t be an island.** This can lead not only to a less than collegial work environment, but can also lead to a very myopic career. I fully appreciate for some it is hard to put yourself out there, but in doing so whether it is at the institution, in your community, or through your professional organization, you will be the one who grows and benefits the most.

**Stay flexible and realistic.** The most common answer to a question in research administration is “it depends.” The trick we all face daily is to understand the guidance we are under and where we can push the envelope and be that creative partner to our faculty while keeping all of us compliant. Communication, professional development and partnerships will be essential when navigating needs/conversations in a manner that is open, flexible, but realistic.

**Remember those Sesame Street/Mr. Rogers adages.** Say “please”, “excuse me” and “thank you.” Treat everyone with respect – treat others as you would like to be treated. Know when to stay and when to walk away – let it go. To gain respect, show respect. Recognize the accomplishments of others and do not look for praise for yourself. It is not about the me, but rather about the we. Always ask yourself, am I living to work or working to live – hopefully it is always the later. Your time is valuable so give yourself fully, but only when you are fully appreciated.

I truly love what I do and am grateful for the life I have. I have met some amazing people and worked on teams where the unbelievable has become believable. I fluidly move between all the tools mentioned above daily to be the strategic partner to my faculty, organization and team to ensure success not only for them, but also for me both care wise as well as personally. A closing thought from Patanjali:

> “When you are inspired by some great purpose, some extraordinary project, all your thoughts break their bonds; Your mind transcends limitations, your consciousness expands in every direction, and you find yourself in a new, great and wonderful world. Dormant forces, faculties and talents become alive, and you discover yourself to be A greater person by far than you ever dreamed yourself to be.”
About the Author

Randi Wasik, MBA, is the Associate Dean for Finance, Administration and Strategy at Washington State University’s Ellison Floyd College of Medicine. Randi has worked at both public as well as private institutions in roles ranging from departmental to central appointments. She has served on certificate trainings at two institutions and actively taught at these institutions as well as for NCURA at both the regional as well as national levels. She is a graduate of the NCURA Leadership Development Institute program. Currently she is the Treasurer Elect for Region VI. With a BFA, she still plays locally as well as enjoying gardening, cooking and collecting antiques. She can be reached at randi.wasik@wsu.edu
Statistics and Survey Results

This section includes statistics and survey results from authoritative sources relating to topics of general relevance to sponsored research administration.

Federal Support to Higher Education Institutions

One way to gauge the growth in sponsored research administration is to look at the growth in and current dollars going to federal research funding at colleges and universities. Statistics from the National Science Foundation’s (NSF) “Survey of Federal Science and Engineering Support to Universities, Colleges and Nonprofit Institutions,” published annually, provide a helpful snapshot of federal sponsorship of science and engineering. NSF, under its mandate, collects statistical data from the 18 federal agencies that account for “virtually all” federal support for science and engineering at educational institutions (for a listing of the agencies, see Figure 160.1-3). Overall, institutions of higher education perform about 50 percent of the “Nation’s basic research.” Some key data from this survey are included at Figures 160.1-1, 160.1-2, and 160.1-3. (All figures will be updated regularly.)

Trend Data. Recent statistics from NSF show that federal agencies obligated a new high in current dollars of $25.3 billion to academic institutions for science and engineering (S&E) activities in FY 2007. This amount represents a slight (0.1%) decrease in current dollars from FY 2006, and it represents a 2.7% decrease in inflation-adjusted constant 2000 dollars over the FY 2006 level (see Figure 160.1-1).

¶160.2  **Growth of Sponsored Research Administration as a Profession**  

The number of sponsored research administrators has increased concomitantly with the growth in and complexity of requirements surrounding federal sponsorship of research conducted at colleges and universities. (See ¶160.1.) Although verifiable data on the number of sponsored research professionals are hard to come by, Figure 160.2-1 illustrates the growth of sponsored research professionals by providing a snapshot of the growth trend in membership of the National Council of University Research Administrators (NCURA).

---

![Graph showing growth of NCURA membership from 1959 to 2008.](Image)

160.3  R&D Expenditures by Higher Education Institutions
AIS editors

Although representing the lion’s share of sponsored funding to institutions of higher education — over 60 percent in FY 2007 — federal funds to colleges and universities in support of research and development (R&D) is not the only source of funds for such activities.

Every year the National Science Foundation (NSF) asks universities and colleges to report their separately budgeted R&D expenditures (see below) within science and engineering (S&E) fields. Data obtained is then compiled and published as the NSF annual “Survey of Research and Development Expenditures at Universities and Colleges” (or “Academic R&D Expenditures Survey”). Conducted annually since FY 1972, the survey collects information on R&D expenditures by academic field and by source of funds. Survey results primarily are used to assess trends in R&D expenditures across the fields of science and engineering. Some key data from the most recently completed survey cycle are included at Figures 160.3-1 through 160.3-7. These figures will be updated regularly as current final data from NSF becomes available.

2009 Trend Data\(^1\)

Overall, universities and colleges reported S&E R&D expenditures of $54.9 billion in FY 2008, 5.8% more than in the previous year ($51.4 billion) (see Figure 160.3-1), according to university-reported data collected by the National Science Foundation. When adjusted for inflation, academic R&D rose by 4.2% in FY 2009.

**Federal Funding.** The federal government remains the largest source of academic R&D funding, on average accounting for over 60% of total R&D expenditures since FY 1972 (see Figure 160.3-3). Its share has dropped, however, in recent years, from 64% in FY 2005 to 59% in FY 2009, according to data from NSF. In current dollars, federally funded academic R&D expenditures rose 4.2% in FY 2009 to $32.6 billion. After adjusting for inflation, this represents a 2.6% increase from FY 2008.

**Other Sources of Funding in Fiscal 2009.** R&D funding originating from institutions increased by 7.6% to $11.2 billion (see Figure 160.3-4). R&D expenditures financed by state and local government funding grew 5.7% to $3.6 billion (see Figure 160.3-5). (Institutions report general-purpose funds received from state and local governments as institutional support.) Industry funding continued to rise, growing 11.6% to $3.2 billion (see Figure 160.3-6). Funding from all other sources combined (nonprofit organizations and other nongovernmental entities) increased 9.6% to $4.3 billion (see Figure 160.3-7).

Research Spending and Economic Growth

The conduct of most basic research in the United States occurs at universities, and, according to the National Science Foundation, the federal government funds almost 60% of this research. “This partnership between the federal government and universities helps to form an entrepreneurial ecosystem that benefits the local economy by creating jobs and spurring economic growth,” according to Rep. Carolyn Maloney (D-N.Y.). Her remarks opened a hearing earlier this summer, “Fueling Local Economies: Research, Innovation and Jobs,” held by the congressional Joint Economic Committee, which Maloney co-chairs (see http://jec.senate.gov/public/index.cfm?p=Hearings.)

The hearing came on the heels of a white paper from Maloney’s committee. According to the paper: “The innovations that have improved the country’s productivity and quality of life are ultimately grounded in the results of basic research....Despite its value to society as a whole, basic research is underfunded by private firms precisely because it is performed with no specific commercial applications in mind....The federal government is best positioned to take on the risks of funding basic research projects, which suggests that it may be prudent for the government to increase its expenditures on basic research significantly.” (See “The Pivotal Role of Government Investment in Basic Research” at http://tinyurl. com/2we8dfu.)

The White House also is seeking to demonstrate the connection between research and positive economic outcomes. Earlier this year, its Office of Science and Technology Policy published a request for information seeking ideas for promoting the commercialization of federally funded research. OSTP wanted input from universities and others to identify ways to “increase the economic impact of federal investment in university research and development and the innovations being fostered in federal and private proof of concept centers.”

Agencies Want to Showcase Outcomes

Federal agencies are also hopping on the bandwagon. “A new initiative promises to monitor the impact of federal science investments on employment, knowledge generation, and health outcomes,” according to the agencies spearheading the STAR METRICS project — NIH, NSF, and OSTP. STAR METRICS is an acronym for Science and Technology for America’s Reinvestment: Measuring the Effects of Research on Innovation, Competitiveness and Science.

There are two phases to the program. In Phase I, officials will “develop uniform, auditable and standardized measures of the impact of ARRA and science spending on job creation.” In Phase II, they will develop measurements of the “impact of federal science investment on economic growth (tracing patents, new company startups and other measures), workforce outcomes (through student mobility and employment), scientific knowledge (measured through publications and citations) and, later, social outcomes (such as positive health outcomes measures and green environmental impact factors),” according to the STAR website (http://starmetricscomp.synthosys.com/index.aspx).

Public Sentiment Favorable

Whatever comes of these recent initiatives, the public seems to be supportive of federal research spending. According to the National Science Foundation, in 2008, 84% of Americans expressed support for government funding of basic research. More than one-third of Americans (38%) said in 2008 that the government spends too little on scientific research, while 11% said the government spends too much. The figures are included in the NSF’s Science and Engineering Indicators 2010, which contains a broad spectrum of “quantitative information” on the science and engineering “enterprise” including data on public attitudes (see www.nsf.gov/statistics/seind10/c7/c7h.htm).

(For information on jobs created/retained under the American Recovery and Reinvestment Act, see www.Reporting.gov. For a general discussion of the economic impact of NIH funding on states, see ¶160.7.)
Academic institutions characterized 74.6% of their FY 2009 total R&D expenditures as basic research rather than applied R&D. This proportion has been fairly constant over the last decade.

**Non-S&E R&D Expenditures in Fiscal 2009.** Academic institutions spent a total of $2.4 billion on R&D in non-S&E fields. (Only institutions reporting S&E R&D expenditures are surveyed for non-S&E R&D spending.) The largest amounts reported for individual non-S&E fields were in

- Education: $921 million
- Business and management: $341 million
- Humanities: $253 million
- Other fields: $885 million

**Pass-Through Funds**

R&D funds for joint projects that were passed through primary university recipients to other university subrecipients about doubled from FY 2000 to FY 2008, from $0.7 billion to $1.4 billion in constant 2000 dollars. The current dollar amount ($1.7 billion) represents 3.3% of total academic R&D expenditures in FY 2008. In FY 2008, 90% of these pass-through funds originated from federal sources. Universities receiving pass-through funds from other universities likewise reported a rapid increase in subrecipient R&D expenditures between FY 2000 and FY 2008, with over 90% of the funding originating from federal sources.

Note: Unless indicated differently, expenditures included in the following figures refer to S&E R&D activities only. Separately budgeted R&D expenditures include all funds expended for activities that are specifically organized to produce research outcomes. These activities are either commissioned by an agency external to the institution or are separately budgeted by an organizational unit within the institution. Expenditures are funds actually spent by an institution during its fiscal year. Separately budgeted R&D equipment purchased from current funds includes all research equipment purchased under sponsored research project awards.

Data from the National Science Foundation (NSF) on federal science and engineering (S&E) support to minority-serving institutions, including historically black colleges and universities (HBCUs), high-Hispanic enrollment (HHE) institutions, and tribal colleges show the following:

- Federal academic S&E support to 78 of the 102 HBCUs totaled $406 million in FY 2007, a 8.6% decrease over FY 2006 levels (see Figure 160.4-2). The Department of Health and Human Services contributed over one-third of all federal academic S&E obligations to HBCUs, with the Department of Agriculture funding over one-fourth of the total. R&D (research and development) programs accounted for almost three-fifths (58%) of the HBCU total with other S&E activities totaling over one-fourth.

- In FY 2007, 96 HHE institutions (out of 257) received $594 million in federal academic S&E support. About three-fifths of all federal academic S&E support to these institutions was from HHS, and almost fourth-fifths of the S&E total was for R&D projects (see Figure 160.4-3).

- There were 298 tribal colleges (from a total of 32) that received federal academic S&E obligations for FY 2007 (see Figure 160.4-4). S&E funding levels for tribal colleges decreased by 13.2% in FY 2007, to a $25.0 million. NSF and the USDA combined, funded 64% of the academic S&E total. R&D programs comprised less of the total S&E support of tribal colleges (about one-third) than it did for other types of institutions. More than one-half of all tribal college funding was for other S&E activities, with most funds for “other S&E activities” coming from NSF.

Profile of a Research Administrator*
Thomas J. Roberts, Florida Gulf Coast University
Jess House, University of Central Florida

Abstract
The purpose of this research was to determine the demographic characteristics of research administration professionals. This is the first time that empirical research characterizing the demographic profile of research administration professionals has been conducted. The population of respondents for the study included 277 research administrators based in the southeastern region of NCURA. Data were collected utilizing an Internet-based electronic survey instrument. A total of 230 usable surveys were collected (83% rate of return). The general profile of a research administrator is: female; 40–49 years of age; bachelor’s degree; 6–10 years in the profession; earning between $40–50,000 annually; and came to the field by working at a university and transferring to a predominantly research administration position.

Delimitations and Limitations
The research was delimited to research administrators based in the southeastern region of the United States as defined by the National Council of University Research Administrators (NCURA) (Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, Puerto Rico, South Carolina, Tennessee, and Virginia). The sample population was selected because the southeastern region is the home region of Thomas J. Roberts, and is one of the largest NCURA regions (NCURA membership = 22%). It was anticipated that the response rate to the administered survey would likely yield the best results if the aforementioned population was utilized.

This study was limited due by the assumption that respondents would answer the survey questions honestly. Furthermore, the accuracy and currency of the records obtained from NCURA could not be verified and therefore could not be controlled.

Introduction
The university research mission has never been more important, yet little is known about a key figure in carrying out this mission: the research administrator. These administrators were not directly responsible for the advances in medicine, science, technology, and the social sciences that have resulted from university research, but they provided and managed the supportive conditions and organizational structures that were necessary for the research. A thorough search of the literature failed to reveal any research on the characteristics of university research administrators, including educational background, age, gender, and salary level. This lack of basic knowledge presents an obstacle to capacity-building and professional development efforts, including

*This article is reprinted from Research Management Review, Vol. 15, No. 1, Winter/Spring 2006, published by the National Council of University Research Administrators. It is used with permission of the publisher.
certification programs and other efforts to further professionalize the role. Yet, the quality of future university research is intertwined with the effectiveness of the research administrators.

The purpose of this research was to determine the demographic characteristics of research administration professionals. No previous empirical research has characterized the demographic profile of research administration professionals.

Formalization of the professional field of research administration was concurrent with the establishment of the National Council of University Research Administrators (NCURA) in 1959. Since this beginning, the number of research administrators has kept pace with the dramatic rise in external funding awarded to colleges and universities for research, the scale of research management on campuses, and the complicated legal and regulatory requirements associated with receiving external funding (Hansen & Moreland, 2004). Several educational certificate programs for research administrators have emerged over the past decade, beginning with the establishment of the Research Administrators Certification Council (RACC) in 1993 (Research Administration Certification Council, 2005), various internal educational programs on campuses throughout the country, and the first graduate certificate program in research administration management at Cleveland State University in 2005. However, no formal degree program in research administration or management has yet been offered, although interest in such a degree is evident from discussions held in various committee meetings and at national and regional conferences of research administration professionals. Universities that would otherwise consider offering a degree in research administration might well hesitate in the absence of basic information on the role. This article contributes a demographic profile of research administrators based on recently conducted survey research.

**Statement of the Problem**

No empirical research has characterized the demographic profile of research administration professionals. Despite increases in external support provided to colleges and universities for research, and associated increases in the number of people employed in the field, the profession lacks basic demographic profile information. It was not known how individuals initially became involved in the field of research administration. The purpose of this research was to begin to collect this data.

**Methodology, Population, and Sample**

The population of respondents for this study included research administrators based in the southeastern region of NCURA. According to NCURA figures for 2005, 1,101 members were based in the southeastern region. Of these potential respondents, 134 were purposely selected because they had achieved certification through the Research Administrators Certification Council (RACC). Another 143 potential respondents were added to the sample by random selection from the NCURA database. The demographic data collected were from the study entitled, *Perceptions of Research Administrators on the Value of Certification* (Roberts, 2005). A more detailed description of the population and sample may be found in this study.
An Internet-based survey instrument, Research Administrator Survey (RAS), was developed to collect demographic data from research administrators. Following a satisfactory pilot study, the survey instrument was distributed to 277 potential respondents via an electronic mail notification. It included a link to an Internet site where the survey could be completed online. Each potential respondent was contacted by telephone or e-mail and notified that the study was in progress. Confirmation of contact information for all potential respondents was checked for accuracy and edited as necessary. Three electronic mail requests were followed by personal telephone calls to those who did not respond to the electronic mail requests.

**Results**

A total of 230 usable surveys were returned, for a return rate of 83%. Analysis of the survey data revealed demographic information on research administrators in terms of gender, age, academic qualifications, experience in research administration, salary, and mode of entry into research administration. These characteristics are described in detail below.

**Gender and Age.** The professional field of research administration is dominated by women. The NCURA member database was accessed on February 9, 2005 and revealed that the Southeast Region had 1,101 members — 79% women and 21% men (NCURA, 2005). In addition, the NCURA member profile database was accessed on February 10, 2006 and revealed that 183 members within the Southeast Region had completed member profiles (NCURA, 2006). According to the member profile, of those based in the Southeast Region of NCURA, 74% are female and 26% are male. The Society of Research Administrators International (2004) database was accessed on September 24, 2004 and revealed total membership of 3,619 people — 73% women and 27% men.

A total of 76% of the respondents to the RAS were female and 24% were male. Respondents ranged in age from 20 to over 70. The majority of the respondents (91%) were between the ages of 30–59. Table 1 presents the demographic data pertaining to age and gender of respondents.

</tr>
</tbody>
</table>

**Educational Level of Respondents.** The educational level of respondents ranged from high school diploma or GED equivalent to doctorate. Over 70% of the respondents held a bachelor’s or master’s degree. Table 2 shows the educational level of respondents.
Classification of Position. Respondents were asked to identify the classification of their current position. The majority of respondents were either coordinators or directors. Table 3 illustrates the position classification of the respondents.

<table>

How Respondents Became Involved in Field of Research Administration. Respondents were asked how they initially became involved in the field of research administration. Table 5 provides a summary of their responses.
The summary findings and discussion of the data collected pertaining to demographic profile information of research administrators are presented below.

The modal demographic profile of research administrators is as follows:

- female,
- bachelor’s degree,
- 40–49 years of age,
- 6–10 years experience as research administrator, and
- $40–50,000 salary.

It is apparent that research administration is a field dominated by females. This is evidenced by the gender make-up of both NCURA and SRA databases. Between September 2004 and February 2006, three random inquiries were made of NCURA and SRA databases. Female membership ranged between 73%–79% and male membership ranged from 21%–27%. This was consistent with the respondents to the Research Administrator Survey as 76% were female and 24% male. Eight-nine percent (89%) of respondents to the Research Administrator Survey ranged in age from 30 to 59, and gender was consistent with the random NCURA and SRA database membership inquiries.

The role of research administrator is clearly dominated by women. As can be seen in the tables in this report, women outnumber men in every meaningful category of response. For example, there are at least twice as many women as men in each of the position classifications, with one exception. The exception is in the vice presidency, where women still dominate, but by a lesser ratio of 3:2. More men than women can only be found in one category of the educational level of respondents. Men have a slight edge over women at the doctoral degree level (52–48%).

| Table 5. How Respondents Initially Became Involved in Field of Research Administration |
|---------------------------------|-----|-----|
| Response                        | N*  | (%)*|
| Worked in another area of the same organization and transferred to a predominantly research administration position | 81  | (36) |
| Worked for a government organization involved in grant related activity, but not specifically research administration | 34  | (15) |
| Worked for a not-for-profit organization involved in grant related activity, but not specifically research administration | 23  | (10) |
| Worked in the private sector involved in grant related activity, but not specifically research administration | 14  | (6)  |
| Was a faculty member/professor and transferred to a predominantly research administration position | 13  | (6)  |
| Was a student worker and offered a position after graduating | 3   | (1)  |
| Worked at another university, but not directly in research administration | 3   | (1)  |
| Grew up wanting to be a research administrator | 1   | (1)  |

*N and (%) exceed because respondents were permitted to check more than one answer.
Recommendations for Future Research

Further research is suggested in the following areas:

1. It is recommended that a replication of the demographic section of the Research Administrator Survey be done in another region of the United States to further validate the results.

2. It is recommended that research be conducted to determine if curricula should be developed at the university level in research administration management.

3. It is recommended that the primary professional organizations in support of research administration engage in research to determine the number of people involved in the profession of research administration in order to provide an impetus for curriculum development and continuing adult education.

Results from the 2007 Research Administrator Stress Perception Survey (RASPerS)¹, ²
Jennifer Shambrook, M.H.A., Ph.D. Candidate, Medical University of South Carolina and Olga Brawman-Mintzer, M.D., Medical University of South Carolina

Authors’ note: This work is dedicated to our research administration colleague, Debra Ann Grandberry, M.A. (1964-2007).

Abstract
Research administrators’ work combines considerable intellectual demands with strict timelines — both potential contributors to job strain. We examined levels of perceived stress, health effects, and coping mechanisms in a sample of research administrators. The Research Administrator Stress Perception Survey (RASPerS) was administered anonymously to over 600 people in the field. We found that the greatest number of respondents perceived their levels of work-related stress as high (41.3%); work-related home stress as moderate (42.5%); and stress from competing demands of work and home as moderate (35.4%) or high (35.1%). Research administrators endorse working in a high-stress environment, often feel under-appreciated for their contributions, fail to maintain a healthy lifestyle, and often feel they have neglected other important aspects of their lives in deference to the demands of work. Sixty-six percent reported having inadequate resources to complete their job in a forty-hour work-week. When asked why they continue to work in research administration, the prevalent responses were the challenge, variety of tasks, working with intelligent colleagues, job security, and feeling a sense of purpose.

Introduction
Roberts and House (2006) described the profile of a typical research administrator as a female in her 40s, with an income between $40–50,000 per year, holding a bachelor’s degree in another field, with six to ten years of experience. Research administrators have to navigate changing and increasing regulations, new methods of grant submission, more frequent deadlines due to new policies at government agencies, more applications to obtain funding due to funding agency cutbacks and rising prices, and budget cuts that eliminate jobs and often create situations in which fewer people are managing an increased work-load. Available data indicate that job strain significantly affects research administrators’ health and quality of life. It is interesting to note that according to qualitative data from this study, participants reported that improving the health and quality of life of others is the primary motivator for staying in this field.

High levels of stress have been shown to be associated with cardiovascular disease, hypertension, depression, digestive disorders, weight gain, insomnia, unhealthy

behaviors, and a host of other maladies due to stress-related weakened immune system (DHHS, 2004; Mayo Clinic, 2006; WebMD, 2005). Smith et al. (2000) reported that professional and support management careers are among the highest stress-producing professions. Jobs were considered to be high stress if 19% or more of the sample from that job class reported feeling high or extremely high stress. In their sample of 17,000 workers, about 20% reported having high or extremely high levels of stress.

The purpose of this study was to look at a previously unstudied subset of professional and support management personnel working in the field of research administration. The Research Administration Stress Perception Survey (RASPerS) was designed with a two-fold purpose: to ask questions and to provoke self-examination as a health promotion tool for this population. If the survey was distilled to one over-arching query, it would be to determine if research administrators are benefiting from the findings of public health research in preventive medicine as it relates to very basic stress management. Additionally, it is hoped that by merely answering the questions, research administrators are increasing their awareness of their health-related lifestyle and moving along the stages of change toward adopting best practices for good health (Prochaska & DiClemente, 1983).

**Methodology**

The RASPerS instrument was developed specifically for the target population. The target population consisted of self-identified research administrators (RAs). The survey instrument was submitted to the Internal Review Board for Human Use in Research (IRB) at the Medical University of South Carolina. As it was being administered anonymously and the only identifiers were gender and years in service, it was categorized as being exempt from review of the full committee. It was approved by a subcommittee of the IRB and assigned protocol number HR 17440.

The RASPerS was administered online through SurveyMonkey® with an original small pilot group of 32 RAs. The original survey used in the pilot was modified in two respects. In one field of the original survey, those who were interested in receiving the survey results could enter their email address. This was eliminated in order to protect the anonymity of the participants. The second modification was to indicate that the last question, which required an essay-type qualitative response, was an optional question. This was done because only about half of the original 32 replied to that question. The authors felt that by labeling this question as optional, the participants would have a greater feeling of satisfaction with their survey experience.

The authors expected fewer than 100 responses and had registered for that level with SurveyMonkey®. Email addresses of RAs that had been copied on email to the first author had been collected and collated into a direct contact list of approximately 40 RAs. A solicitation was sent to the RESADM-L list serve requesting that list serve members participate in the survey. A duplicate email was sent to the direct contact list. In less than five minutes, over 100 responses had been collected and additional participants were being rejected. It was necessary to upgrade the Survey Monkey® account to accommodate 1,000 responses. Another email was sent to the RESADM-L list serve to
notify potential participants who had been unable to complete the survey after the first five minutes because it had reached maximum capacity without upgrade.

Within two hours, over 300 participants had completed the survey. Within three days, over 500 RAs had participated. After two weeks, when the survey was closed by the authors in order to begin writing the report of the results, 624 RAs had completed the survey. This high level of response could be taken as an indicator of the level of interest in the topic of profession-related stress by this population.

The 2007 RASPerS consisted of nine sections:
1. Perceived levels of stress due to:
   a. Work
   b. Home due to work
   c. Competing demands of work and home
2. Priorities and appreciation
   a. Self-efficacy in synchronization of time and priorities
   b. Feelings of appreciation by non-administrative colleagues
3. Healthy lifestyle
   a. Sleep
   b. Exercise
   c. Nutrition
   d. Hydration
   e. Break for lunch
4. Healthy weight
5. Likely response to a scenario of dealing with potentially life-threatening illness during a deadline
6. Perceptions of negligence due to work of:
   a. Physical health
   b. Spiritual and/or mental health
   c. Family or social relationships
7. Adequate resources available to accomplish job in 40-hour work-week
8. Demographics
   a. Number of years in RA
   b. Gender
9. Optional qualitative response to explain why they continue to work in RA
Data were analyzed using data analysis tools included in the upgraded version of SurveyMonkey®. Composite data are shown in the results section, giving absolute numbers and/or percentages and graphical representations. Graphical representations of data shown in all figures in the Results section were prepared using Microsoft Excel.

**Results**

**Demographic Information**

Demographic questions were limited in order to keep the survey as brief as possible and to limit the personal information that might compromise anonymity. RASPerS participants were only asked to indicate their number of years in research administration and their gender. More than ten years of experience was the prevalent answer. Figure 1 shows the breakdown of years of service.

![Figure 1. Years of Research Administration Service by RASPerS Participants](image)

Gender distribution closely replicates the Roberts and House (2006) study, which showed that over 80% of the employees in this profession were females. Figure 2 shows the gender distribution as indicated in the RASPerS data.
Perceptions of Stress

Question 1 was designed to rate levels of stress at work, home due to work, and feelings of anxiety due to competing demands of home and work. As shown in both Table 1 and Figure 3, the prevailing answers were high work-related stress and moderate home stress due to work. For feelings of anxiety from competing demands of home and work, there was no significant difference between moderate (35.4%) and high (35.1%). Figure 4 combines the responses of minimal with moderate and high with extremely high.

Feelings of Control and Appreciation

Participants were asked in RASPerS Question 2 to choose responses from a standard Likert scale of Always, Often, Sometimes, Seldom and Never. The questions were worded as follows:

a. Think of your top priorities and goals in life. Do you feel your priorities and the way you spend your time are well aligned with one another?

b. Do you feel your non-administrative research colleagues appreciate your contributions to the research mission of your organization?

As is shown in Figure 4, there was a huge prevalence for the middle answer, “sometimes,” for both questions. However, the most significant information concerning differences can be seen by comparing the information that is on either side of the middle, or more neutral, selection (Albaum, 1997). For Question 2a, concerning synchronization of time and priorities, there is a similar distribution among RASPerS participants when comparing the Always/Often responses (160, 25.8%) to the Seldom/Never responses (149, 24.0%). The 50.2% in the Sometimes area felt that they were able to align time and priorities at least some of the time. Conversely, those same participants reported that at least some of the time, they were not able to align their time commitments with their priorities. All in all, this is fairly evenly distributed.
Figure 4 also depicts the responses to Question 2b, which concerns feelings of appreciation from non-administrative colleagues for contributions to the research mission. Again, a majority were in the “sometimes” category at 40.7%. Unlike the previous question, however, there was a notable difference in percentage between those who felt they were appreciated either always or often (23.5%) and those who felt they were appreciated either seldom or never (33.6%).

Healthy Lifestyle

Question 3 addressed healthy lifestyle practices and Question 4 addressed one aspect of healthy lifestyle results. These practices were selected as identified as practices that can contribute to stress management (DHHS, 2004; Medline Plus, 2005; NIOSH, 1998). Question 3 asked participants to indicate the number of days per week they practiced the following healthy lifestyle behaviors:

- How many nights per week do you have 7 or more hours of uninterrupted sleep?
- How many days per week do you engage in leisure time physical activity for 20 minutes or more?
- How many days per week do you eat five or more ½ cup servings of fruits and vegetables?
◆ How many days per week do you consume at least eight 8-ounce glasses of water?
◆ How many days per week do you leave your desk and take a break from work during lunch?

The prevalent answers for practicing each of the five health promotion behaviors were between zero and two days per week. For sleep and hydration, the prevalent answer was zero. For leisure time physical exercise, nutrition, and taking a break at lunchtime, the prevalent response was two days per week. Thus, as a group, RAs were not actively practicing these basic health promotion behaviors. Table 2 shows the responses for each category by day.

In Figure 5, a stacked area chart is used to depict the frequency of engaging in the healthy behaviors measured more often than not (four or more days per week). The stacked area chart represents 100% of the respondents for each item and corrects for the difference in the number of respondents in the separate items. The total group of participants was divided to show the percentage who participated in each healthy behavior zero to three days per week; those are compared to those who practiced the healthy behaviors four to seven days per week. As shown in Figure 5, more often than not (4–7 days per week) scored lower in every category as follows: 28%, taking a break at lunch; 36%, exercise; 37%, sleep; 42%, nutrition; and 47%, hydration.

As a measure of the healthy lifestyle outcomes, perceived body mass index (BMI) was measured. The Body Mass Index Scale is a tool used by the National Heart Lung and Blood Institute as an indicator of healthy body weight (NHLBI). Respondents were given the web address of the BMI scale, or were allowed to just give their estimate of whether their BMI was in the healthy range. The question asked was: Are you at a healthy weight according to recommended standards of the Body Mass Index? Their answer choices were: yes, probably, don’t know, probably not, and definitely not. The most prevalent answer was probably not (34.4%). Among respondents, 57% indicated that they either were not or probably were not within the recommended BMI range,
Figure 5. Comparison of Low Frequency or High Frequency of Engaging in Healthy Behaviors. Stacked Area Chart Depicts 100% of Responses for Each Category and Compares 0–3 Days per Week (Less Frequency) to 4–7 Days per Week (High Frequency)

while 3.9% indicated that they did not know if they were or were not within the recommended BMI range. A total of 39.5% indicated that they either were or probably were within the recommended BMI range.
**Work-Related Health Promotion Scenario**

Participants were asked to select the best answer for their possible response to the following situation: “If you had pneumonia during a major deadline, what would you most likely do?” Possible choices are shown below:

1. Work through the deadline and rest afterward.
2. Work at home during the day and possibly come in at night.
3. Work at home.
4. Make arrangements for someone else to manage my desk, call me if needed, and stay home in bed.
5. Expect my colleagues to manage without me while I recover.

The prevalent answer was choice 1, work through the deadline and rest afterward, at 34.4%. Among other participants, 5.0% said they would work at home and come in at night; and 20.5% said they would work at home. The second most popular answer was to have someone else cover their desk and call if needed, at 32.7%, while 7.4% said they would expect their colleagues to manage without them while they recover. Taken together, 59.9% said they would work through pneumonia and 41.1% said they would go to bed.

**Perceived Feelings of Negligence**

Participants were asked if they felt they had frequently neglected their physical health, mental or spiritual health, and/or family or social relationships in order to meet the demands of their job. The response was overwhelmingly “yes” in each of the three areas. Table 3 shows percentages and number of respondents for each of the possible choices of “yes,” “no,” or “maybe, I’m not sure.”

</tbody>
</table>
Adequacy of Resources

When asked if they felt they currently had adequate support and resources to accomplish their job in a satisfactory manner in a 40-hour work-week, RASPerS participants were allowed to select “yes,” “no,” or “other.” The “other” category had a comment box in which they could respond in more detail if needed. Among participants, 29.6% (177) selected “yes,” indicating that they had sufficient resources to complete their job satisfactorily in a 40-hour work-week. Another 65.6% (393) selected “no,” indicating they did not have sufficient resources to complete their job in a 40-hour work-week. Finally, 4.8% (29) selected “other.” Of these, two wrote yes with comment, and seven wrote no, with comment. Twenty essentially said they did not have 40-hour work-weeks now, but plans were in place for that to be alleviated through new hires or redistribution of duties, or that there were wide fluctuations in their schedules depending on the time of year. So, after adjustment for comment responses, 179 (29.8%) indicated that they had adequate resources for a 40-hour work-week, while 400 (66.8%) indicated they did not have adequate resources to successfully complete their work in a 40-hour week.

Discussion

To our knowledge, this is the first survey presenting a detailed profile of a research administrator’s stress perception and health behavior profile. We observed that the majority of survey participants endorsed the following characteristics:

◆ Work-related stress: high
◆ Work-related home stress: moderate
◆ Stress due to competing demands of home and work: moderate/high
◆ Sometimes able to align personal goals with time commitments
◆ Sometimes, but usually not, feels appreciated by non-administrative colleagues
◆ Never gets 7 hours of sleep or drinks enough water
◆ Exercises, eats right, and takes a lunch break 2 days a week
◆ Unhealthy weight status
◆ Would work during a deadline, even if they are very sick
◆ Feels they have neglected physical health, mental or spiritual health, and friends or family in deference to work
◆ Works in an environment where there are not adequate resources to accomplish the job adequately in a 40-hour work-week
◆ Served the profession for more than five years
◆ Female
Recommendations

In looking at the prevalent description above, this does not epitomize best practices from what has been learned and published in biomedical research over the ten-plus years that most of these dedicated people have been serving the research community. Hansen and Moreland (2004) described the need for the research administrator to be Janus-faced, looking both forward and backward, to perform due diligence while embracing the principles and values of research administration. Research administrators must also be encouraged to look in the mirror and consider their lives holistically in the present. Are we practicing the sermons we are enabling the researchers to preach through their research? If not, what can be done to change our behaviors or occupational environments to facilitate the adoption of healthier behaviors and ultimate likely health outcomes?

Limitations of the Study

This survey did not collect extensive demographic data that may have some association with stress. As described above, this was done in the interest of keeping the time commitment of the participants at a minimum and reducing personal identification information as much as possible in order to maintain anonymity. Future studies, however, may collect age and marital status, as other studies have shown an association between professional stress and these demographic factors (Smith et al., 2000).

Recommendations for Further Study

Further study is needed to compare the RASPerS participants in the extreme groups (minimal stress vs. extremely high stress) to see what, if any, differences may exist that could be associated with lower levels of stress. Are there differences in stress perception between long-term and newly entered research administrators? Is there an association between gender and perceived levels of stress? Further study is also needed for qualitative analysis of the optional essay question, which asks why participants remain in research administration, to determine if there is any association between professional motivation and perceived levels of occupational stress.

**About the Authors**

Jennifer Shambrook, MHA, is Associate Chair, Department of Psychiatry and Behavioral Sciences, Medical University of South Carolina. Ms. Shambrook is also a Ph.D. candidate in public health in the area of health promotion and education. Her research interests include healthy lifestyle awareness and promotion. She has served the research community as a research administrator for over 20 years. She has given many presentations on work-related stress at research administration conferences and university workshops.

Olga Brawman-Mintzer, M.D., is professor, Department of Psychiatry and Behavioral Sciences, Medical University of South Carolina. She also serves at the Ralph H. Johnson Veterans Administration Medical Center in both research and clinical service. Dr. Mintzer’s research interests include psychopharmacology of anxiety disorders and psychopharmacology of women.
Impact of NIH Sponsored Funding on States
Families USA

The nonprofit group, Families USA, analyzed NIH grants and contracts awarded in each state in fiscal year 2007 and the economic impact of these awards in each state.\(^1\) In fiscal year 2007, NIH awarded approximately $22.846 billion in grants and contracts to universities and other research institutions in the 50 states.

Key findings from the analysis are included below (see also Figure 160.7-1 and 160.7-2):

**Funding Amounts.** The value of NIH awards ranged widely, from $3.493 billion (California) to $7 million (Wyoming). Seven states received more than $1 billion in funding from NIH: California, Massachusetts, New York, Maryland, Pennsylvania, Texas, and North Carolina.

**Business Activity.** On average, in fiscal year 2007, each dollar of NIH funding generated more than twice as much in state economic output. That is, an overall investment of $22.846 billion from NIH generated a total of $50.537 billion in new state business activity in the form of increased output of goods and services. Business activity generated per dollar of NIH funding ranged from $2.49 (Texas) to $1.66 (South Dakota).

**Jobs and Wages.** In fiscal year 2007, NIH grants and contracts created and supported more than 350,000 jobs that generated wages in excess of $18 billion in the 50 states.

- The number of new jobs created ranged from 55,286 (California) to 127 (Wyoming). In six states, more than 20,000 new jobs were created: California, Massachusetts, New York, Maryland, Pennsylvania, and Texas.
- The increase in total wages from jobs created and supported by NIH funding ranged from $3.111 billion (California) to $5 million (Wyoming). In six states, total wages from jobs created exceeded $1 billion: California, Massachusetts, New York, Maryland, Pennsylvania, and Texas.
- The overall average wage associated with the jobs created was $52,000. The average wage per new job created by NIH funding ranged from $60,285 (Connecticut) to $38,746 (Louisiana). On average, wages associated with jobs created by NIH funding are nearly 25 percent higher than the average U.S. wage.

* Value of additional state business activity attributed to NIH grants and contracts awarded to academic institutions, organizations, and businesses in the state, measured in terms of the dollar value of goods and services, rounded to the nearest million dollars.

*** Total new business activity may not equal the NIH award multiplied by the business activity multiplier due to rounding.

The “average” multiplier per NIH dollar (2.21) is the sum of total new business activity divided by the sum of NIH awards.

* State NIH awards and total wages are rounded to the nearest million dollars. Jobs are rounded to the nearest whole number. Total new jobs and wages may not equal the NIH award multiplied by the relevant multiplier due to rounding.

** In order to calculate the impact of NIH awards on employment, 2007 NIH award data were deflated to 2005 levels in order to be consistent with the BLS employment multipliers, which are based on 2005 data. Data were adjusted using a deflator of 0.919, which is based on the Bureau of Economic Analysis’ index for biomedical research and development (BiRD).

*** The average wage ($52,112) is the sum of the total wages from new jobs divided by the total number of new jobs.

Public Attitudes Toward Scientific Research
National Science Foundation

The National Science Board’s Science and Engineering Indicators provides “a broad base of quantitative information on the U.S. and international science and engineering enterprise.” One set of data, discussed in Chapter 7, pertains to: public attitudes toward science and technology (www.nsf.gov/statistics/seind10/c7/c7h.htm).

Some key findings from the NSF’s data are included below and at Figures 160.8-1 through 160.8-3:

- **Americans consistently endorse the past achievements and future promise of science and technology.** In 2008, 68% of Americans said that the benefits of scientific research have strongly outweighed the harmful results, and only 10% said harmful results slightly or strongly outweighed the benefits. Nearly 9 in 10 Americans agree with the statement “because of science and technology, there will be more opportunities for the next generation.” However, nearly half of Americans agree that “science makes our way of life change too fast.”

- **Support for government funding of scientific research is strong.** In 2008, 84% of Americans expressed support for government funding of basic research. More than one-third of Americans (38%) said in 2008 that the government spends too little on scientific research and 11% said the government spends too much. (Other kinds of federal spending such as health care and education generate stronger public support.)

- **The public expresses confidence in science leaders.** In 2008, more Americans expressed a “great deal” of confidence in scientific leaders than in the leaders of any other institution except the military.

2010 Profile of a Research Administrator\(^1\)
Jennifer Shambrook, St. Jude Children’s Research Hospital and Thomas J. Roberts, Florida Gulf Coast University

Abstract
This paper expands upon the seminal work of Roberts and House, which described the first empirical study of the demographic profile of a research administrator. The original work was based upon data from the 2005 Research Administrator Survey (RAS), a regional study of research administrators in the southeastern United States (see ¶160.6). In this paper, nationwide demographic data from the 2010 Research Administrators Stress Perception Survey (RASPerS) are compared to the 2005 RAS data. These comparisons revealed that the general profile of a research administrator continues to be overwhelmingly female (80.1%), holding a higher education degree (88.7%), and aged 40–49 years (31.9%). The 2010 data showed an extremely significant difference in the modal salary level, which increased from $50,000 to $74,999 (40.0%). In 2005, the increase was from $40,000 to $50,000 (23%). Level of education was slightly higher in 2010 than in 2005, with more research administrators holding both bachelor’s and master’s degrees. Additional demographic and social data are described from the 2010 RASPerS. These include both work and non-work factors. These data are offered to provide information that may be useful for others with an interest in expanding the body of knowledge about the profession of research administration.

Introduction
While a body of information is constantly growing pertaining to what research administrators do, or are supposed to do, little has been done to date to describe who research administrators are as a profession. As pointed out by Beasley (2006), this emerging profession really came into being in the 1940s after Vannevar Bush persuaded President Franklin Delano Roosevelt to create an agency that would coordinate collaboration between federal and civilian laboratories. Hanson and Moreland (2004) reflected upon the conundrum research administrators face in their constant balancing between the sometimes competing demands of sponsoring agencies and over-worked academic researchers. Research administrators must assume many roles, perform both complex and mundane functions, and act as a liaison with both internal and external parties. It takes a multi-talented and mission-dedicated individual to thrive or succeed in the profession. And, as shown in the 2007 RASPerS (Shambrook & Brawman-Mintzer, 2007), research administrators perceive this work to often be done in a stressful environment with little recognition from their non-administrative colleagues to whom they are providing a service (see ¶160.7).

\(^1\)This article is reprinted from Research Management Review, Vol. 18, No. 1, Spring/Summer 2011, published by the National Council of University Research Administrators. It is used with permission of the publisher.
“Research administrators must assume many roles, perform both complex and mundane functions, and act as a liaison with both internal and external parties. It takes a multi-talented and mission-dedicated individual to thrive or succeed in the profession.”

Who are the people who make up this profession? Prior to the 2006 publication by Roberts and House, solid empirical demographic data did not exist for research administrators. In this paper, we update this seminal work using more recent national, rather than regional, data. Comparisons are made that both serve to validate the original work and reveal some differences that indicate professional trends. Finally, additional demographic factors have been added that provide baseline data for additional studies that may seek to expand the body of knowledge about this emerging profession.

Methods
Both the RAS (Roberts, 2005) and 2010 RASPerS (Shambrook, 2010) recruited participants from a closed population of research administrators who were members of the National Council of Research Administrators (NCURA). The RAS recruited solely from NCURA Region III, which is comprised of eleven Southeastern states and the Territory of Puerto Rico. Through the selection and randomization process described in Roberts and House (2006), there were 277 potential study participants for the electronic survey. The usable return rate was 83%, with 226 total survey participants. Thus, with a confidence level of 99%, the confidence interval was 3.69.

The 2010 RASPerS (Shambrook, 2010) modeled several demographic factors after the 2005 RAS in order to make valid comparisons, but expanded recruitment to include the entire nationwide membership of NCURA. Expanding the catchment area for recruitment was a recommendation for future study in the 2006 RAS article Roberts and House (2006). The 2010 RASPerS also sought to make comparisons with Behavioral Risk Factor Surveillance Survey (BRFSS) data from the U.S. Centers for Disease Control and Prevention (CDC). Therefore, some factors were somewhat adjusted in the survey (e.g., salary ranges) and others were added (e.g., ethnic heritage and marital status). It was the intent of the 2010 RASPerS questionnaire to generate data that could be compared with data from both previous surveys (RAS and BRFSS). The National Institute of Occupational Safety and Health (NIOSH, n.d.) Non-Work Factors Scale from the NIOSH Generic Job Stress Questionnaire was used to collect information about other commitments (e.g., eldercare or pursuing another academic degree).

The composite 2010 RASPerS questionnaire consists of 12 components which include demographic data, non-work activities, three instruments for health behaviors, and seven stress-related instruments. These are preceded by an introduction, participant rights statement, and statement of consent.

The data collection process began with an email to the entire membership of NCURA with a link to the 2010 RASPerS electronic survey. The total population of the NCURA membership was 6,232 at the time of the survey in February 2010. A total of 1,188 participants took portions of the survey. As comparisons were being drawn
between multiple factors of the survey, the N varied among the 12 survey instruments which were combined to make up the composite survey. However, for a 99% confidence level with a confidence interval of 4.0, only 891 responses were needed and over 1,000 responses were collected for each of the instruments, generating a 99% level of confidence and confidence intervals of less than 4.0 for each instrument.

Approved protocols for human participant protections were in place by the appropriate Institutional Review Boards for the RAS at the University of Central Florida and 2010 RASPerS at Walden University. Data were analyzed using both descriptive and inferential techniques. Frequencies and percentages are shown for all factors. Fisher’s Exact Test was used in comparing two factors and Cochran-Armitage Trend Test was used for multiple factors to determine statistical level of significance.

Results

Work-Related Factors. Work-related data gathered by the 2010 RASPerS included primary research administration role, number of years in research administration, certified research administrator status, annual salary, usual number of hours worked per week, and health insurance status. These data are shown at Table 1.

</table>

As shown in Table 1, there is a broad distribution across research administrator roles with fairly even distribution between department administrators (30.3%) and pre-award administrators (29.6%); post-award accounting (18.1%) and all other (18.8%); about 3.1% were working in research integrity or compliance roles.

The mode for number of years in research administration was 10 < 20 years (30.7%). The percentage with 5 < 10 years (26.5%) and 1 < 5 years (25.1%) were very similar to one another. Only 2.3% had less than 1 year of experience. There were 15.3% with 20 or more years of experience as research administrators. Health insurance was held by 99.5% of the participants. Only 14.1% indicated that they held credentials as Certified Research Administrators. The mode annual salary was $50,000 to $74,999. Less than 3% earned salaries of less than $35,000. A total of 17.8% reported salaries of over $100,000. This is comparable to data reported by the Bureau of Labor Statistics (BLS), U.S. Department of Labor, which shows the median annual income for all professionals at $59,748 and for all full-time employees with a bachelor’s degree or higher at $60,216 (Bureau of Labor Statistics, 2010).

The mode for hours usually worked per week was from 40 to 45 hours (28.9%). This was followed closely (26.1%) by those working 45 < 50 hours per week. A total of 16.8% reported routinely working from 50 < 60 hours per week and 3.7% reported working 60 or more hours per week.

**Social Demographic Factors.** Social demographic information gathered by the 2010 RASPerS included gender, age, race/ethnic group, marital status, and highest level of educational achievement. These data are shown in Table 2.

RASPerS 2010 national data show that research administration is a profession that is 80.1% female. The modal age group was 40–49 years, at 31.9%, closely followed by 50–59 years at 28.9%. Only 30.8% were under 40 years of age. Over 70% of research administrators reported being either married (65.5%) or partnered (5.3%). A total of 1.1% reported being widowed; 14.7% reported having never been mar-
ried; and only 13.5% were either separated (1.1%) or divorced (12.4%). These data reflect a similar distribution to that reported by the Pew Charitable Trusts (PEW), with 64% of college-educated adults being married (Pew Charitable Trusts, 2010).

Research administrators overwhelmingly reported educational achievement of bachelor’s degree or higher at 88.7%. Of the 11.3% without a higher degree, 10.7% reported having either some college (7.9%) or an associate’s degree (2.7%). Less than one percent (0.6%) reported only having a high school education or GED, or only seven out of 1,146 participants. Master’s degrees were held by 37.3% and doctoral degrees were held by 10%.

NIOSH Non-Work Factors. Additional non-work demographic factors were measured in the 2010 RASPerS which were considered as possible contributing factors to overall stress (NIOSH, n.d.). These factors are offered here to further describe the demographic make-up of research administrators shown in Table 3. These factors include participant reporting of an additional job; children in the home; primary responsibility for childcare duties, house-cleaning duties, or care for an elderly or disabled person; current enrollment in courses for a degree; and/or a high level of time commitment to volunteer work.

Participants reporting having extensive non-family related commitments included 14.3% having an additional job and 14.3% being currently enrolled in courses leading to a degree. A higher percentage, 26.9%, reported devoting at least 5–10 hours each week to volunteer work in addition to their research administration jobs.

Children living in the home were reported by 40.9% of the participants, but only 26.2% reported having primary responsibility for childcare duties. Primary responsibility for care of an elderly or disabled person was reported by 10.1%. Participants overwhelmingly reported having primary responsibility for house-cleaning duties at 74.2%.

Comparisons of 2005 RAS and 2010 RASPerS. Table 4 shows a comparison between the regional 2005 RAS and the national 2010 RASPerS. The purpose of this analysis was to determine the validity of the 2005 RAS regional data by comparison with the 2010 RASPerS national data. A $p$-value equal to or less than 0.05 indicates a significant difference between data sets. As shown in Table 4, no significant difference is shown among gender, age, or education when comparing the results of the two data sets. There is a weak (non-significant) difference in education, which indicates that a trend may be developing toward higher educational attainment.

The only significant difference shown was in the area of salaries, which were significantly higher in 2010 than in 2005. In 2005, only six out of ten participants reported having annual earnings of greater than $50,000; in 2010, eight out of ten reported having earnings greater than $50,000 per year. This indicates an extremely significant difference between annual incomes reported for 2005 and 2010.

<sup>a</sup>: Fisher’s Exact Test p-values  
<sup>b</sup>: Cochran-Armitage Trend Test p-value

Notes:
Gender and Age distribution does not seem to change from 2005 to 2010. There seems to be some evidence of an overall trend of having higher level of education in 2010 compared to 2005, while this finding is not strong. There is a significant change from 2005 to 2010 in salary, where every 8 out of 10 people have salaries above $50,000 in 2010 while only 6 out of 10 did so in 2005.

### Conclusion

The regional 2005 RAS data are supported and validated by the national 2010 RASPerS with respect to age, gender, and education. There is an extremely significant difference in income. This difference may be attributed, in part, to an overall 13.5% rise in national median annual income for all wage and salary earners in the U.S. (Bureau of Labor Statistics, 2010).

Research administrators may be described as a nearly homogenous group who are overwhelmingly university degreeed (88.7%), female (80.1%), earning an annual income of over $50,000 (79.4%), with a majority over 40 years of age (69.2%). Other demographic factors show research administrators to be either married (65.5%) or...
partnered (5.3%), having more than five years of experience in research administration (72.6%), and working more than 40 hours per week (75.5%). Research administrators overwhelmingly have health insurance coverage (99.5%).

**Recommendations for Further Study**

The demographic profile of research administrators may be used as foundational information in the further study of this or similar occupational groups. Further study is recommended of possible associations among salary, gender, ethnicity, and other demographic factors.

About the Authors

Jennifer Shambrook, Ph.D., currently serves as director, Grants & Contracts Management Office, St. Jude Children’s Research Hospital, Memphis, Tennessee. She began her career in research administration in 1986 at the University of Alabama at Birmingham. She is the principal investigator for both the 2007 and 2010 Research Administrator Stress Perception Surveys. Her research focus is on reducing stress, increasing stress resiliency, and promoting good health behavior in the work environment.

Thomas J. Roberts, Ed.D., is the Associate Vice President for Research, Florida Gulf Coast University, Fort Myers, Florida. He has been a professional research administrator for over 20 years and has worked at various types of institutions, including comprehensive, doctoral-granting, medical school, and major research university environments. He authored the first doctoral dissertation focusing specifically on the field of research administration. Dr. Roberts earned his doctorate in educational leadership from the University of Central Florida.
Research Administration Salaries: How Do We Measure Up?
Jennifer Shambrook, St. Jude Children’s Research Hospital

Research As research administrators, we think about money all the time. How can we get more money for our research? How much money are we cost sharing? How much money have we spent this year? How much money have we received in awards? How much money is left for a no cost extension? Money, money, money! But that is OPM – other people’s money. Let’s take a moment to think about the money you are paid for securing, managing, accounting for, or reporting on OPM. How are we doing individually and as a profession?

Research Administration Salaries
The 2010 Research Administrators Stress Perception Survey (2010 RASPerS) collected salary information from over 1,138 research administrators across the country. The data from the survey showed that about 80% of research administrators have annual salaries of over $50,000. As shown in Table 1, 40% of research administrators earn within the range of $50,000 to $74,999 per year. Fewer than 3% earn less than $35,000 and almost 18% earn over $100,000 as research administrators. How does this compare with similar professions?

Comparison with Other U.S. Workers
Salary data from the U.S. Bureau of Labor Statistics (BLS) give us some benchmarks with which to compare ourselves. The BLS reported the median annual earnings of all U.S. fulltime workers at $38,740. For those of you for whom it’s been a while since your last statistics course, the median means that half of all workers make higher than that amount and half of all workers make lower than that amount.

</table>

The 2010 RASPerS data show where we fall within five salary ranges, rather than actual salary amounts for each individual. From the RASPerS data we can see that at least 2.6% are in a salary range that is lower than the U.S. median of $38.7K. There were 18.0% reporting their earnings were in the $35-49.9K range. Of those, we can assume some would be over and some would be under the national median of $38.7K. Assuming a normal bell-shaped distribution within the $35-49.9K salary range would support the likelihood that since $38.7K falls well below the midpoint of the $35-49.9K range, more than half of the 18.0% in that $35-49.9K range are above the $38.7K point. But even putting statistical probability aside, we can clearly see that 79.4% are in salary ranges that earn $50K or more. So we can say with certainty that as a group, research administrators earn well above the U.S. median income.

Education
The 2009 U.S. Census (Educational Attainment) reports that only 29% of the U.S.

---

1 This article is reprinted from the *NCURA Magazine*, Vol. XLIII, No. 3, May-June 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
has completed a college degree of bachelor’s or higher. We know from both the Research Administrator Survey (Roberts & House, 2006) and the 2010 RASPerS that research administrators are far above average when it comes to education. The 2010 RASPerS data shows 89% of research administrators have achieved bachelor’s or higher. U.S. Census data over the years consistently shows higher educational achievement is associated with higher average earnings.

The BLS reports the median for all workers with a bachelor’s degree or higher is $60,216. This can be broken down a little further to show the median for those with bachelor’s only as being at $54,288 and for those with an advanced degree as being at $71,136. Again, looking at our salary ranges in Table 1, we find 40% are in the same range of the median salaries for those with higher education degrees, and another 39.4% earning salaries in the two higher ranges. With that, I believe we can feel comfortable with our salaries being in line with our educational levels.

Responsibility

Another characteristic which we might use to view our salaries is the area of responsibility. While 29% may have college degrees, all degreed occupations do not have the same earning power. The BLS reports those in management, business, and financial operations occupations generally earn more than those in sales or professional occupations. The median income for management, business and financial operations occupations is $59,748; for sales is $33,124; and for professional occupations is $52,520. Again, looking back at Table 1, we see that most research administrators are in salary ranges that either meet or exceed the median salaries for those in management, business and financial operations.

Gender Considerations

The salaries discussed above consider the median or mean earnings of all workers. One cannot consider salary without bearing in mind the gender bias that is still alive and well in the workplace today. This is an especially important factor when discussing an occupational group that is comprised of a population that is about 80% female with a reported gender bias present (Shambrook, Roberts & Triscari, 2010.) The U.S. Census Bureau reports the ratio for women’s earnings to men’s earnings was 78.2%. Stated in monetary terms, for every dollar a man earns, a woman in a similar situation will earn about 78 cents. Table 2 shows the median earnings for men, for women and what we should expect to see for the 80/20 female/male mix
found in research administration when adjusted for gender.

When comparing the salaries reported in the 2010 RASPerS with the median salaries reported by the BLS, it can be said that, as a profession, research administrators appear to be earning at or above the median salary range for our educational level and area of responsibility even before adjusting for gender.

### Table 2: Median Annual Income for Workers with Bachelor’s Degree, Advanced Degree, or Working in Management, Business, and Financial Operations, Divided by Gender and Gender Adjusted for Research Administration

### RA Roles

Research administrators perform different primary functions. Table 3 illustrates the responses to the 2010 RASPerS question: “What is your primary role in research administration?” segregated by salary range. Research administrators working in pre-award and post-award have a significantly higher likelihood of being in the lower salary ranges than those serving as departmental administrators, research ethics and compliance or other roles. Those in research ethics and compliance and “other” RA roles are represented with greater percentages in the two highest salary ranges. Department administrators had 41.4% in the highest two salary ranges. Those in pure pre- or post-award each had around 30% in the highest two ranges.

### Benefits

Employee benefits vary from institution to institution, but we do have one measure of employee benefits that was collected in the 2010 RASPerS: health insurance. Just prior to data collection for the 2010 RASPerS, the 2009 American Community Survey reported that 20.6% of the total U.S. civilian population between the ages of 18 and 64 years old did not have health insurance. For those employed full time, the number dropped to 13.4% uninsured. Only 6.4% of those with a bachelor’s degree
or higher were without health insurance. The 2010 RASPerS showed that only less than one percent of research administrators were uninsured. Of the 1,126 research administrators responding to the question about health insurance status, 99.5% indicated they had health insurance.

**So, How Are We Doing?**

Looking at all of this together, whether looking at comparisons with all occupations, or by educational attainment, and even when accounting for gender bias, it looks like we are doing quite well as a profession. Our salaries tend to be above the median when compared against all occupations, or against those with similar educational achievement. Our salaries appear to be higher that would be expected considering our gender composition of 80% female. Additionally, we have benefits that are significantly better than the national norm. All that, and we get to participate in a profession that helps move the body of knowledge forward for the benefit of the quality of life for all mankind. For me, I’ll feel some satisfaction in that, then turn my attention back to OPM.

**About the Author**

Jennifer Shambrook serves as Director of the Grant & Contract Management Office at St. Jude Children’s Research Hospital. She is keenly interested in research administration as an emerging occupation and is the author of the 2007 and 2010 RASPerS (see ¶160.6 and ¶160.9).
The Incidence and Types of Occupational Role Stress among University Research Administrators

Christine C. A. Katsapis, Gallaudet University

Editor’s Note: The purpose of this article was to examine role conflicts among research administrators through the lens of Hansen and Moreland’s (2004) “Janus face” of research administration. The construct of Janus, the ancient Roman god who had two faces (one that looked to the future and one to the past) seemed to this researcher to imply natural conflict. Looking back now at 2007/2008 and the data collected, it seems that perhaps the evidence that indicated the presence of role ambiguity stress may have indicated the initial changes we are seeing realized in the profession of research administration today.

Since that study was conducted, there has been an increasing amount of specialization in the field. Numerous new master’s degree programs in research administration have led to a more commonly understood curricula for the profession. NCURA held its first pre-award research administration conference in 2007—there have been five since then. Research “development” is becoming known as the precursor to pre-award. There has been an increased emphasis on the role of research administrators in ensuring the integrity of the research enterprise and assuring the public trust in research at institutions of higher education and teaching hospitals. However, one aspect of this study that this researcher believes remains a constant is that despite the diversity of the profession and its structures, research administrators continue to have much in common due to their shared professional values. Hopefully this retrospective will provide the opportunity to consider some of the natural stresses that comes from a growing profession and its role within the institutions it serves.

Please note that Christine Katsapis received the Donald Gatske Dissertation Award in 2010 from the American Association of University Administrators for her dissertation upon which this article is based. This article is being reprinted with permission from the American Association of University Administrators’ (AAUA) Journal of Higher Education Management.

Abstract

This study explored the types of stressors prevalent in the self-reports of university research administrators (URAs) and examined whether or not the degree or type of role stress was influenced by: a) the affiliation of their office unit within their institution, or b) their type. Randomly selected members of NCURA were invited via e-mail to participate in an online survey. The Occupational Stress Inventory-Revised (OSI-R) Occupational Roles Questionnaire (ORQ) (Osipow, 1998) was administered with additional questions about the URAs’ professional characteristics. The study

1 This article is reprinted from the Research Management Review, Volume 19, Issue 1, (2012), published by the National Council of University Research Administrators. It is used with permission of the publisher.
revealed that role ambiguity was present at a level indicating a high probability of maladaptive stress and/or debilitating strain. Role overload was present at mild levels. Lastly, type, office unit organizational affiliation, and years of experience did not influence the occupational stressors reported. Overall, the degree of occupational stress was indicative of a need for intervention from their institutions. The researcher recommends peer review, self-evaluation, and interventions to increase coping skills and reduce potential negative impacts on the URAs and their employers.

Introduction

University research administrators (URAs) are crucial employees for universities (Mishler, 1989). They are responsible for the administration of federally sponsored grants and contracts for colleges and universities. In this capacity they administer high-risk and high-accountability grants and contracts that represent large sums of federal dollars. They assume this administration on behalf of their institutions while simultaneously facilitating their institution’s research and extramural funding agenda (Anonymous, 1997; Atkinson, 2002; Erickson et al., 2007; Gabriele, 1998; Hansen & Moreland, 2004; Lowry & Hansen, 2001). Their jobs are characterized by constant deadlines, intense competition with other institutions for federal funds, and ongoing accountability for service to faculty, university administration, auditors, federal sponsors, and, ultimately, the American public who provide the funds given out as federal competitive grants (Erickson et al., 2007). It has been established that like other higher education occupations, URAs experience stress balancing work, home, and a healthy lifestyle (Shambrook, 2007). However, unlike other higher education occupations, there has been no study about whether or not that stress is perceived as a function of their specific occupation. There are no baseline data examining which stressors are reported by this occupation. The Occupational Stress Inventory-Revised (OSI-R) Occupational Roles Questionnaire (ORQ) has often been utilized for “executive, technical, administrative support personnel”, and types of employees to obtain role stress data (Osipow, 1998). In order to eliminate the lack of data on URA occupational stressors and fill the gap in the literature for this population of educational leaders, this study aimed to administer the ORQ to URAs and obtain baseline data for analysis and further inquiry.

URAs are associated organizationally within their institutions with organizational structures commonly named Offices of: Research Administration, Sponsored Programs, Sponsored Research, and/or University Research Services. These offices are the central location for expertise related to the application for and management of grants. The URAs within those offices are sent demands from multiple entities—the federal government, their own higher education institutions’ administrations, their colleagues, and the faculty and professional staff they serve. All of these demands arrive at varying points along the life cycle of a federal grant or contract (Coverman, 1989; Mishler, 1989). Meeting those demands can be stressful and the way in which URAs perceive the stress associated with their role is associated with higher education administration (Blankinship, 1994). Blankinship summed up the multiple roles and possibly stressful in combination roles of URAs: “... research administration is a dynamic, challenging, and stressful profession. Research admin-
Administrators play many different roles: compliance officer, cheerleader, consoler, advocate, and—perhaps the least appreciated role—crisis counselor.”

Other individuals and organizations have further elaborated upon the role of the URA to examine their organizational context and the focus of their work. Hensley (1986) assessed URAs as a subset of higher education administrators and was quoted as defining research administrators as those who “render assistance directly or indirectly to principal and co-investigators,” and included in this group what he called a “heterogeneous work group” including university staff from both the pre-award and post-award grant or contract life cycle and all those support personnel in between other than the investigators themselves (Beasley, 1992; Merritt, 1995; Mishler, 1989). After surveying 400 URAs, Eveslage and Shisler (1984) found that they tended to characterize themselves as falling primarily into one of two groups: pre-award, focusing primarily on the activities that are part of proposal preparation prior to the receipt of a grant and/or post-award, focusing primarily on grant and contract management after an award has been received. More recently, Beasley (1992) (also one of the authors of the original micrograph on the role of research administration) evaluated the voluntary professional associations that URAs tend to affiliate with and highlighted the importance of the multiple roles of the URA within higher education. Beasley’s assessment added to the pre-award-only and post-award-only group to include the more current trend of a third category of URAs—those who are associated with a combined pre- and post-award organizational unit (Atkinson, 2005; Beasley, 1992; Eveslage & Shisler, 1984; Shisler et al., 1987). As URAs are studied, one must consider their roles and the context (both institutional and federal environment) within which they perform their roles (Hansen & Moreland, 2004). The “structural response” to the changing environment in research administration has resulted in various organizational configurations of the pre-award, post-award, or combined research administration office as well as variation in the main unit to which each type of research administration office may substantially report such as academic affairs or a non-academic affairs office (e.g., Finance) (Hansen & Moreland, 2004).

This study explored the following questions:

1. What types of occupational stressors are prevalent in the self-reports of university research administrators?

2. Is the degree or type of role stress influenced by:
   a. affiliation of their office unit within their institution, or
   b. type of research administrator?

The Occupational Stress Inventory Revised (OSI-R) utilizes McLean’s six types of occupational stress because of its link to occupational role as well as high validity and reliability, and the wide range of employees with which it has been validated. McLean’s types of occupational stress are defined as:

1. Role Overload—The extent to which job demands exceed resources (personal and workplace) and the extent to which the individual is able to accomplish workloads.
2. Role Insufficiency—The extent to which the individual’s training, education, skills, and experience are appropriate to job requirements.

3. Role Ambiguity—The extent to which priorities, expectations, and evaluation criteria are not clear to the individual.

4. Role Boundary—The extent to which the individual is experiencing conflicting role demands and loyalties in the work setting.

5. Responsibility—The extent to which the individual has, or feels, a great deal of responsibility for the performance and welfare of others on the job.

6. Physical Environment—The extent to which the individual is exposed to high levels of environmental toxins or extreme physical conditions (Osipow, 1998).

The study was exploratory and analytical in nature. The emphasis was predominantly on quantitative methodology and a randomly selected population. The limitations of the proposed study were related primarily to population and methodology. One factor that limited the study was the ability to generalize to the total population. The intended sample of URAs was a convenience group and members of NCURA. Not all URAs belong to NCURA. Some affiliate with the Society for Research Administrators (which includes more than university-affiliated research administrators), or other practice related groups like the Council on Government Relations, the Council on Undergraduate Research, or the National Association of College and University Business Officers. Some do not affiliate with a membership association at all. Random selection of NCURA members was a convenient means of ensuring that URAs who were engaged in their field were invited to participate, but the sample was not representative of the total population of university research administrators. Rather, it was only able to be generalized to groups similar to the NCURA members.

Two limitations related to methodology. First, because the Occupational Stress Inventory Revised (OSI-R) measured the extent to which role stress might be experienced by URAs and not the source of that stress, no causal relationships could be proved or inferred from the data collected. Second, there was a risk of social desirability bias because: 1) role stress can only be recorded by self-report, 2) the experience of role stress is individualized and perceptual, and 3) it might have been interpreted by the individual as positive or negative. However, occupational role stress psychologists who have published articles on the validity and reliability of self-report assessments maintain that self-report is currently the best means of obtaining role stress data from a subject due to its very nature. Although there are varying opinions related to which assessments were best for differing types of role stress, all agree that perception of role stress is an individualized psychological process that can only be tapped into via a self-report-based mechanism (Barr, 2005; Biron, Ivers, Brun, & Cooper, 2006; Fiesel, 2006; O’Driscoll & Cooper, 1994; Osipow, 1998).

The electronic admission of the OSI-R to the study subjects involved an e-mail invitation, followed by a web-based OSI-R survey. Although seemingly limited to only those individuals comfortable with e-mail and web-based surveys, URAs engage in extensive use of electronic research administration methods by the fed-
eral government which allowed the researcher to determine that they would be well versed in the use of e-mail, listservs, electronic databases, as well as web-based interfaces in order to perform their duties. Additionally, NCURA and SRA, with which many if not all targeted respondents affiliate, use electronic means extensively to interact with their memberships. Care was taken to ensure that the web-based survey service used was generally user-friendly and no more complicated than those services already in use by URAs.

Lastly, one aspect of self-report methodology for measurement of occupational stressors that was unavoidable is that individuals do not necessarily attribute the stress they feel to their occupations. One criticism of the basis for most inventories of occupational stress in terms of person-environment fit theory is that individuals’ self-perceptions are not always accurate. For example, in a study looking at the occupational role stressor of environment, employees self-reported stressors associated with a “sick” building, which after investigation was determined not to be “sick” at all but the self-reports of the employees identified the wrong source regardless (Lees-Haley, 1993). Also, according to Barling et al., some individuals are simply more prone to stress and therefore, alternately, are more likely to report feeling stressors in general (Barling, Kelloway, & Frone, 2006).

**Research Methodology and Design**

**Sampling**

NCURA has over 6,000 members employed at institutions of higher education and teaching hospitals. The inclusion criteria consisted of self-identification as a URA and NCURA member combined with confirmation that they concurrently identified themselves as working for an office of sponsored programs or other similarly purposed university or teaching hospital unit. The survey administration method was via a direct e-mail to participate in an on-line web survey service that enabled the survey to be completed anonymously.

In his analysis of occupational stress data, Barr (2005) found that the presence of occupational stress was a factor in non-response to organizationally-based surveys and that occupational role stressors like role overload, high role ambiguity, and low locus of control were correlated with non-response. In an attempt to control for this effect, potential respondents were provided with a URL that could be accessed from any setting so that they had the option of completing the survey in a non-occupational setting by forwarding the invitation to their home e-mail addresses.

**Measures**

The assessment administered was the Occupational Roles Questionnaire (ORQ) portion of the Occupational Stress Inventory-Revised (OSI-R). The current version of the OSI-R is appropriate for ages 18 years and older and provides normative data for both gender and specific occupational categories (i.e., executive, professional, technical, administrative support, etc.) which is comparable to the sample population. The ORQ consists of six scales, with ten items per scale, including: role overload (RO), role insufficiency (RI), role ambiguity (RA), role boundary (RB),
responsibility (R), and physical environment (PE). According to Osipow (1998) these six scales are based upon McLean’s (1975) set of six occupational stressors. Because URAs are unlikely employed in extreme physical environments in their university setting or teaching hospital, the sixth scale was not utilized. The generic profile form was used and compared with the T scores of the total normative sample since the internal consistency analysis was conducted with the normative sample. Utilizing a Likert scale, items provided respondents with the ability to rank statements as follows from: 1) rarely or never true, 2) occasionally true, 3) often true, 4) usually true, to 5) true most of the time (Osipow, 1998).

**Procedures**

Utilizing direct e-mail, the researcher extended an invitation to the URAs who comprised the random sample to participate in a survey on occupational role stressors related to university research administration. The researcher made reference to the previous stress survey (Shambrook, 2007) which indicated that the URAs surveyed reported experiencing stress both at home and at work and where those two intersect with each other. The sample was invited to further explore this issue to determine what (if any) stress they might experience as a URA by examining only their occupational experience. Although this was not directly addressed in their invitation, the sample was asked for additional information—type of URA in their organization (pre-award, post-award, combined pre- & post-award, or other) and the type of unit to which they were organizationally affiliated (academic, administrative, or other)—to determine if there were any differences among the commonly recognizable groups internal to the occupation. Because the scope of sponsored programs at institutions of higher education and teaching hospitals widely varies, data were collected to determine what type of university research administrator they consider themselves in order to further clarify their responses. The data matrix utilized to organize the anticipated data is offered below (Figure 160.11-1).

Additional items added to the questionnaire included:

1) Do you consider yourself a pre-award, post-award, combined pre-and post-award or other type of research administrator?
2) What is the title of the university employee that you report to?
3) What is your job title?
4) What is the title of your organizational unit or office?

5) Does your organizational unit report to academic affairs, administrative affairs, or another unit within your institution?

6) How many years have you been a university research administrator?

Via three similarly named e-mail addresses the researcher invited 499 random individuals per e-mail address to participate in the survey. This was done a second time one week later to allow the researcher to get a sense of the percentage of bounce-back to expect. The target number of invitees was 3,000 in total. Because some e-mails bounced back or were likely to have been filtered by institutional firewalls, 3,000 invitee e-mails is not equal to 3,000 who actually received e-mail invitations. Therefore, an accurate response rate cannot be calculated; rather, an approximate response rate of (assuming 15% attrition due to lost e-mails) 17.88% was yielded. The survey was available via the on-line web survey service from March 17, 2008 through May 31, 2008. At the end of the four weeks the survey was closed so that the results could be analyzed.

Once the data were collected and downloaded from the web service, utilizing SPSS the researcher used descriptive statistics to analyze the data. The data were scored and grouped according to the data matrix; measures of central tendency were derived. Correlations were used to assess the relationships between and among the stressors and to inform the researcher’s view of patterns as the reports of the types of URAs and the role stressors they experienced in relationship to their characteristics emerged (Schloss & Smith, 1999). The overall group was finally compared to the normative sample provided by the OSI-R instrument.

As a researcher who is also a university research administrator, the first study, which assessed potential occupational role stressors of URAs, had to be quantitative so the data could not be directly influenced by researcher bias. However, having a URA as the researcher conducting the study is consistent with other research administration literature and its self-reflective tradition. Collecting additional information about the groups of research administrators and their unit’s university affiliation provided data that had the potential to make the incidence of stressors meaningful to not only the total group but also to the specialized groups within the occupation.

The survey instrument was entered into the on-line survey website SurveyMonkey.com, as was the required PAR licensing agreement language “Items 7-77 are adapted and reproduced by special permission of the Publisher, Psychological Assessment Resources, Inc., 16204 North Florida Avenue, Lutz, Florida 33549, from the Occupational Stress Inventory -Revised by Samuel H. Osipow, Ph.D., Copyright, 1981, 1983, 1987, 1998 by Psychological Assessment Resources, Inc.” Further reproduction was prohibited without permission from PAR, Inc., which specified that no copies could be made of the instrument. Based upon the licensing agreement, a copy of the instrument is not provided with this article. The six additional questions preceded the scales provided by the ORQ.

The results were analyzed using a combination of Microsoft Excel spreadsheet software and SPSS statistical software. The six additional questions pertaining specifically to the type of URA and institutional configuration within which they
worked were considered nominal variables. The items from the individual scales of the OSI-R ORQ were considered ordinal variables. Each scale within the ORQ was scored individually and the scales were not totaled because each measured a different occupational stressor; therefore, an aggregate or sum total score would not provide any useful information. Only the respondents who completed all ten questions of a scale were included in that scale’s data set.

Results of Analysis

Sample Characteristics

Although 482 respondents began the survey, 456 surveys were fully completed by the day the survey was closed and were utilized for the scale data analysis. All respondents who completed the first six questions were utilized to form a picture of the population of URAs because even if they did not complete the survey they did reflect a subset of the main population that had been randomly selected. Figure 160.11-2 details the frequency of the responses to the six additional questions and the categories with which the respondents self-identified.

The types reported and the number of years of experience was consistent with the literature. However, in response to the question, “Does your organizational unit report to academic affairs, administrative affairs, or another unit within your institution?” the majority picked “other”, which was not expected. The literature suggests that most URAs are affiliated with either academic affairs or administrative affairs (Davis, 1991; Eveslage & Shisler, 1984; Shisler et al., 1987). The researcher considered

*Of the other category for office affiliation: 169 were academic affairs, 29 were administrative affairs, and 14 were unclassified.
the possible explanations for this to be: 1) the respondent wanted to utilize the text response option of “other” to provide greater detail, 2) the academic or administrative classification did not apply, or 3) the respondent did not feel that their affiliation was a clear fit for either academic affairs or administrative affairs. The data revealed that 43.7% of the “other” URA respondents were executive-level academic leadership employees who did not identify as either administrative affairs or academic affairs but a separate category within their institution. The second largest category was the combined category where 18.6% of the sample considered themselves a combination of the two areas. After further examining the text-based answers, the researcher reclassified the respondents with the following types of text-based answers to either academic affairs or administrative affairs as follows.

**Administrative Affairs**
- Advancement—The office unit to which the URA reports was affiliated with a university foundation, development office, or institutional advancement.
- Finance and Business—The office unit to which the URA reports was affiliated with a higher education business, accounting, or financial office.
- Medical School Administration—The office unit to which the URA reports was affiliated with a medical school’s finance, accounting or business administration office.

**Academic Affairs**
- Academic Leadership—The office unit to which the URA reports was affiliated with an academically oriented administrative office, dean’s office, college administration, or academic department administration.
- Chief Academic Officers—The office unit to which the URA reports was affiliated with a president’s office, provost’s office, chancellor’s office, or a vice presidential-level academic or research office.
- Research—The office unit to which the URA reports was affiliated with a sponsored programs office, research unit, or a research center.

All other respondents who did not fit into the above description remained unclassified as working for an office affiliated with either academic or administrative affairs. Figure 160.11-3 represents the breakout of participants in the study after reclassification. The resulting break-out is consistent with the literature on university research administration.

Respondents were also asked their job title and their supervisor’s job title. These data were text-based and for the purpose of this study collected to allow for future, more detailed study into the organizational trends in university research administration titles and functions as well as to provide potential reference points against which to compare other responses.

**Occupational Roles Questionnaire (ORQ)**

The six scales to the ORQ correspond to the six types of occupational role stress-
ors. The first five scales are pertinent to this study of university research administrators. Although administered as part of the ORQ, the last scale of the ORQ, Physical Environment (PE), is not directly germane to this study because university settings are typically not extreme environments. By definition, research administrators who are at a university are likely in a typical university office setting with a controlled environment. The majority of respondents also skipped the items in this scale. For all scales, the T scores of the population of respondents were compared to the normative sample T scores for the sake of comparison and to interpret the respondent’s scores. The normative sample’s scores had a mean of 50 and a standard deviation of 10 and the normative sample was based upon a diverse pool of applicants in various occupations, ages, and educational levels (Osipow, 1998). The interpretive guidelines were based upon the linear scale scores of the normative sample as shown in Figure 160.11-4. The means of the T scores for the whole population of 456 URAs when compared to the normative sample revealed two means that fell into a range which suggested mild levels of maladaptive stress and strain. Role ambiguity

(RA) had a mean of 70 and role overload (RO) had a mean of 65. The results for role insufficiency (RI), role boundary (RB), and responsibility (R) were unremarkable and fell within one standard deviation of the normative sample’s median and therefore fell within the normal range as shown below in Figure 160.11-5.

According to the interpretive guidelines in Figure 160.11-4, the group mean score of 70 indicated “a strong probability of maladaptive stress, debilitating strain, or both.” The researcher compared the T-score (hereafter referred to as score) means of various groupings from the study sample to determine what degree of variation might be present in the population and if there were factors which increased the score to over 70. The results indicated that the types of occupational stressors in the URA sample which were prevalent were RA and RO and at higher levels than the

(Source: Osipow, 1998)
normative sample. The stressors of RI, RB, and R were within the normal range but still at higher levels than the average employee in the normative sample. Having data that addressed research question number 1, the researcher looked to the types of URAs in the sample population and their organizational affiliation to determine if any variance by group or if there were any relationships between different groups and URA characteristics which influenced the level of RA or RO was present. The researcher further examined that portion of the sample that reported 70+ levels of occupational stress.

**Type of Research Administrator**

As shown in Figure 160.11-6, respondents who identified themselves as “post-award” research administrators or “other” research administrators had the highest scores for RA with means of 71 and 71, respectively. The second highest set of means for the sample were for RO with means ranging from 62 for post-award URAs to 66 for those who identified themselves as other URAs. URAs in all types reported mild levels of RO. Pre-award and combination URAs reported mild levels of RA. RE was a mild stressor for URAs who labeled themselves as other.

**University Affiliation of URA Office Unit**

As shown in Figure 160.11-7, all respondents, with all manner of office affiliations within their institutions, reported a maladaptive level of stress, with each category having a mean score of 70. The second highest set of mean scores fell within the mild level of maladaptive stress range for RO.

**Years of Experience as a URA**

As shown in Figure 160.11-8, respondents who identified themselves as being in the 5–10, 15–20, or the 20+ years of experience group had the highest scores which suggested a high level of maladaptive RA stress. All other years of experience indicated

Data in **bold** indicate a correlation significant at the 0.01 level (2-tailed).
mild levels of RA as well. Mild levels of RO were also indicated in all categories of years of experience with 20+ being the highest score at 68. The data shift from mildly maladaptive in years 1–5 to within the high, maladaptive range in the year 10–15 group back down again for the 15–20 group, and finally up again for 20+.

**Correlations among the Five ORQ Stressors for URAs**

Among the five types of occupational stress included in the analysis were the correlations that could be expected as stress correlates with stress in general. There were positive correlations among them, with Role Ambiguity (RA) having the strongest correlation [.445 significant at the 0.01 level (2-tailed)] with Role Overload (RO), meaning that the higher the incidence of one, the higher the incidence of the other will be. RA was also positively (.131) correlated with RB and positively (.185) correlated with R. Both were also significant at the 0.01 level (2-tailed).

The data provided answers to the research questions. As shown in Figure 160.11-5, the types of occupational stressors most prevalent in the self-reports of URAs were RA and RO. RA was in the range that would indicate the high levels of maladaptive stress that might lead to psychological strain. RO was in the range that might indicate mild levels of maladaptive stress. All other stressors (RI, RB, and R) fell within the average to normal range. As shown in Figure 160.11-3, Figure 160.11-4, and Figure 160.11-6, the degree or type of role stress reported was not notably influenced by affiliation of their office unit within their institution, their type of URA, or even their years of experience as a research administrator as those scores were consistent across groups.

Overall, the URA sample of 456 respondents reported higher scores on all scales of the ORQ than the normative sample provided by the instrument. As shown in Figure 160.11-5, the mean scores for all scales of the ORQ for the URA sample ranged from between 5 to 20 points higher than the normative sample. Approximately 68% of the normative sample reported occupational stress levels within the 40–59 “average to normal range” occupational stress for all stressors or were within one standard deviation of their mean of 50. Comparatively, the URA sample had mean scores for all scales of the ORQ which ranged from 55 to 70, indicating that 68% of the URA sample reported from mild to maladaptive levels of occupational stress or psychological strain as compared to 2% of normative sample. Based upon the results of the study, URAs experience higher than normal occupational stress and that stress is not linked to the individual characteristics of the type of URA, the affiliation of the office they work for, or their years of experience in the field.

**Summary of Findings**

There were three main findings related to the incidence and types of occupational stressors among URAs set within the context of their organizational structure, their type, and years of experience.

1. The respondents revealed that the types of occupational stressors that were most prevalent were RA and RO and those were reported at higher levels than the normative sample. RA was at a level which indicated a high probability of
maladaptive stress and/or debilitating strain and RO was at the level which indicated mild levels of stress and strain.

2. The respondents revealed that the occupational stressors of RI, RB, and R were in evidence within the average range for stress but at a higher level than the normative sample even though they were the three least prevalent of the URA sample.

3. The results showed that the types of URAs in the sample population, their organizational affiliation, and years of experience did not influence the type or incidence of the occupational stressors reported. In fact, the URA sample had consistent responses regardless of affiliation, type, or years of experience.

**Discussion of Findings**

Hansen and Moreland (2004) provided a means of understanding the focus of URAs and their concept of the Janus-faced URA begs the question of whether or not having a Janus-faced role is occupationally stressful. The Janus-face concept embodies the nature of the changes in the field of research administration as a result of multiple responsibilities and increasing levels of compliance that make it challenging to be a facilitator of the research process at the same time. Citing Hansen and Moreland’s “structural responses” to these challenges the researcher included survey questions related to office unit affiliation in order to gain a perspective on the types of structures to which the different types of URAs report (Hansen & Moreland, 2004). The findings conclusively indicated two high levels of occupational stressors RA and RO, and three lower levels of the occupational stressors RI, RB, and R.

Because the scores are for a group of anonymous URAs, for the purpose of generalizing to the larger NCURA population of URAs as opposed to individuals the researcher could follow up with directly, the literature was the source of interpretation of the results. The literature was reviewed in relation to the characteristics of the occupational stressors found to be prevalent in the URA population and formed the basis for the conclusions drawn.

**Finding 1**

**Role Ambiguity**

According to Osipow (1998), respondents who have high scores on RA may report an unclear sense of: a) “what they are expected to do,” b) “how they should be spending their time,” c) “how they will be evaluated,” and d) “where to begin on new projects.” Additionally, they may: e) “experience conflicting demands from supervisors” and f) “have no clear sense of what they should do to get ahead.” The extremely high scores for URAs indicated the seriousness of the level of RA within the URA sample and signified the need for attention to the problem.

Atkinson’s (2005) primer on scientific self-regulation for institutions of higher education and teaching hospitals indicated that the traditional role of the URA as a partner with the faculty was being blurred by the addition of compliance requirements and greater university policy accountability. Collinson’s study of URAs in
England (whose occupation mirrors that of American URAs) found that URAs there were in roles that were simultaneously administrative and academic. They reported experiencing a lack of a consistent perception of their role by the faculty or their academic counterparts than the perception they had of themselves. She described this type of role ambiguity as being ameliorated by a coping mechanism she called “occupational identity work” (Collinson, 2007). Job stress authors cite the need for interventions to improve coping mechanisms to reduce occupational stress as a necessary step (Bowden, 2000; O’Driscoll & Cooper, 1994). The phenomena of varied perceptions of the research administrator can be seen in the reflective literature from 1998 to the present in articles written to define or characterize the specific role of the current field and of the profession of research administration. These articles are offered as education for URAs as well as the institutions they are employed by (Atkinson, 2002, 2005; Collinson, 2004, 2007; Erickson et al., 2007; Gabriele, 1998; Hansen & Moreland, 2004; Lowry & Hansen, 2001). This is consistent with a high degree of uncertainty about what their institutions expect of them, how they will be evaluated as a result of their work, and by what means they should be promoted. If there was a common understanding of the profession, then the articles would be unnecessary and not resonate with their audience or peer reviewers. The cited researchers went on to point out the extreme difficulty of meeting all demands in the current climate of federal accountability while facilitating research—this is consistent with a characteristic of multiple demands upon an occupational role leading to RA (Fried, Ben-David, Tiegns, Avital, & Yeverechyahu, 1998).

**Role Overload**

According to Osipow (1998), respondents who have high scores for RO on the ORQ may “describe their work load is increasing, unreasonable, and unsupported by needed resources.” Also, “they may describe themselves as not feeling well trained or competent for the job at hand,” or “needing more help” and/or “working under tight deadlines.” Descriptions of the profession of URAs include recognition of increasing workload to the regulatory environment and tight deadlines are an intrinsic part of the nature of the job (Kirby, 1992; McKenzie, 1988; Miner et al., 2003; Stockton & Krebs, 1976). There was no evidence in the literature that URAs describe their workload as unreasonable or lacking in funding to provide their services but constant training is emphasized as a result of the increase in electronic research administration, regulatory compliance, and increased fiscal liability of federal grants (“About us,” 2007; Erickson et al., 2007; NCURA, 2007). Reports of mild levels of maladaptive stress or psychological strain from URAs may signify a shift towards URAs’ feeling that they cannot keep up with the pace of professional development needed to succeed in the profession. If so, this is a key indicator for burnout which leads to a reduction in employees’ institutional commitment according to some of the occupational stress literature (Northwestern National Life Insurance Company, 1992; Siefert et al., 1991).
Finding 2

Occupational Stressors Higher than Normative Sample

Although the respondents to the URA survey reported the occupational stressors of RI (55), RB (58), and R (59) within the normal to average range (40–59), their scores were still higher than the normative sample mean of 50. Because RA, the highest reported stressor, is positively correlated with RB (0.131) and R (0.185), significant at the 0.01 level for our population, the researcher concludes that these results are consistent with a higher score for RB and R than the normative sample. The higher URA sample mean of RI (55) as compared to the normative sample (50) cannot be linked to the higher RA or RO scores which may be related to the fact that it is the lowest occurring stressor of the group.

Finding 3

Consistency of Report Regardless of Affiliation, Type, or Years

URAs are employed at a wide variety of institutions ranging from primarily undergraduate institutions (PUIs) to large-scale research universities and even teaching hospitals but the results indicate that they share a common experience of their profession no matter at which point they enter the grants process. This evidence is found in the consistency of scores and the absence of major shifts in the data as a result of characteristic factors. Despite Hansen and Moreland’s (2004) “structural response” to the increasing role of URAs, the affiliation of URAs’ office units did not change the consistency of their responses to the ORQ. Furthermore, individual characteristics such as type of university research administrator or years of experience influence those results as shown in Figures 160.11-6 - 160.11-8. Due to consistency in the level of occupational stress, these results signify that there would also be common coping mechanisms that would manage the potential negative effects of the various occupational stressors.

Conclusions and Recommendations

Two major conclusions emerge from the findings of this study.

1. URAs as a whole are under high levels of occupational stress, indicating a need for intervention. According to Osipow’s (1998) stress, strain and coping model as well as Fogarty et al.’s model which incorporates organizational variables (those an institution of higher education or teaching hospital may influence), intervention is necessary and the degree of strain should be the determinant of the degree of intervention.

2. Occupational stress has negative impacts on employers as well as employees (Reidar et al., 2005; Walter & Gordon, 1998); this study has shown that URAs share a common experience of their profession’s stressors as evidenced by the consistency of their results. Also, the nature of RA is such that there is evidence of potential misperceptions between employer and employees or employees and coworkers; therefore, both URAs themselves as the common denominators as well as their institutions need to be involved in the selection of interventions.
Overall, the high levels of RO and RA and the generally higher than normative group levels for other stressors indicate the importance of occupational stress as an important factor in university research administration. Research is integral to the nature of university and teaching hospital life; this study has shown that the employees who facilitate that process are experiencing maladaptive levels of stressors and/or psychological strain. Therefore, the negative impacts of occupational stress are already impacting those universities and teaching hospitals.

This study was conducted to both fill a gap in the literature on occupational stress for URAs as well as to provide insight into the nature of what is essentially a problem universal to all employees as it relates to this specific profession. Knowing the incidence and types of stressors that a particular group of employees experience allows for interventions to be considered to increase coping and to reduce psychological strain (Fogarty et al., 1999). The two recommendations that emerge as a result of this study include self-evaluation and peer review.

1. URAs know the challenges that they face as a profession with emerging demands and shifting perceptions of what they need to meet those demands. They need to recognize the common experience they share and engage in self-evaluation as well as profession-wide evaluation of those occupational stressors which are most prevalent: role ambiguity and role overload. Armed with this information, they will be better able to meet the demands of their occupations while accruing coping skills matched to the stressors they most experience.

2. Institutions of higher education and teaching hospitals are academically oriented and based upon traditional academic values. The research administrators within their employ operate in an environment that is a hybrid of both the academic and business or regulatory arenas. The URAs in their offices of sponsored research are essentially unique employees and the interventions that might work for traditional higher education administrators may or may not work to alleviate occupational stress as found in this study among URAs. Institutions should provide resources to allow for URAs to engage in peer review processes to alleviate continuing role ambiguity. This could occur informally, for example, within a consortium of their colleagues at other similar institutions, or formally availing themselves of peer review provided by recognized professional organizations within the profession. Being more open to learning from URAs about the occupation itself and the expectations an institution may have of its URA employees should be an ongoing dialogue in concert with changes in the needs of the institution itself and the regulatory environment within which its research process takes place.

In conclusion, by sharing responsibility for limiting occupational role stressors and their impacts, higher education and its research administration employees will be able to take steps to improve outcomes for both employer and employee.

**About the Author**

**Christine Katsapis** has a Ph.D. in Education from American University and currently serves as the Assistant Dean for Research at Gallaudet University. Gallaudet University is the world leader in liberal education for deaf and hard of hearing students. It has an international reputation for its outstanding programs and the research it conducts on the history, language, culture, and other topics related to deaf people. Dr. Katsapis has been at Gallaudet for 15 years, primarily with the Office of Sponsored Programs communicating primarily in American Sign Language (ASL). A member of NCURA since 1996, Dr. Katsapis was in the Leadership Development Institute Class of 2005 and has served on regional- and national-level committees. She just concluded serving on the national Professional Development Committee and recently joined Research Management Review’s editorial board. Dr. Katsapis’ research areas include university research administration, federal evaluation of educational institutions, and occupational role. She is a 2009 recipient of the American Association of University Administrators’ Donald A. Gatzke Dissertation Award.
¶190 Knowledge Check

AIS editors

The Q&As at ¶190.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 100 has been understood. Note: For the answer key for ¶190.1, see ¶190.3, which appears on a separate page (page 190:5) for testing purposes.

Discussion topics at ¶190.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶190.1 Q&As

1. It is often said that the office of sponsored programs sits between the researcher and the sponsor but/and owes allegiance to
   (a) The researcher only
   (b) The sponsor only
   (c) Both
   (d) Neither

2. According to ¶105, there was in particular a “rapid influx of funding from the federal government for research at colleges and universities”
   (a) As part of FDR’s New Deal
   (b) After the Soviet launch of Sputnik
   (c) As a result of countless WWII veterans attending higher education institutions under the GI Bill
   (d) As a result of the “cultural” revolution of the 1960s

3. What is meant by the term “unfunded mandate”?
   (a) The imposition of a requirement, often grounded in legislation, on an institution that is not able to recover the costs associated with complying with the requirement through its F&A rate.
   (b) The imposition of a requirement on an institution, such as for a single audit, that does not relate directly to receipt of federal funding.
   (c) The imposition of a requirement specifically prescribing reporting responsibilities under a federal grant.
   (d) The imposition of a requirement specifically prescribing subrecipient responsibilities.
4. According to ¶105, one characteristic that is perhaps unique about sponsored programs personnel is
(a) Their understanding of the complex world of sponsored research accounting
(b) Their level of education and receipt of advanced degrees
(c) The way that they cooperate with their peers at other institutions, even though the faculty at the institutions may be competing for the same award
(d) The way in which they structure models for their career advancement

5. So far during the first decade of the 21st century, research administration has been characterized by emphasis in which of the following two areas:
(a) Red tape and research compliance
(b) Specialization and increased funding
(c) Compliance and electronic research administration
(d) Peer review and Single Audit Sampling Project

6. Under the federal budget process, funding biomedical research is typically considered:
(a) Discretionary spending
(b) Entitlement spending
(c) A pork-belly project
(d) Only once every five years

7. What is meant by the “life cycle” of an award?
(a) All processes associated with applying for and establishing, upon acceptance, a grant award.
(b) All procedures involved in processing a grant throughout the course of one fiscal year.
(c) The compliance steps associated with filing reports, financial closeout, and audit for a federal award.
(d) All processes associated with a grant award, including those relating to pre-award, post-award, and closeout.

8. As federal regulations regarding sponsored research increased, so too did all of the following EXCEPT:
(a) Complexity of the regulations
(b) The number and types of federal audits required
(c) Importance of internal controls
(d) The level or scrutiny accorded compliance
Discussion Topics

1. It is important to distinguish, as Raymond Woodrow said in his book, between management of research and management for research. How does this difference manifest itself at your institution in terms of your role in your institution’s research enterprise?

2. What are your most pressing challenges as a research administrator today? Where do you go for assistance in managing these challenges?

3. The role of sponsored research offices have changed over the past 50 years. Do you think your role as part of the OSP will change in the future? If so, how are you or can you prepare to change with it?

4. The trend in federal funding of R&D at some agencies, particularly NIH, has slowed in the last couple of years. How has this affected your operations and how will you react if this trend should continue?

5. How does your institution define who can be a principal investigator (PI)?

6. How does your department effectively balance your commitment to “service” and “compliance”? Do you periodically assess and/or modify practices to create a better balance between these two important goals?

7. It is important to remember that the grant recipient is the institution, not the principal investigator. Why is this distinction important?

8. It is often said that the role of research administration is that of “stewardship” of federal funds. What does this mean and how does it play out at your institution?

9. Someone once wrote¹, “[R]esearch administrators are responsible for a wide range of activities: workshops, sponsor relations, financial management, strategic planning, executive administration of institutional operations, facilities management, ethics, intellectual property, technology transfer, continuing professional education for researchers and staff, research law, regulatory affairs and compliance, human resources, knowledge science and information technology, archives, and stewardship.” Is there any additional role you play as a research administrator that is not included in this list? Discuss how you carry out these functions at your institution.

§190.3 Answer Key

Following are the correct answers to the questions included at §190.1.

1. (c) Both

2. (b) After the Soviet launch of Sputnik

3. (a) The imposition of a requirement, often grounded in legislation, on an institution that is not able to recover the costs associated with complying with the requirement through its F&A rate

4. (c) The way that they cooperate with their peers at other institutions, even though the faculty at the institutions may be competing for the same award

5. (c) Compliance and electronic research administration

6. (a) Discretionary spending

7. (d) All processes associated with a grant award, including those relating to pre-award, post-award, and closeout

8. (b) The number and types of audits required

Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter describes models for organizing sponsored programs offices. There is no single model that fits all situations, but exploring various options may help in determining the best model for a specific institution.

Elizabeth Mora, formerly of Harvard University, provides a clear picture of the various ways in which sponsored research functions might be organized. She presents a very broad view of “sponsored research administration” that includes pre-award functions, post-award functions, responsibilities at the central administrative level, and responsibilities at the school, college, and departmental levels. Ranging from the “traditional” model to the “fully integrated” model, there are probably as many different ways of organizing the sponsored research function as there are colleges and universities engaged in the activity.

Mora discusses the advantages and disadvantages of each of the organizational models. She also presents a detailed review of the various kinds of skills that are required for the different types of individuals who are necessary for an effective sponsored programs operation: pre-award, post-award, cash management, and cost accounting. Mora’s chapter also includes a thorough discussion of the various levels of a university at which research administration functions are carried out: central administration, unit level (college or division), and local level (department). As she skillfully points out, there are many different ways of apportioning the responsibilities across the various levels. What is most important, however, is that the roles and responsibilities assigned to each level are clearly understood throughout the organization.

Even if your institution is not in the process of re-examining its organizational structure for research administration, or if you are not the individual who will make the decision about which model will be followed, this chapter provides an excellent opportunity to think critically about the structure in place at your institution within the larger context that Mora describes.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶305, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶320), practical tools (at ¶330), case studies (¶340), and statistics and survey results (at ¶360). A “knowledge check” containing Q&As and discussion topics is included at ¶390.
As sponsored funding at universities really began after World War II, the office of sponsored programs (OSP) enterprise at colleges and universities is a fairly young one. It is probably fair to speculate that no one anticipated the life-changing discoveries in science and the rapid growth that would evolve from the government/university partnership in the research enterprise — at all levels. Many institutions' sponsored programs offices have undergone changes through the years to keep up with the changes in sponsored research.

Certain typical organizational models have emerged over time for the OSP and are outlined in this chapter. In examining four organizational models, the chapter looks at the interdependencies among the activities of a central OSP and its “unit” and “local” counterparts. Although this chapter is written from the perspective of a central OSP, the organizational models, roles and responsibilities of staff, and working relationships among OSP and local department personnel as discussed in this chapter likely will have relevancy to an institution regardless of whether its research enterprise is completely centralized, completely decentralized, or somewhere in between.

The chapter discusses typical organizational reporting relationships of the central OSP to university senior management and potential benefits and drawbacks of each. The chapter describes the core functions of the central office of sponsored programs within a university. It discusses in detail the roles and responsibilities of pre-award, post-award, cash management, and cost analysis/financial compliance, and highlights the various skills needed to staff these functions and how the workflow might be organized within each area. Lastly the chapter explores some ongoing risks and opportunities facing university sponsored research and the OSP enterprise.

What Is an Office of Sponsored Programs?

Typically an OSP — also known as the office for research administration, the office for grants and contracts, or some variation thereof — is in place to support the research mission of the institution. The OSP plays a key role in monitoring the many compliance and risk areas that are such a large part of the conduct of sponsored research in the world today. The OSP operation is one of stewardship, management, and oversight of the administrative aspects of the research enterprise at the institution. The OSP approves the official sponsored award documents (proposals, awards, reports, amendments, etc.) on behalf of the governing body of the institution through the process known as delegated signing or signature authority.

OSP Functional Areas

The OSP is typically divided into two core functional areas: pre-award and post-award. Closely related to, but not necessarily an organizational part of either pre-award or...
post-award, are the important tasks of cash management and cost analysis/financial compliance (also referred to as indirect cost accounting or cost accounting). Oversight of these two latter functions is often included within the OSP. If not part of the OSP, responsibility for sponsored cash management and cost analysis is often housed in the controller’s office.

The pre-award function encompasses the following types of activities:

◆ Assisting faculty in locating funding sources and submitting proposals for support of research and other faculty-driven activities
◆ Accepting awards and ensuring they are administered consistent with sponsor and institutional policies
◆ Mediating the award process with the sponsor to ensure university research policies, such as those relating to publication rights and other intellectual property rights, are adhered to, and that other financial and programmatic terms and conditions are acceptable to the institution

Pre-award compliance activities often include reviewing the proposal for compliance with institutional and external regulations; reviewing the proposal budget for reasonableness, arithmetic accuracy, and completeness; transmitting the completed proposal to the sponsor after providing institutional sign off; negotiating the award with the sponsor; and at many institutions setting up the data record and financial account in the grants management or other university system, which serves as the system of record for sponsored accounts. (For a full discussion of pre-award services, see Chapter 2500. See in particular ¶2505.2.)

It is worth noting that the activities of the pre-award office set the stage for many aspects of how the award will be managed throughout its life or “life cycle.” In establishing the initial terms of the grant (i.e., financial payment terms, equipment title, frequency of reporting to the sponsor, and publication terms), the pre-award function within the OSP is responsible for the award’s destiny, because in many respects, this destiny is determined upon negotiation and acceptance. Staff responsible for the award after its acceptance — post-award and to some extent cost analysis — have to live with and manage what was originally negotiated and accepted during pre-award.

The post-award function is responsible for the following types of activities:

◆ Monitoring expenses posted to the account for allowability, allocability, reasonableness, and adherence to university policy
◆ Reporting to the sponsor on project expenses posted against budget
◆ Invoicing the sponsor for expenses posted to the general ledger or relating to other contractual payment terms
◆ Collecting income (in the form of checks and wire transfers) and posting that income to the account
◆ Monitoring spending against budget, noting certain trends such as overspending or underspending
◆ Completing the final financial report to the sponsor
◆ Closing out the award by ensuring all requirements have been satisfied, including collection of interim and final progress reports, invention reporting, equipment reporting, and salary certifications

◆ Creating and distributing to internal users management reports containing key indicators such as sponsored dollars in accounts receivable, number of unreconciled accounts, and overexpended accounts

(For a full discussion of post-award services, see Chapter 3300.)

Both the cash management and cost accounting/cost analysis functions have a great deal of interaction with and are dependent upon the pre-award and post-award functions and, again, for this reason often are contained within the office of sponsored programs.

The sponsored cash management function is responsible for the draw down of funds on federal awards accomplished through a letter-of-credit mechanism. Due to the large volume, most federal agencies use their own letter-of-credit system, rather than a manual invoicing and check reimbursement system, for collecting income available to each award. These systems are individual federal systems available to one or two persons authorized to draw down funds into a university account based on expenses incurred on an award from a particular federal agency. The cash manager must ensure that excess funds are not drawn; only expenses incurred or funds for immediate need are allowed to be drawn down.

The person overseeing the cost accounting (cost analysis) function is responsible for developing and negotiating the institution’s facilities and administrative rate (also known as an F&A or indirect cost rate) on a periodic basis. This rate is then applied to the direct costs of sponsored research, as allowed by the Office of Management and Budget (OMB) in Circular A-21, Cost Principles for Educational Institutions. (For an in-depth discussion of facilities and administrative rates, see Chapter 1700.)

Audits and Training. Cost accounting staff also oversees the required federal audit known as the OMB Circular A-133 audit, specific agency reviews and audits, salary certification process, and forms collection. Cost accounting staff also can be responsible for training internal constituents at all levels on financial compliance. Training includes educating the pre-award and post-award groups as well as department and college staff on financial compliance topics. Such topics include salary certification, F&A rate dynamics and calculation, cost sharing, equipment management, and audits in general and specifically the A-133 audit. A cost analyst may provide the training in tandem with other related parties such as the department equipment officers or staff at the college level responsible for collecting salary certifications.

OSP and Other Institutional Offices
Described above are the typical functions of a central university OSP. To protect the institution from any inherent or perceived conflicts and to ensure objectivity and consistency, it often is someone in the central office who is the institutional official for purposes of signing executed award documents. To be effective research administrators, central OSP staff must work very closely with sponsored research colleagues at the
college and department levels within an institution.

**Unit (College or Division) Level.** There is often a cadre of people at the “unit” level who work with the central OSP to oversee the management of sponsored administration. A “unit” in this context refers to a school, college, or division. Individuals at this level assist the central OSP with various issues related to the management of sponsored research within that unit. Examples of duties unit personnel might perform include

- obtaining approvals from the various school-level committees to conduct the project,
- helping to get the attention of department-level staff on a compliance issue, and
- monitoring overexpended accounts at the school level.

These unit-level individuals frequently play a role in signing off on the proposal before it is sent to the central OSP for final review, approval, and submittal.

One example of when college or divisional approval should be sought by the sponsored programs office is when college or division resources such as cost sharing are being committed in the proposal. Cost sharing is an explicit financial commitment that the principal investigator’s (PI) college may be responsible for if his or her department does not have the resources. Another example of when provisions in the proposal typically would require college-level approval is for the PI’s level of effort committed, as it is the college that would know what the individual’s other commitments are (e.g., teaching, committee work, and service). By obtaining college-level approval in such a situation, those in the central office obtain assurance that the college dean supports the submission of the proposal. Depending on how the particular college or division is organized, assistant or associate deans responsible for research administration oversight may also play a role in hiring staff at the department level who actually will manage the operational aspects of the award.

**Local (or Department) Level.** The research project administration staff at the department or “local” level generally have overall responsibility for the day-to-day management of the award and therefore

- work with the PI in preparing certain parts of the proposal, such as the budget and other financial support pages;
- work with the PI and others to ensure that approval is obtained for the use of animals, human subjects, and biohazardous substances, and secure other explicit approvals as needed from the various institutional standing committees in place to support research (such as the Institutional Review Board, Institutional Animal Care and Use Committee, Institutional Biosafety Committee, and Embryonic Stem Cell Research Oversight Committee);
- work with the central office to determine how best to establish the award account once the award is made (Often there is some latitude in how the account can be set up.);
- post transactions to the award;
- determine how charges should be allocated between or among multidepartment or interdisciplinary sponsored projects;
◆ assist the central office with reporting;
◆ initiate cost transfers to move charges from one project to another; and
◆ work with the principal investigator on signing the salary certifications.

One example of how department staff and central OSP staff work together is the “chart-of-account” rules at Harvard University. At the university there are a set of chart-of-account business rules that govern sponsored account setup. These business rules set forth the minimal requirements that must be adhered to in setting up the particular sponsored account. If, however, the department wishes to manage the account in more detail, the chart of accounts can accommodate the request through a process involving a series of conversations between the OSP representative and the local department staff.

The interdependency between and among the central, college, and department staff responsible for award administration can sometimes lead to lack of precise clarity about roles and responsibilities. Two examples of where lack of clarity around roles and responsibilities may exist are the following:

(1) **Who is responsible for signing the proposal?**

The institutional official is technically responsible, but it is not unheard of to see PIs submit proposals to sponsors without any other approval or institutional signature.

(2) **Who is responsible for developing the budget?**

The department research administrator should work in concert with the PI on budget development. If the budget is not developed and vetted appropriately, the PI may end up with too few funds to support his or her work (which means the college may need to provide financial support to the project), or with more money than can possibly be used given the available infrastructure (which means that money may need to be returned to the sponsor, which could be embarrassing for the institution if it is a material amount).

This lack of clarity can range from frustrating to devastating, given the amount of institutional risk incurred with the acceptance of sponsored awards. (See further discussion below concerning risk.) Therefore it is highly advisable that the roles and responsibilities of each person in the process at all levels be clarified to the extent practicable. (An example of how one institution defines roles and responsibilities for its sponsored research enterprise is included as Figure 1. Figure 2 outlines some interrelationships among key players involved in sponsored research, certain respective compliance responsibilities, and institutional units or outside organizations providing oversight or training assistance.)
### Figure 1: Sponsored Research Roles and Responsibilities

<table>
<thead>
<tr>
<th>Principal Investigator (PI)</th>
<th>PI Administrator</th>
<th>Department Chair/ Lab Director</th>
<th>Department (Research Center) Finance Office</th>
<th>School Finance Office</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assume overall responsibility for fulfillment of sponsor's terms and conditions, funding purpose, and budget.</td>
<td>Provide correct codings for all transactions, including cost sharing.</td>
<td>Hire department financial administrators who will manage sponsored funds responsibly.</td>
<td>Upload sponsored budgets to general ledger.</td>
<td>With OSP establish post-award policies and procedures in compliance with federal regulations.</td>
</tr>
<tr>
<td>Ensure that charges are reasonable and appropriate.</td>
<td>Ensure correct allocations and charges shared among multiple grants.</td>
<td>Ensure that staff receive adequate training on post-award roles and responsibilities.</td>
<td>Print, distribute, collect, file, and report on monthly salary certifications for non-faculty researchers.</td>
<td>Deliver training to local research staff on policies and procedures.</td>
</tr>
<tr>
<td>Adopt appropriate allocation method(s) for shared charges in research group.</td>
<td>Check transactions posted to the general ledger to ensure allowability of direct costs by reviewing reports and Detailed Listings monthly.</td>
<td>Design and Implement cost allocation schemes for those costs benefiting multiple projects, if appropriate.</td>
<td>Ensure PI administrators have access to reports and Detailed Listings every month.</td>
<td>Serve as a resource in support of departments' roles in:</td>

*continued*
The genesis of each institution’s office of sponsored programs likely has a unique story based on the strengths and weaknesses of personalities in place at the start, where the locus of power lay within the institution, and possibly even where capacity existed at the time. The OSP very likely grew out of either the academic arm or the financial arm of the institution — or perhaps certain parts of it grew out of the academic side and other parts out of the financial structure.

Recognizing that there are unique circumstances at many institutions, this section provides an overview of four general paradigms in sponsored program administration and discusses four organizational models that generally depict how many OSPs are organized. (See Figures 3-6, pages 305:9-10.)

It should be noted that the discussion in this chapter focuses on the OSP as the core research administration operations entity within the university. This chapter discusses certain financial compliance responsibilities typically found within the OSP. Responsibility for overseeing other, nonfinancial compliance areas such as human subjects, animals, biohazardous materials, and human embryonic stem cells, generally fall to other departments within the university.

Traditionally in many offices of sponsored research the pre-award function within the office reports to the academic side of the institution and the post-award function reports to the financial/administrative side of the institution. In many institutions, these units act as separate entities. Conventional thought for this traditional paradigm was that the pre-award functions worked closely with faculty members on academic research policy issues and sponsored proposal development, but the post-award functions, on the other hand, given the core accounting competencies needed to perform these functions, could easily fit within the controller’s or finance office. (This model is particularly true in those institutions where the sponsored research enterprise is relatively small and began as an outgrowth of the controller’s function.)
Along these lines, the cash management and cost accounting responsibilities could nicely fit within the controller’s or finance office, as does the responsibility for overseeing the financial and other data needed to complete the F&A cost proposal and to draw down the cash. Figure 3 — “University A” — illustrates the traditional model for organizing a sponsored research office.

What some term the next “iteration” or transition in the sponsored programs organizational model is the hybrid approach, where separate pre-award and post-award offices are housed within a particular vice president or provost area. Under this model the directors or managers of each department, pre-award and post-award, as well as the cost analysis manager and the controller, report to the same individual at the vice president or provost level. Figure 4 — “University B” — illustrates the hybrid or transitional model for organizing a sponsored research office.

An integrated organizational model has the pre-award and post-award staff working together for a common director or manager. While there are separate teams responsible for pre-award and post-award activities, because each team reports to one director, this is considered an integrated model. In this setup, the cost analysis unit reports to the same associate vice president as does the OSP director. Figure 5 — “University C” — illustrates the integrated model for organizing a sponsored research office.

A fully integrated organizational model is one where individuals work on a “life-cycle” team under a team manager. The team looks at an award as a cycle of related processes — such as start up, cash management, and close out — rather than as a series of isolated events. In this model there are specialists within the team who have expertise in pre-award and those with expertise in post-award.

By virtue of being housed in the same unit and managed by one individual, however, it is natural and efficient for the pre-award and post-award specialists to work together to manage the award through its life cycle. As issues arise during the inception of the award that might impact management of the award throughout its lifetime, pre-

award staff can easily consult with the appropriate post-award person, who is physically and organizationally nearby. Under this model, there is an associate director for cost analysis who reports to the same associate vice president as does the director of the life-cycle teams. Figure 6 — “University D” — illustrates the fully integrated model for organizing a sponsored research office.

As with most staffing models, the “success” of any one of the OSP organizational structures is dependent on the caliber and competencies of the individuals within an institution. “Success” in this context is defined as a highly functional office where deliverables are accurate and satisfied in a timely manner, where communication is fluid and open, and where the customer, defined broadly to include everyone from the principal investigator to the sponsor, feels satisfied and well served. Certainly for Universities A and B, OSP staff with “soft” skills enabling the individuals to work effectively across institutional units or departments are as important as staff possessing the necessary technical skills. (See Figures 3 and 4, pages 305:9-10.)

1305.3 **Staff Coordination**

Returning to the organization models presented above, look at the first model, University A, where the pre-award and post-award functions are completely separate. (See Figure 3, page 305:9.) Each group reports to a different line of management, who ultimately reports to the president. This is the most traditional model and one that is quite common in sponsored research administration. Certainly if these offices have strong leadership that works well together, one can expect there to be strong coordination among the various parties in the pre-award, post-award, and cost analysis phases of grants administration. This would be the best-case scenario.

The worst case would occur when the leadership of the areas does not coordinate effectively and, for example, when the offices use different terminology and have different goals for the “customer” (usually the principal investigator). This would result in the customer receiving confusing information and often ineffective or little support and coordination throughout the proposal, award, and termination stages (the “life cycle”) of his or her award.

In the second model, University B, while pre-award and post-award are separated under the leadership of different senior officers, those senior officers report to the same individual, often the senior vice president for administration and finance. (See Figure 4, page 305:10.) Because of this common direct reporting line, the senior vice president can require that awards personnel have a common interface with the client and share systems, goals, etc. This is also a fairly traditional model for many sponsored programs offices and is used widely. Although the pre-award and post-award functions are separate in this organizational setup, from the perspective of the customer, this is a workable model.

In the third model, University C, there likely is frequent coordination between pre-award and post-award, as those areas report to the same person. (See Figure 5, page 305:10.) The associate vice president (AVP), in this case, also has the cost analysis function as a direct reporting line. If things were to go awry in the pre-award and post-award interface at University C, the AVP would have one person to talk to — the
director of sponsored programs. The director is responsible for the coordination of these functions and can impose common goals, streamlined systems, joint client meetings, etc.

The fourth model, University D, presents an even more evolved model; that is, a model where team managers oversee pre-award and post-award specialists on the same team, in support of a common customer. (See Figure 6, page 305:10.) In this model pre-award and post-award specialists work in the same physical location, use the same system, report to the same person, have the same client portfolios, often supervise a common set of generalists (lower-level staff new to research administration), and feel jointly responsible for the same set of deliverables. In this model pre-award and post-award team members meet together with the client, the principal investigator, and his or her local research administrators to resolve issues.

Another model, not shown, would be similar to that of University D but instead of pre-award and post-award specialists, the team would be composed of staff members who each individually had the skills to manage the pre-award and post-award functions of a portfolio. This model likely would work for only very small colleges where resources and demand would not support resource specialization.

Regardless of the model in place at an institution, one theme repeatedly voiced by sponsored research professionals is the importance of pre-award and post-award staff sharing physical space. In situations where pre-award and post-award staff are physically separated, experience shows that work is not going to flow as smoothly and communication problems are bound to arise. Co-location is something worth insisting on, as it can help ensure effective communications and ward off problems later in the award process.

During an audit it is a fairly routine procedure for audit staff to interview all those who have a role in an award’s life cycle. When responses are given that demonstrate a lack of coordination of and agreement on basic terminology, grants management systems used, report data, basic procedures, etc., one can only imagine the list of potential findings and reportable conditions that could arise in the audit report. (It should also be noted that it is not uncommon to find ill will between uncoordinated, physically remote, organizationally distant groups. Obviously, internal customers and external constituents are not well served by such feelings.)

Reminder

Institutions risk having their customer service suffer where pre-award and post-award are separated, either organizationally and/or physically, where pre-award and post-award are located remotely from the main campus (and/or at different remote locations), where staff report to separate managers through separate leadership lines, and where different systems for conducting pre-award and post-award business are in use. Further, in cases where pre-award and post-award offices generate different reports for monitoring proposals, awards, and accounts, problems could easily arise for an institution during audits.
Skills Needed for Specific Sponsored Programs Staff

What are the types of skill sets needed to perform each of the main functions in an office of sponsored programs? There is much overlap and some specificity/specialization in core competencies needed to be successful in each of the four functional sponsored research areas described above (pre-award, post-award, cash management, and cost accounting). Skills and knowledge needed for each of these jobs are discussed below and sample job requirements listings for staff in these four areas are included as Figures 7-10. (Note that these figures contain sample job requirements postings; position descriptions for these jobs will vary from institution to institution, in part reflecting the institution’s funding portfolio and organizational needs.)

In reviewing the skills and background required for these jobs, key general staff “competencies” emerge including:

◆ knowledge of sponsor (usually federal) policies and regulations,
◆ financial or accounting skills,
◆ understanding of the institution’s financial and grants management systems,
◆ communication skills, and
◆ attention to detail.

In reviewing the requirements postings, one can see how interdependent award staff members are and appreciate the critical need for staff coordination to manage effectively the award through its life cycle.

Pre-Award and Post-Award Professionals

Within the functional areas of pre-award and post-award, there are various levels of positions — junior, mid, and senior. These levels exist to support the varied responsibilities that accompany proposal review, acceptance, reporting, accounting, and cash management. This type of stratification within the OSP also is necessary to differentiate levels of tasks and the skills needed to accomplish those tasks to create opportunity for personnel advancement and growth.

There are many ways to categorize tasks for different staff levels. One way is by “level of difficulty.” For example, senior-level pre-award staff may have, in addition to their regular, assigned portfolio of departments to assist, responsibility for the most difficult proposal negotiations, which are usually with industry sponsors. Senior people may have within their portfolios the most difficult departments with which to work. A department can be difficult to deal with for many reasons including that there are notoriously independent PIs located in the department, the department has complex sponsored agreements involving multiple subcontracts, or the department has new administrators who need more-than-average assistance to get reports completed.

Mid-level pre-award or post-award administrators may be assigned the more-difficult-than-average award portfolios and given the additional responsibilities, for example, of working with the general counsel on training for human subjects and export controls. Junior-level staff, the least experienced pre-award and post-award specialists, might work with those departments with low sponsor volumes, which is
generally true, for example, of humanities departments as opposed to life or physical sciences departments.

*Pre-Award.* A candidate for a pre-award specialist with “experience” might include someone who held similar positions in other universities, nonprofit institutions, or hospitals; has foundation grant-writing experience; or was a program officer for a federal sponsor. Many sponsored research administrators find that attorneys have transferable skills that make them good candidates for the position of pre-award specialist.

It is suggested that the level of formal education sought should be “bachelor’s degree required; advanced degree preferred.” The type of degree an individual has can vary but it will likely be liberal arts in nature, as there are limited formal education programs for research administration. (Although this is likely to change. It is easy to envision there one day being a common degree-granting program in the sponsored research field, given the complexities, knowledge required, and expanding purview of the sponsored research professional.)

An advanced degree in the humanities, social sciences, law, or business would likely give an individual the transferable technical tools to perform proficiently in pre-award positions. Of course recruiting from a research department within the university is an excellent idea for many reasons, including that the individual would have an appreciation for the department perspective and have existing relationships within the department.

The years of experience required for a pre-award specialist will vary according to the level being recruited, but a working guideline is

- five-to-ten years experience in the research administration field for a senior-level person,
- five-to-seven years for a mid-level person, and
- one-to-three years for a junior-level pre-award specialist.

A sample job requirements posting for a *pre-award specialist* is included as Figure 7.

*Post-Award.* In the post-award area, good candidates for entry-level research administrators would be recruited from accounting firms and from general accounting and internal audit departments within universities, hospitals, and nonprofits. Experience suggests that individuals with backgrounds in the insurance and banking professions have skills easily transferable to the post-award specialist role. As with pre-award personnel, recruiting from within the institution can often be a good idea as these candidates likely possess the requisite knowledge of “how it is done in the department” and the relationships to “get it done” in the central office.

The years of experience will vary according to the level being recruited, but, as is true for a pre-ward specialist, a working standard is five-to-ten years experience in the research administration field for a senior-level post-award person, five-to-seven years for a mid-level person, and one-to-three years for a junior-level specialist.
A job requirements posting for a post-award specialist would have some similarities to, but also some differences from, that of the pre-award posting. A sample posting for a post-award specialist is included as Figure 8.

**Figure 7: Sample Job Requirements Posting for a Pre-Award Specialist**

Applicant should
◆ have broad knowledge of pertinent federal regulatory documents including OMB Circulars A-21 and A-110; the Federal Acquisition Regulations; and the Cost Accounting Standards;
◆ have proven abilities to analyze complex problems and communicate (orally and in writing) effectively with multiple internal and external constituents including faculty members, their staff members, sponsors, auditors, and internal and external counsel;
◆ be knowledgeable about and conversant in grants management and contracts terminology and familiar with common references to grants management systems;
◆ be knowledgeable about federal sponsored research compliance requirements concerning human subjects, animals, export controls, USA Patriot Act regulations, etc.; and
◆ possess skills that demonstrate strong attention to detail and an ability to manage multiple tasks.

**Figure 8: Sample Job Requirements Posting for a Post-Award Specialist**

Applicant should
◆ have broad knowledge of pertinent regulatory documents including OMB Circulars A-21, A-110, and A-133, the Federal Acquisition Regulations, and the Cost Accounting Standards;
◆ possess demonstrated financial accounting skills and be able to reconcile accounts, produce financial reports in sponsor preferred format, and run internal grants management reports from institution’s accounting and data warehouse systems;
◆ be familiar with budgeting as required by federal and federal agency-specific guidelines;
◆ have knowledge of financial compliance subject areas such as: time and effort, payroll certification, equipment reporting, cost transfer regulations, cost allocation schemes, and federal regulations governing the use of human embryonic stem cell lines;
◆ have proven abilities to communicate (orally and in writing) effectively with multiple internal and external constituents including faculty members, their staff members, sponsors, auditors, and internal and external counsel;
◆ be knowledgeable about and conversant in grants management and contracts terminology and familiar with common references to grants management systems; and
◆ be able to demonstrate strong attention to detail and an ability to manage multiple tasks.
Accounting Professionals

While research administration professionals in general can be quite difficult to find in the marketplace, the subcategory of research administration professionals who are cash management and cost accounting/cost analyst professionals are even more difficult to find.

Cash Management. The manager of cash — or cash manager — is a position for which one needs very strong accounting and analytical skills, as well as excellent communication skills. For the position, a candidate who is a certified public accountant (CPA) or has extremely strong demonstrated financial accounting skills is critical. The one advantage in recruiting for this position is that strong grants management skills are less important than strong accounting skills. Of course finding both in a candidate would be ideal.

The cash team is usually much smaller than the pre-award and post-award sponsored portfolio teams and may be structured with one manager (with five-to-seven years experience and is a CPA) and one or two cash specialists (with one-to-three years of experience who have accounting backgrounds but are not necessarily CPAs). These less-experienced individuals might be responsible for management of lower-volume letters of credit (from the National Endowment for the Humanities, for example), with oversight from the manager of the cash group. The cash specialists are also responsible for depositing and posting checks and posting wire transferred funds to the correct account.

A sample job requirements posting for the cash management specialist is included as Figure 9.

---

Figure 9: Sample Job Requirements Posting for a Cash Management Specialist

Applicant should

- be able to manage the institution’s cash flow from federal sources by accessing the federal letters of credit in a timely and accurate way;
- have a thorough knowledge of and the ability to implement best practices for cash collection and management in order to assist pre- and post-award staff with non-letter-of-credit cash collection (checks, wire transfers, etc.);
- possess a knowledge of the institution’s accounting system and chart of accounts;
- have the ability to build strong relationships with personnel who oversee cash appropriation to grants and contracts;
- be able to forge strong relationships with other related offices — such as payroll, central institution’s internal bank, accounts payable, and travel;
- have a proven ability to perform detailed, complex account reconciliations;
- have proven skills in cash management and accounts receivable management; and
- be able to work with constituents to predict ebbs and flows of cash needs.
Cost Accounting. As mentioned previously the cost accounting competency is an “acquired” skill, meaning that it is not quickly grasped in most cases by those who have not worked previously in the specialty area. Further there is no degree-granting program where one can acquire the skills through coursework. Many of the people in this field are “homegrown.” That is, they have been in this specialized area for a long time and began as junior cost analysts.

On the other hand, there might be certain jobs where cost accounting candidates could acquire skills that would be transferable to research administration. One can imagine, for example, that preparation of the Medicare cost report, required annually from hospitals for Medicare cost reimbursement, is one concrete task that could help an individual develop the requisite skills for a position in cost accounting in an OSP. Degrees in accounting, coupled with a CPA certification, are educational qualifications that one often sees people in this field having, and the technical skills mastered in acquiring these credentials can be important skills to have in the position.

The cost analysis team is typically a smaller team than the pre-award and post-award life-cycle teams. Normally the director of the team will need 10 or more years experience given the responsibilities inherent in this function. There may be one or two supporting analysts on the team, each of whom would have three-to-five years experience in cost accounting or cost analysis.

A sample job requirements posting for a cost accountant/cost analyst is included as Figure 10.

**Figure 10: Sample Job Requirements Posting for a Cost Accountant/Cost Analyst**

Applicant should

◆ have an in-depth knowledge of the federal OMB circulars, the Cost Accounting Standards, and the requirements of the federal disclosure statement (DS-2);

◆ be familiar with cost accounting financial models and systems;

◆ have the ability to negotiate with federal cost accounting representatives from the U.S. Department of Health and Human Services, the Office of Naval Research, or both;

◆ have in-depth knowledge of financial compliance regulations and the impact of those regulations on the business of research;

◆ have a demonstrated ability to work effectively with faculty and administrators at all levels on compliance issues;

◆ have the ability to assist in developing and delivering financial compliance training across the institution; and

◆ be capable of facilitating the annual A-133 audit by organizing appropriate response teams in a timely, effective manner.
Organizing Work Flow

How is work generally organized within the organizational models discussed above? In some of the more traditional organizational models for offices of sponsored programs, the work is organized around the sponsor; for example, a pre-award specialist and a post-award specialist will work only with National Institutes of Health (NIH) awards or only with foundation awards. While this model allows for a high degree of specialization, it is not always the best approach for the customer, as he or she must work with multiple individuals if there is an array of sponsors within his or her portfolio.

In other cases the pre-award person working on NIH awards may also have responsibilities for a piece of a National Science Foundation (NSF) award, while the post-award person working with NIH awards also may have responsibilities for a piece of a Department of Defense award. In such a scenario, because there is not a clean matching of pre-award and post-award personnel and sponsors, several individuals could be working with the same investigator on his or her portfolio.

From a staff retention vantage point, the research administrator should consider that the variety afforded staff in working with an assortment of sponsors likely would be more interesting and engaging than when their work is focused on only one sponsor. Of course changing portfolio assignments on a regular basis is one solution to assuring variety; another approach would be periodically cross training staff on a mix of sponsors.

Using a Scoring System

One question that is frequently asked in organizing an office of sponsored programs is: “How can one assure balance and equality in a staffer’s portfolio mix?” This is a very difficult question to answer. One possible answer is a scoring system, developed jointly by management and staff. The attributes to be scored could include:

◆ complexity of award (Does the award involve export controls or human embryonic stem cell work, for example?);

◆ whether the award is a training grant (It is well understood that the reporting requirements for training grants are more comprehensive than for the average federal award.);

◆ the degree of difficulty in dealing with the sponsor (For example, the National Aeronautics and Space Administration is known for having difficult award terms, high turnover, and a high degree of decentralization, so there are often multiple points of external contact on the same award.);

◆ the level of expertise at the local level (The less experienced the staff locally is, the harder it may be to move the proposal and award along.);

◆ the level of expertise of the staff managing the portfolio (Is the person new, and therefore will he or she need more hands-on help, or a senior person who has been managing grants for years?);

◆ whether the portfolio contains industry sponsored awards (These can be quite complex and involve protracted negotiations.); and
overall volume within the portfolio. (A medical school might account for a larger overall share of total award and dollar volume of the university’s research portfolio than another college or department; therefore the medical school team would receive a higher score on the volume attribute.)

The important point here is that some process to score the portfolio, jointly developed by management and staff, is a starting point in developing a system of indicators to allocate resources. (See Figure 11.) (For example, Harvard University performs a portfolio scoring exercise annually and usually ends up moving a staff resource or two around the teams to offset changes in overall score based on ever-changing events within the portfolios.)

The bottom line to remember is that achieving a “balanced” load to everyone’s satisfaction is nearly impossible and is more an art than a science. The challenge is to engage everyone in the process of trying to determine how to balance the portfolio properly, while acknowledging that management will make the hard calls when there is staff disagreement over, for example, whether training grants should be more heavily weighted than foundation awards with unusual terms.

**Staff Size**

Another frequently asked question is exactly how many staff members are needed to support the research enterprise? The general rule of thumb is the number of staff needed depends on the size of the research enterprise. As we drill down into the details, the answer becomes complicated and situational and often is mired in internal politics surrounding resource allocation. If the research administration team is established and has wide experience, perhaps there are economies of scale to be realized; that is, a higher level of productivity can be expected because the group is experienced, knows their points of contact well, and has handled a variety of proposals with a variety of sponsors.
In determining staff levels, it may also be helpful to look at recent growth in sponsored activity. If the institution’s portfolio has grown by 25 percent, for example, over the past five years and no staff have been added, it may be useful to examine the account setup backlog, staff turnover, hours staff are working, vacation backlog, subaward turnaround time, and other pertinent data. The data could be useful in making the business case for additional staff or in re-organizing workflow. It could also be useful to compare the institution’s staffing levels with that of other organizations that have similar research volume, although depending on the similarity in organizational structure, such comparisons may or may not be appropriate.

**Major Risk Areas**

What are the major risk and opportunity areas on which sponsored programs officials should focus their efforts? Certainly not all functions of research administration carry the same risk. Research administrators tend to stratify risks into three categories:

1. **Transactional risk**: Is this cost allowable to this award? Is it allocable to this award? At this relatively low risk level, the administrator looks at an actual charge posted to the award and assesses its pertinence to the sponsored project and related tasks.

2. **Specific-sponsor risk**: At this risk level, the sponsored programs administrator is concerned with compliance with specific agency-imposed conditions. It is important for the institution to be aware of the impact of noncompliance on an individual award and the entire portfolio of awards from an agency to the institution.

3. **Institutional risk**: Does the institution have systemic issues of noncompliance? Do investigators understand that they are ultimately responsible for every aspect of this award: financial, compliance, fulfillment of deliverables, etc.? At this highest level of risk, a research administrator is concerned with ensuring basic compliance with internal controls and that everyone involved shares the same understanding with regard to responsibilities, and what the risks are if the necessary controls do not exist or are weak or are not properly implemented by staff.

One challenge for the central sponsored research office is how to organize staff at all levels to distribute effectively responsibilities for monitoring risks associated with overseeing proposals and awards. How can the sponsored research administrator be assured that the team is paying attention to all kinds of risks and not focusing too much on any one type? Assessing the various types and levels of risk for an OSP is an ongoing exercise that should be done frequently by OSP staff and a team of people who represent various areas within the institution including, but not limited to, office of general counsel, office of risk management, and college deans. The team may not necessarily ensure that the right risks are being focused on, but with such a team and a process in place, the institution could better mount a defense if questioned by an external audience as to why more attention was not paid to a certain risk area.

Keeping up with the OSP day-to-day operations can be overwhelming, leaving little time for the research administrator to step back and evaluate risk throughout the entire research portfolio and institution’s research enterprise. Perhaps this is the job of the OSP director or his or her supervisor together with other key business partners.
such as internal audit, controller, and heads of schools’ central offices. Certainly the institution’s audit committee should be involved in asking questions about risk and engaging the right parties to assess and report back on various types of risks and measures being used to control them. Once risks are identified the OSP director can work with his or her management team on developing the proper training, if necessary, and other methods of addressing the problems with the pre-award and post-award specialists, faculty, and staff at the college and department levels as appropriate.

305.7 Future Demand for Talent

What will the future demand in terms of new skill sets for personnel in sponsored programs offices? There are two notable staffing trends in research administration: one is the need for funding development specialists and the second is in the area of grants administration information technology.

Funding Development Specialists

Generally faculty members tend to work independently or only with close departmental peers on funding ideas and proposal development. Certain areas within the institution, such as the life sciences bioanthropology specialty, have trouble locating their funding niche. (And, in the case of this specialty, currently there are not many sponsors funding this work.) Sometimes social scientists who are able to attract foundation sponsors wonder what federal opportunities might exist if they could only partner ideas in some way with their colleagues in the life sciences.

To address these problems and broaden faculty interdisciplinary collaborations in general and support specialty research areas, many offices of sponsored research have created a new staff position — that of a funding opportunity specialist. This person is located in the central OSP but works locally with unrelated departments to scour federal funding opportunity databases to see how certain investigators might partner with others to advance their ideas at the federal level. The funding development specialist would be responsible for working with investigators from seemingly disparate disciplines on their ideas and helping them develop their proposals. The campus, being fairly stovepiped in design, often does not allow for easy collaboration among unrelated parties without such an external driver. The funding opportunity specialist acts as the catalyst for research cooperation and collaboration. (See Figure 12, page 305:22, for discussion of a pilot project involving a funding development specialist.)

Electronic Information Specialists

There are separate chapters of this book devoted to electronic grants administration and information systems, so these topics will not be covered here. (See Chapters 900 and 700, respectively.) Suffice it to say, therefore, that given the sponsored research community’s ever-greater dependence on the Internet and electronic communication, it may make sense in terms of organizational structure to have those individuals who are working on grants.gov and other grants management information technology projects — from the implementation of MIT’s COEUS® System or Peoplesoft for grants or
whatever enterprise resource planning (ERP) software solution or stand-alone system is chosen — reside within the sponsored research office if they don’t do so already.

Many sponsored programs administrators have struggled with the right model to integrate systems analysts and programmers with business/end users over the last few years as they have implemented ERP and other electronic systems. While there is no doubt there are many models to choose from, it is hard to imagine the analysts and end users not working together side by side. (See Figure 12 for a discussion of a project involving business and technology specialists working with the office of sponsored programs.)
¶305.8 Considerations for Small Institutions

The discussion thus far has focused on large and medium-sized research institutions that have the award capacity to support a broad research administration organization that includes pre-award, post-award, cash management, and cost accounting/financial compliance professionals. What about small research organizations that do not have this capacity?

In many ways small institutions carry the most risk because often not only is a single person responsible for pre-award and post-award administration but he or she also is responsible for certain aspects of fundraising/development or has controller responsibilities. On the other hand, as the scale of its research is smaller, the smaller institution is less likely to attract national audit attention as fewer overall dollars are at stake.

The federal government only distinguishes between large and small research entities in two respects:

◆ Schools with less than $25 million in sponsored expenditures in a given year are not required to submit a disclosure statement to their cognizant agency.

◆ Schools with less than $10 million in organized research base can file a simplified F&A cost rate proposal.

Thus the “one size fits all” approach for every other aspect of research administration can certainly make life extra challenging for those who wear several hats within a small institution. Small offices likely will need to develop a compliance infrastructure to meet institutional obligations, perhaps based on one of the models presented, but certainly crafted in response to their own unique circumstances and portfolio sizes. (For an in-depth discussion of special issues for predominantly undergraduate institutions, see Chapter 2300.)

The sponsored programs compliance arena is becoming ever more complex; there have been new regulations issued just in the last decade regarding human subjects, export controls, and the USA Patriot Act. Some in sponsored programs have speculated that such growing compliance rigor could very well put all but the most vigorous emerging research entity completely underwater and potentially right out of the research enterprise.

¶305.9 Conclusion

The old adage, “you’ve seen one organizational model in research administration, you’ve seen one model in research administration,” is still very true. The organization of many sponsored programs offices have developed “organically”; that is, often with little formal planning, but rather as a result of the competencies and preferences of the offices’ personnel. The business of research administration, however, is one which has grown sufficiently complex and “risky” that a research administrator would be well advised to step back and ask if the office’s current organizational model makes sense from business process, customer relations, and audit management perspectives.
The current external regulatory environment, together with the advent of sophisticated data management and resource planning systems and electronic grants management, is forcing a certain amount of efficiency and “best practices” on all sponsored programs offices. Although change is not always easy or without consequence, incremental steps toward highly coordinated, goal-sharing, customer-oriented teams is a model that colleagues in industry adopted years ago. This approach may be something for college and university sponsored programs offices now to consider, if they haven’t done so already.

One place to start if an OSP is considering altering its organizational model is to look at best practices from peer institutions and of course ask customers how the office can best serve their needs.¹ (For an in-depth discussion on assessing the sponsored programs office and organizational evaluation techniques, see Chapter 3900.)

¹ In considering any organization or reorganization plan, a research administrator may also wish to look at the National Council of University Research Administrators’ (NCURA) micrograph entitled The Role of Research Administration. See www.ncura.edu/bookstore/default.asp.
Supplementary Material

This section includes expanded coverage of topics relating to organizational models and the job of research administration. These materials are culled from a variety of authoritative sources.

Moving Tips*
Bo Bogdanski, Colorado State University

I recently completed a job change, moving from one university to another in a neighboring state. Now that the move is complete and I reflect on the events of the past few months, it occurred to me that I followed a series of steps and decision points. Admittedly, I wasn’t this organized when I began the process. I hope by writing this article, I can assist fellow members who are contemplating a similar move. Here are ten points I suggest you consider if you decide to change locations.

Start Networking Early
First, define your objective. Do you want a promotion, a lateral position or a career change? Find out what might be available based on your objectives by using networking techniques. Determine if you have the skills and background to be considered for such a position. Talk to as many knowledgeable people as necessary to help you determine if your objectives are truly attainable. If not, develop a plan and timetable to reach your goals. Ask network contacts to refer you to others who may give you objective advice or help you refine, expand or further develop your goals.

I suggest you ask your network contacts to be discrete as you may decide that after this initial analysis a career move may not be appropriate for you in the near future.

Make the Commitment
If you decide that a job change is right for you, define some parameters (location, pay, job title, timing etc.). Inform your network contacts of your decision and look for ways to further expand that network. Always ask one contact to refer you to at least two others. Use meetings and conferences to intensify and expand your knowledge of potential opportunities. Decide who within your current organization ought to be part of a “secure” network. I suggest you don’t widely advertise your intentions within your current organization until a job offer is firm and accepted. Continue to perform at the highest level of professionalism at your current position as you continue your search.

* This article is reprinted from the NCURA Newsletter, Vol. XXXVII, No. 4, September/October 2005, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Write a Resume Not a CV

Write or update your resume. Find a good resume book and follow the advice. Although we work in an environment of multi-page curriculum vitae, I still suggest a limit of a two page resume and a cover letter specifically addressing the open position. Have someone critically critique your resume. I found many places preferred a downloaded resume onto a local system and/or the organization used an on-line series of questions as the preferred application method. Be flexible and follow the instructions.

Develop a Well-Rounded Set of References

Think of people who know you, your abilities, and most of all your potential. Try to find people both within your current environment and outside your daily sphere. Be sure your references are willing to take the time and make the effort if called upon. References must present themselves well on the telephone. I asked three NCURA members from across the country as well as a department chair, a department administrator and a division director from a related organization within my institution.

Prepare for the Interview

Hopefully the newly acquired resume book will tell you how to dress and present yourself for the interview. But physical preparation is not enough. Find out about the interviewing organization and the people who will be involved in the interview. Have a few facts ready during the interview to show off that preparation. Use the web, network contacts and the library as possible sources of information. If the interview is over the phone, clear the phone area of all distractions, shut off your computer, cell phone and radio, and close the door. If the interview is in-person, there is never a time the interview is over, until after you accept the job offer. Always assume you are being interviewed especially during casual conversations and meals.

Prepare an Exit Plan from Your Current Organization

Once you have received an offer and are willing to accept, decide if you will consider a “counter offer” from someone at your current location. Sometimes the counter-offer may not materialize which should not deter you if you are fully committed to the transition. Research your current institution’s resignation policy and analyze the needs of your new organization. Consider personal needs and time needed to transition. When you have developed the plan, I suggest you discuss options with your current supervisor before you prepare the resignation letter especially if you are thinking of something different from the “normal” resignation rules.

Be Gracious with Accolades, Awards, or Gifts

When you make the final decision and there is some sort of formal “announcement,” various groups of people from your current organization may want to recognize your contribution either through personal contact or some sort of social event. Always keep your discussion or remarks positive, up-beat, and toward the future, this isn’t the time to start “burning bridges.” Accept all invitations to social events because people genuinely want to say “good-bye” and you’ll want to continue to develop professional relationships with many of these people.
Make an Extra Effort to Clean Up Your Desk
Now that your decision is public, you will probably not take on any new long-term projects, so you should have time to get your ongoing work into good order. After your current organization helps you develop a transition plan for your work, make a conscience effort to get things as caught up as possible. Make notes for the file, explain difficult long-range issues to a co-worker or tell your agency counterparts you are leaving and ask them to help you complete necessary tasks. Departed workers are an easy scapegoat for blame and you will probably be a “departed” target too, so don’t provide any additional ammunition. The people who count will know you left on a positive note.

Keep Your New Supervisor Informed
An infrequent e-mail or phone call to your new office communicating your transition actions and plans will help your new organization prepare for your arrival. You don’t have to give day by day details but just an occasion “hello” gives both sides the feeling that things are still on track. Also, find one important person in the new office that can answer the day-to-day questions so you aren’t bothering the supervisor with those types of inquiries. Finally, look at your new organization’s web site for answers to Human Relations questions, parking, orientation, and similar items of personal interest. Your objective should be to show up with many of your questions already answered.

Close the Door and Don’t Look Back
You have defined your objectives, developed your plan, gone through the interviews and made the decision. So much thought and work should give you a good feeling that you’ve made the right choice. Don’t suffer from “buyer’s remorse.” Surely you are leaving with some good memories (and maybe a few bad ones too) but you are now ready to start that next part of your life. Shut off the light, close the door and don’t look back, there are lots of opportunities in front of you.
Observations on Building Offices of Opportunity

James Casey, The University of Texas at San Antonio

In the present climate of a new presidential administration, uncertain funding priorities, and increasing regulatory burdens, it is still important for institutions of higher education to establish, expand, and/or strengthen sponsored programs and similar associated offices. Why is this important? It is important because a productive office can generate greater value for its institution, especially at a predominantly undergraduate institution or emerging research institution. The need remains, but the justification for it may change. In other words, these offices are necessary regardless of whether the economy is prosperous or in the doldrums.

As a research administrator, I have established two sponsored program-related offices and expanded a third to full-time status since 2000. The experiences gained during those tenures are priceless in developing a unique perspective on research management. As a result, I offer the following observations and tips to research administrators who have the opportunity to build or nearly build from the ground up.

Remember the “Big Picture.” It is easy for research administrators to fall into the trap of focusing on the trees and ignoring the forest; this is quite common. Obviously, a prompt and professional level of service to faculty and staff is of paramount importance. Building bridges on campus between previously isolated academic units is another Big Picture item commonly mentioned in developing grants offices. Building two-way relationships with funding agencies is also critically important.

Move beyond the processing mindset. Sure, grants offices, regulatory offices, and contracts offices are on one level processing offices, the efficient movement of paperwork between internal and external offices. But more significantly, such offices are offices of opportunity: opportunity to engage faculty and remove negative impressions; opportunity to develop new ways of doing business; opportunity to find new intellectual opportunities and partnerships. Developing offices of opportunity gives the research administrator the chance to craft, to leave a stamp beyond bureaucratic efficiency. Moving beyond a processing mindset is important regardless of what the official “mission” of the office may be.

Reconsider and visualize your office’s role in the university structure. Working with more senior leaders in your areas of the university, visualize a different reality a year from now. Do you want an office which plays an integral part in delivering your university’s research agenda and of which you can be proud? Visualize how to achieve it.

1 This article is reprinted from the NCURA Magazine, Vol. XLI, No. 1, February/March 2009, published by the National Council of University Research Administrators. It is used with permission of the publisher.

2 The author thanks Saveria Dimasi, Director of Legal Services at the University of Melbourne, for her feedback during preparation of this article.
Think strategically and laterally. This is the “Big Picture,” coupled with the desire to implement on a consistent, vigorous time schedule. It will help you achieve a different role for your office in the university structure. Priorities need to be set, whether they are developing policy and procedure, faculty outreach, or training for other university staff. Thinking strategically also allows for being “creative,” a word not usually associated with research administration.

Communicate well. University research administrators need to do a better job at communicating consistently and precisely to internal and external partners. It is no longer enough to do just enough communication between heavy deadlines. One topic that research administration should focus more on is communication between research administrators in a hierarchical structure. With stronger internal communication, job satisfaction increases, and productivity is enhanced.

These conclusions are part of the essence of the two Laws of Communication as outlined by Dr. Richard Schuttler (www.lawsofcomm.com), a project involving this author: (1) Failure of supervisors to communicate with subordinates results in poor employee performance; and (2) Failure of the organization to effectively communicate results in poor organizational performance.

Build technical expertise. Not only is this necessary within your office, it is also necessary at the department level. Central administration must insist that departmental administrators strengthen their expertise. In many cases it is no longer enough to rely on central administration for service and allow departmental administrators to just “get by” or to be inadequately trained.

Create a professional and welcoming office atmosphere. Create an office that constituents will want to visit and staff will want to work in — for its “vibe” as well as its appearance. Be proud of your entrance areas, where the faculty come for meetings or drop paperwork off. Create something beyond that of the normal bureaucratic mindset. Create uniqueness.

Learn from the past. “Those who don’t learn from the past are condemned to repeat it.” We have all heard this phrase, but what does it really mean for research administrators? If you are creating a revamped grants office, listen to what faculty and staff say about the office as it was before. What was good and bad about it? What did it facilitate and what did it prevent? As I have said for a number of years now, create a culture of “yes,” not a culture of “no.”

Instill a mindset of lifelong learning. As leaders in the office, directors and assistant directors should create a culture of lifelong learning in the profession. Any research administrator worth his or her salt knows that staying current in the field is a professional necessity. Falling behind, as measured by professional training, is no longer an option. Professional development programs, such as those offered by NCURA, are an integral component of this observation.
Know when to fit in. Know when to stand out. Research administrators are used to fitting in and knowing their place (as second fiddle to the faculty, in general). But, one thing I have learned after fifteen years within the profession is that it is good to stand out — at appropriate times and in measured doses. Be assertive when necessary — whether on behalf of your institution or your staff. Call it as you see it, but always in a constructive manner. And always be mindful of the Big Picture. This goes to the broader lesson that effective research management is part art, part science.

Share credit. Sharing credit with others is one of retired Gen. Colin Powell’s rules for success, as articulated in a recent issue of Success Magazine (February 2009). In fact, I would go further than that by saying that always give others credit first, then pat yourself on the back. Remember, research administration is a team sport.

Conclusion
In these most interesting of days for our country and for the research administration profession, it is imperative to rethink our profession for the challenges ahead of us. We expect our Washington representatives to change. We elected a new president based upon his promises of change. It is only appropriate that we should change — to make the profession stronger and more valuable. The question is: Do we have the desire and will to change? An equally important question is: Is bureaucratic inertia too strong to allow for change?

This need to change and think differently is especially true in the area of building offices of opportunity. As a research administrator, stretch your skill set by building such offices. Whether or not you stay in smaller research administration offices, your professional skill set and experience base will be permanently stronger. And that is what I call a win-win situation.
Researchers’ Relationships with Pre-Award and Post-Award Offices: Bridging the Gap
Kristine M. Kulage and Ruth E. Torres

Reflecting on the theme of the NCURA 52nd Annual Meeting, “At the Confluence of Creation and Collaboration,” which centers on the interdependent relationship between the researcher and the research administrator, my colleague and I joined forces to explore the differences between researchers’ interactions with pre-award administrators and post-award administrators within a biomedical research institution. The inherent differences in the types of services these offices provide establish a precedent where faculty members are likely to interact differently with the two offices.

In her article, “Pre-Award Administrators are from Pluto, Post-Award Administrators are from Saturn; Or Are They?” M. Spina isn’t afraid to tell it like it is: “Pre-award administrators are the good guys and post-award administrators are the bad guys.”

During the past year in our department, we have worked diligently to bridge the gap between how faculty perceive and interact with our pre- and post-award offices, and we have already made substantial progress. The first step we took in bridging this gap was to recognize the fundamental differences between the offices.

Pre-Award Administrators: “The Good Guys”

Pre-award administrators are seen as “the good guys” for one obvious reason — everything they assist researchers with is directly related to a positive end result: a funded grant. From the dissemination of program announcements to initial budget meetings and coordination with faculty in other departments, pre-award administrators set up their researchers for success from day one. By editing biosketches, checking grammar, inserting graphics, and uploading electronic attachments, they play a critical role in ensuring the final product has the highest potential for funding. They help faculty recognize budget gaps, assist with application neatness and compliance, and complete administrative elements of a proposal, allowing researchers to focus on the science.

Pre-award administrators also may develop templates for grant sections and deliver presentations to faculty about developments in the research world. Although the scope of pre-award office duties extends beyond grant submission, when there are grant deadlines, all other work is likely set aside, and researchers have the of-

---

Office’s undivided attention. This teamwork attitude immediately places faculty in the frame of mind that pre-award administrators are “on their side.” They don the virtual “white hat” in the world of research administration, and in the best of relationships, they are viewed as valuable members of the research team.

When a grant is submitted, pre-award offices are often complimented by relieved researchers with “I couldn’t have done it without you.” And, when a grant is funded, pre-award officers rejoice with their faculty members in celebrating the accomplishment. Pre-award offices often disseminate announcements about funded grants, singing the praises of our researchers. I have often been the recipient of tokens of appreciation from researchers who are elated to have their grant funded and eager to recognize the “heroic” role the pre-award office played in making it possible.

The funded project is then handed off to the post-award office, similar to a baton in a relay race, for implementation and account set-up. The pre-award office has cleared their plate, making room for the next submission. When this transition is overly distinct, it contributes to the overall gap. Just as researchers view institutional sponsored projects offices more as a barrier than a partner in conducting biomedical research, the same relationship can develop between researchers and departmental post-award offices.

Once the grant is awarded, the post-award office is immediately perceived as policing the project and erecting roadblocks to conducting the science that faculty worked so hard to fund. To complicate matters, post-award offices typically do not participate in the pre-award steps of grant preparation. Yet, once funded, post-award offices are expected to monitor a project about which they have little previous knowledge.

**Post-Award Administrators: “The Bad Guys”**

Post-award administrators sport the virtual “black hat” in the world of research administration, and in their relationships with researchers are viewed as the “sheriff” cleaning up the town. When project spending is going smoothly, researchers are content; but, when a lapse in post-award compliance is identified that affects the research, it is often perceived negatively. Rather than viewing the post-award administrator as a positive team member who is looking out for their safety, the researcher often views their involvement as overly cautious or even unnecessary.

“Post-award administrators fix problems with proposals, unsnarl bureaucratic red tape and move on to the next problem. Unfortunately, they are often associated (at least in the faculty member’s mind) with the problems they are trying to fix.”

They are seen as bureaucratic, trapped in the confines of institutional policy constantly standing in the way of scientific progress. If there is a good relationship between faculty and the post-award administrator, there is an unspoken expectation that in times of doubt the administrator will coach them out of the particular situation. But when the recommendation fails, so does their reputation with faculty.
Post-award administrators in biomedical institutions perform a complex set of duties that are often more expansive than those of pre-award administrators. Besides managing financial affairs, post-award administrators manage human resource issues and clinical practice matters. Performance is measured by how well a post-award administrator navigates through the complexities of the institution rather than how much they assist researchers. In reality, post-award administrators are unsung heroes of research administration, helping faculty members avoid negative, project-threatening situations such as overspending and noncompliance.

Post-award offices work just as diligently for researchers as pre-award offices. They carefully monitor spending patterns, coordinate effort reporting, and conduct financial closeouts. While pre-award offices develop templates and repositories of information for researchers, post-award offices create multiple reporting tools that unravel the complex institutional financial data researchers must review, and they confirm financial reports are accurate and auditable. Unfortunately, these thankless endeavors are seldom recognized by researchers as elements of teamwork or efforts worthy of gratitude.

Joining Forces to Bridge the Gap

If the first step toward bridging the gap in how researchers interact with pre-award and post-award offices is to acknowledge the fundamental differences between the two, the second step is for these offices to recognize they are not two separate entities working in silos but are instead working in tandem throughout the lifecycle of a project. Both offices must project a “teamwork” attitude with faculty, even if the precise nature of the teamwork differs. For pre-award, it’s “working together to create a compliant, successful final product worthy of funding.” For post-award, it’s “working together to ensure that the project is conducted within all required regulations and funds are spent in the most efficient way possible to get the most ‘bang for the federal buck.’”

Faculty members realize that while pre-award administrators are fully versed in the structural elements of grant writing and in various compliance issues (e.g., conflict of interest, human subjects research), post-award administrators can navigate the complex institutional web of “red tape” and help build more accurate proposals. In addition, since post-award offices will inherit the monitoring of projects from the pre-award office once they are funded, it is essential that these administrators not be handed funded grants blindly.

It makes sense for post-award administrators to participate in proposal development, just as it makes sense for pre-award administrators to participate in the financial monitoring of projects. Can there be a united front where pre-award and post-award administrators are both viewed as heroes in the funding battle and, rather than white versus black hats, both wear grey hats? Based on this idea, our offices began efforts to bridge this gap and implemented significant changes in the way we conduct business.
No More Silos!
Successful efforts in bridging the gap between the relationships researchers have with our offices fall under one philosophy: no more silos! Phase I of this endeavor was to break down our silos physically. The pre-award office was moved from a secluded location into our school’s new centralized Office of Finance and Administration. Having pre- and post-award offices in such close proximity not only made it easier for researchers to meet and communicate with both offices, but also visually reassured them that we were working closely together as a united front.

Another physical barrier was broken when pre-award files were merged with post-award. This empowered pre- and post-award administrators to view the history of the other side of business for each project and alleviated any unintentional veils of secrecy. Along with merging paper files, information technology staff created shared virtual network folders that permitted both offices to view proposals and financial reports and to easily share important electronic information. This level of transparency has made it easier to work as a team and provide suggestions for improvement in grant procedures.

After breaking down physical silos, phase II was to eliminate the communication silos between our offices and researchers. We make concerted efforts never to refer to each other as separate entities, which helps convey that we are one team. Our offices constantly cc: each other on e-mail correspondence with faculty, whether pre- or post-award related. Our pre-award office standard procedure now includes post-award administrators’ attendance at key grant proposal planning meetings. Post-award administrators are also consulted in the final steps of grant preparation so that potential post-award budget issues are addressed prior to submission.

At the same time, our post-award office invites pre-award administrators to quarterly financial report meetings with faculty and consults with them to cross-check on spending and effort tracking. Not only has the flow of communication improved, but researchers also have a higher level of confidence in both offices by witnessing firsthand our collaboration throughout the lifecycle of a project. Thus, pre- and post-award administrators are “on the same page” when meeting with faculty.

We are beginning phase III of our efforts: cross-training. This will be the most difficult and time-consuming phase of the process, but it will be critical to breaking down remaining barriers. We are planning for pre- and post-award staff members to literally switch places one day per week to learn each other’s jobs. As directors of our offices, we recognize this may slow down work, but will pay off in large dividends. Not only will staff members of both offices have a greater understanding of pre- and post-award processes, but there will also be the added flexibility of enabled staff to provide job coverage during illness and vacations. It will speak volumes to researchers when they work directly with a pre-award staff member on reconciling an account or with a post-award staff member on uploading files in an electronic application!
From Chasm to Crevice

In 10 months, we have experienced encouraging levels of success. Faculty members freely voice their level of trust and satisfaction with both offices to higher management, as well as praise both offices directly for their expert assistance. Work flows more smoothly between the two offices, there are fewer errors in both pre- and post-award activities, and one office does not receive more credit than the other.

We have also reaped unexpected rewards, having incidentally created an environment of innovation and enthusiasm where all ideas for improvement are welcome. Best of all, faculty members feel they can turn to either office for support and have equal confidence in the information they receive. The gap, although still present, now resembles a crevice more than a chasm.
320.4  The Development and Implementation of a Research Administration Job Family
Elizabeth Adams, Gretchen Talbot, Annette Czech and Amy Kitzman, Northwestern University

Northwestern University is a private, nonprofit institution employing approximately eight thousand total staff and faculty and administering over half a billion dollars a year in sponsored programs. While “research administration” is reflected in the titles of approximately one hundred staff, it is projected that approximately one thousand staff actually perform some research administration function regularly. Thus, the development of a research administration job family had the potential for high impact at the University.

What are Job Families?
Job families are powerful tools in organizations that articulate the range of duties performed by a functional group of employees. Job families provide connection and coherence between job levels within a particular business function, as well as between larger business functions themselves. A job family additionally provides a career ladder for employees and facilitates the process of grading and posting positions for managers. A research administration “job family” was developed in-house at Northwestern University with existing full-time staff and resources. This process was accomplished on a part-time basis, over eight months involving approximately sixty employees in eight of the schools/major departments across University campuses in Evanston and Chicago, Illinois.

Since 2009, the Human Resources-Compensation Division at Northwestern University has created twelve job families for its most significant areas of business. The job families provide clearer definition, differentiation, and clarification of jobs, job evaluation, and salary grade assignments; provide for a hierarchy of progression from one level of job to another within a specific function (e.g., administrative support, research technology, research administration); define associated duties, responsibilities, and education and experience requirements, and simplify the process of creating job descriptions and promoting employees. Turn-around time of transactions (promotions and posting of new jobs) has been decreased from a previous average of six days to one day. Additionally, stronger job descriptions attract stronger candidates.

A Job Family in Action
Offices at the central, school, and departmental levels at Northwestern collaborated in the implementation of the research administration job family and used it as a platform for change shortly after its completion. The goals of the implementation were to enhance the central, school and departmental units’ organizational structures as well as increase the quality and efficiency of transactions as they relate to...
research administration. However, because of the importance of sponsored programs to many units within the University, the overarching goal was to become higher performing organizations.

When the research administration job family was completed at Northwestern in August of 2011, it was the intent of the Weinberg College of Arts and Sciences and the Office of Sponsored Research in Evanston to clarify roles and responsibilities in research administration; increase the visibility of research administration; attract and retain talent in research administration; evaluate how research administration relates to other business functions at the University; confirm reporting lines; and to provide a foundation for improved professionalism, learning, and roles and responsibilities across the entire organization. It is unlikely that these objectives would have been accomplished without job families.

Creating a Research Administration Job Family

Participants

Four full-time individuals in the Northwestern University Human Resources-Compensation Division were involved on a part-time basis in the Research Administration Job Family Project. A steering committee comprised of four director-level, senior research administrators representing the major research organizations on campus (the schools of medicine, arts and sciences, engineering and research centers) met three times for a total of six contact hours. Additional detail was provided by four focus groups comprised of a broad swath of research administrators on campus. The involvement of the full range of research administrators at the University conveyed the transparency of the project to the Northwestern Community, which was essential to the success of the project.

Procedure

Northwestern’s Human Resources-Compensation Division began the broader job family project three years ago. The first step in the job family project was to deter-

mine the primary functions within the University (e.g., marketing, information technology, research administration, etc.). Once functions were identified, Northwestern University’s four thousand job titles were then grouped by function. For example, if the job title included “accounting” or “finance”, the job was placed into the financial job function. Figure 320.4-1 above summarizes this data:

Each function was deemed a job family. Northwestern set priorities under the job family project by beginning with functions that would impact the most employees, starting with the Administrative Support Job Family. As of today, the functions/job families highlighted in pink above have been created, as well as additional job families that were not originally envisioned.

Northwestern has employed two different approaches to create job families. If a given business function pervades the University, carrying with it compliance risks—such as research administration or finance—a steering committee comprised of senior managers (as described above) guides the creation of the family. If the function is specific to only a few units (such as animal technicians or business intelligence jobs), Human Resources Compensation works directly with the unit managers to develop those job families. Combinations of these 2 approaches are used for other families.

For the research administration job family, the steering committee provided an overall framework that included general grade levels of jobs (a total of five levels, including one nonexempt and four exempt levels) and associated factors/responsibilities (complexity of programs, pre-award, post-award, financial, compliance, and supervision). Additionally, the necessary education, experience, competencies, and on-going training were determined for each grade level of research administrator.

Focus groups composed of all levels of research administrators were hosted by HR-Compensation to more finely tune the duties/responsibilities recommended by the steering committee. The finalized Northwestern University Research Administration job family—which addresses research administration in departments, schools, centers and programs—may be viewed at the following link:

http://www.northwestern.edu/hr/compensation/job-families-descriptions/job-families/Research%20Administrator%20Job%20Family.pdf

Department and School Implementation

The Weinberg College of Arts and Sciences is large and diverse, encompassing sixty-seven distinct departments and programs, and overseeing $111 million annually in sponsored programs including its related research centers. There are six hundred fifty faculty members in the College, and their research interests range broadly from topics in the fields of Chemistry to the Classics. Currently, the titles and responsibilities of staff performing research administration functions vary significantly throughout the College. Staff may be involved in pre-award and/or post-award research administration. Reporting structures for research administrative staff are also complex and may involve both direct and indirect reporting lines. That is, staff may report directly to faculty, business administrators or to the Dean’s Office. They may additionally have indirect reporting lines to the Dean’s Office or department leadership.
When the College became involved in the development of the Research Administration Job Family it was immediately evident that this family would create an opportunity for improvement and change. The College determined that it would adopt a “soft rollout” of the job family: to make opportunistic changes during times of employee turnover.

The College’s first opportunity for implementation occurred in Spring, 2012 in the Life Sciences business office, an umbrella administrative unit for the Molecular Biosciences and Neurobiology departments. Historically, the departments had been served by two separate research administrators who only understood pre-award, rarely collaborated, had little or no backup support, and reported to 2 different Assistant Chairs. For these reasons, turnover had been significant in these positions.

The College conducted a thorough review of the two departments, and the positions within the two departments, and made the decision to utilize the new Research Administration Job Family —it was decided to upgrade the job descriptions and change the reporting structure. The College had confidence that over time the job family would be a critical piece of a larger, successful implementation. Once the plan was formulated in detail it was presented initially to department chairs and, once approved by leadership, to all staff. The following outcomes are a direct result of implementing the job family:

**Lower turnover rate:** research administration jobs are now more intelligently interconnected, creating the beginning of a bona fide community of research administrators

**Career ladder:** provided a clear path for professional growth for research administrators

**Job satisfaction:** created a culture in which there are clear job peers, as well as information sharing and collaboration

**Organizational redundancy:** established a structure that provides back-up support for administrators

**Knowledge expansion:** research administrators are now expected to develop expertise in the full life cycle of a grant

**Reporting structure:** established consistency and clarity

**Operational efficiency:** standardization, resulting in knowledge more readily shared as well as streamlining

**Compliance:** all of the above increase compliance levels

---

**Office for Sponsored Research Implementation**

The Office for Sponsored Research is a stakeholder in strong department and school-level research administration. Why? Because strong department and school-level research administration result in higher-quality, higher-efficiency transactions reaching the central office. These transactions are also more compliant and less resource-intensive. To encourage—and maximize—the success of the recent
job family-related changes in the College, the Office for Sponsored Research (OSR) developed a pilot program with the College and the Life Sciences business office focusing on training and workflow. The pilot program provided the opportunity for all three units to formally discuss specific areas of research administration, and exchange feedback on organizational improvements. The session topics were: Roles and Responsibilities, Proposal Development and Submission, Progress Report Development and Submission, Award Setup and Management, Subcontracts and, lastly, Cost Sharing. The pilot program is currently prompting OSR to develop more training materials (such as checklists) specifically written for department and school administrators. The pilot program also provides an opportunity for OSR to make some changes to workflow on a limited, trial basis, with the aim of broader rollout over time. These changes, such as streamlining proposal review and subcontract issuance, as well as transitioning dated paper-based forms to user-friendly electronic formats, are meant to complement the new research administration roles developed by the job family.

The alignment of units undertaking research administration at different levels of an organization is critical. A research administration job family provides a platform for that alignment, and is the cornerstone of efficient, compliant and collaborative operations in institutions conducting sponsored research. A Research Administration Job Family also offers career development opportunities for staff, providing an essential structure within which extremely valuable skills may be fostered.

About the Authors

Elizabeth Adams, Executive Director of the Office for Sponsored Research-Evanston at Northwestern University, has been in research administration for 13 years, at both Northwestern and The University of Chicago. She has worked at the program, center, department, school and central levels of university management. Elizabeth presented at both the 2012 and 2011 National Council of University Research Administrators (NCURA) Region IV conferences. She has degrees in English and Psychology from Emory University.

Annette Czech, Compensation Consultant, returned to her alma mater in 2009 having graduated with a bachelor’s degree in economics from Northwestern University. Hired specifically to coordinate and manage the development of job families for the University, she brings with her over 20 years’ experience in the field of human resources specializing in compensation and human resource information systems.

Amy Kitzman, Associate Center Administrator at Northwestern University’s Feinberg School of Medicine, began her research administration career at NU in 2007. Her background includes an undergraduate degree from University of Iowa in Business Administration. Amy’s responsibilities at NU include department administration, pre-award activities and post-award activities.

Gretchen Talbot, Director of Research Administration for Weinberg College of Arts and Sciences and Northwestern University in Evanston, Illinois, began her career at Northwestern in 2005 as the Business Administrator in the Department of Chemistry. In 2007, she assumed the role of Director of Finance & Budget for the College of
Arts and Sciences for 4 years. She has been Director of Research Administration for nearly 2 years. She has bachelor degrees from Syracuse University in both management and communications and an MBA from DePaul University. She recently became a Certified Research Administrator.
\subsection*{320.5 \textbf{Shared Services: A Journey of Change and Reinvention}:} Randi Wasik, University of Washington

“The Computer Says I Need to Upgrade my Brain to be Compatible with its New Software.”

While we may find the above comment humorous, it is also very true. In a world that is moving with ever increasing speed, we are being asked to do more and more every day with less and less resources – both in terms of equipment and personnel. Bear with me for a bit of a history lesson to drive home this point. The Industrial Revolution encompassed the period of roughly 1760 – 1840, a mere 173 years ago. The computer revolution started with the creation of Leprechaun by Bell Labs in 1947, a mere 66 years ago. Steve Jobs founded Apple in a garage and incorporated it on January 3, 1977, a mere 36 years ago. Microsoft was founded on April 4, 1975, a mere 38 years ago. In 1982 the Internet protocol suite (TCP/IP) was standardized and the flood gates opened, a mere 31 years ago. Stop and think of the impact this less-than-200-year-old transition has had on our world.

As our world changes, we have to safeguard and monitor increasingly granular levels of the research world we support; we have to think smarter, not work harder. We have to embrace the change that is demanded of us while growing not only our individual skill sets, but also mentoring and growing the staff around us. We face a myriad of compliance risks right and left which, if not recognized and adhered to, can leave us vulnerable to audit findings and subsequent costs that are substantial to our institutions, not only in terms of reputation, but also financially.

With this in mind, we at the University of Washington (UW) are embracing the concept of a shared service environment. Institutions can run the gamut from decentralized administrative functions, to centralized, very controlled and regulated functions, to a mix of some decentralized and some centralized functions. UW has components of all three of these administrative functions.

At the UW I am involved with a project at the School of Medicine (SOM) which is one of two projects currently underway (the other project is on our “upper” campus or the Liberal Arts Schools). We have the luxury to build upon the upper campus model as well as a much smaller initiative which is similar in nature and in use by two of our fellow SOM departments. At the UW we are not trying to develop one central shared services organization for the entire campus, but rather will maintain a model for our upper campus and a model for the SOM as the needs and work flow are very different between the two entities. This makes our journey somewhat unique among higher educational organizations.

By moving to a shared services model we hope to unify separate departments (organizations) by linking them through an oversight model. We will establish service level agreements to define the services provided by the Shared Services Team (SST) which will have a focus on customer-driven transactions. In creating the SST,

\begin{flushright}
\footnotesize
This article is reprinted from \textit{NCURA Magazine}, Volume XLV, No. 3, May / June 2013. It is used with permission of the publisher.
\end{flushright}
our goal is to create a performance-driven culture through measurement and feedback. A highly trained and technically competent team that can provide support at a level and consistency that an individual department cannot will ensure better compliance and end product.

The University of Michigan Administrative Services Transformation project created a table defining the advantages of moving to a shared service model which best describes what we are trying to create http://ast.umich.edu/. It is described below.

**Figure 320.5-1.**

<table>
<thead>

</tr>
</tbody>
</table>

There is much to be gained by adopting a shared service model. The benefits can span the following:

1. **Economic:**
   a. Higher productivity
   b. Reduced expenses
   c. Reduced infrastructure costs
   d. Leverage of investments in systems, equipment, and IT development

2. **Strategic**
   a. Support meeting increased demand with fewer employees who are highly trained and specialized
   b. Consistent support of key functions at the institution such as payroll, purchasing, grant preparation, visa preparation, etc.
   c. Achieve process and systems standardization – we all speak the same language
   d. Enable the larger group to move and react at a quicker pace to changes demanded of us in the various functions this team would support

3. **Quality**
a. Improved information for decision making  
b. Better and more consistent service to key stakeholders – the departments, staff, faculty, etc.  
c. Reduced error rates – quality at source – better end product  
d. Develop centers of expertise and innovation  

4. Speed  

a. Reduced cycle times for authorizations, procurement, sourcing, document preparation, submission, etc.  
b. Shorter response time to changes in requirements, rules, etc.  
c. By having a highly trained, centralized staff, they can create an end product with a shorter turnaround  

These teams will allow the departmental level the ability – freedom – for us and our staff to work to the level of our jobs. It is traditionally viewed that at best we only work to 65% of our job – i.e., there are a lot of workplace “detractors” that cause us to “underperform.” Many of us have or know of staff members that are capable of much more but are held back by routines and protocols that do not necessarily breed success and growth. By taking the more routine aspects of our activities and centralizing them where these activities can have the attention required by a highly trained and focused staff, we and our departmental staff can focus on tasks that traditionally take a back seat, but are equally as important. Additionally, when considering compliance risks, these tasks may be even more important. In short, we will be able to work smarter, ensuring compliance and the ability to partner with our leadership to think and work strategically. It will provide us with the ability to mentor our staff up (promote them to the next level) by “freeing” them to think strategically about what they do.  

While recognizing the need for change and deciding on choosing a shared service model, we are also quickly recognizing the need for communication and change management, emphasizing that this has the potential to be a win for everyone in the system touched by the service areas we have selected. From a central level and at our School of Medicine level, the University is partnering with us on this journey. We are being armed with training and tools to help ensure success in this transition. We have just completed a professional development journey on how to manage organizational shifts, with the final presentation on the Immunity to Change by Wendy Fraiser, Ph.D. What has become apparent, especially in this last session, is that as we embrace change, we must first look to ourselves as individuals and identify what “drives” us. Then we can move to the level of how the group/team/organization is moved and driven and thereby will react to change. In Dr. Fraiser’s presentation, it was also pointed out that in looking at change we should remember the following:  

One study cited 6 out of 7 heart patients could not sustain any change in their behaviors (eating habits, exercise, stress) even though they were told by doctors they would die without these changes. WOW! What this says is that even if we know a process, procedure, or protocol is not productive, not compliant, not teaming or forward thinking and we know of a better way, we tend to keep on the same course as it is familiar, comfortable, and makes us feel “safe.”
We know we need to change and quickly because the status quo is no longer
good enough. Therefore, we have identified four areas to which we want to apply
the SST model – Visa, Pre-award, Purchasing, and Payroll. Visa and Pre-award will
be first, followed by Purchasing and Payroll a year later. At the UW SOM and up-
per campus, we are capitalizing on our talented departmental and central staff by
forming small groups of volunteers to build and launch the project. We have a core
leadership group with a diverse membership, and then sub groups looking into IT
and the various services we wish to develop.

We have formed teams comprised of ten different departments and staff from
different levels as well as staff from the central offices that would be impacted by
this change. We have tapped these volunteers as they have expert skill sets in the
areas we wish to move to a SST. The teams will define and create the SST based on
evaluating different models at other peer institutions. We are examining all aspects
of the process map and tools, systems, and staffing to make the SST a success. We
have discovered we also need an IT team for the tools and systems development
as this is key to the success of the SST model. I want to highlight that what we are
creating is somewhat unique as it is anticipated the Pre-award SST will have direct
faculty contact, a concept not commonly used at other institutions.

The mantra on this journey is that the staff – using their skills, listening, team-
ing and empowering them to take ownership of their position so that our custom-
ers are served well – uses and grows your human capital. The staff is our best and
sometimes most undervalued resource, so we are striving to empower them on this
journey of change. As the SST takes root, the departments participating will be sup-
ported in empowering the staff to move to the next level of performance and sup-
port of the department.

I do not have many answers as we have just begun this journey, but I can say
that we are being thoughtful and careful and that in the end we will all benefit and
grow as a result. We recognize that teaming and communication are key and cor-
nerstones to the success of this change. We are actively challenging ourselves and
thereby challenging the system. The status quo is not acceptable – we have to capi-
talize on our human capital, grow the staff, and move everyone toward being able
to work at 100% of their ability.

About the Author

Randi Wasik is the Director of Administration and Finance at the University of
Washington’s Department of Urology. In addition to her Departmental role serving
both the clinical and research operations, she is also very active on several com-
mitties in the School of Medicine, creating a shared service model for the School of
Medicine, and is part of a team teaching a post-award grants management class at
the UW. She has worked in the central pre-award office at Harvard Medical School
and the central post-award office at Boston University. She has worked in central
budget operations and at a start-up R&D company. She is active in NCURA at
both the regional and national level. For “down” time she plays the flute (BFA in
flute performance), gardens, and cooks, is the secretary for her daughter’s Booster
club, is active in the community, and cares for a myriad of rescued pets. She can be reached at randiw@uw.edu.
Maximizing Your Organizational Structure and Business Procedures

Tim Patterson and Rob Rubens, Huron Consulting Group

If yours is like most other institutions, your research administration office feels the growing pressures of the current environment: flat federal research funding since 2004, greater complexity of federal regulations, ever-increasing federal reporting and transparency requirements (including ARRA, FFATA, DATA, etc.), annual audits, federal investigations, a highly diverse funding portfolio with more intricate funding mechanisms, and high demand for excellent customer support.

On top of that, you likely face difficult decisions on how to address these issues while balancing internal challenges such as operating budget reductions, a push for improved processes on a tightened spending plan, staff turnover, an ongoing need for training and education, and meeting service level expectations, all while keeping day-to-day production levels steady.

No problem, right?

So this would seem to be a particularly tough time to transform the operations of your research administration office. However, if your institution wants to get maximum productivity from that office, now is precisely the time to be measuring output against goals and thinking of how to improve those numbers.

The prospect of change, especially in the face of the many pressures of research operations, may seem overwhelming. But when broken down into stages, it is less intimidating. The following is a four stage approach to face and conquer the overhaul of a research administration operation:

1. Vision and Planning: Conduct a visioning exercise that considers the core aspects of the research administration infrastructure and supporting processes and defines performance targets and goals. Who do we want to be? Are we meeting those goals?

2. Discovery: Perform an in-depth assessment of the current infrastructure against your vision and identify opportunities for improvement.

3. Design: Create a roadmap for transformative change.

4. Implementation and Operational Support: Provide oversight and operational support throughout the implementation and after deployment to ensure the sustainability of project goals and results.

Vision and Planning

The initial steps in any organizational assessment or process redesign – determining if there is a need and deciding where to start – are often the most challenging. So, where do you start and how do you know it’s time to take action? Negative customer feedback, comments from process owners about increased workload or process-
ing time, staff turnover, pending system implementations, and audit findings or concerns can serve as drivers to start a review.

Time should be another factor for consideration. If an organizational review has not been conducted in the last 3 to 5 years, it’s time to do one, especially with the ever changing landscape of research administration. Over time, certain processes can become overly manual, time consuming, or redundant with other procedures. If business procedures are undocumented, consistency from one staff member to another grows to become an issue, particularly if there has been turnover.

Put pen to paper and create a vision for your office. Even though you may modify this slightly as you go, you should establish upfront where you hope to take your organization. Focus on your office’s mission statement and ask: where do we want to be 6, 12, 24, 48 months from now? This is not the place to write your business goals; those are the outcome of pursuing your vision and holding your organization accountable for its values. Here is where you draft four or five guiding principles that describe why, how, and what your research organization performs. Empower others who are part of this transformative process to assist in drafting the vision. When drafting: be specific; be actionable. Then, begin asking the more finite questions to get started:

- What are the core responsibilities of your office? What is your office’s mission statement? Are you following it?
- Have you established performance goals, and are you managing to them?
- Who are you serving? Are you meeting their needs? How long does it take for work to flow through your office?
- How many different sets of hands are involved with each process? Whose hands are they?

Once leadership has identified the need to take action, consensus should be obtained from key stakeholders and individuals charged with change management. Buy-in is critical. Not having a thoroughly vetted and agreed-upon plan can create or exacerbate a number of future roadblocks, including scope creep, time mismanagement, unclear goals, unrealistic expenditures, poor resource utilization, increased backlog, etc.

Proactive project planning and management is paramount to successful execution of any operational review. A documented project plan should list key tasks, establish milestone dates for completion, and assign individuals or groups as responsible for completing each task. Project plans should also be flexible enough to allow tasks or steps to be added as part of the discovery step (highlighted below) and realistic enough to allow for the completion of day to day tasks. Don’t forget, your regular business doesn’t stop, slow down, or pause to allow time for this review to take place. Your office still needs to find a way to get the work done; hence, managing expectations around the amount of time required to complete the review is important. Also, make sure to account for items that might impact the work plan, such as month-end close, year-end close, holidays or vacation time, infrequent but
relevant steering committee meetings, and certain sponsor driven deadlines.

**Discovery**

The second stage involves assessing the current infrastructure, including performing an in-depth evaluation of the workload, creating a task inventory of the items your office is responsible for completing, identifying possible processes that would benefit from an improvement in workflow or automation, and noting unnecessary or institutionally over-regulated or overly complicated practices.

If you sense that it takes too long to complete a certain task or to review, approve, and process a particular document, it probably does. How do you test that? Internal tracking metrics, detailed process mapping — which will highlight areas of inefficiency or redundancy — and survey responses from campus customers will validate or disprove that concern.

Who performs this discovery step? A workgroup should be established with mixed representation of process owners, key stakeholders, and other change management personnel to research and collect data. This group should meet with primary customers, as appropriate, to better understand concerns, to isolate pain points, and to identify opportunities for improvement.

Before anyone takes a deep dive into data mining or analysis, carefully review the inventory of areas targeted for review. Establish what the group would like to better understand regarding your organization’s role in each of these areas, and prioritize the work plan accordingly.

Be careful to avoid the trap of “paralysis by analysis.” Try not to take on so much at one time that the workgroup loses sight of its goals. Operational improvement takes place over time and tends to be cyclical with recurring evaluations. It’s not something that will be completed in a week.

Many institutions do not have accurate or current metrics available to evaluate operational or personnel efficiency. These numbers should, however, be one of your outcomes from this initial assessment. You want to have answers to questions like:

- **Are we meeting service level expectations?** Moreover, have we taken time to establish service level expectations that we can then manage to?
- **Does the staff have the support they need to do their jobs?** This includes clear process documentation, tools and templates, systems, training, etc.
- **What type of workloads do individuals at similarly-sized institutions process?**

By gathering an inclusive and representative data set for work completed over a period, for example the past twelve months, you can begin to evaluate your organization’s efficiencies – and sometimes lack thereof.

**Design**

This stage requires answering questions such as: What did the workgroup discover as part of its review? What opportunities for change would you rank as being the highest priority, easiest to implement, or have the greatest return on investment? What are the obstacles that will prevent you from being successful?
Once the workgroup has an inventory of the opportunities available for change, begin brainstorming potential solutions and meet with your key customers, as appropriate, to further discuss the impact and benefit of the suggested enhancements and changes. These might include revised workflow, streamlined approvals, opportunities for automation, or even reassignment of duties or tasks.

Next, narrow your immediate focus to one solution or change, and obtain consensus from key decision makers on the proposed approach. Assuming there is support and buy-in for the suggested changes, identify a desired implementation date. Think about the steps that will have to be completed prior to that date. Are there tools, process maps, checklists, etc. that need to be created or modified? Are there training implications for the staff and/or the campus community? If so, how will you roll out the training? Who will conduct it? Who will attend? Obviously, training needs to be completed in advance of the implementation date, and time must be allotted for it.

Who else might be impacted? A communication plan should be drafted to notify other affected individuals of the pending change, implementation date, anticipated benefits, and any process modifications involving them. Other impacts to consider in your communication plan may include shifts in workload, reassigning staff to different areas, and redefining roles and responsibilities for the unit.

As you complete plans for your first solution or change, start to build long term plans for subsequent changes, and begin the process over again: think through the impacts and steps necessary for success.

**Implementation and Operational Support**

Implementation of change is not easy, but should not be feared. An implementation is likely to be successful if it is thoughtfully planned with open communication, transparency, and support. Employees will require training, ongoing support, and perhaps most important, time to adjust. In the short term (a.k.a. the stabilization period), productivity may suffer, but gains in operating efficiencies, quicker turn-around times, and increased customer support will make up for it in the long term.

How do you survive those first few weeks or months? There may not be much of an impact. To the extent that there is, institutions may consider allowing overtime hours for select staff members or hiring temporary assistance to augment existing staff to guard against productivity letdowns and allow for this stabilization and adjustment period to pass. Additional training or retraining may also be needed to ensure staff members are performing tasks as outlined.

Make sure to establish a series of milestone dates to track progress against newly established goals. Plan to communicate the progress to key stakeholders and impacted customers, and make sure to take time to celebrate the accomplishments with the process owners. This will make future changes smoother and more welcoming for the staff to handle.

**Conclusion**

Transforming an organization and effecting organizational change are not simple
tasks. However, thoughtfully moving through each of the above four stages with adaptation to one’s unique institutional settings will achieve the goals you set out to accomplish. Remember to adjust your plan as you go; each setting is different and typically involves a myriad of moving parts, which will not be the same throughout the course of the project.

Transparency, communication, “staying the course,” and celebrating wins are a few of the most important factors to ensure success and build or restore rapport along the road for organizational change. Are you ready for it? Good luck!!

About the Authors

Tim Patterson is a Senior Director in the Higher Education and Life Sciences practice at Huron Consulting Group. Tim has close to 18 years of experience working in areas such as university operations and research administration with an emphasis on grant and contact administration, compliance with cost accounting standards, operational improvement, training development, and audit resolution. He has presented at a number of regional and national NCURA conferences. Tim can be reached at tpatterson@huronconsultinggroup.com

Rob Rubens, CPA, CFF (IL), is an Associate in the Higher Education and Life Sciences practice at Huron Consulting Group. Rob has experience leading teams in areas related to process redesign, compliance, and finance. He has developed project frameworks, assisted with central office reorganizations, and conducted trainings for multiple higher education institutions. In addition, he is a member of NCURA and the AICPA. Rob can be reached at rrubens@huronconsultinggroup.com
The Advantages of Using Fringe Benefit Rates

Jim Carter and Kari Kelly, Huron Consulting Group

Introduction

Institutions have a choice of directly charging benefits by specific identification by individual or using a fringe benefit rate to charge grants and contracts for these costs – who knew? Applying and tracking fringe benefit costs on an individual basis can be one of the more frustrating and maddening activities a research administrator must deal with in budgeting and charging benefits accurately to projects.

Because the tracking of benefits for each individual employee is complicated, more institutions are establishing a fringe benefit rate system to better manage the process. While such rates have great potential for simplifying fringe rate application, reducing errors, and potentially increasing cost recovery, they are actually not suitable for all institutions.

Eastern Kentucky University (EKU), as an example, recently implemented fringe benefit rates on its campus with assistance from the Huron Consulting Group. At EKU, the primary goal was to develop a more efficient methodology for the budgeting and charging of fringe benefits across campus. EKU had other requirements including the ability to create an annual budget using fringe benefit rates and eliminate the detailed processes required by charging benefits on an individual basis.

“EKU’s implementation of fringe benefit rates has helped us solve significant budgeting issues and allowed us to manage our grants more efficiently.”

– Brad Compton, Executive Director, University Accounting & Financial Services, EKU

The implementation of fringe benefit rates at EKU resulted in a decrease in administrative burden for the campus and the simplification of accounting for fringe benefits. However, no two institutions are the same. What questions does a university need to answer in deciding which type of method to use? First, let’s answer some of the basics.

What is the Difference between Direct Charging and Fringe Benefit Rates?

Fringe benefits are employee related costs typically including: pension plans, contributions to health and life insurance, employment taxes, and workman’s compensation. Institutions have two choices that can be used to apply fringe benefits to funding sources, including sponsored projects. The direct charging method allocates each individual’s specific benefits to each salary source while fringe benefit rates use an average rate (normally a percentage of salary) for groups of employees. The example below shows how benefits are charged under each method. Under the direct charge there would be 6 entries, one for each benefit, whereas the fringe benefit rate requires a single line.

The direct charge methodology for fringe benefits is often used by institutions. This method charges each employee’s specific benefit costs to the appropriate fund-

---

1This article is reprinted from NCUURA Magazine, Volume XVLI, October/November 2014, No. 5. It is used with permission of the publisher.
ing source. All benefit costs are tied to an individual and are budgeted using each individual’s benefit package. This results in continual fluctuation of fringe benefit costs by employee. One employee may have individual health insurance versus another employee with family coverage, for example.

When using the direct charge methodology, many institutions do not always charge restricted funds their share of benefit costs. This is because the tracking, budgeting and charging of these costs can be intrusive and complicated. Instead, many institutions choose to manage and pay these costs centrally.

When using the second methodology, a fringe benefit rate, the pooled benefit costs are divided by the total salaries in an assigned employee group. This results in a single rate for each employee group. These rates are then applied to the applicable employee salary to represent the associated benefits for that type of employee. The key components of a fringe benefit rate calculation are the fringe benefit costs, the salaries, and the defined rate structure (employee groups).

**How do you Calculate a Fringe Benefit Rate?**

The fringe benefit rate is an average cost of benefits for all employees within the defined employee group. The same benefits included under the direct charge methodology are included in the fringe benefit rate methodology. Also, one advantage to using a fringe benefit rate is the ability to include additional fringe benefits costs in the rate structure. Terminal leave, paid leave, graduate student insurance, sabbaticals, tuition remission, and other institutional specific benefit costs are often included in the rate structure. This allows the institution to allocate a fair share of these costs to all funding sources. It is important to analyze all employee benefit costs to determine whether they can be included in the rates.

An institution also needs to consider the types of salaries that should be included in the rate structure. In addition to employees’ regular salaries, the following costs should be considered when developing rates: perquisites, bonuses, student salaries, and salary caps.

The defined rate structure, often referred to as “employee groups,” can vary drastically across institutions. What works at one Institution may not work at others. Institutions may choose to calculate a single fringe rate or develop more than 10 rates. An institution should develop a rate structure that will group fringe benefit costs and align employees with the benefit costs they receive. If an institution chooses to develop multiple rates, then it defines an employee group for each rate. Each employee group will have an individual rate calculated and applied. Common criteria used to develop employee groups are employee type, staff categories, salary bands, and benefits received.

Before switching from direct charging to fringe benefit rates, the institution should fully understand the financial and budgeting impacts on the use of fringe rates across the campus. To determine the funding impacts, a comparative analysis should be completed to compare the differences by funding sources, departments, and other criteria. Completing this analysis will highlight the impact of benefits that were not being equitably charged and the funding sources that are paying for the
benefits. The impacts to key stakeholders and the communication and transition plan should also be discussed by all decision makers.

**Advantages of Fringe Benefit Rates**

There are numerous reasons why large and small institutions are switching to fringe benefit rates. Some of the key reasons are described below.

1. *Increased Efficiency*

A fringe benefit rate will pool fringe benefit costs and distribute costs to the benefitting departments and sponsored projects. This will result in one charge for fringe benefits instead of multiple charges for individual benefits (FICA, retirement, health, etc.). The use of a fringe benefit will allow for easier recordkeeping and less maintenance of benefits and costs of programs for employees. A fringe benefit rate will simplify the following processes: the monitoring of fringe benefit charges to departments, grants, and contracts; billing for grants and contracts; and salary transfers. A fringe benefit rate will provide consistency in how benefits are negotiated and paid and significantly minimize the labor distribution programming. The number of transactions required for an individual employee will significantly decrease.

The table below demonstrates how many accounting transaction would be eliminated for an institution with 1,000 employees that each have 6 benefit categories.

**Figure 320.7-1**

</tr>
<tr>
<td>Annual Fringe Transactions</td>
<td>144,000</td>
<td>24,000</td>
<td>120,000</td>
</tr>
</tbody>
</table>

2. *Increased Recovery*

A fringe benefit rate will allow an institution to recover additional costs. Often times, restricted funding sources are not currently charged the full proportion of benefit costs. Some fringe benefits are paid centrally within the institution from unrestricted funds. Fringe benefits that are funded by central administration are only partially recovered through the Facilities and Administrative (F&A) indirect cost rates. Fringe benefit rates will allow an institution to further increase recovery by directly charging full fringe benefit rates to sponsored awards and auxiliary operations. Sponsored awards will be charged their “full” fair share of actual fringe benefit costs, increasing the recovery of fringe benefit costs.

3. *Reduced Risk of Non-Compliance*

Fringe benefit rates are negotiated annually with the institution’s cognizant federal agency (Department of Health and Human Services Cost Allocation Services or the Department of Defense Office of Naval Research). An institution will need to inform
their cognizant agency of the change in methodology. The fringe benefit rate structure is required to be recalculated and negotiated on an annual basis. This decreases the opportunities for charging unallowable/unallocable fringe benefits. In addition, the fringe rates are adjusted annually for any overage/shortage that an institution may incur from prior base year benefit costs.

4. Easier Budgeting
A fringe benefit rate can be used to budget sponsored projects and departmental expenditures. A fringe benefit rate will result in consistency between budgeting and expense practices. The same fringe benefit rate will be used for both budgeting and charging purposes, which will improve the budgeting process for all the institution’s funds and standardize benefit costs across employee groups. A fringe benefit rate will also simplify budget negotiations with sponsors.

Reasons to Continue Using a Direct Charge Methodology
There are several practical reasons why a direct charge methodology is still a viable option. Switching to fringe benefit rates requires an affirmative action by an institution, and this may not be feasible because of budgeting rules. This is also a change that requires support campus-wide to be successful. Fringe benefit rates require predictability to avoid large rate swings on a year-to-year basis, and that information may not be available prior to rates being submitted. Many state-funded institutions receive direct funding for fringe benefits and spreading those benefits using fringe benefit rates may not be allowed under the state funding rules.

Conclusion
There are many advantages to implementing a fringe benefit rate structure. A fringe benefit rate will provide consistent accumulation and allocation for fringe benefit expenses to all functional activities. In addition, the rate structure will simplify the accounting for fringe benefit expenses and reduce the risk of noncompliance. Importantly, the rate structure will decrease the administrative burden to budget and manage sponsored awards and decrease the risk of under-recovering funds.

About the Authors
Jim Carter is a Managing Director at Huron Consulting Group. His experience includes working directly in universities and academic medical centers as well as serving in consultative roles. Jim specializes in partnering with institutions on the preparation and negotiation of F&A rates and fringe benefit rates in addition to strategically addressing financial and regulatory issues. Jim can be reached at jcarter@huronconsultinggroup.com

Kari Kelly is a Manager in Huron Consulting Group’s Education & Life Sciences practice, focusing on preparing and negotiating F&A rate calculations, structuring fringe benefit rates, and improving service center operations. Kari can be reached at kkelly@huronconsultinggroup.com.
320.8 Considering and Effectively Working within Separate or Combined Pre- and Post-award Organizational Structures

Twila Fisher Reighley, Michigan State University

A common debate in research administration focuses on whether traditional pre- and post-award functions should be combined in one organizational unit or separated into two or possibly more offices. The debate is conceptually interesting and is a natural option to consider when functional improvements are needed. Organizational restructuring is not the only alternative, but whether the decision is to restructure or not, there is often an expectation for improved prioritization of tasks, filtering of work, and client satisfaction.

Research Administration/Sponsored Program Offices (SPO’s) have evolved based on institutional values, cultures, resources, structures, and functions in response to external factors, especially sponsor requirements. Pre-award offices often developed out of a desire to support faculty in increasing award dollars for graduate research and many times were associated with the academic side of the university infrastructure, frequently the graduate college, because of research’s integral role in graduate education. Post-award offices primarily developed out of the need to be accountable to sponsors and receive payment for expenditures incurred, which are functions closely aligned with the financial side of the institution.

Separating and integrating pre- and post-award. With the increased volume and complexity in federal and other sponsor requirements, we are seeing more segregation and specialization of duties, particularly at large institutions. Specialization is easier to manage when pre- and post-award functions are in separate offices, which contributes to the continued recurrence of the separated model. Specialization comes with pros and cons. For example, by assigning one group of people to focus on awards, we see benefit because the group will not be regularly pulled away by proposal activity with immediate proposal deadlines. The downside of re-assigning personnel is coping with the huge cyclical peaks in proposal deadlines from the remaining staff. When specialized units or groups handle facets of research administration, it is important to allocate time for coordination of efforts, which can include developing consistent approaches and figuring out who is responsible for identifying and implementing requirements of a new regulation.

I wouldn’t be surprised to hear that many reading this article have experienced more than one organizational model. In addition to the increased complexity and size of the research enterprise, the last decade of budget constraints also created an impetus for continued organizational model evolution. My experience includes seven structure variations. Although a wide spectrum of organizational structures exist, they primarily coalesce around the models described in Figure 320.8-1.

Pros and cons. Being aware of the advantages and disadvantages of various organizational models will help an institution play to its strengths and develop

---

1 This article is reprinted from NCURA Magazine, Vol XLVIII No 4, August 2016. It is used with permission of the publisher.
mitigating strategies and controls. In practical terms, one of the advantages of a model in which one person handles everything in the life cycle related to a particular project is that a faculty member or project administrator contacts one person and ideally that one person provides the solution every time. This is more common, as you might expect, for practical reasons at smaller institutions, which are more likely to have one person or office handle a wide variety of duties. In larger institutions, consistency between projects may suffer and backup coverage during times of absence can be difficult. It also means that certain items tend to take precedence over other items, which can result in negative impacts to covering the whole gamut of work assigned to the office.

**Figure 320.8-1. Typical Organizational Models**

<table>
<thead>
<tr>
<th>Separate pre- and post-award models</th>
<th>Combined pre- and post-award models</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-award offices report to one Vice President (VP)</td>
<td>Typical variations:</td>
</tr>
<tr>
<td>* • Common reporting is to a VP or Asst. VP for Research, a Graduate College Dean, or Provost.</td>
<td></td>
</tr>
<tr>
<td>* • May see dotted line reporting to a second VP.</td>
<td></td>
</tr>
<tr>
<td>* • Post-award offices report under a second Vice President (VP)</td>
<td></td>
</tr>
<tr>
<td>* • Common reporting is to a VP or Asst. VP for Finance or Controller.</td>
<td></td>
</tr>
<tr>
<td>* • May see dotted line reporting to a second VP.</td>
<td></td>
</tr>
<tr>
<td>Pre- and post-award functions are combined under one Vice President (or Vice Chancellor) in one office, though different people may focus on pre-award functions and post-award functions.</td>
<td></td>
</tr>
<tr>
<td>Pre- and post-award functions are combined into one office and one person handles each project from proposal development through award to completion. With this variation, functions that benefit multiple projects are likely pulled out separately, e.g., letter of credit draws on multiple projects.</td>
<td></td>
</tr>
<tr>
<td>Reporting may vary:</td>
<td></td>
</tr>
<tr>
<td>* • Common reporting for the combined model is:</td>
<td></td>
</tr>
<tr>
<td>* • VP or Asst. VP for Finance or</td>
<td></td>
</tr>
<tr>
<td>* • VP or Asst. VP for Research</td>
<td></td>
</tr>
<tr>
<td>* • May see dotted line reporting to a second VP or reporting through a Provost or Chancellor.</td>
<td></td>
</tr>
<tr>
<td>* • Less common, but sometimes sponsored programs offices will have dual reporting to two VPs.</td>
<td></td>
</tr>
</tbody>
</table>

**Variations.** A variation on the one person “does it all” is that a combined team “does it all.” My personal favorite is a structure that allows the amount of specialization appropriate for the organization’s size, but provides integration accountability at an operational or oversight level by a person whose primary focus is supporting pre- and post-award, i.e., normally below the VP level. Early in my career, I prepared the operational budget request for the SPO of a combined operation and I remember the office director being grilled as two bosses (VP for Finance and Provost) took turns asking the “harder” question. (The director of course did a great job!) I recall thinking: No way would I want to report to two VPs. Fast forward a few decades and I see benefits to the current organization structure in which I work having oversight
of two offices, one managing pre-award and the other post-award administration, and reporting to two VPs (Finance and Research). The joint reporting to two VPs supports the link to faculty and development while providing access to systems and promoting accountability. While I will acknowledge a bias, I’ll also note that having oversight for both offices helps keep people talking and supports integration.

**Factors to consider.** Some ways of structuring, work better than others, but a variety of ways can be effective. Please see Figure 320.8-2 for a summary of some advantages and disadvantages of two typical organizational structures. When looking at the advantages and disadvantages and determining structure, the following organizational or award attributes merit consideration:

**Figure 320.8-2. Considering Separate Combined Organizational Models**

<table>
<thead>
<tr>
<th></th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Separate</td>
<td>• Allows more depth and focus on either area.</td>
<td>• Increased time needed for understanding specific projects and increased coordination between areas.</td>
</tr>
<tr>
<td></td>
<td>• Improves ability to allocate resources and prioritize at a management level instead of the rush proposal and other emergencies always taking precedence.</td>
<td>• Challenges in communicating because of the differing experiences and priorities of the two areas.</td>
</tr>
<tr>
<td></td>
<td>• Manageable staff size may contribute to cohesiveness.</td>
<td>• Multiple points of contact and expertise for administration depending on where something is in the award cycle and the issue involved.</td>
</tr>
<tr>
<td></td>
<td>• Pre-award: when reporting to a Provost or VP for research, the leader is normally aligned with the academic community; the primary emphasis is supporting principal investigators and the research mission.</td>
<td>• Possible lack of understanding as to who is responsible, with duplication in effort in some areas and other areas in which items are not being adequately addressed.</td>
</tr>
<tr>
<td></td>
<td>• Post-award: more likely to have a strong operational leader and integration with other campus systems; the emphasis is normally on managing financial and regulatory compliance.</td>
<td>• Focus and prioritization challenges</td>
</tr>
<tr>
<td>Combined</td>
<td>• Increased integration, communication, and consistency in management of an award.</td>
<td>• Staff size (particularly for large institutions) may contribute to a lack of cohesiveness.</td>
</tr>
<tr>
<td></td>
<td>• Less duplication of effort.</td>
<td>• May not find a leader with expertise in all areas.</td>
</tr>
<tr>
<td></td>
<td>• Client convenience: one point of contact for all or many project life cycle stages.</td>
<td>• Depending on the priorities of the leader, the institution may see less client support or more compliance risk than with the segregated model.</td>
</tr>
<tr>
<td></td>
<td>• Dual emphasis on supporting: a) principal investigators and the research mission and b) accountability and compliance.</td>
<td>• Types and mix of awards: contracts vs. grants, size of awards, types of compliance issues</td>
</tr>
</tbody>
</table>

◆ **Volume of awards:** two offices and specialization makes more sense when dealing with large volumes as it allows more focus and development of expertise in the subject area.

◆ **Sponsors and variety of sponsors:** a portfolio of predominately NIH and foundation funding is different to administer than having a large breadth of sponsors.

◆ **Types and mix of awards:** contracts vs. grants, size of awards, types of compliance issues

◆ **Expertise and number of staff:** the larger the institution, the more likely the benefit from specialized units. Expanded responsibility in one unit is sometimes determined by who is available to serve when a new regulation or challenge is identified.

◆ **Information systems or lack of systems:** impact of computer/electronic systems becomes apparent when filtering criteria to sort and route transactions are limited.

**Working within current structure.** In addition to considering the advantages
and disadvantages of various models and the institutional attributes, it is also worth weighing the costs versus benefits of organizational restructuring. If the benefits don’t exceed the costs or if you’re not the one making the decision, there are additional ways to make improvements.

**Understand each other’s challenges.** It helps to remember when duties are separated that both pre- and post-award staff face pressure from being at the end of a cycle, i.e., 1) pre-award offices are often the last step in getting: a) a proposal submitted, which results in compressed timeframes to review and pressure to make hasty decisions, or b) an award executed allowing projects to start; and 2) post-award offices are downstream of pre-award decisions and sometimes those decisions can negatively impact post-award workload or capacity.

**Making it work.** No matter what organization model is used, *pre-award staff can influence successful implementation at a campus by:* understanding and caring about the post-award impacts of pre-award decisions; keeping costing knowledge current; and getting feedback and learning from post-award offices as to what works in the institution’s accounting/information system(s).

*Post-award staff can influence successful implementation by:* being flexible to the needs of the project and the sponsor; providing constructive feedback to pre-award staff; and understanding that creating proposals in short timeframes is challenging and not always conducive to perfection.

*Both areas can benefit by:* striving for transparency in approach; working through roles and responsibility; reviewing processes, coordinating efforts and collaborating, not competing for resources.

**In summary.** Organizational models, associated advantages and disadvantages, and organizational attributes have been reviewed above and in Tables 1 and 2. Thoughtful consideration of the organizational structure that effectively balances focus and integration in supporting clients, work completion, and the research mission can have positive impacts. Significant variances in organizational structure can work if the unit directors are committed to work within the roles established, have or develop the expertise to competently execute defined roles, and support each other in their defined roles. Considering non-structural changes such as education, policy, procedure and system changes, rather than organizational restructuring can minimize disruption and still yield improved outcomes. It isn’t always easy or clear cut, but finding ways to effectively improve our support for research and other scholarly work of faculty at our institutions is rewarding.

**About the Author**

**Twila Fisher Reighley,** MBA, Assistant Vice President for Research and Graduate Studies at Michigan State University has oversight responsibility for MSU centralized offices providing pre- and post-award administration and accounting. <tr>
<td>• Ability to juggle multiple deadlines and meet them satisfactorily</td>
</tr>
</tbody>
</table>
Qualifications: Specific (choose as many as apply)
- Knowledge of university grants management policies and procedures
- Experience working with a wide variety of programs and funding agencies
- Ability to provide accurate advice and timely resolution to questions/problems
- Knowledge of policies and procedures in federal grants; familiarity with the nonfederal grant arena
- Computer proficiency, preferably knowledge of _______
- Extensive and demonstrated pre-award, proposal development, and grant writing experience
- Experience drafting and negotiating research and research-related agreements
- Understanding of policies and procedures related to research administration, including but not limited to accounting, purchasing, personnel, regulatory compliance, and financial management
- Working knowledge of the FAR, CFR, DUNS numbers, OMB Circulars, Grants.gov and intellectual property laws along with general knowledge of accounting principles and financial management
- Demonstrated ability to foster cooperative and mutually supportive relationships with faculty, administrators, staff, and others
- Demonstrated knowledge of proposal preparation strategies, including budgeting/budget development
- Experience analyzing and interpreting documents
¶390 Knowledge Check

AIS editors

The Q&As at ¶390.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 300 has been understood. Note: For the answer key for ¶390.1, see ¶390.3, which appears on a separate page (page 390:5) for testing purposes.

Discussion topics at ¶390.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶390.1 Q&As

1. As discussed in ¶305, research administrators often stratify risks into three categories, which include all of the following EXCEPT:
   (a) Transactional risk
   (b) Scientific misconduct risk
   (c) Institutional risk
   (a) Specific sponsor risk

2. Typically an OSP approves the official sponsored award documents (proposals, awards, reports, amendments, etc.) on behalf of the governing body of the institution through the process known as
   (a) Institutional commitment
   (b) Expanded authority
   (c) Delegated signing or signature authority
   (d) Cognizant authority

3. Although research administrators have several “constituencies,” perhaps the “first” such customer group is
   (a) Federal sponsors
   (b) Industry sponsors
   (c) Principal investigators
   (d) Institutional vice presidents and provosts

4. The pre-award function typically encompasses the following types of activities EXCEPT:
   (a) Assisting faculty in locating funding sources and submitting proposals for support of research and other faculty-driven activities
(b) Accepting awards and ensuring they are administered consistent with sponsor and institutional policies

(c) Mediating the award process with the sponsor to ensure university research policies are adhered to, and that other financial and programmatic terms and conditions are acceptable to the institution

(d) Monitoring spending against budget, noting certain trends such as overspending or underspending

5. The draw down of funds on federal awards typically is accomplished through

(a) Co-mingled bank accounts
(b) A letter-of-credit mechanism or system
(c) Cost sharing mechanisms
(d) Pre-authorized cost transfers

6. Often, the “success” of any one of the OSP organizational structures is most heavily influenced by

(a) Physical layout of the office or offices
(b) Efficient and proper tracking of award activity
(c) Length of time the institution has been involved in sponsored activity, especially federally sponsored activity
(d) The caliber and competencies of the individuals within an institution

7. At many institutions, responsibility for the day-to-day administrative management of the award generally rests with staff at the

(a) Department or local level
(b) Provost or vice presidential level
(c) Central administrative level
(d) Central operational level

8. The federal government only distinguishes between large and small research entities in two respects. Which of the following is one of these?

(a) Schools with less than $5 million in organized research base are exempt from certain award recordkeeping and reporting requirements.
(b) Schools with less than $5 million in organized research base are exempt from certain financial conflict of interest compliance requirements.
(c) Schools with less than $25 million in sponsored expenditures in a given year are not required to submit a disclosure statement to their cognizant agency.
(d) Schools with less than $30 million in sponsored expenditures in a given year are not required to submit a disclosure statement to their cognizant agency.
390.2 **Discussion Topics**

1. What is meant by the types of risks associated with sponsored research administration? How can the sponsored research administrator be assured that his or her team is paying attention to all kinds of risks associated with sponsored research activity and not focusing too much on any one type?

2. Why is research cooperation and collaboration between individuals, departments, and institutions becoming more common? What can the OSP do to smooth this collaboration? Does how your OSP is organized enhance or hinder cooperation and collaboration?

3. It’s hard to avoid some sort of office re-organization during one’s sponsored research administration career. What do you consider key factors in successfully undergoing an OSP reorganization?

4. Organizing workflow to ensure a balanced and equitable distribution of work in a staff member’s “portfolio” can be important. What does this mean at your institution and how is it accomplished? Has the substance of a staff member’s portfolio changed in light of recent budgetary concerns at your institution?

5. Discuss the concept of “cross-training” and how this plays out at your institution for the functions of the office of sponsored research? Could any changes/improvements be made in the program?

6. During times when money is not available for staff raises, promotions, and incentives, what kinds of nonmonetary benefits or compensation could you offer staff members?

7. How has the sponsored programs office workforce changed over the past decade? What will the workforce look like over the course of the next decade? Is your office prepared to accommodate these changes, and if so, how?

8. What advise would you give a staff member who is transitioning from a position in central research administration at your institution into a position in departmental administration? What if the reverse were true — the person is transitioning from a position in departmental administration to one in central administration — how would your advise be different?
1390.3 **Answer Key**

Following are the correct answers to the questions included at ¶390.1.

1. (b) Scientific misconduct risk
2. (c) Delegated signing or signature authority
3. (c) Principal investigators
4. (d) Monitoring spending against budget, noting certain trends such as overspending or underspending
5. (b) A letter-of-credit mechanism or system
6. (d) The caliber and competencies of the individuals within an institution
7. (a) Department or local level
8. (c) Schools with less than $25 million in sponsored expenditures in a given year are not required to submit a disclosure statement to their cognizant agency.

Introduction
Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter discusses ways research administrators can harness communication skills effectively for success both within and outside the institution.

Research administration encompasses a variety of skills, including, among others, cost accounting, interpretation of government regulations, the management of large quantities of data, and problem resolution. Kim Moreland of the University of Wisconsin, Madison and her colleague, Dr. Kennis Wessel, present a most compelling case for the fundamental importance of communication skills for everyone engaged in research administration, regardless of their specific duties and responsibilities. At the very beginning of their chapter, they come right to the point: “The tools of effective communication are essential to effective research administration.”

Moreland and Wessel provide a thorough overview of the essential principles of communication and an analysis of the principal media by which we communicate. If one were to take a close look at how most research administrators spend most of their days, one would find that they are engaged in communication. The particular variety of communication and the people with whom they are communicating vary greatly, but when all is said and done, communication is what most research administrators do most of the time. Given that fact, it’s quite remarkable that most research administrators have had to acquire their knowledge of communication and develop their communication skills without much formal training, i.e., on the job. For all of us, no matter what our specific role, this chapter is chock full of useful information that can be put to use very quickly.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶505, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶520), practical tools (at ¶530), and case studies (¶540). A “knowledge check” containing Q&As and discussion topics is included at ¶590.
Communications in Research Administration: The Farmer, the Cowman, and the Liaison

Kim Moreland
Associate Vice Chancellor for Research Administration and
Director, Research and Sponsored Programs
University of Wisconsin, Madison

Kennis Wessel, Ph.D.

The farmer and the cowman should be friends.
One man likes to push a plough, the other likes to chase a cow,
But that’s no reason why they cain’t be friends.
Territory folks should stick together,
Territory folks should all be pals.
—Oscar Hammerstein, Oklahoma!

A research administrator is a kind of middleman. As communicators, research administrators encounter a unique difficulty, a consequence of their position between two discrete, dynamic parties. They are liaisons, and this role produces a unique communication challenge.

The key function of research administrators is to bridge differences between constituencies who are driven by different goals and different working models, yet who are essential to each other’s very existence. These constituencies have different vocabularies, different calendars, and different motives. Research administrators must serve the needs of all. They must find tools of communication that suit the needs of each constituency. They must also promote their own cause, a role of service, and explain policies and procedures that are often determined by others.

These conditions inevitably create stress. Just as inevitably, the burden can be lightened by understanding the nature of communication. The tools of effective communication are essential to effective research administration.

The musical Oklahoma! depicts challenges facing two natural enemies, farmers and cowmen. In Oklahoma, a wild new territory, they inevitably compete over ways to achieve growth. Farmers and cowmen have different goals. They utilize resources differently. They are stretched to find common ground. But the territory is unforgiving, and their chances of survival improve dramatically through collaboration. Wise communication makes the difference between perishing alone or surviving together.

Similarly, wise communication can enhance the collaboration of faculty with sponsors and administrators. Research administrators stand at a communications nexus with those parties. They must assume leadership to enable interaction among constituencies. Effective communication by and through research administrators is the network by which folks stick together, by which they become “pals,” in the territory of research support.
The Territory Ahead

General principles underlie all communication in research administration. Although contextual differences influence communication choices, the principles have a broad reach, embracing all contexts.

This chapter explores some communication principles, drawing many examples from research administration. At the outset, an essential, inclusive model serves as a basis for discussing the communication needs of research administrators. Next, the chapter discusses media by which professionals communicate, with special attention to media used by research administrators. Third, the chapter lists key constituencies with whom research administrators collaborate, discussing attributes of each relationship and their influences on the character of communication. Fourth, the chapter delves into elements of strong communication, listing several effective tools and making recommendations. Finally, there is a discussion of essential purposes that guide effective professional communication.

§505.1 Principles of Communication

Basic principles of communication underlie the most sophisticated professional interactions. By identifying these principles, research administrators are able to improve communications at every level, from each simple, spoken word and each instinctive gesture to complex, formal systems of information exchange. By considering these principles, research administrators acquire tools to improve their professional communications.

Communication involves several factors, shown below in a communications model. Communicators should recognize a few basic components that are always present. They should also recognize the communications feedback cycle, the nature of symbols, and impediments that make communication difficult.

A Model of Communication

Communication models identify discrete, interrelated components of communicative acts. A simple model identifies

◆ a sender,
◆ a message,
◆ the medium (or media),
◆ the receiver, and
◆ impediments to effective communication.

Even a simple communication act is complex. In any single instant, the following factors are involved:

◆ The sender is the originator of a communication event. The sender may be a person, institution, organization, or other.

Example

Penelope, a research administrator, is a sender.
In any communication event, each contributor is a sender at some point in time. A sender may be active or passive; passivity itself is a message.

◆ The message is the content of communication. This content may be ideas, attitudes, or feelings. It may be intended or unintended. It may be explicitly stated, implied, or (sometimes erroneously) inferred. Ideally the sender knows what she intends to communicate.

Example

Penelope: “Professor Adams, your proposal doesn’t include full indirect costs.”

Usually the sender intends that a communication occur, but from time to time, unintended messages are sent.

Example

Penelope puts the proposal in a folder, straightens up, and glares at the researcher.

In this case, and in many professional situations, nuances can betray communications. For instance, regardless of what one is saying, body language can support the message or completely contradict it. When someone is speaking to the boss but she’s shuffling papers, the speaker feels a disconnect. Penelope’s actions and the boss’s shuffling of papers send messages that are probably unintended.

◆ The medium is the vehicle by which a message is transported from sender to receiver. In daily communications, research administrators have opportunities to select from a variety of media. Our most essential communicative medium is language, which may be written or spoken. Other visual and audible media also communicate, such as charts, graphs, props, and electronic media. Many factors contribute to the complete communication, such as body language, clothing, font choice, paper quality, screen size, and others.

Examples

Words:

• “You might wish to revise the budget to include indirect costs,” or
• “There is a university policy on indirect costs,” or
• “If you want to submit this proposal, you’ll have to get it right,” or
• “Look, dim-bulb, you don’t have a choice.”

Deeds:

Penelope —

• explains “indirect costs” (again), or
• refers the researcher to explanations on the Web site, or
• provides an example of a funded proposal.
Gestures, physical and verbal:

Penelope —
- speaks softly and slowly, or
- comes from behind her desk for less formality, more openness, or
- slams her fist on the desk.

◆ The receiver is the person who hears, reads, or otherwise perceives the message. Here, again, receivers become senders, exchanging roles with the original sender.

Example

Professor Adams, a researcher, is a receiver.

Impediments to Communications. Communications impediments are factors that prevent the message from being fully received or understood. They may be present in any communication setting. An impediment may occur if the speaker has a different vocabulary from the intended audience. Sometimes inefficiency in the medium such as a bad microphone (that causes “noise”), interruptions in a meeting, or an unfocused presentation intrude. Sometimes a difference of goals or attitude intrudes, causing the audience to “tune out” the speaker’s message.

Sometimes receivers stop hearing. For example, when the Oklahoma! farmer erects fences to keep cattle away from his crops but the rancher wants free-range grazing rights, the polar opposition may seem irreconcilable. Research administrators face an extraordinary challenge whenever they convey dense regulatory information, because the material is daunting and uninviting. In each situation, receivers may stop listening. Simple examples of communication impediments are included below.

Examples

Verbal: Language barriers, such as the jargon of research proposals.

Circumstances: The proposal deadline is this afternoon, which creates stress.

Physical setting: The furniture arrangement favors one person more than another.

Sounds: A new construction project is underway right outside your window.

Other Characteristics of Communication

Communication models give the impression that communication consists of discrete components that behave in predictable ways. That impression is faulty. Words mean different things to different people. Communicators often don’t take turns in polite ways. The ground shifts during communication as attitudes change and new information opens new challenges.

Communication Cycles. Communication cycles occur in even simple dialogue. A communication event generally continues beyond receipt of the message. A receiver may respond to the communication with the twitch of an eyebrow or a fully developed e-mail — and the response is itself a new message. These responses, both overt and
intuitive, communicate to the original sender. In turn, these may provoke some adjustment in the sender, stimulating a new message.

In this way, a receiver becomes a sender, and the original sender becomes a receiver. Such a “feedback loop” enhances communication effectiveness, since both sender and receiver adjust the message (and sometimes the medium) to meet the changing communication needs. Like the feedback loop in a thermostat, the communicators monitor the environment (air temperature), then adjust the message (turn on the heater) until some equilibrium is achieved (a new temperature). Ideally that equilibrium suggests that the message is understood, or that some level of agreement has been reached. In the example below, note that each response stimulates a new message.

**Example**

Penelope: “This proposal is excellent, but the indirect cost calculations are incomplete.”

Professor Adams: “What is missing?”

Penelope: “You need to charge indirects on the two subawards to other universities.”

Professor Adams: “But, wait. Isn’t that double-dipping?”

Penelope: “Good question. Here, let me show you. …”

Successful communication is the result of care in crafting the message and selecting the right medium for the specific receiver. Most successful communication depends on careful use of the feedback model. From the moment a message is set in motion, a good communicator monitors responses and adapts appropriately. Good communication is rarely one-directional, but involves sensitivity to the other communicator(s) and adapts to meet changing conditions. Communicators should recognize the virtual inevitability that conditions will change.

Particularly in sensitive exchanges, research administrators should consciously, continually evaluate the feedback they receive. For example, attitude and emotion often intrude during contract negotiations or dialogue about problems with a grant. An administrator should be ready to alter communications strategies. By doing so, one improves, for example, the likelihood of achieving a productive compromise on a contract. By adapting, for example, one may find creative approaches to cost overruns. Flexible, agile communication is a powerful tool.

**Symbols and Symbol Systems.** Symbols and symbol systems mediate communication. Although one sometimes speaks of “direct” communication, as when two communicators speak face-to-face, directness is an illusion. The degree of indirectness may vary, such as the difference between lovers’ whispers and an overseas “snail mail” letter. But an inevitable gulf sits between two communicators who, after all, have different minds with different thoughts. No “Vulcan mind meld” provides direct access from one mind to another.

Instead, communication is accomplished by means of symbols. The sender chooses a word (a symbol), with an intended meaning. But communicators must always be aware of the potential for differences in meaning. The intended meaning may or may
not coincide with the receiver’s idea for the same word. All communication is mediated by a symbol and by the mental activities of cognition and interpretation. Communication depends on an act of perception and an act of interpretation.

The set of symbols that pass between sender and receiver is the medium. Symbols permit us to refer to things and actions in absentia. For example, the words “elephant,” “grant,” “travel,” and “research” are symbols that permit us to conceptualize phenomena without being in their presence.

The referent of the word — the real elephant, real grant, real research, etc. — is the word’s most essential meaning. The most powerful symbol systems — languages and mathematics — obtain their power by an extensive vocabulary (the essential referential tool) and by their flexibility. The sophistication of language brings challenges to the user: word choice, syntax selection, clear enunciation, attitudes in speaking, and others.

*Different Kinds of ‘Meaning.’* To communicate effectively, it is critical to understand the implications of mediation. One must be aware that meanings are both conventional and personal. Thus, meanings are held in common (by convention) and are also unique to the individual (personal), based on social circumstance and experience. Meanings are not just those agreed upon, as in a dictionary. Meanings are in people. We have a dictionary definition of the word “flood,” but a resident of Phoenix will likely respond to that word differently than a resident of New Orleans. Consider that many words and concepts stimulate emotional interpretations. Possible reactions to “audit,” “FEMA,” “feminism,” or “misconduct” are simply examples of words that provoke divergence in meaning and/or feelings.

For the most part, physical gestures have personal meanings, but few have conventional meanings, as in a dictionary. One may infer meaning in someone’s body language, but inference is often faulty. In some cases, personal meanings may find cultural agreement. The head waggles of a subculture group may express attitude and group identity, but have limited meaning beyond the group. Still, some gestures form a vocabulary. Almost everyone in our culture recognizes nodding for “yes,” head shaking for “no,” “V for victory,” “V for peace,” and “thumbs up” for approval. In a different culture, the same gestures may have other meanings. Depending on the culture of the receiver, they may or may not be interpreted in a way that supports the intended message.

*Social Aspects of Communication.* Communication is inherently a social act. It may involve all aspects of social environments, including social status, power, and goals. Any communication either grows out of, or is grounded in, such social matters as perceptions of competency, experience, gender, race, age, and all other traits to which humans respond. Senders and receivers often have preconceptions of the “other” and the motives of this other. Good communicators are aware of — or intuit — the diverse social implications of every communication act. This awareness is the basis for crafting the medium (and possibly the message itself) to achieve the desired impact.

The best communicators try to identify their own preconceptions. For instance, a manager should at least be aware of how he or she responds to a speaker’s clothing, body language, and word choice. A research administrator may hold opinions of a researcher based on past interactions. Recognition of those biases is critical in crafting
effective communication, whether one is the sender or receiver of the communication. All parties should respond to the actual message in a communication, rather than to factors that may be irrelevant to the current situation.

A receiver is usually not passive. Humans instinctively create or derive meaning from a situation. Even when the receiver encounters a medium that is not laden with meaning, the receiver often infers meaning. A gesture or expression might be perceived variously as support for the message, as ironic denial of it, or as ambiguous. Good communicators modulate their messages, trimming out excess that can lead to misunderstanding.

1505.2 Delivering the Message: Selecting the Best Medium

Selection of the medium affects the character of the communication. Modern communications are often technologically sophisticated, providing new media with new solutions and new challenges. Research administrators, working under pressure with immediate deadlines, still have considerable resources.

Time is a factor in selecting a medium. On the one hand, one may have time to reflect on the best medium, as is usually the case with a policy change or a question about a cost transfer. But sometimes one must act immediately, as in the case of an impending application deadline, when a proposal must be changed prior to submission. With time, a host of alternatives is available, from e-mail to face-to-face meetings to express mail. In haste, one’s selection may be limited to the telephone or face-to-face dialogue.

Given time to select a medium, the communicator should suit the medium to the message and the context. The matrix included in Figure 1 offers some quick tips about selecting the appropriate communication medium.

</tbody>
</table>
At a minimum, decisions about which media to use should be based on considering the factors included in Figure 2.

Speech and e-mail are generally the most accessible forms of office communications, and therefore the easiest to use. Multimedia, on the other hand, generally has a low ease-of-use and high costs. Confidentiality is of concern with all e-mail and, of course, when using any broadcast publication. It is easiest to protect confidentiality in private dialogue and with various kinds of mail, such as certified mail. Conversation and e-mail are often highly informal; letters tend to be more formal, as do published documents in official formats and bearing official letterheads and logos. Complexity can be inherent in any communication medium. Written materials may be long (complex) or short (less complex), and multimedia is inherently complex because of its ability to engage our minds at various levels simultaneously. Whatever other presentation strategies one employs, visual information is best communicated by visual means. It is much more effective to show a pie chart or molecular structure diagram than it is to describe and explain one verbally.

Our principal communicative media are spoken, written, visual, or multimedia. In practical terms, these are available to research administrators in such forms as person-to-person communication, e-mail, Web sites, letters, and electronic conferencing. Each of these offers advantages and has disadvantages. The medium should be selected for appropriateness to circumstances and needs. Below are discussions of and suggestions for effective use of different communication media.

**Person-to-Person Communication**

Most communication is interpersonal. The standards for interpersonal meetings vary. If the meeting is spontaneous, it is probably informal. If scheduled, it tends to be more formal. For relatively formal meetings, some guidelines should be clearly stated in advance, such as expectations for participation and standards of preparation. Advance information helps participants contribute efficiently or merely process content effectively. Research administrators often feel that the workday consists of meeting after meeting — a common malady that prompted Patrick Lencioni, a management consultant, to produce a book called *Death by Meeting*.1 Frustration increases when time is wasted in meetings that are poorly planned or badly managed.

Managers often schedule formal staff meetings on a regular basis. In such meetings, a published agenda helps maintain efficient use of time. Ideally every participant will be consulted in advance about topics for discussion at the meeting.

---

Free Flow of Ideas. In formal meetings, regardless of the number of participants, efficient communication is achieved by keeping to the agenda, diving quickly to the gist of each topic, and keeping meeting goals in sight. Summaries help keep attendees focused on decisions and actions. Such summaries typically restate essential points discussed, agreements made, and possibly also minority opinions expressed. Summaries could come at the end of each agenda item or at the end of the meeting.

Standards of conduct should be stated in advance. When differing opinions are expressed in person-to-person meetings, rules of fairness and respect come into play. It is important to listen carefully to an opposing view. If summaries of the discussion are written and published, those who hold minority opinions should have an opportunity to contribute, such as a chance to review the summary before it is published. Often the tone of a meeting shifts when opposing views are aired. Meeting facilitators or leaders should keep discussions rational, content-based, and free from personal remarks. They should aim for civility in all discourse.

On the other hand, disagreement is inevitable. All participants should be encouraged — overtly, if necessary — to respect differing points of view. They should be cautioned to avoid dominating the meeting with their opinions. Good leaders ensure that all participants respond to content without becoming defensive. This is done by overt compliments and expressed appreciation. Whether a meeting is full of agreement or conflict, a good manager will frequently say “thank you for your ideas,” or “this was a good discussion; I appreciate your contributions.”

Listening Skills. Research administrators should cultivate listening skills. Ideally half of a communication cycle is receiving the other’s input. Listening well expresses respect for the other communicator and for the principle of effective communication.

Communicators should place themselves in the shoes of the “other.” They should remember the bumper sticker: “I know you believe that you understand what you think I said, but I’m not sure that you realize that what you heard is not what I meant.” Each speaker is responsible for clarifying the message, and conversely, each listener

---

**Figure 3: Tips for Developing Good Listening Skills**

- For a substantial period of time, talk little and listen carefully.
- Provide encouragement to the other person with body language and words.
- Draw out the thoughts of the other person: ask questions, and elicit opinions and values.
- Restate ideas expressed by the other person, and ask them to confirm whether you have heard correctly.
- Be careful to avoid correcting every inaccurate interpretation of your own remarks; keep dialogue positive.
- When points of view are expressed with emotion, use analytical questions to get beyond emotion to the reasons behind viewpoints.
- Be careful to hear what is actually said and not what you want to hear.
must take pains to hear what the other communicator actually says. Care in listening is critical in effective communication.

To develop good listening skills, research administrators may wish to practice the tips shown in Figure 3.

**Body Language and Vocal Tone.** When two people meet face-to-face, the degree of complexity increases because many aspects of personality, dress, and gesture enter into the equation. Nuances of body language and vocal tone are tangible factors in the communication.

Figure 4 shows some tips for using body language effectively.

<table>
<thead>
<tr>
<th>Figure 4: Tips for Using Body Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Be careful to convey honesty, since the body may send signals that contradict spoken language.</td>
</tr>
<tr>
<td>• To imply support for a speaker, make eye contact, lean forward slightly, or nod.</td>
</tr>
<tr>
<td>• Be aware of looking away or down, which conveys lack of confidence or disinterest in the other communicator.</td>
</tr>
<tr>
<td>• Be aware of wrapping your arms around your body or covering your eyes, which convey conflict.</td>
</tr>
<tr>
<td>• Observe your body language in a mirror, or request feedback from a trusted friend (not a co-worker).</td>
</tr>
</tbody>
</table>

**E-Mail**

E-mail is user-friendly, offering tremendous power in speed and flexibility. E-mail is often more efficient than personal dialogue, since users can focus exclusively on the written context. Since the message is written, e-mail offers the advantage that it can be stored, re-examined, and re-sent as needed. E-mail is particularly useful for notes to staff and other colleagues.

E-mail is sometimes counter-productive, however. Occasionally e-mail is abused by those who mix personal and professional messages, or who use professional settings for private messaging. The speed advantage of e-mail is sometimes a disadvantage, since e-mail is often written hastily, without the checks one normally makes in more formal correspondence.

**When to Use – and Not Use – E-Mail.** E-mails are risky in some contexts. When the topic is emotional, sensitive, or complex, one should consider using other media instead of e-mail. For instance, avoid e-mail for personal critiques or evaluations. For confidential exchanges, face-to-face meetings or protected mail is much more secure.

When the topic calls for thoughtful discussion, e-mail often results in long, repetitive strings — and these tend to exacerbate rather than relieve the problem. This problem is shown in the example below, the final transmission of a long string of e-mail exchanges. This example, discussing a contract negotiation, came to be known as the “Dry Cleaning Theory of Research Administration.” Throughout the correspondence, a
steady deterioration of tone evolved with each e-mail, causing a shoot-out mentality and hurtful accusations. At the endpoint of the exchange, the pot boiled over, leading to an impasse between the writers. This exemplifies knee-jerk spontaneity, the result of e-mailing without the restraints usually used in direct speech. Haste caused unwise and unthinking liberties, unkind accusations, short-sighted analysis, and a superficial recommendation. Notice the hasty, ill-considered style and content.

Example

Kevin – Please read the trail of E-mail exchange below. I will really appreciate if someone can explain as to why things going for review and disposal to Eleanor sits on her desk for a long time. May be she is over worked by handling too many things. If you recall I voiced this concern long time ago and at time I was assured by Maggie B., who was new to the job, that she will take care of this issue. Why RSP can not set “in and out” schedule? Dry cleaning shops have it: in by 11 AM out by 4 PM. I understand that tight schedule will not work here. Thus, why not: In by “Tuesday — out by Friday.” As far as I could see or understand most of the things don’t get done until several reminders. In this process don’t you think someone’s time is wasted. The worst part of the whole system is that if there is an issue then the PI is not kept informed. In short, I fail to understand why signature of a simple amendment should take so long? [Names have been changed]

This e-mail expresses unveiled hostility. But even neutral e-mails are subject to communication error, such as misinterpreted meaning or tone. Neutral intentions are often misconstrued as conveying a negative tone. A suggestion is often misconstrued as an instruction or command. A deadline reminder is often taken as personal criticism. A humorous remark is often read as sarcasm. The research administrator should compensate for the brevity of e-mail and haste in writing and try to anticipate the spirit of the receiver in reading it.

**Figure 5: Tips for Using E-Mail**

- Message titles should be specific, meaningful, and relevant.
- E-mail should be brief.
- Slow down to proofread for clarity and accuracy, to reduce misinterpretations.
- Carefully select recipients; remember an entire address book opens at a single keystroke.
- Distinguish between “respond” and “respond to all.”
- Remember, e-mail is not secure; encryptions are easily broken.
- Avoid attaching large files when you’re sending to many recipients.
- Distribute large files over multiple e-mails, or place in a common file or on a Web site.
- Overuse of fonts and graphics can be annoying, particularly when viewed by users using various systems.
Unless one tempers the advantage of e-mail — speed — by care and thoughtfulness, e-mails can create as many headaches as they cure. Reasonable guidelines can make e-mail effective and ethical. Figure 5 offers some tips for e-mail users.

Research administrators often communicate in jargon and acronyms. Although jargon is central to the work, it is not always understood by the receiver. Even within the “in group,” such terms change quickly. A new shorthand will not be equally understood by everyone. Consider the example below of an e-mail written in a shorthand commonly used for instant messaging and social exchanges. The translation of the e-mail follows the example.

**Example**

**E-mail:** JW Pls gimme a cll l8tr wen ur fre. I lft the ppw and 411 @ home. I’m OOO at 5pm. AFAICT U R right, we nd sig b4 acct. SWDYT? if you need help, call 2nite @ home B4 10p or SMEM BCOZ i’m bZ nw. Stil nd to RTM and upd FAQL. NUFF . I’ll BCNU. FTTB HAGD. POOF.

**Translation:** Just wondering. Please give me a call later when you are free. I left the paperwork and information at home. I’m out of the office at 5pm. As far as I can tell, you are right, and we need the signature before an account can be set up. So, what do you think? If you need help, call tonight at home before 10p or send me e-mail because I’m busy now. Still need to read the manual and update the frequently asked questions list. Enough said. I’ll be seeing you. For the time being have a good day. Bye.

**Business Letters**

Effective letters are clear and interesting. They keep to the point. They are economical and complete. These attributes are all achieved best by thinking before writing, then revising the written word doggedly.

Good writing has a purpose, and the purpose should be vivid. Professional correspondence, which is inherently purposeful, should be targeted to the recipient. The purpose should be stated unambiguously in the letter. The best placement for a statement of purpose is in the first or second sentence. For instance, the first sentence of a cover letter for a job opening within the office of sponsored projects might be “This letter is an application for the position of Grants Specialist.”

Another example is the clear, strong statement of intent that opens this 1963 letter from President John Kennedy to Alabama Governor George Wallace —

*In response to the question raised in your telegram of last night, Federal troops would be sent into Birmingham, if necessary, under the authority of Title 10, Section 333, Paragraph 1 of the United States Code relating to the suppression of domestic violence. [Emphasis added]*

Good writing is user-friendly. All good communication is about the receiver, and good letter writing keeps the reader’s mind free of distraction, so the reader remains attentive and the journey is clear.

Good letter writing is based on solid information. The reader should be given enough information to understand the writer’s claims. On the other hand, excessive
length is a serious handicap, since it obscures essential concepts. A writer should think in terms of “take-away” value: what essential ideas should the reader take away from the letter? A research administrator should trim away any excess material that detracts from the essentials.

**Coherent Structure.** Good letter writing has structure. Generally that structure is implicit in the central point of the letter, but should be coaxed into view by the writer. Some common structures are

- chronological,
- cause-effect,
- comparison-contrast,
- claim-evidence, and
- topical.

Within these, ideas may flow in a sequence, such as

- best to worst,
- early to late,
- simple to complex, or
- weak to strong.

On the other hand, the sequence of ideas may be the reverse of any of these, or based on other coordinates entirely. In a single letter, a writer may use multiple structures. For example, a chronological format was used in Dr. Henry Kissinger’s 2005 letter to Master Sergeant Broussard on the fall of Saigon. The letter followed Kissinger’s time line of the 1975 event, indicated here in a summary of key phrases —

The Pentagon’s plan for implementing the final evacuation were [sic]

far from precise …

As Americans were being lifted from the roof …

By now it was early afternoon in Washington …

As soon as I thought the last helicopter had left …

Two hours later, North Vietnamese tanks rolled into Saigon …

And now it was too late to alter the course of events …

In his 1963 “Letter from the Birmingham Jail,” Dr. Martin Luther King, Jr. used multiple structures, shown below in summaries of key phrases. In one section, he varied the standard cause-effect structure, giving it the form of effect-from-cause —

I think I should indicate why I am in Birmingham. … I … am here because I was invited here and because I have organizational ties here. … But more basically, I am here because injustice is here. … I must respond to the … call for aid.

---

In another section of the letter, he used a *chronological approach* —

... Negro leaders sought to negotiate. ...

Then, last September, came the opportunity to talk to leaders. ...

As in so many past experiences, our hopes had been blasted. ...

Then it occurred to us. ...

And in yet another section, Dr. King structured the letter by using *comparison-contrast* —

Now, what is the difference between [just and unjust laws]?

Let us consider a more concrete example. ...

Let me give another explanation. ...  

Sometimes a law is just on its face and unjust in its application. ...  

I hope you are able to face the distinction I am trying to point out. ...

**Rhythm and Flow.** Good writing has a rhythm. The elements of an idea should sometimes flow and dance, or sometimes hit the reader like a brick. Rhythm helps a reader follow the thrust of ideas, bringing focus to the key idea at the best possible moment.

In a letter to Native Americans who visited the White House, President Thomas Jefferson emphasized his central idea with a rhythm of phrases. He used relatively small word groups to build complex thoughts. He also varied sentence length for interest and emphasis, as follows:

Brothers and friends of the Miamis, Powtewatamies, and Weeauks:

I receive with great satisfaction the visit you have been so kind as to make at this place, and I thank the Great Spirit who has conducted you to us in health and safety. It is well that friends should sometimes meet, open their minds mutually, and renew the chain of affection. Made by the same Great Spirit, and living in the same land with our brothers, the red men, we consider ourselves as of the same family; we wish to live with them as one people, and to cherish their interests as our own. The evils which of necessity encompass the life of man are sufficiently numerous. Why should we add to them by voluntarily distressing and destroying one another? Peace, brothers, is better than war. In a long and bloody war, we lose many friends, and gain nothing. Let us then live in peace and brotherhood together, doing to each other all the good we can.

Good writing varies the sentence type and length. Some sentences should be simple. Some sentences should be compound, having at least two main clauses. Others should be complex, pulling multiple elements together in a sophisticated way and drawing the reader’s eye to a compelling point. In the example above, notice the force of “Peace, brothers, is better than war.” Jefferson achieves his effect by a series of complex sentences followed by this simple, direct punch.
Good writing uses the active voice. It is more compelling to write “the committee decided” than “it was decided by the committee.” It is more compelling to write “please decide and advise” than “the decision should be reached and I need to be advised.”

Good writing trims out excess. Good writing concludes with a memorable point. Franklin D. Roosevelt’s advice for public speakers is equally apt for writers: “Be sincere; be brief; be seated.” Figure 6 offers some tips for effective letter writing.

**Figure 6: Simple Dos and Don’ts of Letter Writing**

**Web Sites**

Web sites are communication tools. In designing them, research administrators should use the same standards that apply to any communication. Most importantly, the design should be user-friendly.

Offices of sponsored projects (OSP) will find different communication preferences among their constituencies. Many who use OSP services prefer to speak directly to a live person. Others prefer to read. The variety in preference reflects common differences in the way people communicate and process information. If an OSP has a useful Web site — a site that is navigable, thorough, systematic, and user-friendly — customers will be able to solve many of their problems independently. This provides two advantages: the consumer who prefers to read may find the answer online, and the burden on OSP staff will be reduced.

**Designing the Home Page.** The first page a visitor encounters at a Web site is the home page. It should be clean and simple. Ideally it will fit on the screen without the need to scroll in any direction. It should include the following:

- Name of the institution
- Name of the office
- Links to relevant pages, designed for quick access
A design in compliance with institutional standards, e.g., that incorporates a prescribed masthead or format

The home page also typically offers the following:

◆ Contact information for the office and other appropriate officials
◆ Mission statement of the office, stated briefly
◆ Some featured element, e.g., “What’s New,” “Hot Topics,” or highlighted research
◆ Graphics or imagery, usually of researchers or research

The home page should be designed so a user unfamiliar with the site can scan the page and select a link quickly — ideally within fifteen seconds, or thirty seconds at most. Titles of the links must be accurate and familiar to a first-time user. Such eloquence calls for considerable organizational skill, such as finding obvious categories for content offered. Some tips for basic Web page design are provided in Figure 7.

To keep words to a minimum, use key words only. Avoid long narrative statements. If a title will suffice, use it. If a paragraph-length statement must be used, such as part of a press release to spotlight research, keep the sentence number to a minimum and add a “Read more …” link.

To find categories that are obvious, think as a reader. View the site not as an administrator giving information, but as a researcher looking for information. A research administrator will certainly want to provide critical information, but it should be organized for the unfamiliar reader. For example, many university Web sites include a guide for principal investigators to use in the preparation and submission of proposals.

Additional Design Considerations. “Negative space” is a design term. Given some featured visual element, the negative space is whatever “empty” space surrounds it. On this page in the Guide, the negative space is the “uncolored” part of the page or paper (sometimes called “white” space) where there is no printing or design element, most prominently the margin that surrounds this text. The margin is a negative frame, bringing the eye to the text. In advertising, designers use negative space to feature their particular widget. Effective use of negative space, which holds inherently less interest

Figure 7: Tips for Basic Web Page Design

Web page designers, at a minimum, should adhere to the following standards:

• Use few words: limit the page to a 1,500-word maximum.
• Use categories or headers that are obvious and intuitive.
• Sprinkle the page with considerable “negative space,” i.e., unfilled “white” space around words.
• Employ a design that directs the eye to key elements.
• Use few font types, ideally no more than two.
• Avoid redundancy of content.
than the widget, helps focus the reader’s eye on the product. As negative space increases, clutter decreases. Web designers use negative space to direct the reader’s eye to useful points — such as links — more quickly.

The Web page should be designed using other tools that also direct the user’s eye. Some standard tools are lines or boxes that help categorize their contents. It is useful to feature information by font selection, color, and arrangement.

Visual redundancy is often synonymous with clutter. In practical terms, it is often an issue of misdirection. Many sites show multiple routes to the same or similar content. For instance, there may be multiple links to “policies and procedures.” If so the user must search through one link, then also examine another link to verify that he has read all relevant information. On the other hand, if all relevant information is contained under one link, the user saves time by conducting a single search. (The burden then shifts to the Web designer, who must structure the second page in a way that subdivides “policies and procedures” productively.)

Electronic Conferencing

Electronic conferencing is changing the way people work and share information. It offers a low-cost, efficient tool to communicate simultaneously with multiple locations. For instance, on September 11, 2001, the chief operating officer of a large research institute found herself stranded 3,000 miles from home. On a four-day bus ride back, she realized that electronic conferencing could have circumvented the expensive trip altogether. The meeting was indispensable; the trip was not. Returning home, she urged her facilities planners to equip more meeting rooms for electronic conferencing.

Electronic conferencing is commonly used to conduct meetings or carry out negotiations. It can also deliver inexpensive training programs such as online broadcasts. The National Council of University Research Administrators (NCURA) enjoys tremendous success with these programs. They reach a wide audience who keep current on information, but remain at their home institutions as they do so. Electronic conferencing has been well received, particularly as a tool of direct, timely communication.

Television adds to communication complexity. When public speech is mediated by television, the communicator must adapt. The new challenges come partly from the visual component, partly from the auditory. Tips for electronic conferencing are included in Figure 8.

Figure 8: Tips for Effective Electronic Conferencing

In electronic conferencing, the camera is most often static. It does not follow the speaker. The speaker must either step into the camera’s frame of view, or the speaker will be off camera. Alternatively, the camera may show a group of speakers, perhaps seated at a table. The speaker should be aware of the camera’s position at all times.

Tip #1: As a presenter, know where the camera’s frame is, i.e., where the edges of the visual image are. Whenever possible, move into the camera’s frame before making a comment.
Figure 8: Tips for Effective Electronic Conferencing (continued)

Viewers prefer to look at the person who is speaking. There is a visual aspect of “hearing” spoken language. (Ever notice in a theatre performance how often you turn your head to look at the speaker?) If someone is speaking off camera, a viewer, who instinctively wants to see the speaker, may find it difficult to follow the conversation. A viewer’s understanding improves dramatically when the speaker is visible. Also, when the speaker is visible, the viewer will associate values and attitudes with the speaker. As a presenter, be certain you know what the camera can “see.”

Tip #2: On camera, speakers should remember to speak directly to the live audience and to the “viewer in the camera.”

Any speaker enhances communication by making eye contact with audience members. On television, communication with the viewer is enhanced when the speaker makes comments directly into the camera. Political candidates, for example, often look directly into the camera when making a critical point. Since it feels impersonal to speak to a camera (an inanimate object), speakers should imagine a real-life person sitting inside the camera, listening to the speech — someone who is friendly, but who needs to hear the message you have to offer. Look directly at the camera, just as if you were making eye contact with someone physically present.

Tip #3: Viewers respond strongly to visual stimuli.

Movement draws attention. When the camera shows a group, rather than an individual, the relative size of each person appears smaller. In such cases, movement is less visible. When you begin speaking, make sure you draw attention to yourself by moving in some obvious way. If movement occurs at the beginning of a statement, it improves the viewer’s chance of figuring out who’s talking, which improves understanding. Otherwise, the viewer may hear a disembodied voice and not be certain who is talking.

Tip #4: A microphone is easily misused. Remember to always speak into the microphone.

Know where your microphone is. A lapel microphone that snaps on to clothing can affect clothing choices. Select buttoned garments and garments with collars; they provide more places to attach the microphone. With a lapel microphone, be careful to avoid striking it with a hand or pressing it against a lectern, both of which cause distracting noises.

If, on the other hand, the microphone is mounted on an arm or pedestal, be sure to keep it in front of your mouth. If the microphone is static and you turn your head away from it, the sound will be lost to the viewer. In such cases, if you must turn your head to the side, lean away from the object you’re looking at and keep your mouth pointed at the microphone. For instance, if you must turn left to see a PowerPoint slide, lean back to the right, twist, and lean forward when you do, so the microphone is still in front of your mouth. The bottom line is to always speak into the microphone.

Tip #5: Clothing and accessory choices are important in teleconferencing.

In choosing clothing and accessories, consider your background. If you are speaking in front of a PowerPoint screen, try to wear clothing that contrasts with the slides. If your slides are mostly light, dark clothing will help make you more visible. If your slides are mostly dark, the reverse is true. Accessories should generally not be highly reflective, because the lighting will make them stand out and distract the audience.
Using Multimedia and Multiple Forums

Marketing strategists reach their targets by multiple approaches, using different types of media including multimedia. A multimedia presentation typically features spoken, video, musical, and other media blended together. Each of these elements may reinforce the message by repeating it in various media. For example, in a television commercial, the spoken words might say “our trucks are tough as bulls,” while simultaneously displaying the image of a bull breaking through barriers and playing bold, martial music. The image and the music reinforce the truck’s major selling point.

Similarly the standard PowerPoint presentation used by a speaker is inherently multimedia.

Multimedia tools enhance communication in four ways:

◆ First, the message is expressed in more than one way, reaching the audience intellectually and subliminally.
◆ Second, the visual element is potentially more compelling for many people.
◆ Third, because more senses are engaged, one is more likely to pay attention.
◆ Fourth, multimedia is so common in our culture that audiences have come to expect it.

Multimedia Presentations. In professional America today, many multimedia presentations use Microsoft PowerPoint. This program has the potential to include even more extensive media than most presenters actually select. But its versatility and wide use do not necessarily imply maximum effectiveness.

For all its advantages, PowerPoint is arguably overused. Its appeal has made it ubiquitous. But PowerPoint presentations have common problems. Speakers get lost next to the screen. Speakers often put their entire text in the program, and they end up

Figure 8: Tips for Effective Electronic Conferencing (continued)

Tip #6: Lighting is a crucial component.
Standard room lighting casts awkward shadows in a teleconference. If possible make sure light shows directly on your face; you will see the glow in your eyelashes. In general it is more important for you to be seen than it is for you to see the live audience. If your presentation is accompanied by PowerPoint slides, make sure room lights are low, because the camera will have more difficulty rendering the projected slides if any room light is up. On the other hand, make sure your face is illuminated — by a small spotlight, for example — so viewers can see your face and lips.

Tip #7: Build sharp contrasts into slide design.
Any projected image needs contrast between elements to make important features stand out. But contrast diminishes when viewed by a camera. Plan ahead by building sharp contrast into your slide design. Use simple graphics with “negative space” around them. Make sure that contrasts of light and dark are built into the slide design. Also be aware that font sizes need to be larger when a camera must “see” them. Remember that on camera, words at the margins of the screen are difficult to read.
reading aloud from the slide on the screen. Speakers often use far too many slides, with far too many words. An exception to this may be when speaking to nonnative speakers of English, who may have better comprehension when reading, rather than hearing, the presentation. In general, however, PowerPoint is most effective when the speaker uses it to reinforce and amplify a presentation, rather than to become the primary medium.

Using Various Methods. The term “multimedia” implies a single presentation using overlapping media. But any communication can be enhanced by using a variety of media. A research administrator should identify two or three media that most appeal to a specific target audience. One says “I love you” by words, flowers, gestures, and many other means. Similarly there are many ways a research administrator can say “meet this deadline” to principal investigators. One should vary the communication resources.

For example, modern political campaigns are extraordinarily diverse. They reach their constituencies through direct address (in-person speeches), news sound bites, television ads, print ads (magazines, newspapers), mailers, posters and billboards, flyers, door-to-door canvassing, telephone solicitation, and the Internet. Their campaigns are positive (affirming the candidate) and negative (belittling the opponent). They are complex (presidential debates) and simple (sound bites). The images are warm (kissing babies) and forceful (pounding lecterns). They are humorous (anecdotes mocking opponents) and serious (policy documents). Such diversity is effective because it reaches multiple constituencies. More to the point, it reaches the same constituency in multiple ways.

Repeating the Message. To maximize learning and comprehension, the administrator should spread communications out over time, reinforcing by repetition. When various media are used, the administrator should unify the message across media. A communications campaign, which reaches the constituency via several media, should be unified by consistency: repeated use of the same fonts, the same language, and the same graphics. If possible, the “look” of the message should be consistent across e-mails, flyers, mailers, and letters. In other words, “brand” the message. Consistency, reinforcement, and repetition are powerful tools.

For research administrators, communicating change is central to the job. Whether it’s a change in policy, a change in procedures, or a change in electronic systems, the administrator devotes significant time to informing constituencies about new events that affect their research projects. For example, the use of Grants.gov for proposal submission requires multiple approaches to transmitting complex information to faculty and staff. Institutions need a complete arsenal of communications tools — from small group discussions to formal presentations to Web sites — to reach the many people who have to learn new processes and systems. (For further discussion of Grants.gov, see Chapter 900.)
Communicating with Differing Constituencies

Understanding the “other” communicator is essential to good communications. In professional contexts, research administrators encounter categories of “others” whose relationships with the OSP have reasonably consistent patterns. There may be consistency with the farmer; there may be consistency with the cowman. But the farmer and the cowman are not the same constituency. To communicate effectively, a research administrator must understand the goals, needs, and working methods of each. This information will not be static; good working relationships are invented, revised, and reinvented.

Administrators

Research administrators serve the institution, whether they sit in a central office, a college, or a department. Often, particularly for departmental research administrators, this translates into support for a faculty investigator. The departmental administrator provides an effective bridge between central research administrators and investigators. Offices of research administration often find it easier to transfer information to departmental administrators than directly to faculty investigators. Administrators may intercede on behalf of faculty. This is particularly true in regard to complex regulatory or costing issues.

Communications between university administrators and the OSP frequently transfer information about either a specific grant or university policies and procedures for handling groups of grants. These policies are essential for coherent application of institutional plans. Whether the policies are created by the OSP or promulgated by the federal government, it is often the burden of the OSP to communicate these policies to the faculty and departmental constituencies.

This is done best through a variety of forums. Multiple media are often needed to reach a constituency effectively. For instance, a new policy for cost transfers, based on federal regulations, will be most effective if it is developed collaboratively with administrative representatives. The participation of research administrators who represent all parts of the campus helps distribute ownership. This often results in a plan for implementation across the campus that is more likely to serve the needs of faculty and the research infrastructure.

Often administrators raise problems for discussion and resolution. Frequently these situations require conversations with sponsoring agencies or other university administrative groups. In such discussions, the presence of faculty and administration, both departmental and central, allows for mutual problem solving and enhances the prospect for positive resolution.

Faculty

Conversations between faculty and research administrators are made complex by the dual nature of the relationship. The OSP exists to facilitate research. Conversely, the OSP is called upon to protect the institution’s interests and to influence faculty researchers. In particular the OSP may regulate faculty researchers on compliance issues.
This double bind inevitably confounds communication and elevates stress for both parties. All too often, it feels like “us vs. them” (for both parties).

In this relationship, research administrators are frequently seen more as gatekeepers than as facilitators. The pressures on faculty are extreme. They often are expected to write grant proposals, create new knowledge, support a research lab, and also teach and contribute to the university. Consider their frustration when, after spending long hours completing a proposal, they face an OSP staffer who insists on changes before a signature can be added. In that situation, the research administrator’s gatekeeper role is in the forefront.

The stresses on faculty, while very real and urgent, often are not well understood by research administrators. Conversely, the pressures on research administrators to perform, compounded by limitations on time and resources, often are not fully appreciated by faculty. Both groups have the same ultimate goal: securing funding to support research. But they hold different perspectives on what is necessary to obtain funding and to manage it responsibly. As much as possible, research administrators should take initiative to discuss this dilemma with the faculty. Although it is difficult, the job of research administration is customer service.

**Customer-Service Focus.** The advice for research administrators given below can apply in a variety of contexts. Research administrators should remember that they serve the faculty in the following three basic ways:

◆ They are present to help researchers identify, apply for, obtain, and administer funds from an outside agency or organization. As part of that mission, research administrators help maintain standards required by sponsors and their own institutions. Without those standards, both faculty and institutions are in serious jeopardy.

◆ They are not generally rule makers. Their responsibilities for rules enforcement must be moderated by a willingness to offer alternatives and guidance. They are liaisons between researchers and sponsors or between researchers and policy makers. They are facilitators whose purpose is to communicate the rules of others while making sure that faculty can still perform their research.

◆ In their role as helpmates, research administrators must convey support, understanding, and civility. They must take the high road in modeling communications ethics.

**Dealing with Late Submissions.** One of the most common issues facing research administrators is the problem of late submission of proposals. Researchers must understand that OSP offices face a volume of applications, and that submission to a sponsor is only the last step in a sequence. Inevitably pressure mounts on the researcher to meet the deadlines of the OSP, and on the OSP staff to forego review and just sign the proposal.

Researchers must be educated to issues surrounding the review process, workload volume, and thoroughness in completing applications. The OSP staff must be trained and reminded to
◆ understand pressures on researchers;
◆ remember the OSP role as service provider; and
◆ communicate requirements for submission — clearly and accurately.

As stress mounts, OSP staff will inevitably feel the challenge of being “middle-men.” The OSP may find that workshops and communiqués to administrators will help defray the “kill the messenger syndrome” that rears up around deadline time.

Ongoing Communications. Once an award is received and the project under way, those same principles still hold true for interactions with faculty. Good stewardship of sponsor funds requires increasing accountability at the institutional level and at the faculty level. Although an OSP could once protect faculty from audit penalties, the current regulatory climate demands personal and institutional accountability. There are new pressures on research faculty to understand fully the complex regulatory issues. These forces have resulted in new tensions across the research community. Clear and effective communication is a powerful tool in forging partnerships for the research enterprise.

Sponsors

One purpose of research administrators is to advocate for the research community. But rules of the game are established by sponsors. They pay for the research, so they establish the guidelines.

Fortunately there are opportunities for research administrators to discuss policies and procedures with many sponsors, especially with federal agencies. Through informal, one-on-one conversations with agency representatives, research administrators have the floor to engage sponsors on topics of mutual interest. Through more formal mechanisms, such as the Federal Demonstration Partnership, there are structured discussions on ways to improve and streamline the processes. (For more on the Federal Demonstration Partnership, see www.thefdp.org.) When the researcher’s time is constrained, research itself is inhibited. In a number of instances, such discussions have resulted in changes that benefit both the university and the sponsoring agency.

In talking with sponsors about a specific project or with regard to agency policies, and to facilitate communication with sponsors, research administrators should consider the tips included in Figure 9.

**Figure 9: Tips for Communicating with Sponsors**

- Be well prepared before contacting the agency.
- Understand agency policies and standard practices.
- Formulate a case for the request, in keeping with agency standards.
- Build a relationship to whatever extent is possible.
- Take pains to understand the interplay between policies of the agency and policies of the institution.
- Exhibit civility and courtesy in all discourse.
Elements of Strong Communications

Effective communication is tailored to the receiver, the “target” of the sender’s intentions. All good communication begins with understanding the target audience. Henry Ford once wrote that success in life comes from “the ability to put yourself in the other person’s place and to see things from his point of view — as well as your own.” In practical communication, this applies equally to the briefest e-mail and a meticulously prepared keynote address.

Before engaging in a communication act, a few fundamental questions should be asked:

◆ Who is the target?
◆ What does this target audience need/want to understand, and what’s in it for them?
◆ What are the characteristics of the target audience?

This last question is the most difficult to address. To start the process, consider these questions:

◆ What does the target audience know about this subject?
◆ What will be the target’s attitude about remarks presented?
◆ What will be the target’s attitude toward the presenter?
◆ What are the target’s agendas (apparent and hidden)?
◆ What are the target’s values?
◆ What will worry or assure this audience?

Word Choice

Communication choices should be affected by an analysis of the audience. Language should be, essentially, the receiver’s language. In the *Phaedrus*, Plato wrote that a communicator should match “the type of speech to each type of soul.” By this he meant the speaker should use the concepts of the person to whom he is speaking; when speaking to a carpenter, use language familiar to a carpenter, but use different language when talking to a priest. In discussing a technical area like research administration, it is particularly important to choose words that are accessible to the target audience.

Simple words tend to be most effective. Clarity is achieved by focus, and simplicity focuses best. Extra words can lead to mental clutter. Polysyllabic words and complex sentences also can be clutter. Outside academia, scholarly language often is ridiculed and spoofed. Regardless of who the target may be, the communicator should weed out complexity and stress key points.

Using Jargon. Among peers, professionals use discipline-specific language, or jargon. For example, some words are unique to accountants, some are specific to sponsored program accountants, and other words are specific to sponsored program accountants who use PeopleSoft. Each level of specificity involves a more narrow jargon than is used by the wider group. Jargon is a communication shortcut useful to the “in” group. Outside the immediate group, jargon inhibits understanding and impedes
communication. Even when a speaker takes time to define a jargon term, a new user of
the term may have difficulty following it. A business administrator, for instance, may
be challenged to understand the Higgs Field even after the physicist has defined it.

Evidence and Support

Professional communications generally identify problems and offer solutions. Research
administrators of every stripe must develop skills in making and defending arguments
or, more narrowly, skills in making assertions and providing evidence in their support.
The most common kinds of support are discussed below.

◆ Personal experience, either that of others or one’s own, has special credibility because
it carries the force of direct, firsthand knowledge. For instance, in talking about
errors in effort reporting, most research administrators could easily cite examples of
heavy fines and penalties levied on research universities for failures to adequately
manage this responsibility. The recent, dramatic instances of settlements with the
government on effort reporting are convincing evidence of the need to provide
appropriate accountability. Most research administrators know that “seeing is
believing,” and firsthand observations are respected by others — particularly when
one observer’s experience confirms another’s. Personal anecdotes are very
persuasive.

◆ Authoritative sources can be powerful support for one’s position, but only if the
audience acknowledges the authority of the source. Authority can come from
expertise in a specialized field, from bureaucratic rank, from publications (manuals,
policy documents, etc.), or from legal governance (e.g., contracts). When necessary, a
research administrator should mention the reason for the authority’s stature. For
instance, in a letter to an institution’s chief executive officer, a biochemist, one may
find it necessary to explain “When Ted Kooser, the U.S. Poet Laureate, was awarded
an NEA fellowship, he wrote that. …”

◆ Metaphor implies a comparison between dissimilar ideas or things. By his famous
caveat “God does not play dice with the universe,” Einstein used a gambling
metaphor to refute quantum theory. Edward O. Wilson wrote that for scientists, “it is
better to have begun a great journey than to have finished it,” depicting scientific
inquiry as a voyage. In each of these examples, an economical metaphor condenses
the idea, intensifying its impact.

Metaphor is essential when a communicator must explain highly specialized ideas.
Many scientists face a public relations crisis outside their disciplines, because their
research cannot be comprehended by a layperson. For example, details of a quantum
physicist’s daily research are counterintuitive and beyond the scope of human
experience. To most people, it makes no sense that an electron can be in two
locations simultaneously. Since humans cannot “see” strings folded in eleven
dimensions, how can nonspecialists be stimulated to provide funding for string
theory? To communicate with outsiders, which scientists must do to engage the
public, they must find simple words, usually in metaphor, to express fundamental
principles.
◆ **Analogy** is also a kind of comparison, but a comparison between things that have some essential similarity. Because of the similarity, the comparison is direct rather than implied, and analogy traditionally uses the words “like” or “as.” Carl Sagan used analogy when he wrote that “Biology is more like history than it is like physics; the accidents and errors and lucky happenstances of the past powerfully prefigure the present.” Forrest Gump quotes his mother’s analogy when he says “Life is like a box of chocolates. You never know what you’re gonna get.”

◆ **Example** communicates a class by identifying an instance of the class. Clark Kerr, former president of the University of California, is an example of a forward-thinking academic administrator. Administrative costs are often examples of indirect costs. The Indian Ocean tsunami of December 26, 2004, is an instance of the effects of plate tectonics. Each of the examples above illustrates exemplification.

Often the most effective example is a story. Narrative — storytelling — is an especially powerful tool because it engages the receiver’s mind in a chronological, structured sequence. This inherently provides a recognizable structure. The narrative typically leads to a pointed conclusion, the climax of the narrative, and it typically features some person with whom an audience can identify. Stories often have an inherent element of play.

**Example**

There is a creative, playful aspect to scientific discovery. In an interview for BBC2 Television, Richard Feynman told a story that after he left the Manhattan project, he wanted to “play” with physics — to look into things for the pleasure of learning, rather than for some pre-mandated purpose. One day, as he was eating in the Cornell University commons, a young man’s dinner plate flipped up in the air and crashed. As Feynman “played” with that image, he realized that the plate not only rotated, but that it also wobbled. Then through research, Feynman learned that the plate spun and wobbled in a mathematically predictable ratio. Building on that playful research, Richard Feynman developed the theories that won him a Nobel Prize for quantum electrodynamics.3

This anecdote exemplifies the potency of stories. Even when communicating difficult concepts, narrative commands attention and helps embody the idea in images.

**Explanation of Inconsistencies: Accommodating Different Viewpoints**

Research administrators work in opposite domains: a world of policies and a world of liaisons. As the voice of policy, research administrators have little room for open-ended dialogue, for the nature of policies is to draw lines, to be definitive and authoritative. But as liaisons, research administrators must negotiate, find middle ground, and express sensitivity to alternative viewpoints. This latter role is particularly challenging in terms of communication.

---

3Summarized from “Horizon: The Pleasure of Finding Things Out,” replayed on *Nova*. 

---
Dealing with Skepticism. We live in a skeptical time and a critical culture. Michael Shermer, publisher of Skeptic magazine and founder-director of the international Skeptics Society, defines skepticism as “a provisional approach to claims.” Since evidence of some “truth” is always tentative, almost any claim is subject to challenges. Humans refine claims, in part, by testing them. Ideas about research administration are tested in many arenas, such as between OSP staff members and faculty, in conference presentations, and in discussions with federal agencies. The presenter of an idea should be ever self-examining, skeptically checking one’s work for accuracy.

Audiences are skeptical, too. Research administrators, as communication senders, need special strategies to overcome a receiver’s instinctive skepticism. Aristotle’s Rhetoric describes the impact of a speaker’s persona, which he called ethos. He describes ethos in terms of good will, good sense, and good moral character. For instance, when a sender communicates good will for the receiver — one kind of ethos — it can enhance the receiver’s willingness to listen. It is a tool to address skepticism.

Enhancing Credibility. Aristotle’s “good sense” is particularly important in professional interactions. A sender shows “good sense” by publicly identifying his own bias, by pointing out uncertainty in his own data or arguments, or by affirming an opponent. These strategies enhance ethos and credibility.

“Good sense” will help a sender disarm objectors, such as by qualifying conclusions. For instance, it is helpful to say, “I’ll point out some areas of concern about my concept,” or “there are two ways of thinking about this,” or “the old paradigm has merit, but new information should be considered.” In principle such disclaimers are effective tools in all communication. Bridging the gulf between farmers and cowmen, to use the earlier analogy from Oklahoma!, one must be careful to appeal to each without compromising either. Water diverted from the stream to irrigate crops should be supplanted by wells to nourish the cattle.

Socrates began his famous Apology, after which he was condemned to death, with the words: “I do not know what effect my accusers have had upon you, gentlemen, but for my own part I was almost carried away by them — their arguments were so convincing.”

In the U.S. Senate on July 29, 2005, Senator Bill Frist advocated a change in U.S. policy on stem cell research. Since his remarks represented a breach with the Bush Administration, he was careful to explain his reasoning and to express respect for President’s Bush’s viewpoint:

On August 9, 2001, shortly after I outlined my principles, … President Bush announced his policy on embryonic stem cell research. His policy was fully consistent with my ten principles, so I strongly supported it. It federally funded embryonic stem cell research for the first time. It did so within an ethical framework. And it showed respect for human life. But this policy restricted embryonic stem cell funding only to those cell lines that had been derived from embryos before the date of his announcement. In my policy I, too, proposed restricting the number of cell lines, but I did not propose a specific cutoff date. Over time, with a
limited number of cell lines, would we be able to realize the full promise of embryonic stem cell research? …

While human embryonic stem cell research is still at a very early stage, the limitations put in place in 2001 will, over time, slow our ability to bring potential new treatments for certain diseases. Therefore, I believe the President’s policy should be modified. We should expand federal funding (and thus NIH oversight) and current guidelines governing stem cell research, carefully and thoughtfully staying within ethical bounds.

In these remarks, Senator Frist was careful to demonstrate points of agreement between the administration and himself (“fully consistent,” “strongly supported,” “I, too, proposed restricting the number”), careful to use imagery consistent with the administration’s view (“respect for human life,” “staying within ethical bounds”), and careful to compliment the administration’s prior actions (“federally funded embryonic stem cell research for the first time”). Even the word “modified” represents a soft landing on the hot topic of change.

Senator Frist went on to encourage diverse views on this subject, advocating “serious debate,” and not only in Congress, “but across America — at our dining room tables, in our community centers, on our town squares.” He remarked that “We simply cannot flinch from the need to talk with each other, again and again. …” Such rhetorical strategies, advocating respect for diversity, are most useful when points of view are diverse and extreme.

In research administration, the sender may also need to address seeming inconsistencies that are based in institutional or sponsoring agency policy. For example, Office of Management and Budget (OMB) Circular A-110 allows universities to define “equipment” as an item with an acquisition cost of $5,000 or more. But a university may choose to define equipment at a lower cost threshold as part of its institutional policy on property management. That decision is still in keeping with federal policy, but recognizes that certain institutions may need a broader definition. A research administrator “sending” a communication describing “equipment” may wish to specify the definitional policy in order to avoid misunderstandings.

The widespread cultural bias to “test” claims means that any communication is subject to scrutiny. Wise communicators express respect for alternative perspectives. Wise communicators assess their own claims, looking for evidentiary strengths and weaknesses, and stand ready to support their viewpoints.

**Accommodating Give and Take**

Effective communication is a two-way street. The most effective communication builds on a reciprocal relationship between sender and receiver. Different people learn and communicate in different ways. The most effective communicators take time to understand the target audience, to monitor feedback from the receiver, and to adapt to the receiver’s preferred model.

Communication theory is closely related to theories of learning. Some people learn better alone, others through collaboration. Some learn better from verbal material,
others from visual material. Some prefer to deal with abstract ideas, while others prefer social-centered information. These same differences (and others) apply in the world of communication. They suggest that variety in communication strategies increases the probability of effective communication. Different constituencies will respond favorably to different media, so good communicators find diversity in the medium.

In particular, effective communicators know the value of asking questions and listening to responses. Raising questions and listening to the answers help guide the sender to creating effective messages. But they do more than that. Listening is an act of respect that also enhances the stature of all parties, building the interpersonal relationship between communicators.

**Working in Groups.** Groups are often more creative than individuals. Creativity theorists recognize that external stimuli, such as collaboration or friendly competition with partners, bring more ideas to the table. The adage that “two heads are better than one” is a demonstrable fact in many professional settings. Give and take between participants improves communications and enhances the likelihood of achieving positive outcomes.

**Importance of Repetition**
When “receivers” perceive the same message repeatedly, their minds move the information from short-term to long-term memory. Repetition of a message causes the brain to literally build new connections between synapses. The following old speech teachers’ adage applies to all communications:
(1) Tell them what you’re going to tell them.
(2) Then tell them.
(3) Then tell them what you told them.

An effective communicator states the message, then repeats it, then repeats it with variation, then repeats it again for good measure. Remember the three principles of selling reality: “location, location, location.” In a famous address in the darkest days of World War II, Winston Churchill told the students of Harrow —

[T]his is the lesson: never give in, never give in, never, never, never, never — in nothing, great or small, large or petty — never give in except to convictions of honour and good sense. Never yield to force; never yield to the apparently overwhelming might of the enemy. [Emphasis added]

**Identifying Outcomes.** One special kind of repetition is a fundamental tool in outcomes teaching. Students tend to respond positively when the outcomes of their lessons are made clear at the beginning of a learning session. Thus teachers often say to students “At the end of this class, you will be able to [list and explain the principal dynamic factors in the Gunpowder Plot] or [play a chord on the cello] or [determine the allowability of participant costs].”

In a similar way, communicators wisely identify the goals of a meeting. Thus one may hear “at the end of this meeting, we’ll have an action plan” or “I’d like us to name
some ways to … “ or “before we break, everyone should know exactly what his or her responsibilities are for this project.” In essence, identifying outcomes for a meeting is the first step in a series of repeated statements. The most successful outcomes tend to be statements of behaviors, of physical actions. They function for meetings like a salesman closing the deal: they lead to action.

Research administrators should develop individual habits of stating outcomes. At the beginning of a meeting, the goals should be articulated. At the end of the meeting, the conclusions should be reviewed, achievements pointed out, and homework assigned.

Ensuring Successful Communications

To achieve one’s highest potential as a communicator, one must work at communications. It is a worthwhile adventure. In The Future of Leadership, Warren Bennis called communication “the most important leadership skill.”4 Careers can be made or broken by the quality of communication. Generally those who master communications are regarded more highly by society. If someone cannot effectively communicate her contributions to the profession, how will others know her value?

Communication Skills

Communication skills require effort, but the results can impact one’s life dramatically. In Leadership Is an Art, Max De Pree wrote that “to achieve meaningful work and fulfilling relationships,” nothing is more important “than to learn and practice the art of communication.”5 To learn and practice — these are the keys to developing skills.

Communication success is both a factor of instinct and of cultivated skills. Good communication is the result of several “crafted” components including the following:

(1) Care in crafting the essential message, which involves

- knowing the subject and researching the problem as needed;
- finding a solution to the problem and recommending an action; and
- expressing the solution in attractive ways for the specific audience.

(2) Care in crafting the medium, which involves

- analyzing the audience’s needs;
- finding the medium or media that suit(s) the circumstances, message, and resources; and
- monitoring responses and adapting the message and medium accordingly.

Good communicators make certain models habitual. They habitually analyze the audience, habitually listen and observe feedback, habitually frame their messages appro-

---

priately for the situation, habitually trim words to the essence. In part these habits come about through practice. One should be sure to practice a PowerPoint delivery, practice listening, practice repeating someone’s statement back to them, practice re-reading e-mails before transmitting them.

Good communications are artful. They condense complex materials into comprehensible forms. In place of chaos, they create knowledge. In place of inaction, they invite achievement. Mathematicians often appreciate the “elegance” of a mathematical proof, assigning to it a higher probability of truth than to inelegant formulae. Even the simplest directive or request can be artful.

505.6 Conclusion

The writer John Gardner, writing about endings in The Art of Fiction, said that “The novel’s denouement ... is not simply the end of the story, but the story’s fulfillment.” In professional communications, that fulfillment is some form of change.Professional communications may provoke thought, provide tools for achievement, or stimulate action. All good communications culminate in some change, fulfilling their purpose. Change is the purpose of communication whether it lays groundwork, establishes relationships, provides information, or commands assent.

Peter Drucker, one of the great teachers of management, wrote in Management: Tasks, Responsibilities, Practices that:

Communication ... always makes demands. ... It always demands that the recipient become somebody, do something, believe something. It always appeals to motivation. If, in other words, communication fits in with the aspirations, the values, the purposes of the recipient, it is powerful. If it goes against his aspirations, his values, his motivations, it is likely not to be received at all or, at best, to be resisted.

Research administrators should remember the following guidelines when preparing and delivering effective communications:

◆ Give thought to your communications.
◆ Study your receivers; reflect on your messages; and appeal to your specific audience: to their aspirations, values, and purposes.
◆ Build a bridge between “the farmer and the cowman.”
◆ Expand your tools of communication.
◆ Use all available communication resources to develop the territory of sponsored research.

Supplementary Material

This section includes expanded coverage of topics relating to communications — internal and external — in research administration. These materials are culled from a variety of authoritative sources.

An Approach to Negotiations*
Garry R. Sanders, The Research Foundation of SUNY

As a research administrator, you will negotiate thousands of times over a career. You may negotiate a FAR clause with a contract officer at the Department of Defense, or a publication clause with an industry attorney. You may negotiate with a faculty member over responsibilities in meeting a grant deadline. You may negotiate with your boss for an office with a window, or a higher salary, or flexible working hours. You will not negotiate as a lone wolf, but with your boss, colleagues, and other institutional experts in the background. Part of your job will be to keep those who need to know aware of the status of your negotiations.

There is no single technique or strategy to help one succeed in each of these scenarios and settings. Nor is there a trick or ruse that will yield success. There is, however, a recommended approach that will lead to success more often than not. The recommended approach begins with

◆ preparation
◆ knowing yourself and your goals
◆ knowing your negotiating partner and his or her goals
◆ communicating appropriately
◆ thinking and acting creatively and sincerely to accomplish the “best outcome”

Note: “Best outcome” does not mean absolute perfection. Think of this approach as a series of confidence-building events: confidence that you build within yourself and with your negotiating partner.

Preparation

Let’s say that you work for ABC University and you are asked to negotiate your first research contract and the contract is with XYZ Corporation. How do you prepare for this negotiation? What do you need to know?

A simple way to begin is by making a list of items to read and digest, and a list of people to talk to. Your reading list might include germane ABC University policies and processes (e.g., intellectual property, academic freedom, and indemnification). The list may include prior contracts negotiated with XYZ Corporation with a summary of issues and how these were resolved.

* This discussion is based on material presented at the NCURA Annual Meeting, October 31, 2005.
On your list should be the names and contact information of the relevant principal investigator and senior research team members, as well as the key contacts at XYZ Corporation. If ABC University has a standard research contract, read through it carefully, understand and practice stating in your own words and business style what each clause means. You will likely need to explain these clauses to your negotiating partner, so you might as well learn to do it readily and confidently. Your list of people to contact should include your boss, faculty member, and perhaps a peer or two at another university who has significant negotiating experience.

Prepare to manage the flow of documents, revisions, and exchange of information produced by a negotiation. For more complex agreements with multiple negotiating partners and goals, consider using project planning software to track milestones and timeframes to accomplish negotiation tasks.

**Know Yourself and Your Goals**

Each of us has a style of communicating and managing ourselves in business settings. If your style has been effective for you, then there is no reason to change your bearings for the purpose of a negotiation. If you do, you will not appear comfortable to the other party, and it will be more difficult for you to concentrate on the substance of the negotiation. Apply your style toward achieving your negotiating goals.

Ask yourself: What are my goals? Completing a research agreement that is consistent with university policies and provides resources to support a research program? Building a business relationship with a research sponsor? Perhaps all of these goals apply to the negotiation. Be sure you define what the key goals to accomplish are and identify the primary pitfalls to avoid.

**Know Your Negotiating Partner and His or Her Goals**

Negotiation is not mediation. You are not responsible for representing and advocating your negotiating partner’s interests. You are responsible for learning what those interests are, for asking appropriate questions to discern and clarify your partner’s goals and limits. For example, if during your discussions with XYZ Corporation about a budget for a research project, you learn that the company will not pay overhead (facilities and administrative expenses), it may be helpful to ask if the issue is the total costs, or if it is possible to list costs in a different manner or format, or to inform the company that the direct costs do not cover full costs of completing the project. You need to learn the company’s perspective and communicate that to your ABC University colleagues so your team can help you consider options to resolve the matter. (See Figure 520.1-1 for tips on achieving outcomes.)
Figure 520.1-1: Tips on Achieving Desired Outcomes

When setting desired outcomes, be sure
✓ Key interests of both parties are known and satisfied
✓ Criteria to judge options are known
✓ To remember: You’re setting the stage for a working relationship after negotiation is complete

To improve negotiation outcomes
✓ Define negotiating success
✓ Define roles
✓ Understand the other party’s interests
✓ Build the relationship

Communicate Appropriately

Many negotiations begin with a telephone call and then proceed immediately to a series of email communications. Others begin with email and communication continues electronically. Fewer begin as telephone calls and remain as verbal transactions. Whether communicating in writing or verbally, keep your attitude, words, and phrases positive and professional. Address your negotiating partner respectfully and graciously. Stay on point. Be on time for conference calls. If you say you’ll respond to a question by next Tuesday morning, then respond by Tuesday morning. A good practice is to summarize telephone calls with a follow-up email to your negotiating partner. These are all confidence-building steps that build your credibility as a negotiator and representative of ABC University. (See Figure 520.1-2, page 520:4 for tips on developing good negotiating habits.)
Accomplish the ‘Best Outcome’ You Can Achieve

Some negotiations accomplish quickly all goals set at the beginning. These are usually straightforward to handle: two or three emails, one telephone call, one party accepts the other’s contract template with a few variations and innocuous language changes. Other negotiations are more difficult to conclude: the parties do not agree on fundamental terms, such as intellectual property ownership or publications or budget. These negotiations can become protracted and simply stall. In such cases, continue to communicate with your negotiating partner, keep apprising your ABC colleagues of whatever progress and blockages have occurred. Always try to move the process forward. Seek the advice of institutional experts in the areas of dispute (tech transfer, general counsel, etc.) to garner more options and frame these new options to the other party. Always assess the willingness of your negotiating partner to reach an agreement.

Remember: Negotiate to achieve a best outcome, not a perfect outcome.

Figure 520.1-2: Tips on Fostering Good Negotiating Habits

- Be sure to do your homework
- Don’t treat money as the only important item
- Define communication paths
- Remain self-aware
- Recognize what you know and don’t know
- “De-brief” as you proceed
- Educate yourself on negotiation
Communicating With the Boss: Efficiency in the Land of Overwork*
Kim Moreland, University of Wisconsin, Madison and Kennis Wessel, Ph.D.

“BOSS.” The word, laden with implications, sounds harsh. We use it in such expressions as “boss around,” “boss man,” “check with the boss,” and “bossy.” Even the origins sound harsh, since “boss” comes from a Dutch word for “master” — and who among us hasn’t felt the pinch of being subservient to the boss?

A boss-employee relationship can be extremely complex. Stress is built into the relationship. But in order to minimize the stress and negotiate the complexity of the relationship, we must learn to communicate effectively with the boss. How does one do that? How does one bridge the power gulf?

In many ways, communicating with a boss is no different from communicating with anyone. Effective communication always requires understanding the content and character of the message itself, the purpose of the message, and the needs of the audience. With the boss, as with anyone, we must ask what our goals are with the communication, and, perhaps most importantly, what are the boss’s needs. Here are some simple recommendations to follow when communicating with the boss.

Keep Communication Professional

Relationships, including professional relationships, have an inherent personal component. Professional relationships are no exception, although they always balance toward business factors. In a professional relationship with the boss, always monitor the degree of personal information exchanged between you. Generally, it’s wise to let the boss take the lead in establishing the balance.

Even then, remember that the bottom line is always professionalism. Keep limits on personal information. And anytime you speak personally, be ready to cut it off and return to business. The professional obligation is the only constant in a boss-employee relationship.

Understand Your Mutual Needs

The boss and the employee have a symbiotic relationship. Each depends on the other. The boss needs information that is complete, accurate and timely. In the Office of Sponsored Projects (OSP), where information is specialized and highly technical, the employee may have skills or information that the boss does not, enhancing the employee’s value to the boss and the OSP team. Conversely, the employee depends on the boss for resources, interconnectedness to the university, to other agencies, and to the larger global picture. The boss and the employee hold a key to each other’s professional success.

---

* This article is reprinted from the NCURA Newsletter, Vol. XXXVIII, No. 5, December 2006/January 2007, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Organize Your Communication

Employees communicating with the boss should take care in organizing the communication. Bosses in the OSP are often under severe time pressures. To utilize time efficiently, the employee should prepare the message, at least mentally. First, state the central point before explaining it. Put the key piece of information in the lead position. For example, “There’s a question whether we’re in compliance with the NIH policy on human subjects,” or “Dr. Penoyer missed our deadline for Grants.gov submissions,” or “I have a family problem and I need to be out of the office tomorrow.” Second, be so prepared that you can state the essential content with maximum economy. Put the essence in a single, brief sentence. Third, provide supporting information as needed and at the boss’s discretion.

Anticipate the Boss’s Needs

When presenting information the boss has requested, the employee’s choices should be guided by the boss’s needs and by the boss’s preferences of style. Ask these basic questions:

- What information does the boss need to be effective?
- What calendar issues drive the boss’s need?
- What are the boss’s expectations about information provided by employees?

Before you meet with the boss, do your homework. Be thorough. Organize yourself by learning what the boss needs, and the timeline on which he or she needs it. Anticipate questions the boss may ask about presentations. Will the boss need financial data? If so, how much information and in what form? Will the boss need to read a section of a proposal? Have it available. If action is likely, anticipate implications of the information; or, if push comes to shove, what’s the fallout? For example, if the principal investigator won’t submit a Grants.gov proposal by the deadline, what are the workload implications for OSP staffers? Whether or not the boss asks for that input, you enhance your communication if you have possibilities in mind. If action is called for in a report, anticipate outcomes of the action.

In responding to the boss, be sure you know the boss’s style preferences. Does the boss prefer summaries or detailed reports? Should reports be written or oral? If the material is written, the boss has an opportunity to review at her discretion. If the material is presented orally, she can ask follow-up questions on the spot. Each style has implications for quantity of information you should include, for a timeline to prepare the report, and for the possibility that you must prepare follow-up reports. You may have to alter your own presentational preferences to suit the boss.

Know the Boss’s Managerial Style

Does the boss delegate or does she give directives? In general, the boss who delegates wants the employee to assume responsibility for problem-solving. A report to this boss should be relatively global and conceptual, featuring essentials only. The boss who issues directives is more likely a hands-on manager who wants details, and who will be actively involved in your daily decisions.
These style differences have implications for timing. The delegating boss usually prefers information on a regular meeting cycle, with the exception of special needs and crises. The directive boss wants information as it is available and wants to be involved in active decision making. Finally, some bosses listen passively as you present information, but others will be more proactive, asking for clarification and further details. Always know what your boss needs and be prepared to provide it.

Regardless of the boss’s style, be careful to suggest solutions without insisting on them. Remember that the boss has an obligation to run the office, so protect yourself by not taking decisions personally. And remember that the boss needs to hear all information, both good and bad. The boss cannot function, cannot properly act, when important information is withheld.

**Prepare Fully When Making a Pitch to the Boss**

When the employee is approaching the boss, these questions can serve as a guide:

- What do I need from the boss?
- To address my request, what information will the boss need from me?

If you offer a suggestion to the boss, prepare and organize. State the suggestion up front, then give justifications for making it. If background is required before you state the suggestion, keep it extremely brief. Always be prepared to discuss the downside of your suggestion — as well as the upside — and prepare for every question you can anticipate. Once you make the initial pitch, give room for the boss to respond. Follow the boss’s lead. It’s a good practice to keep yourself somewhat disengaged, rather than to become too ego-involved. The decision should rest with the boss, or you wouldn’t be presenting it to the boss in the first place.

In conclusion, communication between an employee and the boss is colored by differences in responsibility and authority. Each person is essential to the proper functioning of the office, and each depends on the other. It’s easy for an employee to see the boss’s dependence on the employee, but do not overlook your dependence on the boss. As an employee, work to support your boss, the office and the institution. To help your communication with the boss, identify the biggest issues before you, and solve them. That calls for each employee to work closely and collaboratively with the OSP team. As head of the team, your boss deserves your most careful and thorough communication. But remember that the biggest single reason people change jobs is not salary, not job descriptions — it is unhappiness with the boss.
Delegation: The Boomerang Effect?
Stacy A. Riseman, Franklin W. Olin College of Engineering and Michelle Joy Powell, Georgia Institute of Technology

When was the last time an employee came in with a question or a problem and somewhere in the process they left and we ended up taking on whatever it was? If the answer is “today,” then it might be helpful to learn more about delegation. It happens to all of us — the need to solve a problem that is brought to our attention. There are several reasons for why we do this. We think we could do it better and faster ourselves. We may not trust the person to do it correctly, the person isn’t qualified or trained, or better yet, the person didn’t handle it well the last time! And for every one of these reasons, why would we NOT take on the task? Anybody in their right mind would, right? At the time we think that we are saving everyone’s time by handling the situation ourselves, when in fact, the joke is on us. Well, maybe not the joke, but now THE TASK is on us!

So why is it sometimes difficult to delegate? Perhaps the act of delegation has more to do with ego than anything. If the person to whom we are delegating fails, it is a reflection on us. If the person exceeds expectations, then we may be upset for not doing it that way first. Not everyone feels the latter but one must keep in mind that when an employee exceeds, we are an effective manager. In this case, use that as an ego boost, rather than taking on every task. These situations are the minority. Many of us have the situation where we are afraid to delegate because we believe that the person to whom we are delegating to, due to past performance history, will fail. And when they fail, we end up cleaning up the mess. It’s much easier to “just do it ourselves” we think. It is harder to figure out WHY this keeps happening with that employee. And yes, unfortunately, that means more work for us. Figuring this out should only occur at the beginning of the process of delegation. Once we learn how to be an effective manager, delegation will happen, and the tasks delegated will actually get done, and to our satisfaction, if not exceeding our expectations.

So how does one delegate effectively?

◆ First, choose what to delegate and have a plan of action.

◆ Second, identify the appropriate person for the task at hand. Knowing our employee’s strengths and weaknesses ensures that the task is something that they can accomplish. Prepare that person for the task and make sure that they understand the scope.

◆ Third, communicate what needs to be done. Try explaining the what and the why. What does the employee need to do and why does it need to be done (why it is important)? It is important to share information like timelines, deliverables, background information, and any advice that is important to the activity. Also,

*[This article is reprinted from the NCURA Newsletter, Vol. XXXVIII, No. 3, July/August 2006, published by the National Council of University Research Administrators. It is used with permission of the publisher.]*
consider who the employee should work with and what resources are available for them to successfully accomplish the task.

◆ Fourth, empower the employee to do the job properly. It may be necessary to back them up in disputes. It is critical to keep in touch with the employee and monitor their progress in accomplishing their task as well as supporting them. Gauge the employee’s feelings by asking how they feel about the project or how they plan on approaching the task. Then, yes, LET GO! It’s a scary process, but necessary in delegation.

◆ Finally, be sure to acknowledge a job well done. Give credit when the task has been successfully completed. Public recognition both reinforces the enjoyment of success and sets a standard for other employees. This last part is the perhaps the most important part of delegation. If a person is not acknowledged, how are they supposed to be encouraged to take on another task?

   Here are some tips to help delegate more effectively:

◆ Try not to underestimate your employee’s potential. If you expect the person to succeed, expressing this often, you will be pleasantly surprised more frequently than not.

◆ Keep lines of communication open at all times. If you let too much time go by, then the person will think that they are not a priority, nor the project.

◆ Keep your mind open to new ideas and ways of doing things. Your way isn’t always the only way. Projects are more interesting to an employee if they share in the ideas.

◆ Encourage feedback from the employee regarding the direction of the project. They are the one who is closer to the project and might be able to offer reasons why a project should take another direction.

◆ Delegation strengthens who you are as a manager. It shows you are an effective manager and can work together with your employees. This helps you with your promotion potential.

◆ Trust your employee and your intuition. Your employee will sense this and react accordingly.

◆ Give praise, acknowledgement, and feedback at the end of the project.

   Initially, delegating does take more time to master; however, the payoff in the long run is greater than the investment. The more often we use these skills and techniques, the easier they become.

   Eventually, delegating effectively will become second nature and more useful to us in our position. We will look forward to delegating because it will help free up more time to focus on the tasks we are responsible for, and haven’t had the opportunity to accomplish. Remember the job that we were hired for, but somehow found ourselves doing everything else? Sound familiar?

Managing ‘Difficult’ People At Work*
Rodney L. Lowman, Lake Superior State University

How does a seemingly mild-mannered employee become an unmanageable, angry monster? What is a manager to do with an employee who is unable to make a decision, leaving emails unreturned and accomplishing little for weeks at a time?

Both these cases are real, and both present serious challenges for any manager. In this article, I’d like to present some ideas for avoiding situations like these — if possible — and dealing effectively with “difficult” employees — when necessary.

Some days I feel like I have seen it all. I’ve been an academic department chair, dean, provost/vice president for academic affairs, and acting president. In October I become president of Lake Superior State University. I’ve also advised organizations on managing difficult employees at work. Consulting is much easier: I can give my advice and go home.

I have seen many articles and books on “managing difficult employees” or “coping with impossible bosses.” I have come to realize the interaction of person and situation matters as much in working relationships as in any other aspect of human behavior. There are rarely universals that make every employee difficult in every work situation. And the boss that some experience as the “worst ever” is experienced by others as their “best ever.” (Trust me on that one: I’ve been seen as both in the same organization, and sometimes, over time, with the same people!) And often, what seems to be a characteristic of a person is at least as much a characteristic of a complicated and too-stressful work situation.

Take the case of the angry monster. His behavior became increasingly difficult to deal with when his anger seemed increasingly out of control. When he stormed out of my office after engaging in a shouting match, he slammed the door loudly in front of others. I had no choice but to take action and did—not just because of this incident but because his behavior had reached intolerable and seemingly unchangeable limits. There were a variety of factors at work. The organization itself was under tremendous pressure—financial and otherwise—and this manager was in the middle of a vigorously contested divorce. Under less turbulent organizational times, the turbulence in his personal life would probably not have spilled over as much as it did into his managerial duties.

The indecisive administrator was also my boss, which made the situation even more difficult to resolve. E-mails were not returned, if at all, for weeks or months, yet there was a constant series of meetings that seemed unproductive and unhelpful. One of the main foci seemed to be on planning the next meeting. A number of the direct reports shared their frustrations, but few of us were willing to take the

* This article is reprinted from NCURA Magazine, September/October 2007, Vol. XXXIX, No.4, published by the National Council of University Research Administrators. It is used with permission of the publisher. Rodney L. Lowman, PhD, was a professor and past president of Lake Superior State University in Sault Ste. Marie, Michigan.
supervisor on. Those of us who did paid the price in terms of chilliness and lowered performance reviews.

In today’s world I’d also have to cite the “e-mail warriors.” These are the individuals who fight from afar by blanketing everyone in the university with their views. Inevitably some will latch on to the most extreme positions. Once started, such e-mail wars are difficult to end. And for the bright and articulate people who work at universities, the stream of words can be endless, if rarely productive.

An Ounce of Prevention
The most important part of managing difficult people effectively, I would argue, is not to get into the situation in the first place. This means rigorous screening up front, lots of reference checks, and interviews with more than one person in the office so there is some consensus on who is being hired. Better to hire a temp than a permanent employee about whom there are questions.

When I was a department head hiring faculty members, I always saved the envelope in which application materials arrived. Letters were almost always pristine and politically correct, but the envelope was often handwritten and gave some sense of how the person presented him- or herself when no one was looking. Think of the interview as a behavioral sample. Don’t just ask the usual questions about background, strengths and weaknesses and career goals in the customary tired way. Be indirect. For example, how would others describe your style as a worker or a supervisor? Also, create situations in which you can see how the person performs under stress. See how the job prospect handles being kept waiting, running over an appointed time, having the schedule for the day suddenly changed, etc. Interview behavior is usually well-rehearsed and well-practiced. You want to see how they respond in more spontaneous and ambiguous situations.

Pay Attention to Your Reactions and Those of Others
A potential hire should not be rejected because she or he reminds you of your difficult mother, but it would be important to figure out the source of the feelings you are experiencing. Do others have similar concerns, or are you experiencing an individual “red flag”? When in doubt, bring the person back for another round of interviews, do more reference checking, or just say no. You can choose your employees and get rid of those who are really ineffectual, but you are stuck with your clients, right? Well, not necessarily. I know of a number of consultants who have “fired clients.” They did so because the income, no matter how great, was not worth the trouble of the persistent and aggressive demands. Psychological health is often more valuable than money. Unfortunately, university administrators have fewer options, but you can manage clients by assigning ones you find excessively troublesome to someone else in the office. A client you find difficult may be no trouble to someone else in the office with a different personality or work style.

Some Courses of Action
We are all trained—at least to some extent—to avoid conflict, particularly when we are in a customer service or support function. Simple statements are a good place
to start, e.g., “I’m bothered that we are not seeming to give you what you need; I’m wondering how we can do a better job.” It’s usually best to start with the assumption that it’s easier to change your behavior than the other person’s. However, when difficult people remain difficult, it’s important to put the issues that are bothering you to them in as neutral a way as you can. “It seems that everything we have tried has not satisfied you, and my staff is finding it difficult to support your office. I’m wondering what we can do to change that.” Some difficult people may need less subtlety and may respond better to a more aggressive counterattack. For example, “You have asked us to drop everything for your last three grant applications, and we are not willing to do it anymore. We will work with you to plan your grant submission in a timely way, but if you give us any less than [fill in the blank] notice, we will have to say ‘no’ to your requests.” Of course, before you take such action, be sure you have informed your own boss of what you plan to do and why and have her or his support to do so.

Here Are Some General Suggestions to Follow in Dealing with Difficult People

1. You are paid to perform a job in a civilized society. You do not have to be badgered or bullied and should set clear boundaries about what you are willing and not willing to tolerate.

2. Gather data and study the problem before you draw any conclusions. Don’t be too quick to jump to conclusions. Check out your perceptions with others. Examine carefully the types of situations in which the behavior you find problematic is generally elicited. Make sure you are not the other individual’s “difficult person.” Try changing your own behavior to see if that makes any difference.

3. Talk to your organization’s professionals in human resources and organizational development (OD). How would they suggest you proceed? Ask them to bring in a consultant who specializes in this type of thing. Ask for a coach to assist you in dealing with the people you have otherwise been helpless to change.

4. Take action immediately once the pattern is established and you feel that you cannot — and should not — have to live with the situation. The longer you let a situation fester, the more difficult it will be to change later. Let the person or unit know what you are unhappy with and how you would like it to be different. Remind them every time the pattern repeats. Train the person or group that bad behavior has clear consequences.

5. Don’t be overly intimidated by power. We, most of us anyway, are programmed to say yes to those in power, those who can affect our futures. You can be cordial and generally supportive while also setting boundaries and limits.

6. Use humor. When a problematic person comes in to your office you can jokingly say “here comes trouble” loud enough for your subordinates to hear. They need to know you are sticking up for them when dealing with a bully.

7. If all else fails and you are stuck in an untenable situation, consider changing jobs or units. Let your boss (unless he or she is the difficult person!) know that you have had it with this behavior and you would rather leave than put up with it any longer. That sends a clear message and may get attention when other approaches have failed.
To Combat Claims, Take Decisive Steps
Report on Research Compliance

React quickly. Be pointed yet open. Respond in kind. And don’t forget to reassure your staff. These are the strategies that the Oregon Health & Sciences University (OHSU) employed when it was targeted by the animal rights group People for the Ethical Treatment of Animals.

Following a two-day inspection prompted by a PETA complaint, the U.S. Department of Agriculture informed OHSU — in a three-sentence report — that it found no items of noncompliance at OHSU’s Oregon National Primate Research Center.

But the efforts OHSU took before the inspection helped it weather the allegations in the public eye. PETA filed the complaint to the USDA on Nov. 13, 2007, detailing instances documented during a four-month undercover investigation of “sick monkeys who received inadequate veterinary care and pain relief; employees who chased terrified monkeys around their enclosures, capturing them and pinning their arms behind their backs to force them into transport boxes; and staff who sprayed water from high-pressure hoses into cages with monkeys still in them, leaving the animals wet and frightened.”

The organization posted videos of the primate center that were taken by a person affiliated with PETA, whom OHSU called an “infiltrator.” After learning of the allegations, Jim Newman, associate director for media relations, and his colleagues went into action.

“We immediately reviewed PETA’s claims and their video when we learned of the infiltration,” he told RRC. “We called a press conference for the media right after PETA’s press conference and invited the press to ask any and all questions they may have. We showed video of many of the same animals PETA made claims about. We also invited media into the facility and even offered free TB tests so they could have extensive access if they wanted.”

Many OHSU Staff Participated

The press conference “featured about 30 staff members from all levels of the organization, from the associate director to animal care staff who directly care for animals. One of the animal care employees who was targeted by PETA volunteered to take part and responded directly to their claims,” Newman said.

Within two weeks of receiving the PETA complaint, USDA performed a two-day inspection, visiting the primate center from Nov. 26–27, 2007. USDA issued the letter stating that no noncompliance was found on Nov. 29. OHSU posted the letter and a press release on its Web site. “We thank Oregonians for withholding judgment on
PETA’s claims until they could be reviewed by independent, unbiased animal care experts,” Daniel Dorsa, OHSU’s vice president for research, said in the statement.

Newman said, however, that, regardless of the “clean” report, “the toll on employees is heavy.” “Whenever claims like this are made, it hurts those who care for the animals because they are very dedicated,” he said. “Many of our employees came to the press conference because they were so hurt and angered by PETA’s claims.”

He added that much of the hurt was related to feeling betrayed by their former coworker. “They often get to know the infiltrators and are upset because [they] do not feel that the activists’ claims match reality. It is hurtful when someone who you considered as a coworker and friend portrays you as uncaring or cruel and is shown to not be who you thought they were,” Newman said. “We do have safeguards to make sure the people we hire are actually here for the right reasons. However, no system is perfect.”

PETA has targeted other universities that conduct animal research. Newman recommended that his approach be followed to minimize the impact on the institution and counteract PETA claims. “I think openness and willingness to talk about the work we do is the way institutions need to respond,” he said.
Leadership Tips: Modeling the Way

Danielle Woodman, Daemon College and Michael Wetherholt, Murray State University

Leadership, we concluded, is not the private reserve of a few charismatic men and women. It is a process ordinary managers use when they are bringing forth the best from themselves and others.

— James Kouzes and Barry Posner, The Leadership Challenge

Learning the traits and techniques of applying superlative leadership skills, as the Leadership Development Institute (LDI) Class of 2006 came to know them, was a fascinating journey of self-awareness, growth and camaraderie. As part of an effort begun by our predecessors in 2005, we hope to use this column as a way to share information on how to become better leaders in our profession of research administration. This month, we specifically focus on the first of Kouzes and Posner’s five practices of exemplary leadership – Model the Way. [For other articles in the series, see ¶¶520.7–5201.10.]

In 1983, James M. Kouzes and Barry Z. Posner sought to identify the practices of exemplary leaders. The two conducted surveys and in-depth interviews of middle and senior managers, and then analyzed personal best cases. They developed a Leadership Practices Inventory based upon this analysis, then asked over 3,000 managers and their employees to assess the degree to which the managers studied engaged these practices. Kouzes and Posner found that, regardless of variations in the industry or profession, good leaders exemplified what the two identified as The Five Practices of Exemplary Leadership®. These five practices include (1) Model the Way, (2) Inspire a Shared Vision, (3) Challenge the Process, (4) Enable Others to Act, and (5) Encourage the Heart.

The first practice of exemplary leaders is Model the Way. In describing this practice, Kouzes and Posner write: “Being a role model means paying attention to what you believe is important. It means showing others through your behavior that you live your values.”

As research administrators, we are often in the position of serving multiple constituents. Pre-award research administrators often work with program or contract officers, while post-award administrators may work with external auditors. Some of us have subordinates or an entire department to manage, and we all have supervisors. We have faculty members procuring grants for research, education, or public service. Other constituents are sponsoring agencies, including the federal government.

*This article is reprinted from the NCURA Magazine, Vol. XXXIX, No. 1, Feb/March 2007, published by the National Council of University Research Administrators. It is used with permission of the publisher. Danielle Woodman is Director, Office of Academic Grants, Daemen College and Michael Wetherholt is Director, Office of Sponsored Programs, Murray State University.
In a microcosm, research administrators work with a wide range of constituents possessing different interpretations and expectations, not just of grant awards and the policies and procedures that govern them, but of our own roles as research administrators. With all these constituents, how do we ensure that we are paying attention to what we believe, and successfully show that we live our values without being chameleon-like, or alienating others?

Marcia Landen and Michael McCallister, who in 2006 wrote about the research administrator as a professional, speak to the core competencies and values of a successful research administrator. The authors’ analysis can serve as a foundation for defining our role and value systems as we fulfill our duties and responsibilities as research administrators. In their article, “The Research Administrator as a Professional,” the two wrote that

Successful research administrators must have an affinity for the creative process in a variety of disciplines, an acceptance for the mixture of ways research and its administration is done, and an appreciation for what constitutes a contribution to the field. Research administrators are brokers, translators, intermediaries, and helpers who value long-term process. But mostly, research administrators are believers in the vital importance of research.

How can the Landen and McCallister model be applied to our daily role as leaders? Being prompt for meetings, thanking others, and returning phone calls and emails promptly are basic examples of how we all can “model the way” to those around us. What about more difficult situations?

At the November LDI retreat, the Class participated in role play in which one person was a research administrator and the other was a kind, delightful, and highly successful faculty member. In this scenario, the faculty member had not met with the sponsored programs office to obtain an authorization on a contract. To complicate matters further, the faculty member had waived rights to the patent, and the university lost all rights and royalties as a result. This was not the first time an “event” of this type had occurred with this faculty member. But as leaders, how might we address this difficult situation without alienating the faculty member? As Kouzes and Posner note, we can begin by paying attention to what is important. For research administrators, what is important is the research.

A research administrator in this situation might begin by focusing on the value of research and his or her role in supporting the process. Contracts are necessary to ensure that the faculty member and institution are protected and that revenue promotes future research and the dissemination of results. All the constituents, from faculty members, staff, program officers and auditors, are striving to ensure that funds are procured and used wisely to advance research. When we are engaged in disagreements about procedures and policies, bringing the focus back to this fact will ensure the conversation does not become personal, will diminish the conflict, and will model the way for others to keep the focus off blame and on resolving the current situation.

Another important characteristic of leaders who model the way is their willingness to share information with others and guide them, rather than operating au-
tonomously. Landen and McCallister refer to successful research administrators as “… brokers, translators, intermediaries, and helpers who value long-term process.” Kouzes and Posner also identify exemplary leaders as those who model the way through long-term processes:

Because the prospect of complex change can overwhelm people and stifle action, they set interim goals so that people can achieve small wins as they work toward larger objectives. They unravel bureaucracy when it impedes action; they put up signposts when people are unsure of where to go or how to get there; and they create opportunities for victory.

Following Landen and McCallister’s definition of a successful research administrator and Kouzes’s and Posner’s definition of a leader who models the way, we can strive to interpret and translate. We can work with faculty members to explain the origin of a new policy or a change in a policy and to ensure that, in conversations, our staff, colleagues, and the faculty with whom we work fully understand the reason behind the policies and the information we are presenting. If staff members express frustration during a change, remind them of how far they have come. Celebrate small gains.

These are just of few examples of how we, as research administrators, can model the way.

Leadership Tips: The Visionary Leader *
Holly Benze, The Johns Hopkins University and Jackie Hinton, University of Utah

Effective leaders are not necessarily born. We become effective leaders through a continual process of self-study, education, and experience. Just ask any graduate of NCURA’s Leadership Development Institute (LDI)! In today’s article, we’re going to look at Visionary Leaders—the people who imagine the future, the ones who believe they can make a difference, the ones who see opportunities and recruit others to share in a common vision. But first, let’s talk about what leadership is. [For other articles in the series, see ¶¶520.6 and ¶¶ 520.8–520.10.]

Leadership is a process we use to persuade others to help us accomplish a common goal. Successful leaders apply their leadership qualities (e.g., values, ethics, knowledge, and skills) to achieve this process. As a manager or a supervisor, you have the authority to accomplish certain tasks. However, having authority doesn’t make you a leader; it simply makes you a boss. An effective leader differs from a boss in that he or she inspires people to achieve high goals, rather than simply telling them what to do.

To succeed, the Visionary Leader wears many hats such as the following:
◆ Coach – helping team members match their wants with team goals
◆ Facilitator – uniting diverse team members as a cohesive group
◆ Pacesetter – establishing challenging and exciting goals
◆ Director – soothing fears by giving clear direction in a crisis
◆ Democratic – encouraging unlimited participation

What makes people want to follow a Visionary Leader? People want to be guided by those they respect and who have a clear sense of direction. People want to be inspired in the workplace. When an employee or colleague is deciding whether he or she respects you as a leader, they don’t think about your leadership qualities. They watch what you do to determine who you really are. Based upon your actions, they decide whether you are trustworthy or self-serving, and misuse your authority. Let’s look at a situation that one employee encountered when starting a new position for a large pediatric department.

Although current employees were aware that someone was being recruited for the new position, they did not know why the position was created, how it would help or hinder their jobs, or how reporting lines would be affected. After being hired, it was announced that Susan would have the lead for electronic submissions to Grants.gov. Up to that point, almost all physician-scientists were accustomed to

* This article is reprinted from the NCURA Magazine, Vol. XXXIX, No. 2, April/May 2007, published by the National Council of University Research Administrators. Holly Benze is Associate Director, The Johns Hopkins University, and Jackie Hinton is Technical Writer/Project Administrator, University of Utah.
submitting hard copy NIH proposals.

The Challenge

How to build trust with potential colleagues who were wary of a non-clarified position, held by a new member of the research team, who was telling them that, in the near future, all of their clinical research projects would be submitted to NIH by the Sponsored Projects Office. Here are some tips that Susan discovered about how to be an effective Visionary Leader:

Risk yourself. Answer questions honestly and be willing to learn from others. Susan was hired to centralize a grants resource unit under the Research Enterprise and to define the grants process for a department of over 500 employees. Although she was expected to lead this effort, the first step to enable leadership was for her to become the trainee. She had to first listen and to learn to lead effectively.

Get to know the people and the culture. Meeting people face-to-face in informal settings is the most effective way to get to know them and what motivates them. Listening to their stories will help you identify people that will potentially advance your vision by helping you discover common visions. The approach you use when trying to effect change is critical. For example, simply telling people what they need is ineffectual and creates distrust. By listening and learning first, Susan was able to focus on how to fill the gaps in grants services and to show appreciation to others for what they did for the grants process.

Envision the future. Look back at lessons learned from the past to help you look to the future. Communicating a clear vision makes it easier for people to sign on. Susan was able to use this information to integrate her past experiences with her current situation to create a clear, focused vision for the future. Do what you say: although Susan was hired to be the grants resource expert, she was new to the medical field. She had to be willing to say “I don’t know, but I’ll find out.” To build trust, it was vital for her to follow-through on every request as accurately and quickly as possible.

Engage others in your vision. In this case, stakeholders were the best source for learning what help was needed to further the grant success of the young physician-scientists. Susan began “sharing her vision” by helping others imagine what could be, especially how they could improve success rates for grants. For example, Imagine a One-Stop-Shop that will smooth the way for…Imagine a resource team that anticipates investigator needs…Imagine a research environment that enables…Imagine that we can make this happen!

Language makes a difference. Using words to paint a picture helps others see new opportunities for improvement. Susan’s enthusiasm for her vision created a sense of excitement and opened the door for others to express their ideas. Her willingness to share her vision encouraged others to buy in to a project with the potential to make their jobs easier and improve grants performance within the department.
The words a leader uses also help build trust. The following quote by an unknown author serves as a reminder of words that are important for employees to hear.

The 6 most important words: I admit I made a mistake.
The 5 most important words: You did a good job.
The 4 most important words: What is your opinion?
The 3 most important words: If you please.
The 2 most important words: Thank you.
The 1 most important word: We.
The least important word: I

— Author unknown

Sharing the vision changes the vision. To draw people into a vision comes at a cost; a cost that ensures success. Susan had to learn who her constituents were and how to speak their language. What began as “my vision” emerged as “our vision.”

In summary, your leadership is everything that you do to affect your institution’s goals and the well being of others. Respected leaders concentrate on who they are (beliefs and integrity), what they know provide direction). People want to trust that their leaders understand their needs and have their interests at heart. They want to know that the dream is for the common good. The Visionary Leader’s belief in and enthusiasm for the vision is what inspires others to join. The most effective Visionary Leader uplifts people’s spirits. He or she encourages and inspires people to strive to be better than they are today.
Leadership Tips: Challenging the Process
Sara Clabby, Northeastern University and Tammy Raccio, Yale University

Our leadership series continues with Kouzes and Posner’s third practice of exemplary leadership—Challenge the Process. [For other articles in the series, see ¶¶520.6–7 and ¶¶520.9–10.]

Kouzes and Posner assert that “you search for opportunities by seeking innovative ways to change, grow, and improve; and, you experiment and take risks by constantly generating small wins and learning from mistakes.” To remain successful in the current stagnant/declining research funding environment, institutions must be willing to challenge existing practices. We are doing more with less. Institutions able to challenge existing processes and embrace ensuing changes will be better prepared to succeed in today’s uncertain funding climate. Let us explore how the six steps in challenging the process might help increase your sponsored program success.

1. Check for Limiting Assumptions. When we search for innovative ways to change, grow, and improve, we may be stymied by our “limiting assumptions.” That inevitable list of “we can’t do this because: we don’t have enough staff; we’ll never get buy-in from faculty and/or senior university officials; our systems cannot handle this type of change,” and so on. To move forward, we must identify the statements that are true and unchangeable and the statements that can be challenged. What if we used the list to generate new ideas that transform “limiting” assumptions into “boundless” opportunities? How can the sponsored projects office respond to the increasing need for their services with its limited resources? Can we creatively take a list of “cannots” and turn them into opportunities that will challenge the status quo? Can we cross-train existing staff to cope with potential catastrophes? How can we assist faculty, especially junior faculty, in an increasingly tight funding environment? Can we use a “train the trainer” model to develop department or college-level research administrators, using existing staff?

2. Look Outside. In research administration, sharing innovative ideas and best practices is the norm. Relying on colleagues within your organization and peer institutions can be a great source of creative inspiration; looking to other organizations and industries can also provide inspiration. Consider approaching faculty or departmental staff for suggestions on what you and your team can do more effectively. What about other departments on campus? Do they have a process or service that could work in your environment? For example, to be more responsive to requests for assistance from faculty and staff, a department may implement a

* This article is reprinted from the NCURA Magazine, Vol. XXXIX, No. 3, July/August 2007, published by the National Council of University Research Administrators. It is used with permission of the publisher. Sara Clabby and Tammy Raccio are alumnae of the Leadership Development Institute, Class of 2006. Sara Clabby is Manager Pre-award Services, Northeastern University, and Tammy Raccio is Associate Director, Yale University.
helpline using the same software as the university’s Information Services’ Help Desk. The caller to the helpline receives a remedy ticket and the appropriate staff member responds to the ticket as quickly as possible. Once the question is answered, the ticket is closed and an e-mail is generated to the original caller. The software allows tracking of responsiveness and an opportunity to increase responsiveness because there is measurable data to build upon.

3. **Innovate and Create.** Behind every limitation lies an opportunity waiting to be discovered. Encourage people to think outside the box and discover new ways to approach obstacles. Look for innovative ways to make meaningful changes that challenge you and others. As an innovative leader, don’t be afraid to volunteer and become involved with a difficult job. This will test your limits as you share new challenges and opportunities with people on your team. If you are not having fun doing something, others are not either. Since people perform best when they enjoy what they do, try to integrate fun ideas into your organization’s work. People who have not been asked for their opinion often thrive when given the chance to contribute.

4. **Check the Fit.** Get to know the people you lead. Learn their skill levels; discover what motivates them; and encourage each person to contribute to the success of a project, maintaining a sense of its urgency. When a project is finished, celebrate the victory and don’t forget to renew the team before the next project! Don’t just celebrate the big win - a finished successful project - celebrate the small wins. Let the team know they are valued by recognizing the day-to-day successes. Teams get stale and need to be refreshed. Send team members to a professional meeting, rotate members on teams, or make sure members stay connected with other areas of your organization. Your commitment will help ensure that team members maintain the vision and values of your organization.

5. **Take the Initiative.** As a leader, be proactive about taking risks. Take the initiative and challenge the status quo. Find something that you believe in, that plays to your strengths and gives you a chance to stretch. Make sure the opportunity is in line with the organization’s vision and goals. Then go for it! Voluntarily place yourself in a difficult situation and look for ways to celebrate the small wins. Admit your mistakes and keep the environment safe for others to join in and contribute. Just because something has always been done a certain way doesn’t mean it stimulates creativity and innovation. If something you and/or your team tries does not work, stress the positive gains. Show that you value the creative attempt and learn from the process.

6. **Encourage the Initiative in Others.** Encourage others to question and take risks. Create a safe environment for them to speak up if something doesn’t seem right or they have a new idea. Organizations thrive when its employees are willing to be catalysts for change. Leaders need others to succeed! Model the way forward by helping others see opportunities in limitations. Opportunities can be achieved when others say “I will do that; we can make this a reality; it’s not a problem for us.”
We’d like to challenge you to eliminate the negative and search for opportunities that will strengthen your organization in today’s difficult environment of flat/reduced federal funding. Look for innovative ways to change, grow, and improve the practices in your office. Take steps to challenge the process. Generate the small wins and value the process.
¶520.9  **Leadership Tips: Enabling Others to Act**  
Chris Green, University of Texas Health Science Center at San Antonio and Tammy Raccio, Yale University

As we continue with Kouzes’ and Posner’s fourth practice of exemplary leadership — Enabling Others to Act — we will review some leadership fundamentals. Enabling others to act involves fostering collaboration where creating a climate of trust is essential. [For other articles in the series, see ¶¶520.6–8 and ¶520.10.]

Successful leaders have demonstrated the importance of trust and collaboration in improving team performance. They have shown that team goals are met because of collaborative rather than individual performance. In research administration, challenging situations often arise with a great deal of urgency. Success is more likely assured when they are able to work in a climate of trust, acknowledge interdependence among team members, and support face-to-face interactions. Learning how to assess the needs and requirements of your team so that they can develop these elements will enhance collaboration and improve overall performance.

*Creating a climate of trust* is the primary competency if leaders are to enable others to act. Effective leaders must make a conscious effort to develop and sustain trust among team members. People are more willing to risk being innovative and creative when they feel trusted. As leaders, we must first have trust in others. Although you may feel vulnerable and uncomfortable at first, the rewards of developing a high-trust group will enable your employees to grow and prosper. Employees experience more success as a group, more personal satisfaction and higher levels of commitment to excellence.

*Acknowledging interdependence among team members* is the second component in fostering collaboration and enabling others to act. When a sense of interdependence exists, we tend to rely on each other. Genuine teamwork enables extraordinary achievements that could not be accomplished individually. An understanding of mutual dependence is essential for success in the research administration environment. Interdependence among team members also involves reciprocity. A readiness to be cooperative, and not take advantage of others’ willingness to share, is a very successful approach to achieving collaborative goals. The risk of escalation is minimized with reciprocity. In addition, when people know you’ll reciprocate they’re more likely to cooperate with you and become a recipient of your cooperation. It’s a win-win situation. Highly collaborative people tend to be team...
players who get more pleasure from the group’s success than their own individual achievements. Emphasizing the long-term goals of the group can help strengthen the team and enable them to continue during temporary setbacks.

**Face-to-face interaction** is the most powerful competency in fostering collaboration and enabling other to act. It is extremely valuable for us to intermingle and have team members associate with internal and external contacts. Positive face-to-face communication promotes relationships that will have a positive influence on tomorrow’s dealings. If we can approach face-to-face interactions with the assumption that we’ll be working together in the future, building a good relationship will be mutually important to everyone on the team. Expanding our network of collaborators increases our opportunities for success. Nurturing these relationships and investing time and effort in building new relationships enables us to accomplish extraordinary goals. Staying connected to people that we deal with on a regular basis will keep us engaged. In today’s world, it’s more difficult to maintain face-to-face encounters where we try to build many of relationships by a click of a mouse and the stroke of a key. Leaders must remember—as we build trust, virtual trust doesn’t really exist. As with many aspects of research administration, we must balance our use of technology with the human contact—a balance that is vital to building effective teams. One way we achieve this balance is by sharing resources and information. When team members share a common goal and are committed to seeing it achieved, they are willing to share the necessary resources to make it happen. Face-to-face interaction requires a level of social competency. Social awareness and social skills must not be underestimated. Building strong relationships and working well with others will have a direct impact on your organization’s future successes.

NCURA members have an advantage. Many of us understand and practice Kouzes’ and Posner’s leadership pearls and many of our colleagues are successful leaders who model the way. Our collaborators have established trust with each other and often turn to their peers for suggestions on how to approach issues at their home institution. NCURA also exemplifies reciprocity with various training opportunities and mechanisms for exchanges of ideas. Attendance at the regional and annual NCURA meetings attests to the value we place upon face-to-face interactions in today’s virtual workplace.

In summary, allow yourself to reflect upon the competencies we’ve discussed and look for ways that you can enable others to act that will improve your chances for significant results. For example, managers can create a climate of trust with their fellow employees by encouraging them to work on special projects that will enable them to learn and grow. Interdependence can be accomplished during proposal and financial reporting deadlines by sharing a common set of goals. Lastly, foster collaboration by phoning rather than relying on email. Face to face or verbal interaction is still the most effective means of communication.
Leadership Tips: Encourage the Heart
Jeanne Galvin-Clarke, University of Maryland, Baltimore and Sinh Simmons, University of Washington

In this issue, we come full circle in our journey through “The Leadership Challenge” by James Kouzes and Barry Posner. [For other articles in the series, see ¶¶520.6–520.9.]

We have learned that a successful leader models the way by demonstrating the values that form the foundation of a strong organization. An effective leader articulates a vision that guides and energizes the team. He or she challenges the status quo to create new solutions to old problems, and enables others to act by fostering an atmosphere of trust, credibility, and support. A good leader brings all of these skills together when he or she encourages the heart, recognizing the contributions of individuals and celebrating the values and victories of the team. Adapting these leadership practices to your research administration office will improve the cohesiveness, self-motivation, and productivity of your staff. As international research administration becomes more common, effective leadership skills will impact significantly our ability to teach and to learn from our colleagues in foreign countries. Our ability to genuinely encourage the heart will strengthen our efforts to build new relationships. Let us look at ways we can encourage the hearts of others.

Expect the Best. Expectations can color outcomes. If you expect someone to fail, your non-verbal communication may express doubts that can become self-fulfilling prophecies. Instead, why not use expectations to help your team achieve success? You can shape your ideal team by envisioning what they can be and sharing your expectations with them. Positive expectations are infectious. As you model this orientation, you’ll find that team members will expect the best from themselves and each other, achieving common goals where everyone wins. This practice reinforces your efforts to enable others to act and expresses your commitment to their success.

Provide Clear Standards for Values and Goals. People perform better when they believe what they do is important and understand how it affects the whole. It gives

Sinh Simmons is Associate Director, Office of Sponsored Programs, University of Washington.
purpose to their actions. To keep a team motivated and engaged, it is vital that they receive useful feedback. People want to know if they are making progress towards a goal. Encouragement from the team leader lets them know whether or not they are on the right track. When team members believe that a leader wants them to be successful, they are more likely to be open to suggestions for improvement, strengthening the trust between leader and team member. As Kouzes and Posner point out, “with clear goals and feedback, people can become self-correcting.”

**Pay Attention.** Practice caring by walking around (Kouzes and Posner’s twist on the phrase) and catch people doing their best. Encourage team members to notice and acknowledge the contributions of their teammates. For example, Kouzes and Posner tell of a manager who issued “Gotcha Certificates” to each team member, managers and staff alike. Each certificate was valued at $5, redeemable at a local coffee bar. When someone on the team became aware of a co-worker who made an extra effort or accomplished a small victory, he or she would call out “Gotcha” and make an impromptu presentation of a certificate. The surprise and public acknowledgement of that moment packed a lot of punch for only 5 dollars. Make encouragement and recognition part of your team culture.

**Personalize Recognition.** To preserve trust and credibility, recognition must reward behaviors that exemplify the team vision and actions that support the team goals. People know when recognition is perfunctory. In lieu of the nebulous “employee of the month” award, specifically recognize the professionalism of the person who remained calm and courteous when faced with a demanding PI and a last-minute proposal. To be memorable, recognition must be personalized to the individual. NCURA demonstrates the power of recognizing and honoring individual achievements. Rather than receiving a plaque and handshake alone, recipients of the organization’s most prestigious awards stand on stage while the audience views a brief, personalized video of each recipient’s accomplishments. This approach is much more meaningful for the award recipients and personifies the values and skills respected by the NCURA membership.

Leaders learn from the many small and often casual opportunities to get to know their team. Make the effort to design recognition that individuals will appreciate. For example, one employee may like to have his or her successes written up in the office newsletter, while another may prefer to receive a hand-written note of thanks. One person may like to be taken out to lunch; someone else may prefer to have an extra hour off one day. Recognition doesn’t have to be formal or conventional, just meaningful.

---

**Celebrate values and victories by creating a spirit of community.** Celebrations serve a dual purpose: to honor achievement and to remind everyone about the history and values that bind you together. Group celebrations bolster employees’ spirit. They provide opportunities to reinforce the values you want integrated into your organization and recognize progress toward reaching the vision you have set-forth.
Schedule Celebrations. Schedule celebrations so that they become rituals within your team culture. For example, host a celebration when the institution’s annual report is released to show the contributions sponsored programs make to the overall health of the institution. Remind your team that it is their efforts that made that possible.

Show Passion and Compassion. Celebrations for individual staff achievements remind employees that you value them as whole persons, not just for the work they do. Various celebrations such as birthday rituals, completing an advance degree, and farewell celebrations for colleagues who are promoted to new positions, reinforce the sense of community and connection between team members. Similarly, expressing compassion when team members suffer a personal loss or difficulty is equally important to building a sense of interpersonal connection.

Be a Cheerleader for Your Team. It is important to promote your team’s contributions to the institution’s success across campus, communicating the value of your staff to the institution’s mission and demonstrating your pride in their efforts. For example, you can highlight successes in your campus newspaper or add a “kudos” section to your sponsored research office website. Let your team know when you speak up for them before higher management. Show them the PowerPoint presentation you are going to present at the Dean’s retreat and don’t forget to ask for their input in that report.

Share Stories About Your Team. Telling stories about your team builds a sense of belonging to something important. Tell stories of individual team members who have demonstrated the values that underlie the work you do. For example, tell the story about the administrator who went out of his way to help a new faculty member identify a funding opportunity. Or, the story of a grants and contracts specialist who made sure a grant application was completed even though the due date was the same week her first son was born. These examples illustrate your office staffs’ dedication to serving its customers and the mission of the university. Tell the story about how the contracts your office negotiates lead to specific new technologies that saves lives. Telling stories enables your staff to feel proud of the roles they play as partners in the institutions’ research mission.

Have Fun. Be creative in your celebrations. Implement a water balloon throwing contest at the annual office picnic; dress up as Glenda the Good Witch or one of the Ghost Busters to hand out annual recognition awards. NCURA often reminds its members to enjoy the fun side of our profession. Remember the Blues Brothers and Blues Sisters who join the Soul Source and No-Cost Extensions band at the Tuesday night parties? The “man-on-the-street” interviews asking “What is a research administrator?” could have won an Oscar for best comedy short. Involving humor in your organization’s culture builds camaraderie. During an annual luncheon, one university had each of the central administration departments present a skit to illustrate what they do. The theme of the sponsored research office’s skit was
“1-800-SIGN THIS.” Working together to write the skit was as much fun as performing it, and the experience created a memory that continues to bind them together.

Encouraging the heart of your team is the exclamation point that emphasizes the value of each team member’s contribution. It is a visible symbol that publicly marks team efforts and stores memories in their hearts. Our deadline-driven, compliance-oriented jobs create plenty of stress for everyone. Reinvigorating their hearts with recognition and celebration will help your team balance that stress and encourage them to excel.

The LDI Class of 2006 invites you to enhance your own leadership journey by integrating Kouzes’ and Posner’s five leadership practices in your daily work. You will discover that your newfound leadership skills will increase cohesiveness and self-motivation among your team, improve productivity for your institution and provide a greater sense of satisfaction and purpose for you as a leader.
1520.11  **Good Time Management = Good Stress Management**
Jennifer Shambrook, St. Jude Children’s Research Hospital

There is a growing mountain of evidence which lists the associations between high levels of stress and chronic disease. By chronic disease, I’m not just talking about persistent dull headaches, or even throbbing migraines. However, there is a link there. Nor am I talking about recurring redness, swelling and itching of hives. Again, the link exists. Or neck and shoulder pain, or acne, or diarrhea or hair loss … although all fall into the category of being potentially stress-induced. No, what I’m talking about are the things that can cut our lives short by decades. Stroke, coronary heart disease, hypertension, some forms of cancer, and severe depression, that’s what I’m talking about. The leading causes of mortality in the U.S. today. I’m serious as a heart attack here (sorry, couldn’t resist).

We work in a profession that is deadline-driven, where we often have little control over our workloads (such as those last minute proposals). We thrive on playing our role in the advancement of human understanding of the mechanics of our bodies, our planet, or our universe. We must remember, however, we have chosen to devote years of our professional lives to this activity, not to forfeit years from our lives because we didn’t manage our stress properly. Stress in this profession is a given. It’s there, it’s not going away. However, by incorporating some time management activities into our individual lifestyles, we can reduce some unnecessary stress through prioritizing, planning and organization.

**Prioritize**
This needs to be done at both a micro and a macro level. Prioritization of your own big picture takes some quiet time and soul searching. What do you want? Do you love your job and want to be the best you can possibly be? Do you see this as a stepping stone to something bigger and better? Do you hate it and feel trapped or resentful? Once you set your priorities at the macro-level, it is important to set your daily and weekly priorities in tune with your own big picture.

**Consider Using Electronic Tools**
We have some great electronic tools available to us that are surprisingly not often used. Two absolutely essential tools are task lists and calendars. An electronic task list can help you set daily and weekly priorities. For each task, I make a quick little list for everything that needs to be done concerning the task (i.e., find a policy; draft an email; compile mail list; send for approval; disseminate information). This organizes my thoughts, breaks down the task into manageable parts, and helps me to jump back into something when I am interrupted. Using the task list is also an aid for fighting procrastination. For example, if a meeting ends 20 minutes early, I have a few unplanned minutes that can be used for something productive. By scanning the task list, I can quickly identify a task that I can either complete, or make some

---

1 This article is reprinted from the *NCURA Magazine*, Vol. XL, No. 5, December 2008/January 2009, published by the National Council of University Research Administrators. It is used with permission of the publisher.
progress upon. Finally, when it comes time for a meeting with your supervisor, you can show them exactly what you’ve done and what progress has been made on your open tasks.

One last thing on the task list: For it to truly be an accurate reflection of how you spent your time, you do need to put unexpected tasks on it. Someone from campus royalty asks you for a report. You drop everything and work on that for the next three hours. This means that the items you had originally planned to work on are not done when expected. Put it on your task list.

Do the breakdown in the notes section, so you can organize your thoughts in how to attack the task, or explain to anyone else what was entailed in preparing the report. (“What, do you mean you can’t just press a button?”)

The electronic calendar can be Nirvana in a work environment when everyone uses it consistently. Years ago, I kept my calendar posted on my door. Now, I just make my calendar available to the people that need to see it. They can see where I am and when I will return. Of course the calendar is used for scheduling meetings, but I also block out time to work on my task list items. Without that, you may find others can rapidly gobble up every unscheduled moment of your day. It also helps you give better estimates when guessing turn-around time for projects you must give back to others.

Look at your task list and calendar as the last item of business each day. Review what you have accomplished, or left undone for the day. Set or revise your priorities for the following day. Denote top priorities on the task list. Schedule time for completion on your calendar. This will both help you realize the accomplishments of the day and prepare you to begin the following day at a high level of productivity. These activities can assist in lowering your stress. You can see what you have done, can do, and where you may need to ask for help.

The Task List and Calendar are extremely valuable tools for both organization and prioritization. If you are not using them now, I encourage you to try for six weeks and see if you have forgotten small tasks less frequently, kept a better record of how your day was spent, increased your productivity, given better customer service and lowered your overall stress.

**Avoid Time Bombs**

Here’s a cosmic truth: Almost EVERYTHING takes longer than you think it will. If it didn’t, you probably left out a step or forgot to get someone’s permission. And of course, getting with that person, explaining it to them, getting their buy in after you think the task is near completion can be significantly stress producing. Being aware that things usually take longer than anticipated is worth bearing in mind when you contemplate volunteering for anything.

If you have considered the time bombs and still want to volunteer to head up the fundraising drive party planning committee, or writing the department newsletter, there are a few things you might want to consider. Can the task be divided between people where you lead a task force, rather than doing it all on your own? Does your immediate supervisor see this as a valued activity?
Does this activity align well with your personal and professional priorities? Is volunteering for this particular activity a strategic decision, or just an impulse? Have you broken down the task into parts as it would appear on the notes section of your task list? Can you see where you would schedule the activities involved in completing the task on your calendar? If you review these things and the answers are looking pretty unfavorable, then perhaps you should decline the “opportunity.”

Keep a Time and Stress Journal

It is hard to modify what has not been identified. For just a few days, try to jot down things that make you feel either stressed out or waste your time. For example, if someone keeps you on the phone too long repeating themselves over and over, note that. If someone drops by your office to tell you about their vacation for 20 minutes, log that. How many “touching moments” or “thought you’d find this funny” emails are you getting in a day? (And if you get one that’s supposed to be forwarded for good luck, PLEASE don’t forward it to me! I feel lucky when I don’t get those things!!) In just a few days, you will see where the time wasters might be lurking. Each person’s journal will be slightly different. There will likely be a pattern of repetitive occurrences that suck productivity out of your time... and ultimately, add to your stress. By identifying these productivity parasites, you can develop a plan for minimizing or eliminating them.

Plan for a Healthy Lifestyle

A healthy lifestyle is another factor that can increase your productivity and reduce your stress. Substitute a half hour of television or reading for a half hour of exercise. Get an MP3 player if you have to be constantly entertained. It makes the exercise more fun. Keep healthy food at your desk. For those days when you don’t get to take lunch, a can of soup, or some dried fruit can be a lifesaver and keep you away from the vending machine. Obtain or maintain a healthy body weight. Finally, get enough sleep.

To do these things, you are going to have to extend the prioritizing, organizing and planning to your personal life as well. But we don’t live compartmentalized lives. To live a holistic healthy lifestyle, we must set priorities for health above convenience. In our profession, where we might be sedentary for eight hours a day, it is essential. A healthy lifestyle is a major contributor to stress reduction. And contrary to what seems logical, scheduling a half hour of physical activity gives us more energy. It also gives us sharper minds and a more positive attitude.

So, prioritize, organize and plan your way to a longer healthy life through stress and time management.
Bridging the Gap: Communicating News and Policy Changes from a Central Financial Research Administration Office
Kerry Peluso, Emory University

One of the most commonly heard challenges faced by financial research administration central offices is the challenge of communicating policy changes and other information across their campuses. One of the most commonly heard complaints from non-central research community members is frustration with a lack of communication and too limited involvement with policy changes and decisions made regarding research administration policies and procedures. Those involved in both central and non-central research administration offices are busy and generally work in stressful, deadline-driven environments. As everyone struggles to keep up with the changing requirements, tight deadlines, and increasing reporting and compliance requirements, communication can often take the back burner to more pressing issues. The unfortunate result of this situation is that the volume of issues and challenges experienced by all is multiplied.

Beyond this, many central offices struggle with how to reach those they need to communicate with. There are a multitude of methods used for communicating within a university. Unfortunately, many of these methods are overused, and messages are often ignored by the recipients. Members of university communities generally receive large numbers of emails with messages or links to newsletters. They have access to dozens of university central administration websites and central information systems. There can be several central administration offices involved in the administration of their sponsored programs. Even knowing who to contact for what can be very challenging.

Communication Cannot Move in Only One Direction

The most important thing to keep in mind when trying to design an effective communication plan for a central research administration office is that communication will not be effective if it only travels in one direction. While some messages will need to be “delivered,” a successful communication plan has to keep in mind that communication needs to travel in many directions. When a central office has the need to communicate an important change or new policy, the likelihood of a positive reception will be greatly increased if the community has had the opportunity to be involved in the development (when reasonable and appropriate).

Use Multiple Methods of Communication

There is no one method to best communicate financial research administration news and policies. Relying on one method of communication to reach dozens, hundreds, or commonly thousands of members of a research community would be foolish. As

---

1 This article is reprinted from the NCURA Magazine, Vol. XLII, No. 5, September/October 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher. Kerry Peluso is the Associate Vice President for Research Administration at Emory University.
we all have different learning styles, we all have different communication styles. Posting a new policy on your central policy website and assuming that it has been communicated would be foolish. While perhaps a good idea in concept, most administrators will probably not visit the policy website regularly to check for updates or additions.

There are a variety of methods commonly utilized to widely communicate financial research administration news and changes:

**Listservs.** Sending messages out via a listserv made up of a select group of interested parties can be a very valuable resource. However, this should be used sparingly for important messages. Sending large numbers of messages with information of varying and limited levels of value can lead to recipients deleting them without reading. Generally, this mode of communication is best used for information that needs to get out there immediately and demands high attention from many or most of the listserv members. Utilizing the subject line to grab the appropriate attention and audience is strongly recommended.

**Newsletters.** Newsletters can become an essential communication mode for many research communities. It can provide a single location for research administration information. Coordinating efforts with other central offices such as the pre-award office makes good sense. Limiting the number of newsletters that need to be reviewed by the research community increases the chance that they will read what is made available. The initial announcement of the availability of a newsletter should be widely communicated with the message that everyone involved in sponsored project administration should view each newsletter as made available.

A newsletter can be very effectively used as the main information source for research administration news. In order to accomplish this, the central office should communicate that all important changes or announcements related to sponsored project administration will be included in the newsletter (emphasizing that a review of each issue will ensure that one is aware of what they need to know). It is recommended that all issues are posted and retained on the central department’s website. In addition, the use of an opt-in listserv is recommended for sending out the issues as they are published. Many institutions find that monthly issues work best while others find that quarterly (or less frequently) can meet their needs. Newsletters can be fairly easily developed using software such as Microsoft Word or Adobe InDesign. They can be provided in printable or html formats.

**Websites.** Obviously, websites can be a very effective communication tool. However, it is important to keep in mind that people will typically visit the website only when they have a specific need. While posting news on your homepage can be valuable, important announcements should not be communicated only on the website. Careful consideration and planning should be given to the organization of the website. It is important to obtain feedback from the community you are trying to reach on the effectiveness of your website. They should be able to find the
information they need without significant struggle. All websites should include the contact information for someone to provide feedback to.

**Old-fashioned Human Contact.** While modern technology has brought many efficient methods to communicate to large numbers of people very quickly, it often lacks many of the benefits that direct interaction between two or more humans can provide. Providing information in person allows the communicator to respond to any confusion or questions immediately. It provides the receiver with the opportunity to express any questions or concerns. The challenge here is reaching the large number of interested parties within a University. Effective methods for doing this can include offering open forums or town halls which work well for providing many with the opportunity to have input. However, detailed issues can often be better addressed in smaller groups. Forming committees that represent the different groups within the institution can usually be more effective for obtaining feedback and comments on specific issues. For example, having a group of faculty and a group of non-central administrators (from across the institution) can provide strong forums for receiving feedback on decisions to be made.

**Surveys.** For some decisions, utilizing smaller or open forums to receive feedback or discuss particular issues may not be appropriate or efficient. Obtaining feedback from larger groups can often be most easily accomplished utilizing an electronic survey. There is a variety of low or no cost tools available that will allow you to set up a simple survey that will gather a variety of information from a large group. It is important to carefully design your questions to obtain the information you need in as few questions as possible. When sending out the survey, it is important to note how long the survey should take (the longer it takes, the less respondents you may have so keep it as brief as possible). You should also include a note as to when the survey must be completed and will close.

**Educational sessions.** The main communication role of a central financial research administration office is disseminating the information the research community needs to properly administer their project. This often goes beyond simpler communications and expands into more of an educational effort. Offering brown bag lunch sessions or brief educational sessions on a particular topic can provide an opportunity to more fully communicate a new policy, procedure, or process.

**Online educational modules and tools.** While in person educational sessions work very well and should be included as part of the communication efforts, online educational tools can be very effective in providing the information that many need in an easy to access format. While there is a variety of creative software available to develop online education, power point presentations can be effectively used in this area. Financial research administration areas where these modules can be effective include (but are not limited to) topics such as the OMB circulars and effort reporting.
**Did you get the memo?** While the formal memo is seen less and less these days, it still has its value. For important issues that need to have attention drawn to them, issuing a memo (that can be sent as an attachment to a listserv announcement and posted on a website) can provide a more official announcement for an important communication.

In the demanding and busy pace of a central financial research administration office, it can be extremely challenging to maintain a high focus on the area of how we communicate. However, the ability to effectively communicate news and policy changes from the central financial research administration office to the institution’s research community is essential to a successful research enterprise.
Navigating the Four Corners of Change Through Collaboration
Greg Luttrell, University of Notre Dame

Change is not just a campaign slogan; it is a constant. In our personal lives, change manifests itself in numerous ways: marriage, divorce, birth of a child, death of a loved one, promotion, pursuit of other opportunities, and so on. These life changes can be planned or unexpected, and in either case can generate strong emotions and confusion that can cause a temporary loss of vision of the path along life’s journey.

Layered upon these personal events are the changes one experiences in the workplace. These changes too may be planned or unexpected. Changes such as the incoming or outgoing transfer of colleagues, the rearrangement of an organizational chart, campus-wide implementation of new electronic systems or the creation of a different strategic focus for the organization can also generate feelings of unease and disorientation that, if left unmanaged, can blur the organization’s vision.

Each individual and organization responds to such changes in different ways and at different rates. A critical component of the art of leadership is the ability to discern where the individuals composing an organization are on the continuum of change implementation. Many are familiar with the Kübler-Ross model, commonly known as the “Five Stages of Grief.” This model was first introduced by Elisabeth Kübler-Ross in her 1969 book, On Death and Dying. Similar to the Kübler-Ross model’s description of five discrete stages through which an individual progresses when dealing with grief and tragedy, there are models describing how individuals deal with change. One of these models is represented by the “Four Rooms of Change” model introduced by Swedish social psychologist Claes Janssen in the late 60s and early 70s, also referred to as the “Four Room Apartment” model.

Janssen’s “Four Rooms of Change” model postulates that individuals progress through four discrete stages of change: Contentment, Denial, Confusion, and Renewal. The following is a discussion of each of Janssen’s stages of change and suggestions for leadership behavior during each stage based on the “Five Practices of Exemplary Leadership” model introduced in Kouzes and Posner’s book, The Leadership Challenge.

Contentment
In the Room of Contentment, we are concerned with Modeling the Way of being centered and in control with a strong focus on the current situation. It is also important to balance the focus on the current reality with being open to Challenging the Process, or being receptive to change so that you can take advantage of opportunities and

---

1 This article is reprinted from the NCURA Magazine, Vol. XLII, No. 5, September-October 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
are not blindsided. As a leader, one should avoid treatment of the Room of Contentment as a room of complacency.\(^5\) A continual focus on processes and potential areas for improvement keeps the group from stagnating in the midst of a dynamic fiscal and regulatory environment.

You might find yourself in this room just prior to finding out you are expecting a child, before a major system implementation (ex. grants.gov), or new regulations (ARRA) are being imposed. Just prior to these changes you are likely hard at work focused on meeting deadlines, managing staff, and attending meetings, and must always be sure to keep an eye towards the horizon of continuous improvement. A group will typically experience a transition from the Room of Contentment to the Room of Denial due to internal forces (ex. New process needs) or external forces (ex. budget cuts).

**Denial**

The Room of Denial is understandably difficult, but essential to the change process. The group may be experiencing anger, disorientation, apathy, disappointment, or any combination of the above. As in the Room of Contentment, a leader needs to be open to **Challenging the Process** and being receptive to change. It is critical to **Model the Way** by staying calm so that you can be open to hearing new information as it becomes available and creating an environment that is conducive to information sharing so that you can **Enable Others to Act**, or assimilate information and create future structure or process.

Before the group can transition from the Room of Denial to the Room of Confusion, it needs to exhaust itself of the feelings of discontentment described above. While the pragmatic, perhaps impatient, leader might consider the group’s necessity to vent as an unaffordable luxury and a waste of time, it is important to allow those storm clouds to dissipate rather than steering the ship away from them. Allow everyone to be heard, including the introverts in the room that may feel uncomfortable among the venting extroverts. One thing to keep in mind is that it is important to make sure that venting is done constructively in the workplace (and beyond!). A creative idea to turn venting into a constructive activity is to brainstorm.\(^6\)

The Room of Denial is not one that will produce the solution(s) to the situation at hand, yet it is vitally important to **Encourage the Heart** as we support each other through the transition into the next room.

**Confusion**

The Room of Confusion is a place where you have acknowledged that change is a reality, but that reality is still not clear. You are in a place where you can start to figure out what initiated the change, what the change means, and what the future will look like as the pieces of the puzzle start to come together.\(^7\) In this Room it is critical that you **Model the Way** of bringing people together to share information and

---

\(^5\) “Managing Change,” web.mit.edu/hr/oed/learn/change/art_four_room.html

\(^7\) See footnote 4.
to collaborate. As information comes in and the vision becomes more defined, we need to commit ourselves to *Inspiring a Shared Vision* in each other. While Inspiring the Shared vision, it is still important to give people room to *Challenge the Process* as we analyze information and fine-tune the vision. Through *Enabling Others to Act*, we allow our colleagues to guide themselves through the Room of Confusion and transition to the Room of Renewal with a clearer vision of where they need to go.

The Room of Confusion is the one in which the direction forward is charted. Similar to the Room of Denial, each group member should be encouraged to participate in the problem definition and the solution selection. Again, the leader should focus on gathering input not only from the always-willing-to-contribute extroverts, but also from those who may take a bit longer to formulate and express their opinions. A more thorough approach in this room will enable a better solution than one that is hastily contrived.

### Renewal

In this Room, all five of the Practices of Exemplary Leadership can be applied. The Room of Renewal requires that you *Model the Way* of moving the organization and processes forward. To accomplish this goal, it is necessary to give people the structure and freedom to digest their new reality, which can be accomplished by *Inspiring a Shared Vision*. While we are in the Room of Renewal, we start to transition to the Room of Contentment, where we are at ease with our current reality, but must still keep our minds open to continue to *Challenge the Process* in a commitment to continuous improvement. Throughout the experience in this room, it is also critical that we continue to *Enable Other’s to Act* by allowing them the freedom to piece together their new reality within a broad framework. And of course, as with each room we visit, it is critical that we continue to *Encourage the Heart* as we support one another through the change process.

The Room of Renewal is where the group can take a breath and celebrate a victory, whether it is great or small. You have gotten past the anger in the Room of Denial, the wilderness of potential alternatives in the Room of Confusion, and arrived at the place where the future path can finally be viewed. Again, the leader should be patient and allow the group to express itself. Bring the group together and reflect on the process by reviewing the successes and/or disappointments that lead to this point. Recognize achievement of the group and the individuals that enabled the success. Resist the urge to “put this one behind us,” and focus on the next challenge. Allow the celebration to take its course, just as allowing the clouds to dissipate in the Room of Denial.

### About the Author

**Greg Luttrell** is the Associate Director of Post-Award Administration in the Office of Research at the University of Notre Dame. His role is primarily focused on contract negotiation for all of the University’s sponsored projects. He has worked in research administration for seven years, all at Notre Dame, and is a graduate of the Leadership Development Institute class of 2009. Greg has degrees from the University of Notre Dame and the Naval War College, and is a former Naval Flight Officer. He is currently serving on the Program Committee for the NCURA AM52.
520.14 The Leadership Paradox
Joyce Ferland, Tufts University and Jeff Ritchie, Aurora Health Care

The field of research administration deals with crises, deadlines, paperwork, bureaucratic red tape and, more recently, the pressure to do more with less. With the high pace of the research administration field, promoting effective working relationships is essential to organizational success. By gaining awareness and appreciation of the different ways you and your team can build relationships within your environment, you can learn to work more effectively and become a better leader. To assist with this, we have outlined seven paradoxes.

1. Leaders Who Are Strong Ask for Help

Increased scrutiny imposed upon institutions has forced many universities to tighten their business processes. One question research administration leadership should ask is “who can help?” One option would be to get stakeholders (central accountants, department administrators, other leaders, etc.) involved with the process. This can be accomplished by asking for advice, for input and recommendations in addition to delegating, trusting and training… in other words fostering teamwork.

When research administration leaders ask for help from a position of strength, accompanied by proven ability and trust, it has an immeasurable effect. The paradox involved here is that there are some who believe that asking for help is a sign of weakness. In reality, research administration leaders must be strong and self-confident to ask for help; paradoxically, it is when they ask for help that leaders gain increased stature, respect and gratitude. Successful teams and team work fuel the accomplishment of your institutional goals. Fostering teamwork is creating a work culture that values collaboration. In a teamwork environment, people understand and believe that thinking, planning, decisions and actions are better when done cooperatively.

2. Leaders Who Share Power Gain Power

Leaders who share power gain power. If we use our power to empower others, our influence will extend far beyond our grasp. The paradox is that leaders who share power assume heavier responsibilities because they are still accountable. Leaders make their subordinates feel stronger through sharing their power. When retaining responsibility, power is delegated; when delegating a task, delegating the authority is also necessary to carry out the task. Failure to do this negates the purpose of delegation. Withholding power results in less confident followers who are afraid to attempt projects for fear of failure. In today’s current economic situation, reduction in workforce is commonplace in both university and hospital settings. Due both to this reduced workforce and the increased scrutiny and compliance regulations imposed

upon our institutions, leaders in research administration have more responsibilities with fewer resources. Delegation is an essential part of management.

3. Leaders Who Give More Receive More

The old axiom is true “the more you give, the more you receive.” A perfect example of this is volunteering for NCURA. What do NCURA volunteers receive in return? Volunteers gain the opportunity to help guide the future of NCURA, to establish a strong network of peers, to acquire new skills and experiences, and to help advance the field of research administration. This is paradoxical because some could perceive that research administration leaders share their knowledge with others could create competition and then could be displaced. However, leaders who are secure and possess inspired visions realize that training people strengthens teams.

4. Leaders Who Take the Blame Avoid the Blame

Let’s say that Dr. Jones has been experiencing difficulties with getting his R-01 application put together and out the electronic door on time, and he is not satisfied with the support he has been getting from your staff. Your staff reports that Dr. Jones has rarely made himself available to discuss the project, and they’re getting plenty frustrated as well. As a manager and a leader, you need to be prepared to accept your legitimate share of the blame for this situation, but at the same time, you need to be prepared to go to the mat for your staff. If your people were not prepared to handle Dr. Jones’s application, you need to own that, but you need to make it clear to Dr. Jones that he plays a role in this process and needs to be available. To really understand this paradox, look both up and down the chain of command. If you studiously avoid accepting the blame for ANY situation, you are exhibiting a lack of judgment to your superiors and a lack of accountability to your subordinates. When there are legitimate complaints with service that your people provide, accept responsibility for it and work with Dr. Jones and your staff to fix the problem.

5. Leaders Who Take Time, Save Time

“I can do this faster by myself” is the familiar refrain from the overworked and stressed out supervisor. Rather than taking the time to transfer knowledge and reinforce behavior in the staff, the manager thinks that it’s more expedient to just do it all. Alone. Every time. This is a recipe for professional burnout. Taking the time to train your staff (including your colleagues and superiors) is making an investment in your future productivity. In the short term, it will require a little more of your time to mentor those who need your expertise to perform the myriad tasks required of a research administrator. In the long term, you’re going to have a more efficient and well-organized staff who are capable of making good decisions without the need for your constant guidance.

As a manager, there is nothing more satisfying than learning that there was a crisis yesterday that your staff successfully resolved without your involvement. While there is a degree of technical expertise involved, another key component of “training” is establishing basic professional values within your organization. Quite often, the important decisions are not driven by the demands of policies and proce-
dures. They are driven by what your staff perceives to be the values of your department, so make sure that you clearly communicate – by words and by actions – what those values are.

6. Leaders Are Not Technicians

To be an effective research administrator, one needs to master a daunting body of technical knowledge. We have to be able to review a research contract just as efficiently as we order supplies from the procurement office. The degree of technical expertise required for our profession is ridiculously high, which is why we often can’t see the leadership forest for the technical trees. The paradox here is that to be an effective leader in research administration, one needs to lay aside the emphasis on those technical skills. Of course we know how to write a budget for a training grant, but we have to comfortable with allowing our subordinates to do the technical tasks while we handle the oversight and managerial duties that come along with leadership.

Nobody likes being micromanaged, and I suspect that even leaders would admit that looking over the shoulder of their staff doesn’t make for a professionally satisfying workday. You still need the body of technical knowledge that you gained while rising in this profession, because new professionals are entering research administration every day. Your role now is not to be a technician, but to be a teacher and a mentor to your staff. For years, you were willing to learn everything you could about being an effective research administrator, now is the time for you to be willing to share.

7. Leaders Do Not Lead

When we think of the traditional view of leadership, we think of one person out in front of a large group, leading the way into an uncertain future: The captain of a ship or the general at the head of a vast army. But the study of leadership in recent years has shown that this view is largely unrealistic. Leaders provide vision and inspiration, and while they may sometimes find themselves out in front, they’re just as likely to be in the background. Leaders are effective when they provide encouragement to others and the opportunity for others to achieve great things.

Ultimately the most important elements of true leadership are what occur out of the spotlight. Inspiring a shared vision for the institution is part of being a leader, but so is mentoring your employees and coaching them in their development as research administrators. Equally important are providing your employees with opportunities to grow, both personally and professionally, and celebrating their success along the way. These are all what we used to call the “soft skills” of management, but nothing proves to be harder. Perhaps that’s the ultimate paradox of leadership.

About the Authors

Joyce Ferland has recently accepted the position as Manager of Sponsored Programs Accounting at Tufts University following a 17-year tenure at Brown University. In this new position she is responsible for the fiscal management of grants and contracts in accordance with government regulations, donor requirements and University policy including post-award account management. She has been a member of NCURA since 2004 and is a graduate of the LDI class of 2009. Joyce holds a bachelor’s degree in Financial Management and is pursuing her MBA focusing on Business Leadership.

Jeff Ritchie is responsible for Gift and Grant Administration for Aurora Health Care, charitable, nonprofit healthcare provider serving eastern Wisconsin and north-east Illinois. In this position, Jeff is responsible for the post-award administration of external grant funding, in addition to managing the flow of funds through the Aurora Health Care Foundation. He is a 2009 graduate of the Leadership Development Institute.
Can We Talk? Contacting Grant Program Officers
Robert Porter, University of Tennessee

Abstract
For success in grant seeking, solid writing skills are necessary but not sufficient. In addition to compositional excellence, researchers must master the relational demands of external funding. Chief among these is the need to establish an effective line of communication with an appropriate grant program officer in the funding agency. This paper presents the rationale for initiating contact with a program officer and describes a sequential set of activities designed to assure a productive dialogue. It concludes with a sample coaching script research administrators can use to assist investigators in this critical process. The time taken to do this, prior to writing the proposal, will be the best possible investment new researchers can make in the grant seeking aspect of their academic careers.

Introduction
“A sound concept, but it does not fit our current funding priorities.” Each year, disappointed grant writers will read comments like this on the reviews that accompany notices of proposal rejection. Successful grant writers know that early contact with a program officer before deciding to write a proposal is key to avoiding this distressing outcome (Porter, 2005). Pre-proposal communications can have a powerful impact on the researcher’s thinking, from reshaping the research design to rethinking where the proposal should be submitted, or if it should be written at all. Most grant writing texts mention the importance of early and effective communications with grant officers, but few offer specific advice. The most helpful materials have been published by New and Quick (1998) and Blackburn (2003). This paper presents an extension of their work, emphasizing the research administrator’s role as coach and mentor to inexperienced investigators.

Background
This article is based on interviews with sixteen senior researchers at Virginia Tech that were the basis for a 2005 paper published in The Journal of Research Administration, “What Do Grant Reviewers Really Want, Anyway?” All had strong track records in sponsored research, served on multiple review panels, and interacted with numerous grant program officers. Further insight has been gained as the author designed and directed an annual Grant Writing Institute at the university, which involved a series of intensive summer sessions over a three-year period from 2006 to 2008 that included a “Day in DC,” where a total of thirty-four faculty members met with program officers at several funding agencies. In debriefing Institute participants after such meetings, the author noted important lessons learned, especially

where program officers imparted critical information that was not apparent from their grant programs’ printed materials or the agencies’ web sites.

**Skill Sets for Success**
Creative scholarly expertise drives sponsored research in all disciplines, and strong grant writing skills are a recognized prerequisite for success. Less widely appreciated is a second skill set—the relational skills needed for positive interactions with a sponsor agency (Figure 1).

![Figure 1. Skill Sets for Success](image)

At the outset, the most important relational skill needed by researchers is the ability to initiate and maintain contact with an appropriate grant program officer, a dialogue that aims to (a) determine whether the researcher’s basic concept is a good fit with the program’s goals and objectives; (b) seek advice concerning project design and appropriate funding track; (c) ascertain trends in preferred research methodologies; and d) identify possible limits in project duration and budget.

While several senior investigators commented on the importance of relationship-building, one senior researcher with an impressive funding history credited this skill as key to his success: As a PI or co-PI you need to have a relationship with the program manager. Your job in writing the proposal is to help the program manager be successful. I really believe that. So if the program manager says, “Look, I want to develop the next XYZ,” your job is to help him or her be successful by doing just that. That’s the truth. Your job is to help that manager establish that XYZ program. You do it by showing a 2 or 3 page white paper and asking “How about this, does this fit your program?” It’s very important to strike up a relationship with the program manager in a somewhat personal way. I mean go visit face-to-face first: You don’t want to send a white paper out of the blue, you want to go up to DC and meet these people (T. Long, personal communication, May 20, 2004).
A Question of Fit

Starting to write a proposal without assurance of how well it matches what the sponsor wants to fund is a bad gamble indeed. New and Quick (1998) have estimated that up to 60% of all proposals are eliminated on first reading because the writer had not made an adequate project match or failed to follow directions. Where there is a poor fit, grant writers squander a good deal of their most precious resource—time—developing, revising and polishing documents that have little or no chance for success.

Why do many bright people make such a fundamental mistake? The answer could lie in longstanding traditions of academe. From sending off papers to refereed journals to applying for jobs, academics are accustomed to parsing meaning from written materials, expressing their best thinking in written form, and then awaiting the judgment call. Writing or phoning to inquire if the paper will be published or the job will be offered is considered gauche, if not verboten. In the absence of coaching to the contrary, they reflexively apply the same habits to grant funding agencies, not realizing that winners in sponsored research play by different rules altogether.

Tip of the Iceberg

Young investigators are prone to plunge into proposal writing based on what they read in the program solicitation. But this information is like the tip of an iceberg. Much of what needs to be known about that program—the critical success factors—is hidden beneath the surface and cannot be gleaned from the most careful study of published information. Following are core findings from interviews with seasoned investigators, as well as numerous meetings with program officers as reported by less experienced researchers in Virginia Tech’s Grant Writing Institute:

1. Published material should be viewed as just the “official line” for the grant program, and may not reflect underlying considerations that determine which proposals are likely to be successful.

2. Program officers and their review panels can develop distinct preferences and dislikes over time; these rarely find their way into print.

3. Program priorities can shift over time, sometimes substantially, while published materials remain unchanged.

4. A PO’s candid, informal response to the proposal’s core theme is the best predictor of success, even though no guarantee is expressed or implied.

5. PO’s can and often do give valuable advice on matters related to program track, budget, collaborations, and project structure.

6. Finally, if the proposed project is not a good fit with the identified program, the PO can often suggest better alternatives.

In short, the unofficial “rules of the game” can separate winners from losers, and these are best learned at the outset. Finally, it is well to remember that the part of the iceberg that sank the Titanic was below the water.
Why Program Officers Welcome Inquiries

For investigators who are new to sponsored research, the prospect of initiating contact with an official in a funding agency can be daunting. How will I be received? Is it really legitimate to discuss my project before I’ve submitted a proposal? Can I be specific enough to be credible? Unanswered, questions like these can freeze a young investigator’s initial apprehension into a state of permanent inaction, needlessly. In fact, most program officers welcome such contacts for a variety of reasons.

First and foremost, as Blackburn noted, talking to researchers is one of the most important responsibilities assigned to PO’s, especially by the federal agencies, so we should help them do their jobs. They are supposed to give away money, not hold on to it. Also, it is well to keep in mind that most PO’s are former academics; many were successful in their research careers prior to joining the agency, and they enjoy opportunities to reconnect with their academic counterparts. For a deskbound bureaucrat, talking over fresh ideas is a pleasant way to keep up with the field and track future directions. Two other motives have a more practical bent: First, if the core idea is not likely to be funded, the PO can reduce the office workload by discouraging the submission. Conversely, if the PO finds the idea intriguing, she or he might provide helpful hints on how to shape the proposal in ways that will result in a more positive review.

Finally, key federal agencies—the National Science Foundation, National Institutes of Health, Department of Energy, National Endowment for the Humanities—engage grant reviewers by the tens of thousands each year and are constantly on the lookout for fresh talent. A young investigator should never hesitate to express a desire to serve on a review panel; it will be a graduate education in grant writing (Member, 2003, Porter, 2005).

A Sample Coaching Script for the Research Administrator

Apprehensive young investigators will benefit from coaching on how to arrange a successful encounter with a program officer. The following is a sample coaching script for the research administrator, written as advice to the researcher:

1. **Identify the grant program(s) whose objectives most closely match the core themes of your proposed research.** Study the mission statement of the program office and parse any relevant program solicitation. Be prepared to modify your ideas somewhat to assure a good fit, as long as you stay within your proven expertise. Look up recent awards to see how your work will make a contribution or fill a gap. From the staff directory, identify an officer who has responsibility for that program.

2. **Write a brief pre-abstract summarizing your proposed project.** Using accessible language with a minimum of specialized terminology, describe your project in concise, concrete terms. List your main objective(s), methods, and expected outcomes. Stress the project’s uniqueness and how the outcome(s) will address an important problem or contribute to the field. The PO does not need much detail to give you an initial reading, so do not write more than half a page. Rehearse it until
you can recite it easily and without hesitation. Think of this as an “elevator speech,” as it helps to envision a personal, time-limited encounter with a PO. A sample pre-abstract is included here as Appendix A.

3. **Start with an e-mail.** In your pre-abstract, indicate why you think your project will achieve the grant program’s objectives. End by asking if your work is the kind the program might consider funding. You should get a response within a day or two—study it for tone and nuance as well as its direct message. You might get a recommendation to contact a completely different program office. There might be hints about how to strengthen your proposal. Some PO’s will ask to see a longer description of your project—usually a positive sign. If there is encouragement of any kind, go to the next step.

4. **Make the call.** Once there has been an exchange of e-mails, you have a relatively easy way to begin the conversation. Describe your project again, and then say you would like to discuss some issues the PO raised in the e-mail. If it is a federal agency and you happen to be within reasonable travel distance to Washington, ask if you could meet within the next couple of weeks. One way is to suggest that you are planning a trip to the DC area and it would be convenient to stop by. If the PO agrees to a meeting (and many will), you should expand your pre-abstract into a short (1–2 pages) white paper and send it first. For researchers applying to the National Science Foundation, the Office of Proposal Development at Texas A&M University has published a particularly helpful guide to preparing for a face-to-face meeting (Nader, 2009).

5. **Take advantage of professional meetings.** In addition to contacting PO’s in their offices, researchers in most disciplines have opportunities to interact with program officers at regularly scheduled academic and scientific conferences. PO’s attend these events to keep abreast with current and emerging developments in their fields, and often to present topics of their own.

   Additionally, NSF and NIH hold regional grants conferences at locations around the country (National Science Foundation, 2010a; National Institutes of Health, 2010). Attended by numerous program officers, these events are specifically designed to update researchers and research administrators on agency policies, changes in the grant application and review processes, as well as developments in funding priorities. Of special interest to less experienced researchers are the NSF Days, hosted several times a year by sponsoring colleges and universities (National Science Foundation, 2010b). As members of National Council of University Research Administrators and the Society of Research Administrators know, their national and regional meetings typically feature presentations by program officers from several federal agencies.

6. **Conducting a successful conversation.** Whether by phone or in person, remember you are using this as an opportunity to obtain “between the lines” information to decide (a) whether to write a proposal for this program; and (b) how to shape it in
such a way to get a favorable review. In the course of the conversation, seek answers to the following:

*Does my project fall within your current priorities?*

If it does not, explore different objectives that might yield a better fit or ask for suggestions of other programs that might be interested in your project.

*What would you recommend to improve my chances for a favorable review?*

Do not be bashful about asking this question—the PO knows this is the main reason for your call!

*What is the anticipated proposal success ratio?*

Success ratios are your statistical odds for success. Rates are highly variable among grant programs, ranging from 5% to 40%, with most in the 10–20% range. First-time submissions have lower rates; resubmissions are higher.

*Do you expect last year’s average award amount to change this year?*

This answer should help you determine your project’s budget size.

*What are some of the common reasons for proposal rejections?*

This will help you understand likes and dislikes of review panels that do not show up in the program’s written materials.

Throughout the discussion, listen carefully for helpful hints about proposal structure and content. Do you hear any “buying signals,” i.e., signs that the PO is intrigued by your idea? Conversely, be on the lookout for hints that the PO does not think you have much of a chance. (Sometimes they hesitate to come right out and say it.)

7. **Follow up.** A short “thank you” note is more than good manners—it is a way to keep the line of communication open and fresh for both parties, especially if you summarize the key points you heard in the conversation. It is also a good idea to repeat your desire to serve as a reviewer, and attach a one-page CV with your picture on it. Sponsor agencies seek to enhance the diversity of their panels, and some, like the National Science Foundation, will engage young investigators before they write their first proposals. Others, like the National Institutes of Health, typically issue an invitation after the first award is made.

**Conclusion**

Even if they are new to sponsored research, investigators should not hesitate to initiate contact with program officers. PO’s are accustomed to these inquiries, and most will do their best to be helpful. As stressed repeatedly by National Science Foundation officials at a regional grants conference: “Ask early, ask often!” (National Science Foundation, 2007). The time taken to do this will be the best possible investment inexperienced researchers can make in the grantseeking aspect of their careers.
APPENDIX A

Sample Pre-abstract

TO: Director, Green Infrastructure Grant Program

I am writing to inquire if our research project is suitable for funding by the Green Infrastructure program. Its title is “Green Infrastructure: Collaborative Networking for Sustainable Water Systems,” and our major goal is to demonstrate how this concept can be implemented at the local and regional levels by forming effective working relationships among academic researchers and community leaders.

While the significant environmental and economic advantages of decentralized water distribution systems are well known, communities in the U.S. have been reluctant to adopt them. We propose to utilize a community capacity-building model to inform community leaders of the long-term advantages of current technologies, while providing educational and technical assistance to encourage their adoption. Our interdisciplinary team includes specialists in the technology of sustainable water systems, environmental design, organizational change, and building community capacity.

Our project outcome will be a model program that showcases the merits of local sustainable water management systems, with a strong potential for national and even global impact. To accomplish this we will (1) Form a consortium of local governments, regional planning commissions, and state agencies; (2) Develop an electronic manual for planning and implementing decentralized, sustainable water systems; (3) Offer workshops on sustainable systems to target audiences; (4) Develop an interactive web site that will facilitate networking and decision making; and (5) Develop video clips, exhibits and brochures for broader impact. Project assessment will be undertaken by an external evaluator with national experience in this field.

Is this project a suitable fit with your program? If so, we would appreciate your advice about how to proceed with proposal development.

Sincerely,

Aqua Vita, Ph.D., Director
Water Resources Research Center
Alpha University

About the Author

Robert Porter is Director of Research Development at the University of Tennessee, where he works with faculty to enhance their grant writing skills. With thirty years’ experience as a tenured professor, private consultant, and research administrator, his proposals have won major awards from government agencies and private foundations. Dr. Porter has presented papers and workshops on grant writing at national conferences and has published prize-winning articles on this subject. In addition to working with University of Tennessee faculty, he has conducted grant writing workshops at leading universities and medical schools nationally.
1520.16  **Bringing Out the Best in Both Introverts and Extroverts on Your Team**

Erin Bailey, Buffalo Center for Social Research; Julie Guggino, Central Washington University; and Samantha J. Westcott, University of California, Irvine

Demanding leadership challenges in both work and personal relationships often originate from the personality differences between introverts and extroverts. How many of us have been in a meeting with individuals who are quick to respond, often talking over one another or talking over anyone who speaks? At that same meeting, others may sit quietly, seemingly taking everything in, or appear bored or overwhelmed. Meetings and other workplace activities often fail to be productive when conflicting personalities contribute to a breakdown in communication. Neither personality type is better than another; however, learning to successfully lead your team to coalesce where all members play to their strengths and understand how to work together can lead to greater success for the entire organization.

**Introverts and Extroverts 101**

The terms “introvert” and “extrovert” may be defined as follows: “(1) Introvert: An individual in whom exists an exaggeration of the thought processes in relation to directly observable social behavior, with an accompanying tendency to withdraw from social contacts. (2) Extrovert: An individual in whom exists a diminution of the thought processes in relation to directly observable social behavior, with an accompanying tendency to make social contacts.” (Freyd, M. Psychological Review, Vol 31(1), Jan 1924, 74-87.)

Since 1975 the Myers-Briggs Type Indicator (MBTI) has been used for psychological assessments and as a self-exploration tool. It considers four personality preferences:

◆ Extroversion/Introversion: how people derive their energy;
◆ Sensing/Intuition: how individuals perceive the world around them;
◆ Thinking/Feeling: how individuals make decisions; and
◆ Judging/Perceiving: how individual’s public personas, or outer world orientation are viewed.

In this article, we will discuss the Extroversion/Introversion personality preference. As with many aspects of the human personality, introversion and extroversion spectrum can be seen as a continuum.

Each individual’s preference falls somewhere along the continuum. Introverts are internally-directed. An introvert needs time to reflect, appears reserved, contained, and guarded in public. Introverts are often considered “deep” by others. The introvert typically thinks before speaking. Extroverts, on the other hand, are externally-directed. An extrovert is often action-oriented, appears gregarious, expressive,

---

1 This article is reprinted from NCURA Magazine, Volume XLIII, May / June 2011, No. 3. It is used with permission of the publisher.
and unreserved in public. An extrovert typically needs to speak to think.

These observable behaviors intuitively make sense when some of the physiological differences between extroverts and introverts are examined. With newer technologies like brain scanning and mind mapping, scientists are beginning to identify physiological differences. Introverts, for example, have a longer neural pathway in their brains and more blood flow to the parts of their brains related to internal experiences like remembering. Extroverts’ blood flow, conversely, is increased in the areas of the brain supporting sensory input: seeing, smelling, sensing. Introverts and extroverts neural pathways also rely on different neurotransmitters. Extrovert pathways utilize dopamine differently than do introvert pathways whereas introvert pathways utilize acetylcholine.

**Introverts and Extroverts in the Workplace**

With such a broad spectrum of personality types ranging from the most reserved to the most outspoken, respecting one another’s work styles and finding ways to accommodate the continuum of personality types will result in greater job satisfaction and increased productivity. We will explore opportunities where leadership can bring out the best of everyone on the team.

In meetings, for example, while introverts may find meetings stressful and often times draining, extroverts may see meetings as a way of being productive: a way to energize their batteries and energize those around them. For many introverts, their voices will be heard later, sometimes much later, after they have had a chance to examine all the facts and come up with a sound and informative answer. The leadership necessary for making successful meetings begins with awareness: the leader who can see those quietly biding time and find opportunities to make sure their voices are heard will enrich the interactions in meetings. With proper planning, effective leaders can intervene and create conditions that bring out the best in both the introvert and the extrovert and lead to more productive, effective meetings. Setting a tone and stating expectations for meetings can help curb the distraction or talking over and allow each voice to be heard. All those on the spectrum benefit from one another being a party to the meeting. The introvert needs the spontaneity and energy of the extrovert to start discussions and bring ideas to the table; while the extrovert learns to value the introvert’s ability to look at all the facts and problem solve.

In day-to-day interactions, consider some of your colleagues – you can probably name those who get their energy being around people. Those team members are likely extroverts. When extroverts are faced with a problem, they like to bounce their ideas off others. The extrovert may pick up the phone and call someone or drop by a colleague’s office. They have a need to connect with people. They externally process information and thrive on the energy from others to solve their problems. Extroverts are typically vocal, spontaneous and comfortable expressing their ideas. Introverts, on the other hand, get their energy from working alone and processing information internally. When faced with a problem, introverts need to gather all the facts and need time to process the information before giving an answer.

To work most effectively, introverts need to have a space where they can retreat
and work quietly. They dislike interruptions and are content to work alone. They don’t mind working on long, complex, even tedious, projects. Extroverts can more easily adapt to open concept office environments and may actually increase their productivity due to the constant interactions. They are more welcoming of interruptions and physically move around more. They are quicker to become bored or impatient with repetitive tasks.

**Effective Workplace Leaders: Introverts or Extroverts?**

A good leader can be anywhere on the spectrum: from the shiest introvert to the most outspoken extrovert. Outgoing personality traits are often associated with top leadership roles. They are the ones seen as outgoing, assertive and excellent at giving directions. However introverts can also be great leaders with their attention to detail, listening skills, and their ability to think through issues in a more focused manner. Research suggests many businesses fail when they do not promote executives with more understated styles. Both introverts and extroverts have various talents and strengths and neither should focus on what they are not. Successful leaders know they are not perfect at everything nor do they want to be, hence they select team members who compliment their challenge areas as well as having a strong track record.

Effective leaders who are aware of the interpersonal dynamics of the members of their team can help alleviate problems based on the differences between introverts and extroverts. There are often assumptions or misunderstandings that occur when individuals come from different personality types. The two different types are diverse in the way that each processes information. If a person is rewarded for participating in meetings in an office, it can create tension for those who find it uncomfortable to speak up in meetings. On the contrary, if the atmosphere is unwelcome to those who think creatively in the moment and who may stray off-topic to follow a train of thought, it can stifle some of the ideas of those who work best when in a group setting. The best listeners in a group are not often the ones who share openly and their contributions can be missed. A lack of response may be misread as a lack of interest by someone who is openly sharing ideas and working within the group. Sometimes, conflict can be extended beyond what is necessary to solve it due to a need to talk everything out by some in the team. Other times, conflict avoidance can be detrimental, as key problems do not get addressed if they are not brought to the surface.

Given that effective leadership is not tied to a specific personality trait or type, the benefit of accepting the different personality types exists in how a leader both understands himself and how he understands and works with his respective team members. A major portion of a leaders’ role is communication, so it is very important for leaders to understand how their employees’ process information, so the leader can adjust their approach to fit their audience needs. Also the leader with this insight can create a safe space in meetings to seek input from those who may be reluctant to speak. Through the resulting diversity of thoughts shared, the end result likely will be more effective and have greater buy in by the entire team.

A leader’s natural style will also offer enhanced development opportunities to the team members. Since a leader’s success is normally a direct result of his team
members’ success, everyone wins when everyone’s strengths are leveraged. A leader who is on the far extreme end of the extroversion side of the scale may offer his team the networking and interpersonal skills that make connections to effectively improve business. A leader who is extremely introverted may offer his team the benefit of long-range strategic planning and written communication skills. The extrovert can lead those team members who are not as likely to stand up to opportunities to shine by connecting them to projects for which they would not volunteer. The introvert can lead those team members who are outspoken to more introspection by modeling the benefits of taking the time to make a thoughtful decision.

The differences in personality types are real and they matter. The contributions of the individual to the team are best when the individual can work at his best. While it is impossible to create an ideal environment that works for all members of a team all the time, knowing how each works best and providing those opportunities for the team member to thrive and do his or her best is the job of the leader. Giving the introvert the time to think, work independently, work quietly, and to get the job done right is key. Offering the extrovert the time to connect and work with others, to listen to others, and try doing things differently than before while still meeting the deadline can lead to success. Furthermore, forming teams that are balanced and sharing the expectations up front of how the team will work together and use their strengths to achieve the goals can offer the chance for every member of the team to share in the success. As introvert Henry Kissinger once said, “The task of the leader is to get his people from where they are to where they have not been.” The journey is as important as the destination to ensure long term repeated success.

**Tips for Extroverted Leaders:**

- **Be concise.** While you are invigorated by talking, are energized by interruptions, others may consider you overbearing and overpowering.

- **Circulate information ahead of a meeting.** Provide as much written information as is feasible before a meeting so that introverted team members have a chance to review the material in order to give you their best thinking.

- **Don’t expect immediate decisions.** Pressuring introverted team members to come up with a decision on the spot may likely result in a decision that they don’t fully buy-in.

- **Allow silence its moment.** A common complaint of introverts about Extroverts is about their listening skills— in particular, their rush to fill the silence. Practice self-management by valuing pauses which allow the real conversation to be heard.

- **Ask introverts for their thoughts.** Introverts generally dislike having the light shining on them, so you may have to seek out their opinions. It is often more fruitful to meet one-on-one rather than in a public forum.

- **Respect introverts’ need for privacy.** Practicing good social awareness skills entails understanding that extended extroverted activities can be draining for introverts.
Tips for Introverted Leaders:

◆ **Give visual clues when listening.** While introverts are often better listeners, their expressions may sometimes give the impression that they lack interest or involvement in the topic being discussed. Remedy this with simple things like a nod, a smile, and leaning forward—micro gestures that go a long way to signal to others that they are indeed being heard.

◆ **Raise your comfort level with public speaking.** If public speaking ranks among one of your top dreads, resolve to conquer this. Developing the ability to stand up in front of an audience to deliver an engaging presentation is a strategic imperative. Lee Iacocca once said: “You can have brilliant ideas, but if you can’t get them across, your ideas won’t get you anywhere.” Develop the skills to help you share your brilliance with a wide audience.

◆ **Beware of voids created by non-communication.** A void will be quickly filled by rumors, misinterpretations, and grapevine musings. Take the initiative to share information.

◆ **Provide timely feedback.** Consider voicing your opinions sooner. Providing critical feedback once a project is well underway can frustrate or de-motivate others on the team.

◆ **Learn the art of small talk.** If this is not a preferred activity for you, consider that small talk is the oil that lubricates relationships and paves the way for more important discussions.

◆ **Share more personal information.** This helps more people know you better and increases the level of trust. Transparency strengthens our connections to others.

About the Authors

Erin Bailey is the Center Manager and Senior Research Administrator for the Buffalo Center for Social Research where she is responsible for the daily management of the Center, strategic planning, administration of all research grants both pre and post award, provide oversight and direction to faculty regarding research support activities, sponsor guidelines, grant or contract application requirements, post-award project administration and research policies and procedures. She received her CRA in 2007, has a bachelor’s degree from Wheeling Jesuit University and is currently enrolled in the Emmanuel College working on her Master of Science with specialization in Research Administration.

Julie Guggino is Associate Director of Research and Sponsored Programs in the Office of Graduate Studies and Research at Central Washington University. She is responsible for all preaward functions, oversees grant-funded units and research centers assigned to Graduate Studies and Research, and manages graduate studies personnel and functions. Julie received a BS in Administrative Management and an MS in Family Studies from Central Washington University.

Samantha J. Westcott is the Assistant Director, Sponsored Projects Administration for the University of California, Irvine where she supports the efforts of research administration for the UCI campus. Sam is involved in strategic planning, training, and supporting the IT infrastructure enhancements and implementations, among her many duties. Sam is a long-standing member of NCURA and has served NCURA since 1995 in many capacities. She is a graduate of the 2010 class of the NCURA Leadership Development Institute. Sam is also a faculty member of NCURA’s Departmental Research Administration traveling workshop teams and was elected to the NCURA Board in 2010.
Practical Tools

This section includes practical tools — reports, flow charts, checklists, etc. — relating to internal and external communications. This material is culled from a variety of authoritative sources.

1530.1 Time Management Tips for the Research Administrator

Shelley Hesselton-Mangan, Internal Control Reviewer, Chartwells/Worcester Polytechnic Institute

Research administrators have a wide variety of issues to deal with on a daily basis. Our minds are cluttered with the many, often conflicting, priorities faced every day. It is up to us to decide what needs to be done immediately, what can be done later, and what can be assigned to someone else or forgotten about altogether.

**What Is Time Management?** Time management can be defined as controlling the use of your most valuable (and undervalued) resource. We all know the consequences of its absence — including last-minute rushes to meet deadlines, double-booking meetings or holding ones that achieve little or nothing, crises cropping up from seemingly nowhere, and days slipping by unproductively or not as productively as they could be.

**Why Is Time Management Important?** Research administrators need to effectively manage their increasingly heavy workloads and demands on their time in order to reduce stress, cut back on long hours, and restore balance to their lives.

**How Can Over-Busy Research Administrators Achieve Effective Time Management?** One way to effectively manage one’s time is by implementing the “best practices and techniques” that fall under five key areas

- Organization
- Planning & Scheduling
- Taking Breaks
- Managing Interruptions
- Delegating Tasks

These practices and techniques are set down in Figure 530.1-1.

---

1 This discussion is based on material from a presentation at the NCURA Annual Meeting, November 2005.
Survival of the Fittest

Being successful means keeping a healthy balance and not allowing work to take over your life. It is important to remember that you will eventually self-sabotage your success if you neglect any one or more of the seven vital areas of life (which are health, family, financial, intellectual, social, professional and spiritual) and that you should continually monitor and re-evaluate your priorities, choices, and lifestyle.

Research administration is not going to get any easier. There will always be a never-ending stream of changes — about which research administrators must be aware of, understand, communicate to others, and implement. Effective time management can help research administrators prepare for and cope with these changes and the ever-present worry over noncompliance.

Reminder
To be successful, remember to
- Strive to go beyond coping and surviving
- Continually learn and adopt new tricks and techniques
- Network!!
- Keep your perspective
- Evaluate and re-evaluate your priorities
When all else fails . . .
Remember why you are a research administrator!

Figure 530.1: ‘At-a-Glance’ Suggestions for Effective Time Management

Organization
File . . . file . . . file!
- Use a color-coded filing system (to easily locate paperwork).
- Make and label binders (to contain often-needed reference information).
- Keep most-often used resources within arm’s reach.
- Keep less-often used resources on out-of-the-way shelves.

Don’t crowd your desk.
- Have vertical file holders for active and pending files (on your desk).
- Use In and Out boxes for mail and other correspondence (not on your desk).
- Install over-the-desk shelving (to keep often-needed materials within reach).
- Set up horizontal file slots (to sort paperwork by action required).
- Use sorters for pens, highlighters, paperclips, etc. (don’t crowd your desk!).

Planning & Scheduling
Exercise project management.
- Review specifications of projects.
- Make sure what needs to be done is clear.
◆ Break down tasks into sections and estimate time needed for each.
◆ Assign due dates/deadlines for each task.
◆ Review progress periodically.

Stay on top of grant deadlines.
◆ Don’t wait for others to come to you: Go to them!
◆ Take a proactive stance with faculty —
  • Remove lack of communication
  • Make periodic visits
  • Make policies well known

Note: When you don’t plan your day . . .
◆ “Squeaky wheels often get the grease.”
◆ You often end up defensively reacting to demands of others.
◆ Others’ needs tend to dictate your day.
◆ Last-minute frenzies and panic occur.

Taking Breaks
◆ Consequences of skipping breaks include
  • Eyestrain and fatigue (Doctors recommend 10 minutes each hour away from computer)
  • Tension headaches and backaches
  • Decreased ability to focus and concentrate
  • Loss of energy and productivity
◆ Get out of the office (take a walk without compromising productivity) —
  • Deliver or pick up things in other departments or buildings
  • Tour your office and laboratories (keeps you on top of what’s going on)
  • Pop in on your faculty and staff (great time to ask about grant submissions!)

Eat your lunch! (Studies show that working through lunch to increase productivity actually has opposite effect.)
◆ Eat somewhere other than your desk (so you are not tempted to do work).
◆ Avoid scheduling appointments during lunchtime (early morning or late in the day is best and less disruptive).

Managing Interruptions
Plan your day.
◆ Avoid others dictating your schedule (remember: the squeaky wheel gets the grease!).
◆ Put aside low-priority issues (schedule time to take care of all of them at once).
Figure 530.1: ‘At-a-Glance’ Suggestions for Effective Time Management (continued)

◆ Schedule days and times to complete tasks (give yourself deadlines).
  ◆ Maintain a “To Do” list (do not put on scrap paper).
  ◆ Keep track of items you are waiting for.
◆ Block out times when you are “unavailable” (and try not to compromise these).

Reduce/eliminate interruptions.
◆ Set regular times to be available as well as not available.
  ◆ Make these times known.
  ◆ Can be difficult with faculty or emotional staff.
◆ Let people know “Now is not a good time.”
  ◆ Let them know when they can come back.
  ◆ Be polite!!!
◆ Advise new staff to save up questions to go over at a scheduled time.

Try to eliminate or minimize socializing (hallway conversations, family or friends’ phone calls, emails, or office chat).

Note: When interruptions do occur, get right back to task at hand to minimize impact of interruption.

Delegating Tasks
You don’t need to do it all!
◆ Give clear and concise directions.
◆ Be patient! (training takes time at first).
◆ It’s OK if it’s not done your way (let it go and allow for creativity).

Realize the long-term benefits of delegation including
◆ Reduced routine tasks and duties
◆ Increased time for other issues
◆ Staff empowerment

No staff to delegate to?
◆ Use faculty administrative assistants (typing, copying, mailing, etc.).
◆ Bring in temps for large, short-term projects or for projects beyond scope of your staff.
Many of us are charged with developing training programs on our campuses. While this can be a daunting task, it doesn’t have to be thanks to models such as instructional design methods and techniques. Two principles provide a foundation to the overall instructional design process. The first principle is to determine what the learners REALLY need to know in order to accomplish the objective. In other words, separate the “need to know” from the “nice to know” (or from our desire to tell “everything we know.”) The second principle is to ensure our training program is geared to the audience. For research administration/management training, we must assume that adult learners comprise our audience. As such, the training must provide relevant information, must be based on the learner’s needs with active participation, and must provide lessons that are logically and sequentially integrated.

The five steps of the instructional design model provide a step-by-step process for creating training programs as follows:

1. Analyze the Problem or Need. This step insures that we understand the performance problem so that we can solve the problem in the most effective and efficient way via training or a better solution. We understand the performance problem by identifying specifically what needs to be different. This is often done via information from focus groups, audit reports, performance evaluations, “gut instinct,” error reports, learners, supervisors, etc. Once we’ve identified current performance vs. desired performance, the solution will bridge the gap between the two.

Consider the following: if the performance solution comes in the form of job aids, on the job training, individual study, or perhaps involvement in a professional organization’s professional development programs, then we have a training solution. If, on the other hand, the performance solution may be met through mentoring, a reduced workload, a policy/procedure change, etc., then we may well have a non-training solution. One basic question may provide a shortcut here: “does the employee know how to meet the required performance standards?” If the answer is “no,” then training is needed.

If we find that training is the best solution, then we can describe the desired performance by determining what steps the learner needs to know in order to perform well and sequence those steps so the task can be learned in an efficient
and effective manner. Next, we must know our learners. Are they novices, experts, or everyone in between? What is their related work experience? What are their roles? Are they faculty? Staff? Students? What is the estimated number of learners who need training? What is their familiarity with university processes? For new employees with minimal or no prior knowledge and experience, training must be very basic and comprehensive. For more senior employees with extensive knowledge and experience, training would be more minimal addressing only the new or “need to know” information. Without a clear understanding of who our learners are, we cannot customize the course design, content level, and training methods to ensure optimum learning.

Choosing the instructional media follows. For this, we should consider the number of learners, the deadline for the desired performance, our budget, the frequency that updates may be required, and how often the training must be available. Next we must estimate the training costs. Our considerations here may, depending upon the situation, include instructional design time, Subject Matter Expert (SME) development time, SME/Trainer time for preparation and delivery, web developer time, learners’ time away from their job, classroom rental, materials (binders and copying per person), food per person, and commute time for both the learner and trainer. Note: At some institutions, the SME and the trainer is the same person who develops the training and conducts the training sessions. At other institutions, the SME may develop the training and an external trainer is hired or brought in temporarily to conduct the training sessions.

2. Design Phase – Content is Designed with Learning Objectives in Mind. Learning objectives are written according to the steps of the desired performance. They provide the structure for the content and help us decide what content must be included. The learning objectives keep us focused on the “need to know” information by identifying the task (what the learner must perform), the condition (how it will be performed), and the standard (how well must it be performed). In addition, learning objectives help us to sequence and structure the content so the learner can easily follow. Remember, the more meaningful the content, the easier it is to learn and, consequently, the more effective the instruction.

Along with the learning objectives, consider developing a post-test. A post-test not only forces us to nail down exactly what we want the learner to know after the training (the desired performance), but it will also help the learner evaluate what s/he knows. The posttest may be written, oral or a job-related exercise. The post-test allows the learner to immediately apply the information taught and confirm that this information has been learned for future use in job-related tasks. Take comfort in knowing it is okay to teach to the test. In addition, the post-test may be used both as a pre-test and a post-test so learners can test out of all or part of the training.
3. **Develop the Content.** This is where the learning objectives serve as our guide in selecting the content (remember “need to know” is the key). Once we’ve determined the content, we will want to sequence and synthesize the content to facilitate understanding and meaningfulness as well as retention of the content. Consider the nature of the content, the learners and organization to determine what’s best — there is no single right way to do this.

Create summaries throughout or at the end of a lesson to systematically review what has already been learned. Good examples for creating summaries are group activities, case studies, metaphors, charts — or a juicy story! Instructional activities also facilitate learning by involving the learners and helping them find the gaps in their knowledge. Learning activities enable the learners to evaluate what they know and to receive immediate feedback.

---

**Training Tips for Instructions**

1. The purpose of training is to produce results back on the job. It is not to cover content. It is not to entertain.

2. Training is best when it is instructor-led, but participant-centered. This means that the focus is on the participants themselves, not the instructor.

3. Use your personal experiences to illustrate points you are trying to convey. It’s much easier for people to remember a point when there is a colorful story to go with it.

4. Adults can listen with understanding for 90 minutes, but listen with retention for only 20 minutes. The bottom line is that when we talk less as instructors, the participants learn more. Facilitating involvement and encouraging participation is the key.
   
   a. Ask a question about every 10 minutes. Take time to listen to the answer, and ask others if they have something to add.

5. Help people leave with an action plan. One of the purposes of training is for participants to leave excited with what they now know, that they didn’t know before, excited about what they can now do that they couldn’t do before and with more confidence in their abilities to do this.
   
   a. In the beginning of the class, ask the participants to keep a list of things they learn and how they can use each one back on the job.

   b. When you need a change of pace ask an individual to share something on her list with the class.

   This process allows people to start taking ownership of the information being presented. They move beyond the classroom to application on the job.

6. Deliver a strong close. Often trainers don’t close; they just run out of time. A good close will tie things together.
Next, we develop our content selections into a “straw man.” A straw man is created as the starting point (or first draft) for reviews/revisions to occur in order to produce the final training product. The straw man/first draft is shared with other SMEs for their review and feedback (and revisions made as appropriate). The straw man is then developed into a training pilot and tested with a sample group of learners that includes a novice, a moderate, and a very experienced person to ensure the pilot accomplishes the training goal and the learning objectives.

4. Implement the Training Program. Our training program must include a management plan for scheduling, registration, tracking attendance, certification/testing, course materials for learners and the instructors, required technology, and location set-up.

5. Evaluate. Evaluation occurs AFTER EACH of the previous four steps to insure that we are accomplishing what we intend. Evaluations can occur in numerous ways. While an evaluation form will provide us with student feedback, analyzing post-test results will provide an indicator that learning occurred. In addition, if you measure a change in job performance, this will provide an indicator for how well the learning translated into a change in job performance. Regardless of the evaluation method, we should use the information/feedback to revise the training as needed to ensure continuous quality assurance.

Some people believe that once a training program is developed, their job is done. In actuality, developing a training program is only the beginning. A truly effective training program involves constant tweaking. We must continuously ask ourselves whether 1) the information conveyed is current, 2) the learning objectives are met, 3) the educational medium (online, classroom, manual, etc.) is effective, 4) the job performance is improving, etc.

Want to know more about instructional design methods and techniques? Simply search Google for “instructional design” for articles and other sources, or search “instructional design books” for a substantial bibliography.

In closing, remember that training requires a commitment of time and resources, but it also gets results. Best wishes for your continued training successes!
The Art of Successful Management*
Jerry Fife, Vanderbilt University

As I contemplated the topic for my first article as contributing editor, I had only to look at a book on my desk. A few weeks ago, I began reading *Lessons in Loyalty*, which describes how Southwest Airlines continues to be successful in an industry that has seen many companies fail. The book describes in detail, from an “insider’s” perspective, how Southwest hires, trains and retains employees. Consistently ranked by Fortune magazine as one of the top companies to work for and one of the most admired, Southwest has become a U.S. business phenomenon and its workplace culture a popular icon among industry professionals and the broader public. I am not going to review the book but rather take a couple of items highlighted in its nine loyalty lesson chapters, as well as from my own personal experiences, to discuss a few key attributes of successful managers. These concepts are applicable to the effective management of any organization, including research administration.

Successful Managers Understand that Good Employees Represent One of the Organization’s Most Critical Assets

One of my former colleagues used to tell me, “I can make a bad system run if I’ve got good employees, but I can’t make a good system run with bad employees.” While this statement may have some flaws, it illustrates the importance of hiring and retaining good employees. As managers, we owe it to the organizations we work for to hire the best employees and then work hard to train, nurture and retain them. Hiring the best means having patience and resolve. It doesn’t mean hiring someone you might consider average simply to get a position filled but waiting until you find an applicant that you are confident will become an excellent employee and then training and nurturing that person to ensure their success. I’d rather fight to retain a good employee than sacrifice my unit and my university with an employee whose skills, background and overall “package” may be marginal to the requirements of the position.

Show Employees that They are Highly Valued

It is important that employees know that they are highly valued. A simple but effective way to recognize this is to tell them. This can be done informally via a comment or more formally by a certificate such as “You were caught doing something good.”

Recognition should come not only during times of success but also when times are tough. Good employees make mistakes, and it is important that we remind them that they are highly valued during these times. Good employees will accept accountability, learn from the mistake and take steps to ensure that chance of reoccurrence.

* This article is reprinted from the *NCURA Newsletter*, Vol. 39, No. 2, April/May 2007, published by the National Council of University Research Administrators. It is used with permission of the publisher. Jerry G. Fife is Interim Vice Chancellor for Administration at Vanderbilt University.
rence is minimized. Good employees rarely require reprimands. They normally are harder on themselves then we would be anyway.

Compensation is another method of showing employees their value. Ok, I can hear you saying, “But we don’t have the money to give additional compensation.” Or you may be saying that compensation is not a primary motivator. I’ve said both of these in the past, but I’ve also lost good employees when a salary increase would have retained this employee. It is a fatal mistake to underestimate the cost of turnover to an organization’s performance when you have good employees.

Managers Must be Bold Enough to Let Others See That They are Human

Comments such as, “I need help,” “I made a mistake,” or “I don’t know” when used correctly by managers demonstrate to employees that you view yourself in a realistic way. All managers make mistakes and at times these mistakes involve not taking the advice of the employees which report to us. Consider the damage done when these mistakes are not corrected. Consider also the credibility we as managers gain when we admit to making a mistake and correct it with our employees.

Treat Employees in the Same Manner that You Would Like to be Treated

Lessons in Loyalty refers to this principle as “People Give as Good as They Get”. I can relate. Early in my career, I worked for a manager that was a former drill sergeant. His philosophy was that all employees would take advantage of the organization if given the opportunity. He would spend his time trying to catch employees doing things that, in his mind, would validate his philosophy. As a result, the organization was run in military fashion, and there was no trust between management and employees. It was a terrible environment. Employees were bullied constantly and management spent a great deal of time responding to employee grievances.

I have also worked for supervisors who led gently, fostered a culture of trust, supported their employees, demonstrated that they valued their employees, and readily admitted when they made a mistake. In short, they treated others in a fashion similar to how they would like to be treated. In this environment, employees excel and are not afraid to show initiative or question decisions if they believe it is not in the best interest of the organization. They also tend to extend this philosophy to customers!

Know When to Lead and Know When to Get Out of the Way!

I have been fortunate during my career to supervise many great managers. Among this group are two individuals in the research administration office at my current institution. Both are very competent, experienced, and well respected. The best thing I can do day-to-day with them is to let them know I am available, willing to help, and offer advice if needed. If no advice or assistance is needed, the best thing I can do is stay out of the way! Micromanaging these individuals would frustrate them, reduce productivity, and eventually drive them away. This is not to say that good managers shouldn’t maintain some high-level monitoring and follow up, but care must be taken not to over manage good employees.
In summary, managers are entrusted with hiring, training, nurturing, and retaining our organizations’ most critical asset. We need to do this in a fashion which lets employees know that they are a member of a team, are highly valued, and that they work with a manager that is human and willing to listen.

Oh, I forgot one other item; we should have fun while at work!
‘Human Capital’ Survey Questions

The following questions were developed as part of the National Science Foundation’s “human capital survey,” which is conducted regularly (see results at www.nsf.gov/pubs/2010/od10006/od10006.pdf). The survey questions may be useful for research administrators in formulating their own employee survey.

Personal Work Experiences

◆ Overall, how good a job do you feel is being done by your immediate supervisor/team leader?

◆ I have trust and confidence in my supervisor.

◆ The people I work with cooperate to get the job done.

◆ My work gives me a feeling of personal accomplishment.

◆ I like the kind of work I do.

◆ I am given a real opportunity to improve my skills in my organization.

Recruitment, Development, Retention

◆ The workforce has job-relevant knowledge and skills necessary to accomplish organizational goals.

◆ Physical conditions (for example, noise level, temperature, lighting, cleanliness) allow employees to perform their jobs well.

◆ The work I do is important.

◆ I know how my work relates to the agency’s goals and priorities.

◆ My talents are used well in the workplace.

◆ Supervisors/team leaders in my work unit support employee development.

◆ My training needs are assessed.

◆ My work unit is able to recruit people with the right skills.

Performance Culture

◆ In my work unit, steps are taken to deal with a poor performer who cannot or will not improve.

◆ Creativity and innovation are rewarded.

◆ Managers/supervisors/team leaders work well with employees of different backgrounds.

◆ Promotions in my work unit are based on merit.

◆ In my most recent performance appraisal, I understood what I had to do to be rated at different performance levels.

◆ In my work unit, differences in performance are recognized in a meaningful way.

◆ Pay raises depend on how well employees perform their jobs.
My performance appraisal is a fair reflection of my performance.

Discussions with my supervisor/team leader about my performance are worthwhile.

My supervisor supports my need to balance work and family issues.

**Leadership**

- Managers review and evaluate the organization's progress toward meeting its goals and objectives.
- Managers communicate the goals and priorities of the organization.
- I have a high level of respect for my organization's senior leaders.
- In my organization, leaders generate high levels of motivation and commitment in the workforce.
- Employees are protected from health and safety hazards on the job.
- My organization has prepared employees for potential security threats.
- My workload is reasonable.
- Employees have a feeling of personal empowerment with respect to work processes.

**Job Satisfaction**

- Considering everything, how satisfied are you with your job?
- How satisfied are you with the information you receive from management on what's going on in your organization?
- How satisfied are you with your involvement in decisions that affect your work?
- How satisfied are you with the policies and practices of your senior leaders?
- How satisfied are you with the recognition you receive for doing a good job?
- Considering everything, how satisfied are you with your pay?
- How satisfied are you with your opportunity to get a better job in your organization?
- How satisfied are you with the training you receive for your present job?
Is Mentoring Right for You? 1
Kathy Bir, University of Alabama and Rosemary Madnick, Los Angeles Biomedical Research Institute

Mahatma Gandhi said, “Be the change you want to see in the world.” What better way to accomplish this than by choosing to mentor others. Mentoring, as an integral part of leadership, can be particularly effective in achieving change and growth, organizationally and personally.

While in many organizations it is a supervisor’s role to manage and motivate individuals to achieve their performance goals, it is a mentor’s role to build trust, foster collaboration, provide ethical guidance, and foster an understanding of the environment around the mentee. More importantly, a mentor is an advisor, role model, teacher, and advocate and can ultimately become a life-long ally.

Although exemplary leaders use mentoring as a vehicle to lead, anyone can be a mentor. A successful mentoring relationship will help hone communication and leadership skills, bring new insight from different perspectives, and provide a sense of accomplishment.

Whether the mentoring relationship is formal or informal, successful mentors practice certain skills such as active listening, providing guidance, building trust, encouraging others and a consideration of other viewpoints. Mentoring is not only about sharing intellectual capital, it is a vehicle for others to advise, engage, and support. As described in the article “How Coaching and Mentoring Leverage Leadership Talent” by Maynard Brusman, mentors can adopt many styles, but one highly rewarding approach to the mentee is based on a style of inquiry rather than one that is directive or authoritative. One of the roles of a mentor is to challenge the mentee in their thought process thereby allowing them to reach their own conclusions as well as providing a path for self-discovery.

Performing a self-assessment will allow you to better identify and understand your ability to serve as a mentor and simplify the task of identifying a mentee. Some key points to consider include:

♦ Do you have a desire to share your experience and knowledge with others?
♦ What are some of your goals for mentoring?
♦ What are your strengths?
♦ What type of relationship do you want? Informal, formal, short-term, long-term?
♦ What expertise can you offer?
♦ Do you have the resources to become a mentor?
♦ How much time can you realistically commit? Weekly, biweekly, monthly?

1 This article is reprinted from the NCURA Magazine, Vol. XLI, No. 4, September/October 2009, published by the National Council of University Research Administrators. It is used with permission of the publisher. Kathy Bir and Rosemary Madnick are graduates of the 2008 NCURA Leadership Development Institute. Managing Editor: Ty Lane.
How are you going to meet? Face-to-face, e-mails, phone calls, or via other media?

Once you decide to be a mentor, match your skills and needs to the potential settings, opportunities and mentees. It is ok if you do not match perfectly, as long as you have a good rapport and share similar interests. When reaching out to a potential mentee, discuss how you would like to help them as a mentor, making sure to discuss their goals and objectives, assist in resolving problems, and provide guidance to achieve their goals and objectives. While both the mentor and mentee have certain responsibilities for ensuring the success of the relationship, it is important for the mentor to be available to the mentee or the relationship will likely fail.

Besides being knowledgeable and successful in their careers, common characteristics of excellent mentors include the desire to devote time to develop others and the ability to listen and act as a sounding board without being judgmental, provide constructive feedback in a timely manner, and network and be resourceful. As a mentor, one of the most valuable things you can do is to help connect your mentee with people, opportunities, and information that may otherwise be inaccessible to them. Additional mentoring skills of successful mentors include

- Be available to break the ice
- Build confidence and trust
  - Be available
  - Be supportive
  - Actively listen
  - Keep conversations confidential
- Offer guidance
- Be non-judgmental
- Allow for differing opinions
- Let the mentee make the decisions
- Assist in defining and achieving career goals
- Encourage and challenge mentee to reach goals
- Share experiences, knowledge, and best practices
- Maintain an attitude for free and open discussions
- Provide insight and perspective on how to achieve goals
- Open the door by providing new opportunities and introductions

Building an effective mentoring relationship is a process; therefore, establish clear expectations and boundaries to manage the roles and any problems, should they occur. Be clear that the mentee drives the relationship and that it is the mentee who identifies the goals and objectives to be achieved and communicates them to
you, the mentor. In addition, the mentee is responsible for communicating to the mentor whether his other expectations are being met.

Circumstances may arise that will not allow you the time to continue mentoring. If this occurs, discuss the situation as soon as possible and preferably in a face-to-face meeting. If your mentee determines to end the mentoring relationship for whatever reason, do not take it personally and remind them that you will be glad to be available to them in the future. Maya Angelou once said, “…people will forget what you said, people will forget what you did, but people will never forget how you made them feel.”

Upon reflection of our experiences as recent graduates of the Leadership Development Institute (LDI), we have learned the value of mentoring and its importance in educating and training. We encourage you to accept the challenge to become a mentor for a period of one year or longer and experience the benefits that will last for both you and your mentee. Be prepared to be personally transformed by the relationship.
Knowledge Check

AIS editors

The Q&As at ¶590.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 500 has been understood. Note: For the answer key for ¶590.1, see ¶590.3, which appears on a separate page (page 590:5) for testing purposes.

Discussion topics at ¶590.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶590.1 Q&As

1. Tips for basic Web page design include all of the following EXCEPT:
   (a) Use few words: limit the page to a 20,000-word maximum.
   (b) Use categories or headers that are obvious and intuitive.
   (c) Sprinkle the page with considerable “negative space,” i.e., unfilled “white” space around words.
   (d) Employ a design that directs the eye to key elements.

2. Good writing has the characteristics of all of the following EXCEPT:
   (a) Varies the sentence type and length
   (b) Uses the active voice
   (c) Trims out excess
   (d) Conveys only simple, straightforward ideas

3. When communicating effectively, be sure your body language furthers your communication by all of the following EXCEPT:
   (a) Be careful to convey honesty, since the body may send signals that contradict spoken language.
   (b) To imply support for a speaker, avoid making direct eye contact or signaling assent by nodding.
   (c) Be aware of looking away or down, which conveys lack of confidence or disinterest in the other communicator.
   (d) Be aware of wrapping your arms around your body or covering your eyes, which convey conflict.
4. Some of the advantages in using multimedia as a communications tool include all of the following EXCEPT:
(a) Can deliver a complex message
(b) Can be used to reinforce your message
(c) Receiver “selects” medium
(d) Is usually the cheapest means

5. The “old speech teachers’ adage” about repetition in a message advises
(a) Repetition is often a good thing: “Tell the audience what you’re going to tell them. Then tell them. Then tell them what you told them.”
(b) Repetition is usually to be avoided. “Preface what you’re going to tell the audience. Then tell them. But don’t repeat what you just told them.”
(b) Repetition is often to be avoided. “Prepare the audience for what they’re going to be told. Then explain the importance of what you’re going to say. Then tell the audience.”
(d) None of the above

6. Typically, care in crafting the essential message involves all of the following EXCEPT:
(a) Knowing the subject and researching the problem as needed
(b) Finding a solution to the problem and recommending an action
(c) Precise planning of feedback mechanism
(d) Expressing the solution in attractive ways for the specific audience

7. Symbols and symbol systems are said to
(a) Mediate communication
(b) Complicate communication
(c) Impede communication
(d) Supersede communication

8. Metaphor is particularly helpful
(a) To identify with the audience
(b) When explaining highly specialized ideas
(c) To enliven a discussion
(d) When closing a presentation
9. Communication by definition is a two-way street, which often leads to the receiver of the original message becoming a sender and perhaps the sender modifying the original message in response. This is often referred to as

(a) The artful nature of communication
(b) The feedback loop
(c) Narrative or storytelling
(d) The “shelf life” of a communication message

Discussion Topics

1. Research administrators have many different “constituencies” with whom they must communicate? What is meant by this and who are your constituencies? How and why might what you say and which medium you use to say it to each group differ?

2. Time management is a critical skill for an effective research administrator to develop. What are your most effective time management practices?

3. There is a rhythm and flow to communications. Knowing this, how can you use this to your advantage when crafting an effective communication?

4. Job postings for research administration staff usually include the requirement “good communications skills essential.” How can you determine if a job candidate has the necessary skills?

5. The “how” and “why” of communication often changes quickly. Discuss how you office evaluates on a continuing basis both the methods and substance of the communications you office regularly engages in.

6. Research administration is generally thought to be a highly people-oriented profession. Do you think this statement is true? And if it is true, does that mean that there is no role in research administration at your institution for someone whose interpersonal skills are not as strong as their technical or financial skills?

7. Do you have a “deskbook” for use by departmental sponsored research personnel? If yes, how does the material in this reference differ from what is in a similar reference for central office staff and is the deskbook the same across all departments? If no, what do you think should go in such a handbook and should its content vary from department to department?

8. Some institutions maybe responding to the current economic climate in a variety of ways such as instituting pay cuts, pay freezes, furloughs, hiring freezes, buyouts, and layoffs. Regardless of how your institution may be responding, discuss the role of “communications” in keeping staff morale from deteriorating during this time.
1590.3 **Answer Key**

Following are the correct answers to the questions included at ¶590.1.

1. (a) Use few words: limit the page to a 20,000-word maximum.

2. (d) Conveys only simple, straightforward ideas

3. (b) To imply support for a speaker, avoid making direct eye contact or signaling assent by nodding.

4. (d) Is usually the cheapest means

5. (a) Repetition is often a good thing: “Tell the audience what you’re going to tell them. Then tell them. Then tell them what you told them.”

6. (c) Precise planning of feedback mechanism

7. (a) Mediate communication

8. (b) When explaining highly specialized ideas

9. (b) The feedback loop

Introduction
Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter discusses requirements and strategies for effective use of information technology for sponsored research administration. Information technology — and its companion, electronic research administration — have become essential tools for research administrators. (For a full discussion of electronic research administration, see Chapter 900.)

Kenneth Forstmeier of Pennsylvania State University takes on the challenge of describing the application of “information technology” to the sponsored research office at an educational institution. Clearly, we live in the information age and the sponsored research office is a place where we are reminded of this many times each day. Forstmeier begins by describing the purpose of information systems as “aggregating, analyzing, and delivering” data that is considered useful by the recipient. He goes on to discuss organizational and staffing considerations in determining how best to structure information systems. Acknowledging that we are a long way from having “paperless” sponsored research offices, Forstmeier nevertheless looks forward to the time, perhaps not so distant, when extensive aspects of the business of research administration will be conducted electronically.

Forstmeier provides useful information on the respective roles of institutional IT organizations and sponsored projects IT functions. While the specifics of these arrangements will vary from one institution to the next, Forstmeier points out the sorts of issues we need to think about in implementing, modifying, or just living with the ways in which information systems services are provided.

For those readers who are not already highly knowledgeable and sophisticated in the complex, and occasionally intimidating, world of information technology, this chapter provides extremely nourishing and healthy food for thought.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶705, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶720), practical tools (at ¶730), case studies (¶740), and statistics and survey results (at ¶760). A “knowledge check” containing Q&As and discussion topics is included at ¶790.
Today’s professional athletes can achieve feats that were unimaginable thirty years ago. Innate athletic ability is an important factor in their success. However perhaps nearly as crucial to their sustained success is the scientific way that athletes and teams approach training, technique, and technology. The measure individual human performance efficiency (using ergometers to measure fitness), component efficiency (using structural analysis of athletic equipment), and overall system efficiency (by replicating environmental forces to adapt to them).

The emphasis on measurement and efforts to optimize system elements represents a radical departure from traditional preparations for athletic competition. For centuries athletic training had been a flying-by-the-seat-of-the-pants affair, and it is only in recent decades that science and measurement have been seriously applied to optimizing human performance.

Likewise, managing offices of sponsored programs, more often than not has traditionally been more art than science — and with good reason. The information for "scientific" decision making either did not exist or was difficult to collect and analyze in a timely (and so actionable) time frame. Just as technological advances have permitted accurate assessment of athletic performance, technological advances permit a research administrator to more accurately measure office efficiency. For the office of sponsored programs (OSP), this means the overall performance of individuals, processes, and the institution’s research enterprise can now be continually and periodically measured, monitored, and assessed.

This chapter briefly addresses some issues pertaining to information dissemination, including organization and staffing considerations, the resources needed in providing information systems, and how OSPs use the Internet. Also discussed is the use of information as a tool for measuring performance. Where other chapters of the Guide may generally deal with techniques and processes relevant to how offices of sponsored programs can or should work, this chapter focuses on methods to measure how well those processes are working. This chapter considers process metrics (standards for measuring performance) at several levels — from the individual negotiation to the individual negotiator or team, the office as a whole, and the overall research enterprise. When appropriate, tactical (day-to-day) and strategic (long-term) applications for information are also considered.
What Is ‘Information’?

For purposes of this chapter, the term “information” refers to the aggregation, sorting, or categorization of data; that is, how data can be made useful for the average person. In essence, then, the purpose of the “information systems” (IS) as discussed in this chapter is to bring data and people together in a manner that is meaningful. The system used to provide information includes both basic information technology (IT) infrastructure (hardware and software) and information-related processes (to include a system design that delivers the information required in reports needed by the user community).

Much, and perhaps the vast majority, of the information discussed in this chapter will typically be derived from data generated by transaction-based electronic research administration (ERA) systems, such as those used to create budgets, monitor proposal processes, or submit proposals. These transaction-based systems are those software applications that are used to conduct the business of offices of sponsored programs. The details (the data) generated by these individual transactions are the data that are aggregated, analyzed, and presented by information systems. These transactional systems are discussed in the chapter on electronic research administration and so will not be addressed here. (Although, practically speaking, it often is difficult to define where ERA ends and information systems begin. Indeed, a single software application may encompass both types of system activities.)

Note: The examples contained in this chapter are derived from the systems used at The Pennsylvania State University and are not intended to be prescriptive but rather illustrative. The reports are sample reports and not indicative of the entire range of reports available. The solutions a research administrator chooses for his or her institution may be quite different. Further, much as the information needs and the reports created in response to those needs at Penn State change over time, so too will any institution’s information needs.

Organization and Staffing

There are so many ways to organize the delivery of information — and the right approach for one institution may not necessarily work for another institution — that it is perhaps impossible to prescribe a single actionable organization and staffing model. This section will instead describe some factors to consider when developing an organizational and staffing plan for the OSP’s information systems.

There are four major issues to consider:

◆ The sophistication of the information system one is planning to use.
◆ The institution’s information technology organization and culture.
◆ The source of the system one is planning to use.
◆ The selection of system service provider.

The first consideration, the sophistication of the information system one is planning to use, is a critical consideration. If the institution has a relatively small research portfolio and few potential users of the system, the institution’s information system needs
may be completely addressed through the use of a simple spreadsheet housed on one computer workstation. On the other hand, if the institution has a somewhat larger research portfolio and numerous users, a more sophisticated software application (that is presumably Web-based) may be more appropriate.

The second consideration is the institution’s information technology organization and culture. Do individual institutional units provide their own IT support? Or is all IT support managed centrally? Or does some sort of hybrid system exist, combining elements of the first two models? Many offices of sponsored programs fall into the first category by default: For some inexplicable reason, many colleges’ and universities’ central IT shops tend to overlook the needs of offices of sponsored programs. By necessity such offices end up funding for themselves. For purposes of this chapter the term IT refers to all computer (hardware and software) technologies and computer professionals. The term information systems (IS) refers exclusively to the systems used to aggregate, analyze, and deliver information.

Obviously the more a sponsored programs office does for itself, the larger the IT staffing requirements will be for the office. If the office is located at a “non-IT-savvy” institution, help from outside the institution may be necessary. If the institution is IT-savvy and the central IT office agrees to it, the sponsored programs administrator has a choice whether to outsource or not.

The third consideration, the source of the system one is planning to use, as a practical consideration only comes into play if one is planning to implement a sophisticated information system. The fundamental question is: build or buy? If one chooses to buy a system, one can outsource some headaches (and gain some others), reduce the size of the IT staff, and (sometimes) reduce total cost of ownership. On the other hand, if the OSP builds its own system, the office will have complete control over the design and assume total responsibility for the life-cycle maintenance of the system. Using home-grown systems requires larger staffs than do purchased systems. However beware. *Purchased software requires staff to administer and maintain it; don’t make the mistake of buying a product and thinking expenditures are complete.*

The fourth factor in determining staffing needs is deciding who should host the system. The sponsored programs office can host (that is, manage) the software application (that constitutes the information system) itself, outsource it, or choose an application service provider (ASP) (really a subcategory of outsourcing). An ASP is a vendor that will host the system and data.

Depending on the OSP’s specific size and information needs, personnel with varied skills will be needed to maintain the system. However most OSPs will not require such staff services on a full-time basis. Their talents also could be used to support other, general IT tasks.

Finally, and this is probably the most important staffing issue to consider with respect to information systems, *if an office of sponsored programs can only hire one person, make sure it is someone skilled in both database design and administration.* Information derives from data, not from programs with fancy user interfaces. A simple database and a skilled database person will give one access, albeit unadorned, to the information that is really needed.
Figure 1 contains some general questions that may be useful in determining IT staffing needs. Figure 2 provides a case study of how one university’s research enterprise has satisfied its information needs.

**Figure 1: Determining IT Staffing Needs**

Every office of sponsored programs (OSP) will need to determine its own information technology (IT) staffing needs. The following simple outline may help an OSP to do so.

**OSP IT Staff**

- A simple spreadsheet will satisfy information needs
  - YES ➔ None
  - NO

- Institution’s central IT unit is willing to provide support
  - YES ➔ None
  - NO

- A third-party hosts the system
  - YES
    - IT staff: 1 project manager to work with the vendor and manage user accounts (possibly part-time)
  - NO

- Buy a system and host it
  - YES ➔ IT staff: 1 system administrator (probably part-time); 1 project manager to work with the vendor and manage user accounts (possibly part-time)
  - NO ➔ IT staff: at least 1 programmer/analyst; 1 database specialist; 1 system administrator (probably part-time)
Some years ago Penn State’s vice president for research mandated the implementation of systems for managing the university’s research enterprise. Penn State’s (science and engineering related) research and development expenditures for fiscal year 2003 were in excess of $533 million. The unit given the responsibility for delivering these systems is named the Office of Research Information Systems (ORIS). In addition to a director, ORIS has eight people organized into two teams: one team (administrative) maintains the IT infrastructure (including servers, firewalls, local area network and Internet connectivity, and workstations) and the other (information systems) designs, codes, and maintains the information systems (software applications and databases).

The administrative team consists of three system administrators who provide support to all the administrative units reporting to the vice president for research; these units include about 180 people, located in five buildings (separated by several miles) and 20 servers. Examples of the diverse units supported by this team include the offices of the vice president, sponsored programs, research protections, intellectual property, animal resource program, Penn State/Research (outreach and magazine), human resources, and finance.

The information systems team is composed of five people: three programmers, one database designer/administrator, and a single software tester and documentation writer.

In addition to maintaining the grants and contract information system, ORIS also has developed and maintains a system for managing the protocol approval process and a content management system that automates the creation of Web pages describing the institution’s research centers and institutes. ORIS is developing a new system that will permit faculty to monitor their project expenditures on a (nearly) real-time basis. ORIS also responds to ongoing incidental requests from staff for various custom reports.

One thing ORIS does not do is maintain Web site content. The unit does host (or manage) the sites for sponsored programs (and those of other units under the vice president for research) but does not maintain them. Units in the office of the vice president are individually responsible for maintaining their own Web sites. This serves a very pragmatic purpose; after all, IT people do not have the subject matter expertise to maintain the content for specialized offices. In the case of sponsored programs, one staffer is in charge of maintaining the office’s Web site and promulgating opportunity announcements.
1705.3 **Resources Required**

This section addresses the type of resources — not including staff — required of a sponsored programs office only for the delivery and analysis of information and not for tasks such as serving up a static department Web site. Because the information systems are electronic, the office will need computers. The question then arises: How many and of what type? The answer is straightforward: It depends. That may sound glib but how many and what type of computers an OSP needs really does depend upon what one wants to accomplish.

The following discussion will help a research administrator think through the process of determining his or her office’s computer hardware needs. Discussions of technology do not include recommendations for specific choices, because technology advances so quickly that any specificity offered would be obsolete by the time the chapter were printed.

This section instead addresses the components that could be associated with a typical information system used by an office of sponsored programs. These components include a variety of servers (for the database, application software, and Web site) and software (for the database, the software application itself, and the Web server). Depending on how an OSP’s information system is configured and what its information needs are, the system may or may not include all of the elements discussed.

**Databases and Database Servers**

This chapter is about information, and the information under discussion is derived from data. Hence the single most important information resource for a sponsored programs office is a database. In many cases the underlying information with which a research administrator will be working likely will be derived from the fusion of multiple data sources. For instance some of the reports the sponsored programs office may need will require that proposal and award-related data be combined with data from other institutional units (such as the human resources or business office).

Institutions with smaller research portfolios typically would not derive substantial benefit from the analytical capabilities of a complex database; typically, their needs could be well-served by spreadsheets and the analytical tools usually provided by the spreadsheet software. On the other hand, institutions with larger, heterogeneous portfolios can derive substantial benefit from the more sophisticated analyses that complex relational database software permits. The primary criterion to use for the selection of database software therefore is the size of the database. The more research the institution does, the more powerful the database software needs to be.

Perhaps a more interesting question pertains to the complexity of the database design. “Relational” databases are composed of a number of tables; the database software relates the data in these individual tables. It is by joining and sorting the data in the various tables that reports are generated. Although this is an oversimplification, basically the more ways one wants to look at and manipulate the data, the more complex the database design must be. (For example, the reports included as Figures 3-20 below were created using a relatively complex database.)
Depending on the size of the research enterprise, the research-related database supporting the enterprise might be hosted on a desktop computer, a departmental server, or even an enterprise server. A server is a shared, usually very powerful, computer on a local area network dedicated to handling a single task. A local area network comprises those computers that are interconnected and share local resources like user authentication services, file storage, and e-mail. An enterprise server is a server that supports users throughout the entire institution. (One potential area of confusion: The term server can refer to both the software and the hardware.)

In general, larger offices of sponsored programs will either maintain their own database server or ensure that they have ready access to one (either elsewhere at the institution or through a third party).

**Data Warehouses and Data Marts**

A “data warehouse” is really nothing more than a special-purpose database that is (generally) designed to make reporting easier or faster. If an OSP generates on a regular basis certain user reports, the OSP can use a data warehouse to reorganize the data in anticipation of the need for these reports. For example, when a proposal is submitted a large number of data elements (list of principal investigators, sponsor, total dollar amount, start date, and so on) are generated. Perhaps initially then the organizing principle surrounding these data is the proposal, but subsequently one might want to aggregate this data with other data and report according to sponsor, start date, or any other data element. The data warehouse provides the “prebuilt” infrastructure to accommodate these multiple reporting perspectives. Similarly data warehouses can also be used to aggregate data from multiple databases of various types.

In essence data warehouses are used to “preprocess” data to make it better conform to known reporting requirements. Because the “reorganization” is done ahead of time, the computer doesn’t have to devote as many processing resources to the task at the time the user makes his or her query, and the report is delivered more quickly to the user. Data warehouses archive information usually from a variety of sources to make it available for query by many users with differing data needs. In addition to making reporting easier and quicker, because data warehouses are generally hosted on a separate server, they tend to reduce the load on the computer hosting the transactional system (the source of the data), making the system faster.

“Data marts” are also databases designed for reporting, but they are generally even more focused in that they are typically used to serve a smaller user group or a more limited data set than the typical data warehouses. For the purposes of most offices of sponsored programs there really isn’t much difference between data warehouses and data marts. While the OSP’s IT staff may have occasions to access data warehouses or data marts, most of the time those warehouses and marts will be maintained by other units at an institution.

**Applications and Application Servers**

A good database administrator can provide all sorts of useful reports. However involving the “specialist” (the database administrator) every time a report is requested or needed may not be the best use of resources or staff time. To reduce the need for a
specialist’s knowledge, a software “application” could be added to the system. The application sits between the database and the user. Properly designed, the application increases the potential number of users who can access the information and will permit users to *self-serve* their information needs.

For a variety of reasons, often, but not always, the application is not hosted on the same server as the database. Therefore, if the research administrator decides to use an application program, an application server — or at least access to one — may be necessary.

**Web Software and Servers**

As we live in a Web-enabled world, the research administrator should make sure that the office’s information system application works on the Web. This requires Web software and a server. Fortunately this can (and often is) installed on the same hardware server that hosts the application server.

**Other Resources**

It is prudent to maintain a “failover” system (a server that automatically takes over if the primary server fails) or at least a “backup” system (manual replacement of the failed server) for the database and application servers. (See further discussion on security and recovery below.) If software applications are developed internally, development and test environments, including equipment, will be needed.

<table>
<thead>
<tr>
<th>How Many Servers Are Needed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>At Penn State, the Office of Research Information Systems (ORIS) is the unit overseeing information systems for the university’s research enterprise. ORIS manages 20 servers that provide assorted network services as well as a proposal and award system, a system used to help manage the protocol routing approvals, an intellectual property management system, a Web-based testing system, and a system that automatically generates Web pages describing the university’s centers and institutes. Those 20 servers also provide IT infrastructure services not directly related to the sponsored programs information system.</td>
</tr>
</tbody>
</table>

1705.4 **Security and Recovery**

No technology is 100 percent reliable; bad things sometimes do happen to computers. Therefore it is important to remember that an information system should include not only systems to minimize the likelihood of failure (“security”) but also systems and procedures to mitigate the impact of system failures when they do occur (“recovery”). A good security and recovery policy should cover the following four basic elements:

◆ **Network and data security:** Carefully consider the options identified for network and data security. (See discussion on the Internet below.) Outline a course of action. Remember that an ounce of prevention is worth a pound of cure.

◆ **Data backup:** Consider implementing local data backup systems like RAID (Removable Array of Independent Drives) as well as automatic backup to another physical location (an institution-wide service may exist already).
◆ **Hardware backup and failover systems:** Contemporary computer equipment is fairly reliable, especially machines built as servers. They will have redundant, hot-swappable components including removable arrays of independent drives, power supplies, and network interface cards (these connect the server, or any computer, to the local area network and the Internet). Nonetheless, if money is available, it is wise to maintain a failover server or at least a backup system for the database and application servers. A failover server is one that automatically and immediately takes over for a broken server. A backup server usually requires human intervention before it can substitute for a failed server. It is important to determine how long the unit can afford to be without its servers — can afford to be without the ability to deliver information services. Depending on the acceptable length of time, solutions can range from service-level maintenance contracts (for example, those providing 24-hour, seven-days-a-week backup) to clustered servers providing real-time failover (no interruptions).

◆ **Hardware maintenance:** It is important to keep production servers (those servers actually running the information system in contrast to backup or software development servers) under a maintenance contract. The contract should specify vendor response times and these should be appropriate to the research administrator’s level of risk tolerance. Because vendors often do not offer maintenance contracts for older computers (or they charge an exorbitant amount), plan to replace servers on a periodic basis. As a rule of thumb, plan on replacing production servers every five years. Of course after a server has been removed from production service, press it into other, less critical, duties.

### 705.5 Internet and the Office of Sponsored Programs

As the term “information system” is very broad, it is useful to categorize information systems in terms of how the information will be used. For information systems pertaining to sponsored programs, perhaps the first use for information will be to create an “information presence.” This usually is done via the Internet.

This section provides a survey of what might be characterized as run-of-the-mill uses of the Internet and covers

◆ disseminating routine information;

◆ electronic document storage or archiving, including related issues pertaining to document destruction; and

◆ system (including network, data, and user) security.

**Disseminating Routine Information**

It would be very unusual for today’s OSP to be without a Web site. At a minimum, the OSP Web site should present institutional procedures; contain links to federal regulations, circulars, and proposal guidelines; provide the institution’s sponsored research
forms (online forms should be interactive); and disseminate electronic notification of awards.

Even simply scanning hard copy award documents and e-mailing the resulting files to individuals or groups will save time and resources. It is important to note that whether the document was born digital (for example, an electronic notification of award) or scanned into a digital format, institutions may be required to maintain and secure them for a defined period of time (for example, as required for audits).

**Digital or Electronic Archiving**

It is critical that any office of sponsored research have an adequate process for electronically archiving research administration records. This particular activity is fraught with hidden complexity and the relevant technologies are not as advanced in this area as they are in other information systems arenas.

Perhaps the most basic consideration when implementing an e-archive system is establishing the “nonreputability” of documents stored in the system. This simply means that an auditor reviewing documents stored in the system should have confidence that the documents are unaltered — that they accurately represent the original document. This nonreputability can be achieved in two basic ways: first, the documents can be stored on a nonvolatile media like write once read many (WORM) disks, or second, through implementing a strict, programmatic auditing of all records. In either case it is important to safeguard both physical (with “locks”) and logical (with “strong passwords”) access to the system used to store the documents.

The next consideration in implementing an e-archive system is one that is often overlooked: documents must be “viewable” by (accessible to) authorized users. This isn’t a big deal if the document was created yesterday on current generation software, but what if the document was created using software written by a company that went out of business a decade ago, or if the software is otherwise no longer supported by the institution? One great thing about information written on paper is that the access technology advances at a rather manageable pace; one bad thing about electronic information technologies (including hardware) is that they advance at a rather less deliberate and comfortable pace. If the sponsored programs office chooses to maintain its records electronically, the research administrator must ensure that they remain accessible for as long as mandated by law, regulation, or institutional policy.

**E-mail.** E-mail presents, perhaps surprisingly, particularly thorny issues in terms of storage. Current case law — the law is still evolving — says that e-mail, as such, may constitute an institutional record (in contrast to the former generally accepted holding that e-mail was a form of “communication” and so did not constitute institutional records). As such, in addition to preserving the basic content of the e-mail, the institution must preserve human discernable addresses and e-mail
delivery dates and times.\(^1\) Therefore, simply cutting and pasting the content of an e-mail into a document management system for storage probably is not sufficient under this new legal interpretation. Access to e-mail becomes critically important during the discovery phase of any litigation in which an institution may be involved.

**Document Destruction.** Another important consideration in the electronic archiving area is document destruction. The problem with electronic documents is that it is entirely too easy to keep them — even beyond a policy-based destruction date. Why is this bad? Well, even if one has the right or obligation to destroy a document, if it has not been destroyed, an auditor — or anyone else — could ask to review it. This unnecessarily increases institutional risk.

Suppose a research administrator is conscientious about destroying documents according to policy. How does one destroy electronic documents stored on nonvolatile media such as WORMs, when the document to be destroyed is commingled with documents that must be preserved? Obviously the WORM disk cannot physically be destroyed until all the files it contains are “eligible” for destruction.

If the objective is recast from document destruction to preventing document retrieval, an easier-to-implement solution presents itself. When a document is to be “destroyed,” one can delete references (pointers) to the document being “destroyed” in the software that is used to manage access to the stored documents. In effect this makes the document irretrievable (or at least much more difficult to retrieve). Then when every document on a given disk is eventually “destroyed,” the disk itself can be physically destroyed.

**Network Security**

Network security is a subject that continually worries information systems administrators and one about which every organization that uses computers should be concerned. There continue to be antisocial individuals who seem to have nothing better to do than disrupt other people’s work by playing with “viruses.” A virus is a software program that is capable of replicating itself to cause harm to an information system.

In the last couple of years, though, the threat environment has worsened. A “cracker” is someone who illegally “cracks” into someone else’s computer by accessing passwords or who “cracks” the copy protection of software. There is a new breed of crackers who have found ways to make money by either writing malicious software or selling access to an institution’s or person’s computers over which they have taken control (so-called “zombies”).

---

\(^1\) *Armstrong v. Executive Office of the President, et al.* and *Public Citizen v. Carlin* are perhaps the most notable. Locate *Armstrong* on the Web at [http://caselaw.lp.findlaw.com/cgi-bin/getcase.pl?court=dc&navby=case&nro=955377a](http://caselaw.lp.findlaw.com/cgi-bin/getcase.pl?court=dc&navby=case&nro=955377a). *Public Citizen v. Carlin* can be found at [http://news.findlaw.com/hdocs/docs/gwbush/ahanara112801cmp.pdf](http://news.findlaw.com/hdocs/docs/gwbush/ahanara112801cmp.pdf). Also, while it is not yet law, there are indications that the “Uniform Rules for Electronic Discovery” may require that all e-mail (including routing data) be preserved in case of future lawsuits referencing the e-mail. Such discovery rules for e-mail would impose a substantial archival and retrieval burden on research administrators (as well as many others).
Any research administrator must be concerned about computer system and network security in order to keep the information systems running and prevent them from being used or accessed by criminals. It is no exaggeration to say that an unprotected computer (one with no firewall or patches) connected to the Internet can be compromised in minutes.

Presented below is simply a “laundry list” of network security issues that serves to highlight the importance of this topic and give a research administrator an overall understanding of some security options. As with all effective defenses, the architecture suggested is “layered” (discussed in turn ranging from the inside “layer” to the perimeter of the network). The following four basic practices will enhance network security.

1. **Patch all of your computer systems and keep them patched:** This is perhaps the most important rule of network security. Contemporary software is very complex, so complex that it always contains errors or bugs; some of these errors can be exploited by malefactors to gain access to computers (and data). When software vendors become aware of such errors the “fix” they provide is called a software “patch.” Today, an “unpatched” computer can be taken over by a criminal in minutes — and often without the owner ever knowing about it. Patching systems will substantially reduce exposure to risk by eliminating vulnerability.

2. **Install antivirus software on the network and on workstations:** “Malware” (malevolent software, including viruses) can enter computers through any of several “avenues.” Currently the most common is e-mail attachments. By installing antivirus software and using automatic updates on an e-mail gateway and on individual workstations, exposure to risk will be reduced significantly.

3. **Protect the network with security appliances (such as firewalls, intrusion prevention systems, or intrusion detection systems):** Another significant avenue for the introduction of malware into computers is by exploiting the infrastructure used by computers to communicate with the Internet. Computer-to-computer communications is defined by the endpoint on each computer. These endpoints are called ports — think of ports as the doorways into a computer. There are thousands of ports and what the bad people do is use computer programs to look for (called port scanning) open or unguarded ports (think unlocked door). When they find a vulnerable port, they use that opening to install malware on a computer.

   A network-based firewall provides an outer defense that, if properly configured, will further and substantially reduce vulnerability. A network-based firewall does this by preventing computers outside of the network from communicating with those inside of it by, among other mechanisms, restricting the use of specified ports. A good firewall permits the network administrator to define who and what type of Internet traffic should be blocked. Firewalls can also be configured to block outgoing traffic; this can prevent the spread of viruses if the network has been compromised. Of the various security appliances available, the one that will provide the most immediate benefit is the firewall.
Implement and maintain strong passwords: All the patching, firewalls, and antivirus software in the world will be of little use if users don’t use “strong” passwords and keep them secret. A strong password is a complex password system that

◆ is of eight or more characters in length;
◆ includes uppercase and lowercase letters, numbers, and special characters;
◆ is not a real word in any language; and
◆ makes a user change his or her password every so many days.

Under such circumstances, passwords are hard to remember, but it is precisely the complexity of strong passwords that makes them hard to crack. The metric used to measure password strength is called “entropy”; the more entropy a given password has, the more difficult it is to break or decipher. Most authentication systems provide mechanisms to ensure that passwords comply with whatever policy is established.

Data Security

If network security keeps research administrators up at night, add data security to the mix, and no research administrator will ever get any sleep. There are some types of data that must be protected under the law (for example, social security numbers) and other types that must be protected according to institutional policies (this obviously will vary). The obligation to protect systems’ data is serious, so serious that data security should be a concern from the moment data is first stored on the office’s computers to the day the storage media are wiped clean. Similarly access control should be an issue from the moment one starts thinking about making sponsored research programs data available through a Web-enabled system.

While the technical security issues described in this discussion are critically important, it is essential to recognize that most data leaks are not the result of a technical attack but rather perpetrated by disgruntled insiders (employees) or trickery. Trickery could involve an unauthorized person seeking access to data by trying to trick an employee into divulging his or her password through “phishing” schemes (e-mails or phone calls purporting to be from — but not associated with — an official institutional unit asking for user name and password, for example, to verify/test/reset a system). Sponsored programs administrators should instruct staff and system users to never, ever, give out a user name and password and ensure that all users understand the reasoning behind this critical precaution.

The basic issues surrounding data security include

◆ authentication (establishing that a given user is who he or she says he or she is);
◆ access control (once the user has established himself or herself, defining what information is available to the individual); and
◆ encryption (ensuring that a person “eavesdropping” on or electronically monitoring the transmission of sensitive data cannot decipher useful information).
User Authentication. As a general rule, instead of establishing an authentication system unique to the sponsored programs office (and having to manage it and potentially annoy users with yet another user ID-password pair they have to keep track of), it is best to use whatever authentication system is in general use at the institution. Most authentication systems provide mechanisms to ensure that passwords comply with whatever password policy is established.

Access Control. Access control, regulating who gets to see what data and what they can do with that data, is something with which a research administrator, as steward of the data, must be concerned. This chapter is not the appropriate venue for an in-depth technical discussion of access control, but it is appropriate to highlight here some of the differences between controlling access to hard copy data and databases. Perhaps the single biggest difference is that database technology permits an administrator to introduce finer “granularity” to controls than is available in the print world. It turns out, perhaps counterintuitively, that by using more “granular” (item-by-item or person-by-person) access control, more people can have access to the data (or at least portions of the data) while control over the data is still maintained.

Access generally is controlled by giving individual users (or groups of users) specific rights to access specific data elements (or groups of data elements) in specific ways. (A “data element” is a basic unit of information that has a unique meaning, such as sex, age, time period, or geographic location.) User rights can be derivative of some user attribute (for instance, certain users may only have the right to access records relevant to their own colleges or departments). On the other hand, one might also want to control access to data elements for which there is no easy way to derive access rights. For example, one might want to control access across the board to a data element like salary information. In this case a research administrator could explicitly assign rights to individual users (either by individually assigning access rights or assigning them to user groups that have predefined or predetermined sets of access rights).

The benefits of granular access control are many, but there are also costs. In the long term, there are increased administrative and maintenance costs; in the short-term, there are increased programming costs. It is up to the research administrator to determine what level of cost and access control is acceptable.

Data Encryption. Not only are there bad people in the world who want to break into an institution’s computers (formerly just for fun and now increasingly for profit) but some also are very interested in the data the institution’s systems contain (for, among other reasons, identity theft and industrial espionage). In addition to breaking into computers, evildoers will also attempt to eavesdrop on data being transmitted over the Internet. The countermeasure to this is straightforward and not terribly costly: Encrypt all data sent over the Internet and of course maintain physical security on edge switches and routers (the “stuff” in your telecommunications closet).

In the case of a Web site, one can purchase a “certificate,” a bit of software that establishes and assures the “identity” of the computer (from Verisign, Thawt, and other vendors) and install it. From then on (presuming the subscription is kept up to date),
the data sent out on the Internet will be encrypted from the server to the user’s browser. Be sure people accessing any Web pages (or systems) that contain sensitive data are being authenticated — it would be foolish to encrypt the transmission of sensitive data without also authenticating users.

### 705.6 Generating Reports

For an information system pertaining to sponsored programs, it is useful to examine three main categories of uses for information:

- To manage the office
- To manage the research enterprise
- To satisfy the needs of others to understand and access the research enterprise

This section discusses how a research administrator can manipulate data in order to generate reports to assess and manage the OSP — its people and processes. Further, as steward of proposal and award data, the research administrator will need to assist others at the institution who have various reporting requirements or information needs. While it is not essential, as a practical matter, most reporting will be done over the Internet. Some types — but certainly not all types — of reports for a variety of research-related purposes are discussed below.

Readers are reminded that the reports contained in this discussion are derived from the systems used at The Pennsylvania State University and are provided as examples of the type of reports that might be useful to an office of sponsored programs. The reports a research administrator chooses or needs for his or her institution may be different from the ones discussed below.

### Managing the Office

A research administrator will want to measure how well the OSP is performing. Once a research administrator understands the efficiency of individual staff members, teams, and processes, he or she will be in an excellent position to analyze overall processes, develop and implement improvements, and measure the results of any such implementations. This section discusses ways to use information systems to measure and manage performance.

**Process Optimization and Metrics.** One can approach “optimizing” or accessing and improving office processes in either an *ad hoc* manner or empirically. Either approach can yield success but only an empirical approach can validate success. And, only an empirical approach can be used to objectively document individual performance.

As a manager the first thing to decide is what to measure, and then second determine what metrics (“measurements”) can be used to generate this information. Determining what to measure depends on what the objectives are and is not a terribly difficult task but it will take some time. There is a tradeoff: The more one measures, the more one can analyze, but also the more burdensome data collection becomes.

Metrics can be applied to personnel or services. They frequently are collected consistently over time and can be used for trend analysis and projections. Metrics are
an excellent management tool for looking at how the office is doing currently and providing a basis for future direction. Strictly speaking, electronic systems aren’t necessary to provide office performance metrics but from a practical perspective, they really are. Sample reports to assess some basic metrics are included as Figures 3-6 and discussed below.

One could argue endlessly over whether a particular set of metrics is the best or whether particular methods of measuring performance are statistically optimal, but such discussions aren’t terribly productive. So long as the metrics chosen are reasonable, one will be able to derive actionable information about office efficiency and then, later, the effectiveness of any changes made to improve efficiency.

A very basic metric that can be used to determine an office’s processing efficiency is the number of days it takes to complete a negotiation. Penn State’s information system tracks the number of days that elapse from the time an agreement is entered or logged into the system (the first substantial internal transaction after the notice of award) until the negotiation is completed and an account is ready to be created (referred to as “to contract file”).

This metric, considered retrospectively for an individual negotiation, can provide some insight into how well that particular negotiation proceeded. When this data is aggregated and examined from numerous negotiations (over a given time period), a picture of the office’s overall performance emerges. This aggregation could be expressed in terms of the number of negotiations completed for each negotiation interval (one day, two days, three days, etc.). Clearly such a data set, comprising upwards of two hundred data elements (one for each interval), would be difficult to analyze.

One can better manage the proliferation of data points by further grouping the performance data into sets or “bins” that correspond to negotiation lengths that have some meaning. For instance, at Penn State eight bins are used to characterize negotiation efficiency. (Some might argue that the use of bins of varying size will distort the analysis; in an absolute sense this is true, but the purpose here is to gain an overall understanding of negotiation status, which does not necessarily require statistical purity.) Figure 3 shows some sample Penn State contracts negotiation data organized in this way.

This report alone provides a nice enough “snapshot.” However when reviewed in light of or compared with additional performance data — such as from last year, prior

to a reorganization, etc. — the report begins to take on real value because trends can be
identified or the impact of changing workloads or processes can be assessed. One
important job of management is monitoring the changing efficiency of the office to
courage improvement and address backsliding at the earliest opportunity. A series of
snapshots such as the one provided in Figure 3 can provide the information a research
administrator may need to stay on top of office efficiency.

Figure 4 examines the data by sponsor type. This sort of breakdown is interesting
because it permits one to consider whether or not the differences in performance across
sponsor types are reasonable or unreasonable. Here qualitative, as well as quantitative,
assessments (for example, how difficult or complex a given negotiation is) should be
factored in when evaluating the data.

Figures 3 and 4 look at relatively coarse metrics; certainly, over time there may be
changes in performance that do not significantly shift the distribution from bin to bin
(data sets to data sets). In these cases one might find it interesting to see what the
average performance is in each bin. This is shown in Figure 5. Of course this same
approach can be used to assess any definable functional element of the office whether it
is a team (unit-based, sponsor-based, or otherwise-based team) or an individual.

| Figure 4: Days to Contract Account Creation Authorization |
|----------------|-------|-------|-------|-------|-------|-------|-------|-------|
| SPONSOR TYPE   | DAYS  |

| Federal-Percent| 70.8  | 9.3   | 6.6   | 4.6   | 5.5   | 1.5   | 1.1    | 0.5   |
| State          | 110   | 57    | 64    | 59    | 58    | 10    | 9      | 2     | 369   |
| State-Percent  | 29.8  | 15.4  | 17.3  | 16.0  | 15.7  | 2.7   | 2.4    | 0.5   |
| Other          | 249   | 72    | 48    | 56    | 78    | 36    | 30     | 13    | 582   |
| Other-Percent  | 42.8  | 12.4  | 8.2   | 9.6   | 13.4  | 6.2   | 5.2    | 2.2   |
| All            | 1441  | 383   | 274   | 222   | 292   | 94    | 94     | 38    | 2838  |
| All-Percent    | 50.8  | 13.5  | 9.7   | 7.8   | 10.3  | 3.3   | 3.3    | 1.3   |
One important aid for optimizing office performance is the ability to “expose” (show or determine) individual and team workloads. Figure 6 is a screen shot of Penn State’s daily log report. In this case it is a daily log report for an individual; various attributes of the assignments are listed that permit supervisors to monitor productivity, distribute the load fairly, and assess portfolio status. (As a side note, Penn State plans to add a qualitative element to the exposure of workload data by assigning a weight to the various negotiator tasks that are tracked. For example, a low-weighting factor would be assigned to processing a no-cost extension, while a negotiation with an industrial sponsor with extensive intellectual property implications would be assigned a high-weighting factor.)

**Building Trust Through Transparency.** Trust makes relationships more successful, and in a business environment there are few better ways of engendering trust from customers than by exposing the service provider’s process metrics. An efficient manager of an office of sponsored programs is already tracking the office’s efficiency, so it is relatively easy to share these data with customers as appropriate. There is risk however. Transparency engenders accountability and some members of the staff may

---

**Using Data To Assess Efficiency**

Several years ago, in an attempt to improve process efficiency, Penn State’s associate vice president for research reorganized the office of sponsored programs. Some insiders predicted that immediately after the reorganization process efficiency would decline (as people learned the new ropes), and then gradually the level would rebound to the original efficiency level before eventually improving beyond the baseline. It turned out that the conventional thinking was wrong; process efficiency improved beyond pre-reorganization levels in just two or three weeks. The data available clearly backed up this rapid (and un-anticipated) improvement in efficiency.
be uneasy at the prospect of such public visibility. Before implementing such a policy, one should be sure to anticipate what may be significant staff resistance and be prepared to address any concerns that surface. However it is important not to underestimate the customer service benefits of increased trust that transparency can create. Further, when presented with the facts, potentially hostile customers often can be assuaged.

At Penn State selected negotiation data is “proactively” exposed. For instance, in cases where it has been over 28 days since a grant or contract has been logged into the system without it being either awarded, not funded, or withdrawn, an e-mail is automatically generated and sent to both the negotiator and relevant personnel in the college and/or department. This process occurs again at the 60-day mark. Once an e-mail has been sent, the sponsored programs negotiator is expected to personally follow up with all interested parties to explain the reason(s) for the delay in completing the negotiation.

In addition to tracking negotiation closing time, Penn State’s system also tracks the status of negotiations. The negotiation status includes additional detail on the current state of the negotiations, summaries of meetings, copies of e-mails, and logs of phone calls. Sometimes it’s the office of sponsored programs, sponsor, college, department, or faculty member who is responsible for the delay; whatever the case, often emotions can be divorced from the problem and solutions can be sought in a (more) objective manner when the facts are on the table.
Figures 7 and 8 show two slices of Penn State’s “Negotiation Manager” software interface. The first presents the summary status for a negotiation; the second presents the history of the negotiation. Taken together, the two screenfuls of information provide a window into the current status and the history of any particular negotiation. At Penn State these records are maintained by the sponsored programs staff but are visible to the relevant college and departmental research administrators; this availability dramatically improves communications. These sorts of negotiation histories also can prove useful during follow-on negotiations.
Managing the Research Enterprise

Just as data is needed to evaluate the day-to-day performance of a sponsored programs office, data also is important in evaluating the longer-term performance of an institution’s research enterprise. A research administrator (and others at the institution) periodically may want to know: “How does my institution stack up?” In today’s information environment there are few excuses for a research institution not to have a firm grasp of its research portfolio and the portfolio’s performance in relation to changes in available funding.

At a minimum a research administrator should understand the research portfolio in terms of funding source categories (e.g., federal, industrial, and foundation) and the respective amounts of funding. This sort of “quick” analysis can provide a clear snapshot of the overall research enterprise. It is recommended that the information systems be designed such that users have the ability to view information down to the individual sponsor level.

While such snapshots are useful, it is perhaps more important to understand funding trends. For instance, if the institution receives significant funding from the...
National Institutes of Health (NIH), a research administrator might want to look at the institution’s funding levels together with the NIH budgets (that is, the NIH budget history, current budget, and proposed budgets — presidential, Senate, and House versions) for extramural research. Then it becomes easy to see how the amount of NIH research funding the institution receives correlates with the overall NIH budget for extramural research. If the institution’s funding does not track the NIH funding profile, the institution is either doing something very right — or very wrong.

**Return on Investment.** One mission of research-intensive institutions is to create new knowledge. Unfortunately much of today’s science is big — big and expensive. The high cost of scientific research compounded by limited institutional financial resources, for all practical purposes, forces research universities to adopt a model with some businesslike characteristics when allocating funds to research initiatives competing for institutional support. For example, although each initiative must first be evaluated on its scientific merit, after scientific merit has been established, research initiatives could be considered in terms of investment potential.

Like any business, research institutions are looking for a return on their investments; unlike for-profit businesses, however, research institutions seek a return qualitatively different from that sought by the average capitalist. A research institution does not seek profit, but rather to increase the size of its research portfolios so that it can do more research — to generate more knowledge.

Given that an institution has limited resources, the only way to grow the research enterprise efficiently is to convince others to fund the research. It is indeed unfortunate that external sponsors often seek to decrease their risk by preferring to fund research initiatives from institutions that can demonstrate some level of research maturity or potential for success. Simply stated, new research initiatives require start-up or seed funding in order to prove themselves worthy of external funding, and often the only source for this seed money is the institution itself. The looked-for return on the investment of seed funding by an institution is an increase in external sponsorship. The objective is to make research initiatives self-sustaining (as a result of external support), and then institutional funding can be reallocated to other initiatives.

An institution may be trying to leverage an area of research in which it already is a major player or it may be attempting to build up an area of research in which it is deficient. Although it is easy to evaluate whether a given proposal succeeds or not, it is far more difficult to measure the success of a broader research initiative or area of research focus. However, information systems can prove helpful in this endeavor.

It can be difficult to determine which portion of the incoming award should be allocated to a given research area. This is particularly difficult in an era of multidisciplinary and interdisciplinary research where any given award might be funding research in multiple areas. It is axiomatic that multidisciplinary projects correspond or map to existing departmental structures on a one-to-many basis and that those mappings are not always obvious. It is an even greater problem to map interdisciplinary projects because, by definition, there are no existing departments that correspond directly (or completely) to the focus of the project.
To accommodate these interdisciplinary initiatives, Penn State has superimposed another “structure” on top (or perhaps alongside) of existing departmental structure, which allows for the capturing of additional data on these initiatives. Award “credit” is distributed among strategic research categories (as institutionally defined). Once these assignments or distributions are made, it is simple to make year-to-year comparisons and develop a sense of what the return on the institution’s investment is. Although Penn State’s system has a variety of ways to display this type of data, one popular report is shown in Figure 9.

One initial objection to the report shown in Figure 9 was that it would be too difficult to persuade faculty members and research administrators to provide these data. However since implementation (fiscal year 2001-2002), the level of compliance has been remarkably high and consistent. What makes this cooperation even more surprising perhaps is that the institution also asks that credit be distributed among the participating faculty members. Figure 10 shows the data-entry screen for this assignment of credit.

**Increasing Nonfederal Support.** Many institutions derive a significant portion of their research portfolio from industrial sources, and most institutions are very interested in increasing this component. One way to attempt to increase this share is to focus on two categories of sponsors: those who are already large supporters and those who possibly can be converted to large supporters.

Because it is often easier to keep a sponsor than to capture a new one, it is vitally important that current major industrial supporters of research be identified and that concerted efforts be undertaken to keep them in that category. A research administrator can foster and expand the relationship with external, nonfederal sponsors armed with key knowledge about the sponsor obtained from the OSP’s information systems.

Figure 11 exposes Penn State’s best industrial customers to whoever needs to know about them. Perhaps what’s most important about this report is that it can provide this sort of information in a “context-specific” or “context-sensitive” manner. That is, in a manner that cuts or slices and presents the data according to user needs. Staff at different units and different levels of the institution will require different cuts of the data. For example, while the vice president for research or the director of corporate philanthropy
might want to know about the university’s overall “top ten” sponsors, the associate dean for research for a college most likely will focus on his or her unit’s “top ten.” It is important to remember that to be truly effective, information must be provided in a context-specific manner.

**Figure 10**

![Figure 10](image10.png)

**Figure 11**

![Figure 11](image11.png)
A report similar to Figure 11 addresses the institution’s interest in the second category of corporate sponsors: those sponsors whose money the institution is attempting to grow. How one “populates” this report, in other words how one determines what sponsors are being looked at, must be user-defined (where the user selects the sponsors to report on).

Who might use the data presented in Figure 11? Vice presidents for research and associate deans for research, of course, but also staff in both university development (corporate philanthropy) and industrial relations (industrial sponsorship) need to be able to portray the breadth of the relationship that exists between the institution and any given corporate partner. The only difference between this sort of report and “canned” or “predefined” reports is that the individual user defines which sponsors to add to his or her list of sponsors to track and this list is maintained in the user’s profile so that it need be defined only once. (The only caveat is that only sponsors who have been defined in the system can be selected for the user-defined list.)

Understanding the Research Enterprise

Again, as discussed above, data is valuable in evaluating or managing an institution’s research enterprise. It is also important in helping various constituent groups understand or assess the research enterprise. Providing information to users, in the form of reports, is one of the primary reasons OSP information systems exist. Users will undoubtedly require many other reports than are described in this discussion. The “take-home” message from all of these reports is that users should be able to directly access research trend information without having to interact with the research office’s IS staff. In other words, the OSP staff should maintain the boat, engine, and tackle; the users should do the fishing.

Basic Institutional Reporting. Because many of the reports requested by a research administrator’s many “constituencies” are routine (that is, most users ask for the same type of reports on a regular basis) effective use of information systems can put the information in the hands of the customers and enfranchise them to serve themselves. This is done in three ways.

First, one can provide any number of standard reports and permit users to access them. At Penn State users are permitted to access such reports in the dashboard-like interface shown in Figure 12. The users display only the reports they want in their user environment and these settings are maintained in the user’s profile.

Second, one can provide users with an interface that permits them to create their own queries. Because the average user is not a database specialist, the interface provided should be easy to use, which means the user should be able to use the database without needing to know any standard query language or understand the database structure. Because users tend to rerun the same queries, it is very helpful and efficient to enable users to store their queries for reuse. Figure 13 shows the screen used to define queries at Penn State.
Third, there will be occasions where neither standard reports nor a customized query will provide the flexibility to satisfy user needs. In these cases, provided the data exists, a research administrator can create so-called predefined reports that users can then access like custom reports. While users cannot self-serve predefined report definition, once the report is created by programmers, users can self-serve report generation. These reports also can be designed to require user input at runtime (for example, the user can request certain date ranges or other query parameters). Figure 14 shows the screen used to access predefined reports at Penn State.

![Figure 14](https://dev.sims.psu.edu - SIMS Custom Report Manager - Microsoft Internet Explorer)

**Figure 14**

The screen used to access predefined reports at Penn State.
**Enterprise Metrics: Performance.** It is important to recognize that as steward of proposal and award data, the research administrator may have different stakeholder groups that have vastly different information needs. Senior executives often don’t need (or want) detailed reports; they need information aggregated in forms that quickly convey the information they seek. But in aggregating such data, a context also needs to be provided.

Figure 15 shows an “Executive Award Trend” report, which provides three year-to-year comparisons that convey the health of the research enterprise at a glance. The three comparisons exposed (year-to-date, current month-to-date, and prior month)
integrate the award data over three defined periods so that yearly and more recent trends can be easily discerned. The upward and downward pointing arrows assist stakeholders to more easily track trends.

Current-year/last-year comparisons are very useful (and are requested by many types of users), but on a fairly regular basis customers require multiyear comparisons to assess longer-term trends. Figure 16 shows a report addressing this need that Penn State makes available to all users.

What is perhaps more instructive than the report itself, is the fact that the user is permitted to define both the number of years to compare and the specific portion of the year that is being compared year-to-year. (See Figure 17.)

It is a sad characteristic of research funding that the amount of yearly funding can be somewhat uneven due to the vagaries of the federal funding cycle. The occasional huge, multiyear center award can introduce unsettling (and relatively meaningless) discontinuities in year-to-year trends. The impact of these discontinuities on users looking at year-to-year funding trends can be substantially reduced by multiyear averaging. Penn State uses three-year running averages (where the values for any

**Figure 17**

**Total Average**

| Average | $169,966,177 | $156,263,429 | $145,385,064 |

Given year reflect the average of the current and the two preceding years). This report, available to all users, is shown in Figure 18.

**Enterprise Metrics: Trend Analysis.** Most of the reports examined so far have conveyed various types of highly concrete information, i.e., size of awards, number of awards, and status of awards by PI. However there is also value to be gained in looking at the general character of awards.

Figure 19 compares the percentage of Penn State faculty receiving increasing award amounts for seven colleges (note that this is not automatically generated but is the result of the manual synthesis of human resources and award data). The bins are cumulative, which presents an effect similar to percentiles. By using percentages one can “normalize” the curves, which makes college-to-college comparisons easier (the significant variation in college-to-college total awards is concealed). Also note that the
figure doesn’t use consistent bin sizes; instead they are smaller on the lower end of the scale (in effect magnifying that portion of the curve) and larger on the higher end. This may render the resulting information not statistically valid but will nonetheless satisfy a need for general information.

It’s interesting that the funding profiles for this relatively broad cross section of colleges are pretty consistent, although differences do exist. On the low end, there seem to be two clusters of colleges: those colleges with 5-to-12 percent of the faculty receiving no awards and those with 20-to-25 percent receiving no awards. Then there is College A, whose curve bows out between the $100,000 and $500,000 levels. Most likely the answers to why these differences exist are more qualitative than quantitative and do not diminish the report’s general usefulness.

Usually one can directly access the metric that one is interested in (for example, time to award). However, sometimes one can only get access to the metric by measuring something related (for example, if one were trying to measure average number of departments contributing to proposals as a gauge of interdisciplinary collaboration). Such a related metric is called a “surrogate.”

Over the past decade or so, many institutions have striven to encourage multidisciplinary research. Figure 20 shows one coarse surrogate (percentage of awards with multiple investigators) for estimating an institution’s transition to multidisciplinary research. At around 1999 there is a change in the slope of the three curves — the percentage of awards with multiple investigators began to increase. This
does not *conclusively* prove that more multidisciplinary work is being awarded but, in light of the knowledge that federal sponsors and the university were encouraging multidisciplinary activity, it provides an *indication* that more multidisciplinary work is being awarded.

**705.7 Risk Areas and Critical Success Factors in Implementing Information Systems**

The success of any software application is a function of one primary metric: number of people using it. In other words, if no one uses it, the software application has, by definition, failed. Of course once people start using the software, other factors come into play that influence the “success” or “failure” of the system. Traditional return-on-investment metrics is one such factor in determining the success or failure of software. However, adoption by users is the *sine qua non*; if people won’t or can’t use the software, it is essentially useless. The reality of the IT business (and of many other businesses as well) is that people only use products that they *perceive* as valuable.

It is incumbent, therefore, on any proponent of new software to articulate clearly the value of the software for the individual user as well as for the institution. Once promises are made, however, one must deliver on these promises and meet — or exceed — the expectations of users and customers. And there’s the rub. To design valuable software, developers must ensure that it meet the needs of the target audience. To do so, developers must understand the needs of the customer base before they begin designing. This requires that developers (and business analysts if appropriate) meet with target users and engage in an often extended dialog. Likewise, if an OSP is purchasing or outsourcing an information system, it must be sure that everyone charged with making the system selection fully understands users’ *actual* and *perceived* needs.
Financial Considerations

It is a very common error to consider only start-up costs when deciding to implement a software application. This is a very serious error because in doing so, “life-cycle” costs are not accounted for upfront, and the necessary monies to maintain the system are not budgeted for. Over a very few years, if the necessary maintenance funds are not found, the system will be rendered progressively less useful and more vulnerable.

Life-cycle costs include application software maintenance (if the application is developed in-house this cost manifests itself in salaries of programming and database staff); operating system maintenance (including version upgrades and staff time); security and system redundancy; and hardware maintenance and replacement. These costs are significant.

Resistance to Change

It is often true that there will be (at times significant) opposition to the introduction of any new system or process. Indeed it is not uncommon for potential users to simultaneously hold two mutually exclusive fears: that the new system will both eliminate their job and introduce additional work. The only effective counterargument to this is to ensure that the information system adds value, not only to the OSP or institution at large, but also to the individual user. If users see that the system is adding value to their work, they will embrace it.

It is also extremely helpful if the OSP in which a system is being deployed has a change advocate to promote the system and its value. Unfortunately this is not the type of person one can requisition from the office of human resources; they’re either already on staff (if one is lucky) or not. If someone in the office is championing the system, he or she should be nurtured and supported.

Shadow Systems

A shadow system is a system, not always computerized, that is used by a unit (or units) to either replicate some functionality of an institution’s central systems or provide some functionality that a unit’s system is not providing that the user thinks is necessary. A shadow system is an “unofficial” system maintained by institutions or departments within the institution. If the shadow system is redundant it is, at best, a waste of resources and, at worst, a profound statement that existing systems are not to be trusted.

On the other hand, if the shadow system is providing a function that existing systems are not capable of providing or are not providing for some other reason, the existence of the shadow system should be used as a rationale for determining and making enhancements to the central system. (Of course the cost of an enhancement should always be weighed in light of the number of potential users who would benefit from the enhancement.)

Shadow systems do not so much present a risk as they indicate whether or not an information system is successful. One measure of success may be the spontaneous elimination of shadow systems.
Special Issues for Small Institutions

The volume of research conducted by the typical small institution may not be sufficient to justify a significant investment in systems (purchase and life cycle) or personnel. On the other hand, the lower volume — and resulting smaller amount of data associated with the research enterprise — could also mean that much valuable analysis could be accomplished without sophisticated (and specialized) IT systems.

Still every institution, despite its size, will want to determine information needs, understand processes, and analyze efficiency in order to manage the sponsored programs office and the research enterprise effectively. The average small institution will probably neither develop its own application nor purchase (and host) a software system. Given this reality, there are three basic options:

◆ The first option, and probably appropriate to only the smallest research portfolios, would be to track metrics in a simple spreadsheet. Today’s spreadsheets are remarkably capable and enable all sorts of manipulation and presentation options. (Note that spreadsheets were used to merge data from multiple sources and generate several of the reports from Penn State included in this chapter.)

◆ The second option is a step up in terms of capabilities. There are a variety of desktop databases that, if properly handled, can provide a nice user interface that permits users to easily access the data. In terms of hardware and software expenses, this option costs little more than the spreadsheet option. However, if this route is taken, the research administrator should seriously consider hiring a person (or at least have access to a significant portion of a person’s time) who is skilled in database design and programming.

◆ The third option for smaller research institutions is to contract with a third party to host (manage) the system and data — in other words, outsourcing. In general these application service providers (ASPs) also license the application software directly to larger institutions. This option offers three significant advantages: first, as the research portfolio grows, it can do so without overtaxing existing information systems infrastructure; second, it will provide access to (presumably) more sophisticated analytical tools; and third, no specialized IT staff will need to be hired.

The downside of this third option is significant but certainly manageable. That is, certain compromises may have to be made in terms of control over the data collected, available reports and how information is presented in them, and the system’s “look and feel.”
Conclusion

This chapter surveys the myriad issues that should be addressed when considering the OSP’s requirements for an information system. The use of commonplace terms like “information systems” might lead one to infer that the field of information technology and database design is well-established and well-understood, and that cookbook approaches for implementation exist. Of course such an inference would be far from the truth. Not only are the technologies underlying information systems in continual (and sometimes rapid) flux, but the use of information systems in research administration is a relatively recent phenomenon that is likely to undergo enormous changes in the near term.

The bottom line is that there are no standard recipes for implementing an information system. This chapter outlines important broad considerations in crafting a system for an office of sponsored programs. A specific solution used at any university will be, to some extent, unique. But this is good news for those adventurous souls who enjoy a challenge and being creative — those who like to break new ground and help stabilize a very fluid environment.
720 Supplementary Material

This section includes expanded coverage of topics relating to electronic information systems. These materials are culled from a variety of authoritative sources. (For additional discussions on electronic research administration, see Chapter 900.)

720.1 Navigating the ERA Maze of Building, Buying, and Maintaining Computer Systems

Steve Shapiro, Computer Services Manager, Office of Research Services and Administration, University of Oregon

As computer systems become increasingly important tools used to store, transmit, and maintain administrative grant information, the total number of problems associated with their use is increasing as well.

The topic of electronic research administration (ERA) has become prevalent at conferences and seminars. As more institutions are looking at options to maintain this information, it becomes germane to address the underlying fundamental questions that individuals and organizations should address prior to making a decision concerning an ERA initiative. Given the high expense, often in the hundreds of thousands of dollars, of these systems, the impact of these decisions will be felt for years to come.

We are going to explore four decision trees that your organization can traverse in order to determine what approach might be best for your institution. As we dig deeper into the problem, we are also going to find that there is no ultimate correct answer, and the currently correct answer will probably change over time. Furthermore, the answers on one of the decision trees will depend on the answers on other trees. Changing any of the answers on one tree will impact the others.

---

1 Steve Shapiro is an IT professional who has been employed in the Office of Research Services and Administration, University of Oregon for 11 years. During that time, he has both written and purchased electronic research administration systems and is an ongoing contributor and participant at NCURA conferences. This article is adapted from a presentation given at the NCURA annual meeting in November 2006. The author would like to acknowledge the help of Dave Dose, University of Oregon and Jon Peterson and Tyler Wilson, Colorado State University.
1st Decision Tree: Where Are We Now?

The root of the first decision tree asks the question where your mandate is coming from. For the purposes of this discussion, we are going to assume that you are a Sponsored Projects (or Research) Administrator or Officer working in a Sponsored Projects (or Research) Office at a grant-funded research organization.

◆ From “above”?
Concern with institutional performance and overall funding often drives activity at the Dean/Provost and President levels. Most often, these individuals will be concerned with increasing research funding. Along with increased funding comes increased administrative overhead.

◆ From SRO staff?
Typically, SRO staff are overworked and underpaid. However, if you find that your office is churning through staff, proposals are not being submitted on time, or awards are not being managed appropriately, this may indicate that your office has a problem that simply throwing an FTE at may not solve.

◆ From your PIs?
Are PIs proposals getting submitted and funded? Are they creating and submitting proposals in the quantity and of the quality that you expect? Are their technical and financial reports getting turned in on time?

◆ Do you have departmental grant administrators?
Do your departments have staff with access to the information they need to manage proposals and awards (assuming this is done at the departmental level)?
Once you understand the root of the tree, you can look at the upper structure and ask yourself questions such as:

1. What is our institutional culture?
   - Are we centralized/decentralized? What is our administrative organization process?
   - How are our researchers organized? Are we an undergraduate, graduate, or both level institution? Are we a teaching, research, or both type institution? What other institutions are similar to us?

2. What role do we play in the proposal/award process?
   - Are we pre-award, post-award, or both? Do we participate in proposal development? Does our office submit reports or remind the PI to submit them?

3. How are we handling things right now?
   - Are our current methodologies working? If not, what should we look at changing? If they are working, what can be enhanced by applying information technology?

2nd Decision Tree: Build or Buy?

<table>
<thead>
<tr>
<th>Build or Buy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build</td>
</tr>
<tr>
<td>Both</td>
</tr>
<tr>
<td>Buy</td>
</tr>
</tbody>
</table>

- How am I handling it now?
- What’s my volume?
  - How many proposals, how many awards, what else?
- Start over or enhance existing?
  - Who should help me answer this question?

To answer the first questions of the second tree, you’ll dig deeper into the questions you asked yourself in the first tree:

1. How are we handling proposals, awards, and IT right now?
2. What is our volume, both in terms of number of proposals/awards and their dollar volume?
3. Should we enhance an existing system or start over?
Who should help you answer these questions?
(1) Current IT staff at your institution
(2) Other SRO professionals
(3) Person or persons who establish your office’s budget

Some pitfalls to pay attention to:
(1) Don’t assume you’ll save money by building your own system. Try to put together five- and 10-year estimates of expenses.
(2) Don’t assume the software you buy will be perfect, regardless of vendor promises.
(3) The answer will change over time.

3rd Decision Tree: What Kind of Support Is Needed?
Regardless of the system you build or buy, you will need end-user computer support for both your office staff and individuals across your institution who use the application. Bundled with that is the issue of training, both for your office and end users.

If your office computers are located on a local area network (LAN), or you connect to the Internet via a LAN, then you will also need support and security for your network. The support can come from any number of different sources:

◆ Homegrown: This is the person in your department who was hired for a non-IT-related function and has become the “go-to” person for IT assistance. This accountant, SPA, or other person has risen to the task, perhaps creating some spreadsheets or databases. He or she is the go-to person when the printer jams or your computer locks up.

    Advantage: Knows your business, your language, and you probably already have a good relationship with them.
Disadvantage: Probably does not have in-depth computer skills and multi-tasking will dilute their efforts.

◆ **Department IT Professional:** Position was created to assist, create, and/or maintain computers and computer applications for your department.

*Advantage:* Depending on the skill set the person had when hired, they may have abilities to do things with the computers you did not know were possible. He or she will offer new thoughts and perspective on solving your ERA problems.

*Disadvantage:* Will have to learn your language and your business as they go through a breaking in period.

*Wildcard:* The person you interview may become a different person after they start working.

*On the side:* He or she may want to take an occasional day off, or holiday, vacation, or sick leave. They require care and feeding, including possibly the ability to take advantage of educational opportunities!

◆ **External IT Professional:** A person contracted to your office to assist with hardware installation and maintenance and to design and maintain software. The person may be from within your institution, the vendor of your product, or an independent contractor.

*Advantage:* You only pay for what you need, and you usually get a high level of technical expertise. If internal to your institution, you may be able to use “funny money” to retain this person.

*Disadvantage:* The person may lack commitment to your unit and disappear with little or no notice. Also, he or she may not understand your culture or needs.

*Note:* An external person is a little bit more expensive than an internal person after fringe benefits are taken into account.

Questions to ask yourself when considering adding IT support to your organization:

◆ What do we need done?

◆ Are we looking for network management, application development, or both? These functions require very different IT skills, similar to someone majoring in one subject with a minor in another. Double majors (or people highly skilled in both areas) are rare.

◆ Evaluate the communication skills of the people you are considering. Can you understand them? Can they understand you?
Depending on the scope of the project and the type of information to be managed, data storage and application service can take place on something as simple as a networked — end-user — workstation that shares folders with other workstations on the network (and the Web), department-based servers (LAN, Web, E-mail), central organizational servers, or servers located at the vendor location and accessed via the Web.

In order to determine the appropriate platform for your application, you should first determine how it will be accessed. Are your users sitting right next to you? Are they located across campus or across the world? Will they want paper output and reports? Is security an issue?

Who is going to be responsible for the integrity of the data? Data integrity is a very broad reaching term that encompasses the following:

- Data validation at input
- Connecting the user to the data they are entitled to view
- Securing the data against unauthorized access
- Backing up the data
- Ensuring the backup contains usable data

Put simply, data integrity is the assurance that data is consistent, correct, and available when needed.
Each of these available platforms has advantages and disadvantages:

◆ **Local Workstations**

  *Advantages:* Very low cost ($$$), direct access to data.

  *Disadvantages:* Limited simultaneous access, multi-user applications will be limited to two-three simultaneous users, and one or two Web users. There is a high probability of the workstation crashing or shutting down.

◆ **Department-Based Server**

  *Advantages:* Relatively low cost (low $$, $$$), direct access to data, Web access to data is possible with fewer than 100 simultaneous users.

  *Disadvantages:* IT personnel to manage the server are highly recommended.

◆ **Computing Center-Based Servers**

  *Advantages:* High volume, high reliability.

  *Disadvantages:* High cost ($$$, $$$$), IT personnel to manage the server are mandatory, lack of access to raw data, new level of administrative overhead, difficult to modify.

◆ **Vendor-Based Servers**

  If you are purchasing a system from a vendor, there is a high probability that you will be offered hosting services as part of the package. All traffic for your application will be directed to the vendors’ data center, transparent to your office staff and end users.

  *Advantages:* High volume, usually high reliability, no technical assistance needed at your location.

  *Disadvantages:* Very high cost ($$$, $$ $$ $$), but often bundled as part of the system price. Lack of access to raw data, new level of administrative overhead, difficult to modify, lack of control over data may present institutional issues. What happens to application and data if vendor goes out of business?

**So … Is It Build, Buy, or Both?**

Ultimately, there is no right answer to the build or buy question, and the situation is constantly changing. You are in reaction mode in that sponsors dictate how you will send applications to them. While they do have a mandate to give you money in order to do research, you still have to apply for and manage the money subject to their terms and conditions.

Whether you build or buy, there is going to be a notable financial commitment. If you build there is a low initial investment cost, but you will have continuous expense related to the maintenance and upkeep of the application and the developer. Loss of the developer can be catastrophic to the application. Are you patient and prepared to make mistakes? Are you able to function if the application is unavailable? Do you have a long-term vision of where you are going and the resources that will be required to get there?

continued
If you buy, the application will require a *gap analysis* in order to determine the differences between what your requirements are and what the application does. Other questions that are wise to ask yourself are:

(1) Will we have to modify our current methods of doing business to accommodate the software, or can the software be modified to our way of business. What percentage of our current problems will the system solve?

(2) Are institutions that have similar culture to ours using the system with a moderate degree of success? Can you do a site visit to evaluate how they are using the system on a day-to-day basis? What features of the system do they use, which are ignored?

(3) Try not to rely on querying members of a listserv for their opinions. The context and culture of the member institutions who reply may be completely different from your own.

(4) What are your expectations that this vendor will be around for the next 10 years?

If you are considering a build/buy solution, it may be advantageous to purchase a system that gives you access to the data and source code, then modify it for your institution. While it is not likely that a private vendor would consider this option, other institutions may.

You may also consider merging institutionally developed systems with vendor solutions. If their data resides on the same platform, a skilled IT professional should be able to enable the systems to communicate and transfer information internally.

Regardless of which solution you decide to go with at any one point in time, gathering support from your administration and end users early on can be critical to your success. Ask them for input as to what the system should do, and the features they would find the most useful. Emphasize how your proposed solution encompasses their needs, and keep them in the loop concerning your successes and failures as you begin the implementation process. Consider including them in demonstrations and beta testing. Emphasize the benefits that they can look forward to, and the difficulties they might encounter as changes start to happen and the system begins to take form.

The most important thing to remember is that we are in a dynamic systems environment. The answer that we arrive at today will have to be constantly re-evaluated over time.
720.2  Developing an Institution-wide Web-based Research Request and Preliminary Budget Development System
Julia L. Glenn and Royce R. Sampson, Medical University of South Carolina

Abstract
While medical research may often be regarded by academics and the general population in terms of the remarkable science being conducted or the study participants willing to volunteer their time for the advancement of medical innovation, many in the research administration field recognize the tremendous amount of effort that goes on behind the scenes (Shambrook & Roberts, 2011). Accurate budgeting and compliant billing are two of the critical pieces of an evolving research administration puzzle. These activities are vital to the overall success of any research project and to the integrity of the research institution. In today’s technology-driven world wherein the term “process improvement” is widespread in academic research, electronic tools to reduce burden and increase efficiency have become a common goal at many research institutions.

Along these very lines, the South Carolina Clinical and Translational Research Institute at the Medical University of South Carolina (MUSC), the “academic home” of the National Institutes of Health Clinical and Translational Science Award (UL1RR029882), partnered with the institution’s Office of the Associate Provost for Research to develop a streamlined, centralized infrastructure for accurate research budgeting and compliant billing. The purpose of this paper is to describe the conceptual model of an institution-wide secure, web-based research service request and preliminary budget development tool currently under development at the Medical University of South Carolina.

Background and Introduction
The Medical University of South Carolina (MUSC) was founded in 1824 and today remains the only comprehensive academic health sciences center in the state of South Carolina. The institution strives not only to provide an outstanding educational atmosphere for its students and deliver patient care of the highest quality, but also seeks to be an international leader in the development of new medical knowledge and cutting-edge innovation. To that end, MUSC has a robust portfolio of basic, clinical, and translational research. In FY2010, the institution was awarded more than 1,200 research awards totaling over $234 million and representing over 500 investigators and countless research staff (Office of Research and Sponsored Programs, 2010).

In recent years, MUSC administration and leadership have continuously emphasized the importance of using available technological advances to create streamlined...
and effective systems for the management, review, and administration of the institution’s abundant research. In the last decade, MUSC has implemented electronic tools for the submission and review of Institutional Review Board and Institutional Biosafety Committee applications, grant proposals to the Office of Research and Sponsored Programs, as well as the submission of applications to Grants.gov utilizing a system-to-system interface (Medical University of South Carolina, 2006).

While such processes have undergone a technology overhaul, the critical processes of budget development and review as well as compliant research billing have remained static and have been deemed challenging by many research faculty, staff, and administrators. These processes rely almost exclusively on manual paper transactions and constant, repetitive email and face-to-face communications between various contributors to the study, such as the investigator, study coordinators, service providers, and billing specialists.

Research study team members must begin to construct their preliminary research budgets by contacting individual service providers separately to obtain pricing for research procedures. For example, price quotes for a myriad of laboratory tests are requested from the individual laboratories performing the tests; quotes for radiological procedures must come from the university’s Imaging Center or the Department of Radiology; estimated costs for an entire menu of investigational pharmacological services originate from Investigational Drug Services; quotes for specific research nursing services might be secured from the Clinical and Translational Research Center; and so on. Quotes may be obtained via email, paper applications, or phone calls, depending on the individual service provider. In addition, providers of research-related services often operate in silos. They provide pricing for their specific services, when in fact protocol procedures are often interrelated. A radiological scan, for example, may require contrast media, the cost for which must be obtained from a different source than the scan itself. The current system requires that the individual requesting research services is (1) aware of this complicating detail, and (2) obtaining the fee for the scan from the Department of Radiology and the technical (or facility) fee for the administration of the contrast from the Hospital Compliance Billing Office.

Once study teams obtain an “accurate” budget through this current method, the equally complicated coverage analysis process begins. This process also relies heavily on constant communication between research study team members and very specific (and sparse) service providers with valuable but individualized knowledge. Research staff must construct a billing grid complete with every research-related service that may incur a cost and subsequently be billed. The billing grid must indicate whether each identified service will be billed to the study sponsor, is a routine care procedure to be billed to a third party payer (such as the research subject’s insurance carrier), or is to be covered by study personnel’s effort.

Often these grids must be built from scratch. Sponsors of investigator-initiated protocols frequently do not provide a general template complete with all billable study procedures. However, while sponsors of industry-initiated/industry-sponsored protocols often supply such templates, they are extremely different from the
way the institution actually bills for services (for example, the common line item of "chemistry" may be comprised of a variety of different billable services). In either case, the study team must generate an original grid.

Once the billing grid is complete, a Medicare Coverage Analysis (MCA—a thorough review required for all clinical research studies to ensure that any tests, procedures, and/or interventions performed on study participants and being billed to any third party remain in compliance with legal mandates) must be requested from the University Compliance Office to ensure compliant billing throughout the subsequent study. This review entails manually entering information from the billing grid into a large Excel database so that historical decisions regarding coverage can be accessible at a later date. Coverage decisions are communicated to the study team via email and/or phone. Billing grids and budgets are manually updated as a result of the billing review as needed.

Figure 1. Overview of Research Budgeting and Billing Compliance Review Process at MUSC

This current labor-intensive system of research budgeting and billing compliance review is time-consuming, outdated, and prone to human error. As such, and with a large and growing portfolio of medical research, the South Carolina Clinical and Translational Research Institute (SCTR) and the Office of the Associate Provost for Research sought to develop an electronic system that would accomplish three critical tasks: 1) streamline and centralize the process of requesting research-related services across campus; 2) assist in the timely creation of an accurate preliminary budget and billing grid to ensure research billing compliance for individual research studies; and 3) allow MUSC to be competitive with academic medical centers of similar stature (Stanford University, 2010; Whitney & Wolff, 2011) with regard to electronic research administration and clinical trials management systems. What follows is a discussion of the conceptual model used to develop a comprehensive electronic system for research service requests and budget development at MUSC.
Methods

Groundwork for the proposed model first began by identifying major stakeholders in the research budgeting and billing process at the MUSC. Key participants, in addition to SCTR and the Office of the Associate Provost for Research, were initially identified as: the Department of Radiology, the Investigational Drug Pharmacy (IDS), University Medical Associates (UMA) and Medical University Hospital Authority (MUHA) Compliance Billing Offices, the MUHA Clinical Chemistry Laboratory (MUHA Lab), and the Department of Medicine.

These stakeholders were approached with the basic concept of a centralized electronic research request and preliminary budgeting infrastructure and asked to lend support to the project by endorsing the pilot-testing of the proposed system for day-to-day research service requests and approvals. Early meetings with the stakeholders centered on functionality of the proposed system and changes to current workflow. After their endorsement, key project personnel were identified (see Table 1).

                           |                                                        | • Implements actual system content and design from a programming perspective  
                           |                                                        | • Responsible for performing daily/weekly development tasks in support of system release  
                           |                                                        | • Provides general system maintenance |
These personnel set three goals at the outset of the conceptual model development. With the help and expertise of identified stakeholders, SCTR research specialists, SCTR biomedical informatics programmers and analysts, and departmental research administration professionals who can offer proficient pilot-testing and recommendations, project personnel sought to

- develop a dynamic and intuitive user interface prototype wherein faculty and staff can request research services from multiple service providers simultaneously and concurrently develop associated research service-related budgets and billing grids with ease;
- develop a streamlined administrative portal model wherein service providers can electronically manage, review, and approve requests for research services and prices as well as provide a thorough billing compliance review; and
- keep all identified stakeholders engaged and informed throughout development to encourage their ongoing recommendations and continued support for the project.

Results

Goal 1. Develop a User Interface Prototype

Project personnel identified three basic objectives for the original user interface model: (a) allow users to request research services and associated pricing from various service providers simultaneously via an electronic system; (b) allow users to construct a preliminary billing grid and subsequent draft research budget using the requested research services and prices electronically; and (c) allow users to electronically indicate how requested research services will be billed/funded for billing compliance review.

To achieve the first objective, project personnel, in collaboration with the service providers whose research services would ultimately be displayed in the system, developed the service catalog interface displayed in Figure 2.
Using online shopping as a model, project personnel created a prototype where users can easily search for research services under logical groupings. Much like shoppers can search for genres of books at online bookstores, users can search for groupings of various services, such as Laboratory, Radiology, Investigational Drug, etc., or perform a simple search for one particular service. Users can browse services under any of the listed service providers. As users find the service they are looking for, they simply click “ADD” to include the service in “My Services,” which is analogous with an online shopping cart. Rather than requesting services from each service provider separately, users can now select services from multiple providers concurrently.

The system allows each request to be associated with one research project. Users may associate the newly submitted service request to a project that already exists in the system or enter a new project (Figure 3) by providing some basic project information such as title, involvement of human subjects and/or research animals, and funding source, as well as authorize project personnel for system access and specific rights. Next, users are asked to provide the estimated total number of subjects and estimated total number of visits to begin constructing their preliminary budget (Figure 4).
With this initial information, the system generates an electronic billing grid template. To achieve their second and third objectives, project personnel created a billing grid with multifunctional views—allowing users to accomplish two tasks: 1) generate an initial budget based on the research services requested, the quantity of selected services at each visit, and the current fees from each of the appropriate service providers, and 2) indicate how each requested service will be billed throughout the course of the study for a thorough billing compliance review. As illustrated in Figure 5, users first enter the number of times per visit that each service is to be completed (1st grid), followed by the funding source (2nd grid). A preliminary research budget (3rd grid) is then produced. Fees that are to be billed to a third party or are to be covered by study personnel’s effort are not included in this original budget.

Goal 2. Develop an Administrative Portal Prototype

A robust and intuitive administrative portal is as important as the user interface to ensure success of the system as well as stakeholder buy-in. The administrative portal allows system administrators to manage, review, and approve users’ service requests within a centralized electronic portal. Project personnel identified three key objectives for the proposed administrative prototype: a) allow administrators to receive service requests electronically and quickly view all service requests for their program by status; b) allow administrators to review services of individual requests for approval and tracking purposes; and c) allow administrators to view services requested from other programs to help identify additional required services (for example, contrast media for a particular radiological exam) as needed.

To achieve the first objective a familiar, email-type interface was adopted, wherein administrators can view all service requests for their program sorted by status (Figure 6).

Figure 6. Administrative Portal “Inbox”

Similar to any modern email client, administrators have an “Inbox” (“Submitted Requests”) where newly submitted requests that need to be addressed reside until the Administrator changes the status from “Submitted” to “In Process.” Once logged in, the administrative portal automatically defaults to this “Inbox” view. The folders indicating status (“Submitted,” “In Process,” “Completed”) denote the phase of service request review. Administrators can quickly move back and forth between each status to gauge workflow and any outstanding issues at a glance. Administrators can likewise place requests “On Hold” (for example, if the sponsor of a study has put the study on clinical hold for further FDA review), which removes the request from the standard service request status folders and places it in the “On Hold” folder until manually changed by the administrator. Administrators can likewise send requests out for additional “PI Review” prior to approval (if the contents of the request have changed dramatically from initial submission, for example).

Changing a request to “PI Review” status generates an automatic email from the system to the principal investigator summarizing request changes that require
his/her approval. Similarly, when any request has been reviewed and approved (described below), the system places the request in the “Completed” tab. This folder (status) view provides a global, multiple-project perspective that facilitates efficient administrative management of the service requests for the program. Within each folder, each request also includes an abbreviated view of pertinent request information: the names of the principal investigator and requester as well as an overview of services being requested (available in a drop-down menu). Additional features of the administrative portal include the ability to assign any request to a particular staff member for management, review, and approval and to access individual service request details by clicking on the hyperlinked Service Request Identification Number, SRID.

Administrators have a variety of tools available to them in the Service Request Details module (Figure 7).
To accomplish the second and third objectives for the Administrative Portal, project personnel designed a multipurpose Service Request Details module wherein administrators can view both in-depth details about the protocol itself (funding source, sponsor, IRB and IACUC numbers, etc.) as well as the individual services being requested. Within this module, administrators can review, edit, and/or complete data required for service request processing, tracking, and reporting. Examples include ensuring that users have requested the correct services, entered the correct quantity, and received the appropriate service pricing (the system accommodates multiple-tiered pricing dependent upon funding source).

Administrators can add and/or delete services to the request as indicated through review of project and/or after discussing the request with the requester and investigator. Since many institutional service providers have policies that require requesters to be contacted within 24 hours of the initial request, the system also tracks the date and time of status change for comparison with established program metrics for evaluation and reporting as well as for continued process improvement activities.

In addition, administrators not only have access to any pertinent documents users may have attached to the initial request under the “Uploads” tab but can also upload applicable documents related to the service request to facilitate the proposal pricing process, document work fulfillment, or share pertinent information directly with the investigative team (Figure 8). Often, review of a protocol and consent by the service provider helps to ensure that all necessary services have been requested and pricing is accurate. Likewise, this ability for users and administrators to share documents can facilitate effective service consults as needed in areas such as regulatory, ethics, and biostatistics. All service request documents are accessible to the requester, the Principal Investigator, and any other users given access. This feature allows service providers and users to “communicate” as needed through a versioned/auditble document repository.
Lastly, to view those services requested from other programs for any individual service request, administrators simply click on the “Related Service Requests” tab within the module (Figure 9). Like their Administrator Inbox, administrators have access to an abbreviated view of all other service providers involved in the protocol as well as individual services requested from each provider. This functionality ensures that service providers do not operate in silos but are able to provide integrated, collaborative, and comprehensive services in order to better promote the success and compliance of investigators’ requests.

Figure 8. Administrative Portal—Document Repository Prototype

Figure 9. Administrative Portal—Associated Service Requests Prototype
Goal 3. Engaging and Informing Stakeholders

Due to the trans-institutional nature of this project, as well as multiple and diverse service providers and potential system users, project personnel recognized the critical importance of keeping all stakeholders engaged, involved, and informed throughout conceptual model development. Encouraging input, suggestions, and pilot testing from stakeholders would be the key to the overall success and eventual institutional adoption of the model. To succeed, this system could not simply be the sole innovation of SCTR.

To achieve this crucial goal, project personnel employed a variety of methods, including bi-monthly meetings with all identified service providers. With all providers convened together in an open forum, suggestions for and concerns with the proposed system were elicited and encouraged. Because providers had a long history of operating separately, this joint meeting proved extremely beneficial. Providers were able to discern how others operated and discuss centralized workflow through the new system. Project personnel were able to identify additional features that may allow the system to function even more efficiently. Project personnel also arranged separate meetings with individual service providers to ensure that no one provider perceived any major difficulties or issues with the system, as well as to encourage providers to voice ideas on how to enhance the system using their individualized knowledge.

To keep potential system users engaged and informed during conceptual model development, project personnel also participated in a number of bi-monthly campus outreach meetings (departmental meetings, clinical trials billing meetings, Lunch ‘n’ Learn presentations). During each meeting, project personnel gave a brief overview of the proposed system (functionality, use cases, proposed workflow) as well as an update on the conceptual model development and future implementation. User feedback, small user workgroup participation, and user pilot testers were solicited during each meeting.

To garner support from institutional leadership and administration, project personnel provided a number of brief presentations on the proposed system at the College of Medicine Dean’s Council meeting as well as various Departmental Administrators meetings. All presentations were received enthusiastically.

The success of these assorted techniques to keep stakeholders engaged and informed has been evaluated by several metrics. The number of service providers wishing to partake in the system has grown from the original six to more than 10, and the list continues to grow with the recent addition of numerous institutional Cores and Facilities. Project personnel have identified no fewer than 15 departments and divisions across campus requesting to utilize the system for requesting and budgeting for services, ranging from Transplant Surgery, to Pediatric Cardiology, to Radiology.

Conclusion and Next Steps

These results, which demonstrate the successful development of comprehensive prototypes that delineate a practical and efficient means of electronically managing, reviewing, and administering a variety of vital pre-award activities, while ensuring
the continued interest and participation of current stakeholders and encouraging future participants, have clear implications for the proposed system.

Due to such sizeable interest in the proposal from not only the individual providers of research-related services but also from the research administration community at large, development of the system has begun in earnest. The SCTR Biomedical Informatics Program has dedicated five full-time programmers and analysts to the project in hopes of releasing the first iteration of the system in late Fall 2011. In preparation for this release, project leaders and project managers continue to publicize the conceptual model of the system across campus—to individual departments and divisions, research administrators, and top institutional leaders—in order to garner further support and solicit additional feedback for future upgrades and enhancements. In addition, project personnel have begun to draft a training and education plan to coincide with the release. System training will focus on both broad institutional education (Tegrity sessions available to all users, SCTR Lunch ‘n’ Learn presentations, new faculty orientation, etc.) and individualized/one-on-one training sessions as requested.

Proposals for future system enhancements and upgrades already abound. Planning and designing activities have already begun to incorporate the first of many such system augmentations. After the release of the initial system this fall, SCTR and its collaborators will begin to develop a robust user dashboard (a prototype of which is displayed below) that will display an overview of pertinent study and investigator information, such as a list of all protocols and service requests within the system, a catalog of related grants and publications, system notifications, etc.

![Figure 10. User Dashboard](image-url)
In addition, SCTR will begin to develop a strong study tracking and work fulfillment infrastructure that ties directly into the request and budget development system. This study tracking system (a small pilot of which has already been released for early feedback) is multifunctional and will enable study team members to track work performed on a discrete study (at the individual study participant and visit level) for sponsor invoicing purposes and service providers to track work performed within their individual service centers for PI billing.

Other proposed upgrades that will be explored include: an electronic subject enrollment log and visit scheduling calendar, a consent tracking and versioning system, and electronic source documentation abilities.

Acknowledgments
The authors thank Amanda Zimmerman for her wonderful graphic design and the SCTR Office of Biomedical Informatics System for its tremendous development abilities, without which this project would have been nearly impossible. Furthermore, the authors wish to thank the continued support and superb ideas of Loretta Lynch-Reichert, Stephen Skelton, Stephanie Gentilin, Randal Davis, Rebecca Barry, Reece Smith, Susan Rittman, Romeka Washington, Kimberly Porter, Dixie McNamara, Faleshia Davis, and Patti Lofmark.

About the Authors

Julia Lane Glenn recently received her master’s in research administration from the Medical University of South Carolina (MUSC). The resource described within this paper was the culmination of her master’s project, in which she focused on identifying a research administration need at MUSC and developed a means of addressing that need. At MUSC, she holds the position of Research Navigator within the SUCCESS Research Support Center of the South Carolina Clinical and Translational Research Institute (SCTR), the academic home for the National Institutes of Health (NIH), Clinical and Translational Science Award (CTSA) U54 grant mechanism for research infrastructure and training support. In this role, Ms. Glenn assists in providing investigators and research staff research support services spanning the entire research spectrum from inception of ideas through technology transfer and dissemination of best practice models. Ms. Sampson served as her mentor on the aforementioned project.

Royce Sampson is a Research Assistant Professor in the Department of Psychiatry and Behavioral Sciences, Medical University of South Carolina. She holds positions as the Chief Operations Officer, SUCCESS Center Director, and the Finance and Administration Director for the South Carolina Clinical and Translational Research Institute (SCTR). The SUCCESS Center, a research support service center, serves as the “front door” to SCTR programs and services and provides expert guidance, training, and support to researchers and their study team members related to regulatory affairs, recruitment and retention, budget development and grants management, and research conduct. Ms. Sampson has extensive research experience and has served in a variety of research management and grant administrator roles. She served as the Associate Director for Geriatric Psychiatry and the Alzheimer’s Research and Clinical Programs. She also served as the Regulatory and Quality Assurance Director and Node Coordinator for the NIH, National Institute on Drug Abuse, Clinical Trials Network, Southern Consortium Node. Prior to the CTSA grant, Ms. Sampson served as the Co-Administrative Director, Administration and Finance, for the NIH, NCRR, General Clinical Research Center and the Business and Grants Manager for the Department of Psychiatry, Clinical Neuroscience Division, which conducts research in addictions and co-morbidity under the direction of Dr. Kathleen T. Brady.
**Practical Tools**

This section includes practical tools — checklists, flowcharts, etc. — on topics relating to information systems of relevance to sponsored research administration. These materials are culled from a variety of authoritative sources.

### Checklist for Preparing an Information Security Plan

AIS editors

“Pervasive and sustained computer-based (cyber) attacks against ... infrastructures pose a potentially devastating impact to systems and operations and the critical infrastructures that they support,” according to the General Accountability Office.¹ A research administrator must be concerned about ensuring the integrity of your critical information systems and preventing them from being used or accessed by individuals without authorization. Bad things sometimes do happen, so it is important to remember that an information system should include not only systems to minimize the likelihood of attack (“security”) but also systems and procedures to mitigate the impact of system failures when they do occur and guide your response (“recovery”). This discussion focuses on how to develop a policy to protect your data and systems from attacks by individuals bent on wrongdoing and should be read in conjunction with ¶705.4 and ¶705.5.

**Identifying the Threat**

Threats to critical information systems and infrastructures are sometimes discussed in the following broad groupings²: Unintentional threats sometimes arise from software upgrades or maintenance procedures that inadvertently disrupt systems. Intentional threats include both targeted and nontargeted attacks. A targeted attack is when a group or individual specifically attacks a critical infrastructure system. A nontargeted attack occurs when the intended target of the attack is uncertain, such as when a virus, worm, etc. is released on the Internet with no specific target.

Specific types of threats categorized by US-CERT (the federal information security incident center) include the following:

- **Unauthorized access**: An individual gains logical or physical access without permission to a federal agency’s network, system, application, data, or other resource.
- **Denial of service**: An attack that successfully prevents or impairs the normal authorized functionality of networks, systems, or applications by exhausting resources.
- **Malicious code**: Successful installation of malicious software (e.g., virus, worm,

Trojan horse, or other code-based malicious entity) that infects an operating system or application.

◆ **Improper usage**: A person violates acceptable information or infrastructure use policies.

◆ **Scans/probes/attempted access**: Any activity that seeks to access or identify a federal agency computer, open ports, protocols, service, or any combination of these for later exploit.

According to GAO, a system’s vulnerabilities “become particularly significant when considering the ease of obtaining and using hacking tools, the steady advances in the sophistication and effectiveness of attack technology, and the emergence of new and more destructive attacks.” Therefore, protecting “computer systems and the systems that support critical infrastructures has never been more important” (see Figure 730.1-1).

**Figure 730.1-1: Cyber Attacks Are on the Increase**

Incidents Reported to US-CERT in FYs 2005-2007

![Bar chart showing types and number of incidents reported to US-CERT in FY 2005, 2006, and 2007]

Types of Incidents Reported to US-CERT in FY 2007

![Pie chart showing the distribution of incident types in FY 2007]

**Note**: US-CERT is the federal information security incident center at www.us-cert.gov.

Who is threat to information infrastructure? The following types of individuals are often identified as posing a possible threat to information security systems³:

◆ **Hackers**: Hackers sometimes crack into networks for the thrill of the challenge or for bragging rights in the hacker community. While remote cracking once required a fair amount of skill or computer knowledge, hackers can now download attack scripts and protocols from the Internet and launch them against victim sites. Thus, attack tools have become more sophisticated and easier to use.

◆ **Hacktivists**: Hacktivism refers to politically motivated attacks on publicly accessible Web pages or e-mail servers. These groups and individuals overload e-mail servers and hack into Web sites to send a political message.

◆ **Disgruntled insiders**: The disgruntled insider, working from within an organization, is a principal source of computer crimes. Insiders may not need a great deal of knowledge about computer intrusions because their knowledge of a victim’s system often allows them to gain unrestricted access to cause damage to the system or to steal data. The insider threat also includes contractor personnel.

◆ **Criminal groups**: There is an increased use of cyber intrusions by criminal groups that attack systems for monetary gain.

### Developing a Security Policy

Obviously, you cannot afford the loss of critical (or sensitive) information or the risk of propriety information getting into the wrong hands or the downtime that could result from a breach in your security, therefore planning for prevention and response are important. Key elements of an information security program include⁴

◆ **Develop a comprehensive plan for critical infrastructure protection.** Include in the plan a strategy that clearly articulates objectives, goals, and priorities and identifies. Identify someone to manage the process and others on the team and what responsibilities each has. Identify plans for providing adequate information security for networks, facilities, and systems or groups of information systems, as appropriate.

◆ **Develop partnerships and coordinate with other offices/units within your institution; improve/enhance information sharing involving attacks, threats, and vulnerabilities.**

◆ **Develop and enhance analysis and warning capabilities.** Identify and implement protective programs. Identify a process for planning, implementing, evaluating, and documenting remedial action to address any deficiencies and that accommodates periodic testing and evaluation of the effectiveness of information security policies and practices. Perform testing with a frequency that correlates to risk, but no less than annually.

---

³ See footnote 2.

⁴ These tips are based on material contained in the following General Accountability Office reports available at www.gao.gov: GAO-09-432T, GAO-08-571T, and GAO-08-64T.
◆ Provide and coordinate incident response and recovery planning efforts. Identify plans and procedures for (1) deterring security incidents, (2) detecting, reporting, and responding to incidents, and (3) ensuring continuity of operations in the event of an incident.

◆ Identify and assess threats and vulnerabilities. Support and promote efforts to reduce threats and vulnerabilities and strengthen security. Conduct periodic assessments of the risks. In assessing risk, be sure to identify potential consequences of attacks, methods to screen risks and assess vulnerability, process to encourage voluntary vulnerability assessments. Address implementation and maintenance of protective programs. Identify assets, systems, networks, and functions and related “dependencies/independencies.”

◆ Promote awareness and outreach; foster training. Develop and offer security awareness training for personnel, including contractors and other users of information systems that support your operations. Describe how new technology will be assessed for security

◆ Integrate cyber security with other security efforts.
¶730.2 **Data Privacy Assessment Form**

Information privacy, or data privacy, is sometimes described as "the relationship between collection and dissemination of data, technology, the public expectation of privacy, and the legal issues surrounding them." Privacy concerns often arise when personally identifiable information is collected and stored. *Personally identifiable information* usually refers to any information that can be used to distinguish or trace an individual’s identity, such as their name, Social Security Number, date and place of birth, mother’s maiden name, biometric records, etc., and any other personal information which is linked or linkable to an individual. Addressing the challenges surrounding data privacy often involve software, hardware and “people” — and policies and practices regarding all three.

The checklist below\(^1\) may help research administrators develop an effective data policy surrounding their sponsored-research-related data stored in their information systems. The checklist should be tailored to meet a specific institution’s system and institutional policy requirements regarding stored information and privacy. (For additional discussions of privacy issues, see ¶¶2120.2 and 2130.3.)

◆ **Contact Information**

◆ **General System Information**

1. Name of system:

2. Description of system:

3. What is the purpose of the system or electronic collection of information?

4. Requested operational date?

5. Does this collection create a new privacy act system or is this information collection covered by an existing privacy act system? If so, what is the name of the current privacy act system?

6. What specific legal authorities, arrangements, and/or agreements require the collection of this information?

◆ **Data in the System**

1. What data is to be collected?

2. What are the sources of the data?

3. Why is the data being collected?

4. What technologies will be used to collect the data?

5. Does a personal identifier retrieve the data?

---

◆ Attributes of the Data (Use and Accuracy)
1. Describe the uses of the data:
2. Does the system analyze data to assist users in identifying previously unknown areas of note, concern or pattern?
3. How will the data collected from individuals or derived by the system be checked for accuracy?

◆ Sharing Practices
1. Will the data be shared with any internal or external organizations?
2. How is the data transmitted or disclosed to the internal or external organization?
3. How is the shared data secured by external recipients?

◆ Notice to Individuals to Decline/Consent Use
1. Was notice provided to the different individuals prior to collection of data?
2. Do individuals have the opportunity and/or right to decline to provide data?
3. Do individuals have the right to consent to particular uses of the data?

◆ Access to Data (Administrative and Technical Controls)
1. Is the data secured in accordance with institutional/departmental requirements?
2. Describe the privacy training provided to users, either generally or specifically relevant to the program or system?
3. Will contractors have access to the system? If so, will they be trained on privacy principles?
4. Has the retention schedule been established by records management? If so, what is the retention period for the data in the system?
5. What are the procedures for identification and disposition of the data at the end of the retention period?

◆ Privacy Analysis
Given the amount and type of data being collected, discuss what privacy risks were identified and how they were mitigated. Be sure to consider the following:
• Personally identifiable information
• Data completeness
• Data accuracy
• Data access
• Data disclosure
• Documenting data access
• Division of responsibilities
Overview of an ISCM Strategy and Program
National Institute of Standards and Technology

This chapter describes the process for developing an information security continuous monitoring (ISCM) strategy and implementing an ISCM program. A well-designed ISCM strategy encompasses security control assessment, security status monitoring, and security status reporting in support of timely risk-based decision making throughout the organization. It also incorporates processes to assure that response actions are taken. An organization’s strategy for action based on the data collected is as important (if not more important) than collecting the data. The process is as follows:

- **Define** an ISCM strategy based on risk tolerance that maintains clear visibility into assets, awareness of vulnerabilities, up-to-date threat information, and mission/business impacts.

- **Establish** an ISCM program determining metrics, status monitoring frequencies, control assessment frequencies, and an ISCM technical architecture.

- **Implement** an ISCM program and collect the security-related information required for metrics, assessments, and reporting. Automate collection, analysis, and reporting of data where possible.

- **Analyze** the data collected and **Report** findings, determining the appropriate response. It may be necessary to collect additional information to clarify or supplement existing monitoring data.

- **Respond** to findings with technical, management, and operational mitigating activities or acceptance, transference/sharing, or avoidance/rejection.

- **Review and Update** the monitoring program, adjusting the ISCM strategy and maturing measurement capabilities to increase visibility into assets and awareness of vulnerabilities, further enable data-driven control of the security of an organization’s information infrastructure, and increase organizational resilience.

This process is depicted below in Figure 730.3-1.
Risk tolerance, enterprise architecture, security architecture, security configurations, plans for changes to the enterprise architecture, and available threat information provide data that is fundamental to the execution of these steps and to ongoing management of information security-related risks. Security-related information is analyzed for its relevance to organizational risk management at all three tiers.

**Define Your ISCM Strategy**

Effective ISCM begins with development of a strategy that addresses ISCM requirements and activities at each organizational tier (organization, mission/business processes, and information systems).

The guidelines below, though not prescriptive, help to ensure an organization-wide approach to ISCM that best promotes standardized methodologies and consistent practices and hence maximizes efficiencies and leveragability of security-related data. As changes occur, the ISCM strategy is reviewed for relevance, accuracy in reflecting organizational risk tolerances, correctness of measurements, and applicability of metrics. An inherent part of any ISCM strategy is the inclusion of criteria describing the conditions that trigger a review or update of the strategy, in addition to the pre-established frequency audit. Likewise, the organization defines criteria and procedures for updating the ISCM program based on the revised ISCM strategy.

The following policies, procedures, and templates facilitate organization-wide, standardized processes in support of the ISCM strategy:

- Policy that defines key metrics;
Policy for modifications to and maintenance of the monitoring strategy;
Policy and procedures for the assessment of security control effectiveness (common, hybrid, and system-level controls);
Policy and procedures for security status monitoring;
Policy and procedures for security status reporting (on control effectiveness and status monitoring);
Policy and procedures for assessing risks and gaining threat information and insights;
Policy and procedures for configuration management and security impact analysis;
Policy and procedures for implementation and use of organization-wide tools;
Policy and procedures for establishment of monitoring frequencies;
Policy and procedures for determining sample sizes and populations and for managing object sampling;
Procedures for determining security metrics and data sources;
Templates for assessing risks; and
Templates for security status reporting (on control effectiveness and status monitoring).

Policy, procedures, and templates necessarily address manual and automated monitoring methodologies. Additionally, organizations establish policy and procedures for training of personnel with ISCM roles. This may include training on management and use of automated tools (e.g., establishing baselines and tuning of measurements to provide accurate monitoring of operational environments). It may also include training for recognition of and appropriate response to triggers and alerts from metrics indicating risks beyond acceptable limits, as well as training on internal or external reporting requirements.

Establish an ISCM Program
Organizations establish a program to implement the ISCM strategy that is sufficient to inform risk-based decisions and maintain operations within established risk tolerances. Goals include detection of anomalies and changes in the organization’s environments of operation and information systems, visibility into assets, awareness of vulnerabilities, knowledge of threats, security control effectiveness, and security status including compliance. Metrics are designed and frequencies determined to ensure that information needed to manage risk to within organizational risk tolerances is available. Tools, technologies, and manual and/or automated methodologies are implemented within the context of an architecture designed to deliver the required information in the appropriate context and at the right frequencies.

Determine Metrics. Organizations determine metrics to be used to evaluate and control ongoing risk to the organization. Metrics, which include all the security-
related information from assessments and monitoring produced by automated tools and manual procedures, are organized into meaningful information to support decision making and reporting requirements. Metrics should be derived from specific objectives that will maintain or improve security posture. Metrics are developed for system-level data to make it meaningful in the context of mission/Business Or Organizational Risk Management.

Establish Monitoring and Assessment Frequencies. Determining frequencies for security status monitoring and for security control assessments are critical functions of the organization’s ISCM program. For some organizations, dashboards and ongoing assessments are a shift away from the model of complete security control assessments conducted at a distinct point in time. For this shift to be constructive and effective from security, assurance, and resource use perspectives, organizations determine the frequencies with which each security control or control element is assessed for effectiveness and the frequencies with which each metric is monitored.

Considerations in Determining Assessment and Monitoring Frequencies. Organizations take the following criteria into consideration when establishing monitoring frequencies for metrics or assessment frequencies for security controls:

- Security control volatility. Volatile security controls are assessed more frequently, whether the objective is establishing security control effectiveness or supporting calculation of a metric.
- System categorizations/impact levels. In general, security controls implemented on systems that are categorized as high-impact are monitored more frequently than controls implemented on moderate-impact systems, which are in turn monitored more frequently than controls implemented on low-impact systems.
- Security controls or specific assessment objects providing critical functions.
- Security controls with identified weaknesses.
- Organizational risk tolerance.
- Threat information.
- Vulnerability information.
- Risk assessment results.
- Output of monitoring strategy reviews.
- Reporting requirements.

Event-Driven Assessments. Events may occur that trigger the immediate need to assess security controls or verify security status outside of requirements expressed in the ISCM strategy. This may require an assessment that is unplanned, but of the type defined in the ISCM strategy or a customized assessment tailored to address an emerging need (e.g., a change in planned assessment or monitoring frequency). When defining criteria for event-driven assessments, organizations consider events such as incidents, new threat information, significant changes to systems and
operating environments, new or additional mission responsibilities, and results of a security impact analysis or assessment of risk.

**Develop ISCM Architecture**

The core requirements of an architecture implemented to support ISCM are data collection, data storage, data analysis capabilities, and retrieval and presentation (reporting) capabilities. Methodologies are standardized to facilitate efficiencies, intra- and inter-tier information exchange, correlation, and other analysis.

Organizations use automated tools, technologies, and methodologies where appropriate to allow for increased efficiencies and insight including those gained through collection, analysis and dissemination of large volumes of data from diverse sources. The architecture and associated policies and procedures are designed to minimize data calls and maximize data reuse.

**Implement an ISCM Program**

Security-related information (data) is collected as required for predefined metrics, security control assessments are conducted, and the security-related information generated is reported in accordance with organizational policies and procedures. Every control is monitored for effectiveness, and every control is subject to use in monitoring security status. Data sources include people, processes, technologies, the computing environment, as well as any existing relevant security control assessment reports.

Collection, analysis, and reporting of data are automated where possible. Whether manual or automated, the data collected is assembled for analysis and reported to the organizational officials charged with correlating and analyzing it in ways that are relevant for risk management activities. As indicated in the examples above, this may mean taking data from a variety of sources, collected at various points in time, and combining it in ways that are meaningful for the official receiving it at the time that it is requested. Part of the implementation stage of the continuous monitoring process is effectively organizing and delivering ISCM data to stakeholders in accordance with decision-making requirements. Tools and methodologies are chosen for the organization-wide ISCM architecture, in order to help ensure that risk-based decisions are informed by accurate, current security-related information.

Discrete security processes inform and are informed by ISCM data. Organizations also use ISCM data to inform processes that are not primarily used to control information security risk. Similarly, data from those processes can also be used to inform the ISCM program.

**Analyze Data and Report Findings.** Organizations develop procedures for analyzing and reporting assessment and monitoring results. This includes the specific staff/roles to receive ISCM reports, the content and format of the reports, the frequency of reports, and any tools to be used. Also included are requirements for analyzing and reporting results of controls that are not easily automated. It may be necessary to collect additional data to supplement or clarify security-related
information under analysis or provided in initial reports. System- and mission/business-level staff receives and provides reports as required by organizational and mission/business-level policies and procedures.

**Respond to Findings.** Security-related information obtained from monitoring is analyzed and met with appropriate responses. Response to findings at all tiers may include risk mitigation, risk acceptance, risk avoidance/rejection, or risk sharing/transfer, in accordance with organizational risk tolerance.

Response strategies may be implemented over a period of time. As weaknesses are found, response actions are evaluated and any mitigation actions are conducted. Other key system documents are updated accordingly. Security controls that are modified, enhanced, or added as part of the response step of the continuous monitoring process are assessed to ensure that the new or revised controls are effective in their implementations. Going forward, new or revised controls are included in the overall continuous monitoring strategy.

**Review and Update the Monitoring Program and Strategy.** ISCM strategies and programs are not static. Security control assessments, security status metrics, and monitoring and assessment frequencies change in accordance with the needs of the organization. The continuous monitoring strategy is reviewed to ensure that it sufficiently supports the organization in operating within acceptable risk tolerance levels, metrics remain relevant, and data is current and complete. The strategy review also identifies ways to improve organizational insight into security posture, effectively supports informed risk management decision making/ongoing authorizations, and improves the organization’s ability to respond to known and emerging threats.

The organization establishes a procedure for reviewing and modifying all aspects of the ISCM strategy, including relevance of the overall strategy, accuracy in reflecting organizational risk tolerance, accuracy/correctness of measurements, and applicability of metrics, reporting requirements, and monitoring and assessment frequencies. If any of the data collected is not required for reporting purposes or found to be not useful in maintaining or improving the organization’s security posture, then the organization considers saving resources by discontinuing that particular collection.

Examine consolidated information to determine if there are common weaknesses/deficiencies among the organization’s information systems and propose or request solutions. Status reports and metrics are analyzed to determine if there are any security trends that suggest changes to the monitoring strategy may be necessary.
§790 Knowledge Check

AIS editors

The Q&As at §790.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 700 has been understood. *Note: For the answer key for §790.1, see §790.3, which appears on a separate page (page 790:5) for testing purposes.*

Discussion topics at §790.2 are designed to engender dialogue among staff on general issues of importance in the field.

§790.1 Q&As

1. According to §705, perhaps the single most important information resource for a sponsored programs office is
   (a) Authentication software
   (b) A database
   (c) An encryption algorithm
   (d) A data integration server

2. What is a failover system?
   (a) A server system that has repeatedly failed to function as promised.
   (b) A paper-based system that duplicates the functionality of an existing electronic system.
   (c) A server system that automatically and immediately takes over if the primary server fails.
   (d) A server system that by definition is not state of the art.

3. Most data leaks are
   (a) The result of a technical attack against your computer system by random hackers outside your community
   (b) The result of hardware failures
   (c) The result of software failures
   (d) Perpetrated by disgruntled insiders (employees) or through trickery

4. Which of the following would you contact to purchase a “certificate,” typically a bit of software that establishes and assures the “identity” of a computer?
   (a) Google
   (b) Yahoo
5. What is a shadow system?
(a) A system used to either replicate some functionality of an institution’s central system or some functionality that such system is not providing that the user thinks is necessary
(b) An individual who provides the necessary backup protocol for the system
(c) A system that allows remote access to the central server
(d) A fully integrated system used to provide services that is in testing phase

6. What is authentication?
(a) The process of establishing that an electronic payment has been processed
(b) The process of verifying that a requested report has been processed
(c) The process of establishing that a given user is who he or she says he or she is
(d) The process of establishing an integrative reporting system

7. Using an application service provider (ASP) can offer certain advantages to a small institution including all of the following EXCEPT:
(a) As the research portfolio grows, it can do so without overtaxing existing information systems infrastructure.
(b) It will provide access to (presumably) more sophisticated analytical tools.
(c) No specialized IT staff will need to be hired.
(d) Tracking metrics is more easily down by an outside vendor.

8. Security of an information system typically encompasses all of the following EXCEPT:
(a) Shadow security
(b) Network security
(c) Data security
(d) User security
1790.2 *Discussion Topics*

1. There is always a build or buy consideration that must be factored into any decision about information systems. What are some of the factors that should go into this decision making?

2. There is no standard recipe for implementing an information system for use in sponsored research administration. Do you agree or disagree with this statement and why?

3. It is up to an institution to determine what level of cost and access control is acceptable. This implies that there could be a trade-off between control and cost. Do you agree or disagree and why?

4. How effectively does your information system(s) interact with or integrate with other systems at your institution, such as electronic research administration, contracting, payroll, human resources, etc.? What role can you play in ensuring a helpful integration, as appropriate?

5. Are the reports you provide principal investigators and administrators adequate? How do you determine this? Is there any opportunity provided for PIs and others to request a customized report, or is access to data provided so that PIs and others can customize their own reports? Why or why not?

6. What is your electronic records retention policy? Does the policy provide adequate protection/compliance for sponsored research-related records? Does the policy have separate criteria for different types of emails and documents and emails/documents generated by different types of personnel? How does the policy dovetail with your paper records retention policy?
¶790.3 **Answer Key**

Following are the correct answers to the questions included at ¶790.1.

1. (b) A database

2. (c) A server system that automatically and immediately takes over if the primary server fails.

3. (d) Perpetrated by disgruntled insiders (employees) or through trickery

4. (d) Verisign

5. (a) A system used to either replicate some functionality of an institution’s central system or some functionality that such system is not providing that the user thinks is necessary

6. (c) The process of establishing that a given user is who he or she says he or she is

7. (d) Tracking metrics is more easily down by an outside vendor.

8. (a) Shadow security

Introduction

This chapter discusses requirements and strategies for effective implementation of electronic research administration, with specific emphasis on the important Grants.gov initiative. Electronic research administration — and its companion, information technology — have become essential tools for today’s research administrators. (For a discussion of information technology, see Chapter 700.)

Stephen Dowdy of the Massachusetts Institute of Technology and Lori Schultz of the University of Arizona clearly focus this chapter on Electronic Research Administration, a process that Dowdy described as “seeking to streamline research administration by using computer technology and the power of the Internet.” This topic is so vast that one could easily devote entire books to it. Dowdy and Schultz have chosen to deal primarily with the ERA systems that are used by the major federal research sponsors.

The chapter provides an extremely thorough description of Grants.gov and how it is intended to work. The authors paint a picture of the future sponsored research enterprise operating in a totally electronic environment. While we aren’t there yet, there’s no doubt that this is where we are going. There is no turning back. Whether we love it or not, they provided us with a solid understanding of what lies ahead.

Chapter 900 will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶905, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶920), practical tools (at ¶930), case studies (¶940), and statistics and survey results (at ¶960). A “knowledge check” containing Q&As and discussion topics is included at ¶990.
Electronic Research Administration (ERA) is the process of performing research administration electronically. It encompasses everything from creating a spreadsheet template to printing a funding agency’s form to implementing complex database management systems to handle the entire research administration life cycle.

In the past, ERA meant building a home page for a sponsored research office, using the Web to locate a funding opportunity, incorporating e-mail lists in the daily work of the sponsored research office, making publications available electronically, and/or creating faculty profile databases. Over the past decade with the rise of the Internet, ERA has dramatically changed the job of the research administrator. Today the office of sponsored programs (OSP) has embarked on a new culture of research administration. Universities are using ERA to simplify and make more efficient, award acquisition and administration for all offices within the institution. Funding agencies are using ERA to improve the efficiency of their operations. By automating the complex processes associated with research administration, all parties seek to streamline research administration by using computing technology and the power of the Internet.

Since ERA can encompass everything from Excel files to complex database management systems, this chapter will focus primarily on the standard processes and systems being used and implemented by the federal government. Attempting to catalogue and describe every ERA system in use by an OSP would be impossible at this point given the number of systems spread across the landscape of ERA. One thing is certain, however: ERA is here to stay and is now ready to mature and will be woven into the fabric of the entire research enterprise. The ultimate goal of ERA is that all parties will be able to conduct all aspects of the life cycle of a grant electronically.

Why ERA?

ERA has been around for many years. Early systems developed by universities and federal agencies have long been replaced by more robust state-of-the-art technologies. Many agencies and universities continue to rely on legacy systems to conduct their day-to-day operations, while others have implemented enterprise-level ERA systems that encompass the grant lifecycle. While end-users often are reluctant to give up their current legacy system, in the fast-moving information technology (IT) industry, a system is considered stable and “old” as soon as it is properly implemented. Legacy systems will eventually be upgraded, replaced, or archived. Today, almost uniformly, both parties — the sponsors and the research community — are
working to adopt new processes, systems, and rapid technology changes to handle
the evolving nature of ERA.

**Institutional Readiness**

Institutional readiness is as diverse as the student populations enrolled at an in-
stitution. Some institutions have well-established post-award systems but lack
pre-award capabilities or vice versa. Some institutions have systems that handle
pre-award, post-award, and compliance, but those systems may not be integrated.
Others have embarked on major enterprise implementations in an attempt to inte-
grate functions from pre-award proposal development and submission to compli-
ance (Conflict of Interest, Human Subjects (IRB), Animal Care (IACUC) to contract
negotiation to award setup/maintenance, and finally, to closeout.

**‘Legacy’ Systems**

Generally speaking, yesterday’s legacy systems were often stovepipe applications.
That is, the pre-award system met the needs of the pre-award office but had little or
no interaction with the financial system. The financial system had little to no inter-
action with the human subjects system or the intellectual property system. In effect,
each ERA process was a stand-alone application, developed over time, to satisfy a
particular business process or transaction.

With yesterday’s technologies, this was often unavoidable since often these ERA
systems were simply data storage to capture information created in a paper-based
process. As the paper transactions moved from office to office, person to person, the
relevant data was re-keyed into these stovepipe applications leaving some data to
only exist on the paper form. Simply put, if the data on the form was of little use or
value to an office/person, it was not captured since data storage costs were often a
deciding factor on the amount of data to capture. Disk space used to be expensive,
but this created future costs in storing redundant data, reconciling inconsistencies
between disparate systems, and not having consistent data for decision support.

The goal of our systems today is to fully integrate all of these disparate systems
and to collect data once, at its inception, without the need of redundant data en-
try. Today, the cost of equipment and disk storage is not generally an obstacle. The
major obstacle is the price of the software (whether purchasing a vendor solution or
developing a solution internally), but even more so, the implementation costs.

**ERA Planning**

Today most institutions are at varying stages in planning for the continuing evo-
lution of ERA. Some are (or soon will be) issuing requests for proposals (RFP) for
vendor solutions or support. Some have decided to build their own systems or team
up as part of a consortium of like-minded institutions. Others have decided to wait
until the seas calm and allow others to navigate the ERA ocean. For small schools,
ERA can be challenging given resource constraints and institutional priorities.

In almost every case, the urgency of establishing a state-of-the-art ERA system
continues to be driven by Grants.gov application submission. (see discussion on
Some schools continue to use the free, Grants.gov-provided Adobe form solution, while others larger schools are investing in a system-to-system (S2S) capability. Vendors of all sizes offer fully integrated ERA systems or options that make system-to-system an achievable goal. As of this writing, Grant.gov has begun work on a web-based submission system that will provide a third alternative to apply (S2S, Adobe, web-based.)

**Self-Assessments**

All institutions are well advised to undertake self-assessments of capabilities, gaps, and possible ways to address the wide range of issues that comprise the electronic research endeavor. They must address the cost of change, including hardware, software, and personnel. Also, schools need to define a vision, recognizing what they can/must do internally and what they might be able to adapt from others.

Whatever systems are developed or purchased, institutions need to understand their individual research process and make an institution-wide commitment to ERA. Most importantly, institutions should focus on the business of research administration, and then develop technology to meet the business needs.

For years, schools have had elaborate systems for dealing with student information, human resources, payroll, accounts payable, purchasing, and general ledger activities. Only now are many of these institutions able to invest in the technologies to incorporate their ERA systems into the overall architecture of their other systems of record. Many schools, in conjunction with the budget and planning offices, are attempting to provide “leading indicators” to assist in budget forecasting. ERA systems bring a wealth of information to senior institutional officials. “Business Intelligence” is now emerging as a critical tool once the ERA have been implemented and data can be correlated to bring some meaning to the vast amount of data being captured in robust, mature ERA systems.

**Data Integration**

Having reliable, accurate, aggregate data from submitted proposals in an attempt to develop models that may assist in developing trending and predictions about future awards is just one example of the inter-linkage of the ERA data being collected internally at institutions. Some institutions are attempting to merge their human resource and payroll data with their ERA activities. All of these activities will help move ERA into the forefront of the institutions’ acceptable business processes. (For additional coverage of information systems, see Chapter 700.)

The federal ERA initiative is the driving force behind many of the major projects currently underway at institutions and is the reason that many universities have started to address ERA in a much more focused approach than previously undertaken. Some of the ERA transactions currently being handled via computer technology are included as Figure 905.1-1.

**The Reality of ERA**

Universities have found that adopting ERA solutions helps to obtain research funding, maintain its research endeavor, and use staff resources effectively. The goals of
ERA include requirements such as the following:

- Implement highly reliable, secure systems that provide a complete set of tools that help ensure data quality and integrity across the entire grant process
- Implement user friendly systems that guide users through the process, using error checking and validations that smooth transactions, including proposal submission
- Provide a state-of-the-art architecture that allows the systems to be responsive to the ever-changing business processes, policies, and technologies
- Include sufficient training for all personnel required to use ERA systems and reach out to the stakeholder communities to ensure they are informed, trained, and having their needs met
- Capitalize on existing systems to save costs

Figure 905.1-1. Types of ERA Transactions

Types of transactions currently being handled electronically are listed below. Some of these transactions are being conducted at the federal level, while others are being conducted at universities, although institutional implementation of ERA varies.

**Pre-Award**

- Identification of funding opportunities
- Proposal development
- Institutional and faculty profiles
- Electronic approval and routing
- Budget development
- Cost sharing information
- Subrecipient tracking

**Protocol Management**

- Regulatory protocol development and approvals including IRB, IACUC, IBC, and radiation safety
- Electronic submission of protocols
- Electronic notification of protocol status
- Animal facilities management and purchasing

**Clinical Trials Management**

- Budget preparation
- Integration and use of approved university costs/charges
- Patient/procedure scheduling
- Sponsor billing
- Financial analysis

**Conflict of Interest Management**

- Prepare, submit and maintain COI disclosures
- Track significant financial interests

**Submission of Proposals to Sponsors**

- Electronic submissions and tracking of proposals to sponsors who support electronic submissions

**Electronic Notification of Award Notices**

- Automatic notification
- Automated project setup

**Post-Award Management**

- Project financial management
- Sponsor invoicing
- Project closeout and reporting

**Reporting**

- Timely and accurate reporting at all phases of the project life cycle
- Ability to link sponsored project data with other university systems of record
◆ Provide a good return on investment.

Each year the government invests billions of dollars in grant awards to tens of thousands of investigators worldwide. In Grants.gov alone, applicants submit approximately 250,000 grant applications each year. FastLane handles approximately 40,000 NSF proposals per year. The NIH sees over 27,000 R01 applications per year, 40% of which are submitted via S2S.

Federal agencies must support thousands of peer-review meetings and disseminate these applications to reviewers prior to review sessions. This massive enterprise generates hundreds of millions of pieces of paper each year. The costs of managing, duplicating, processing, storing, and entering data, and reconciling all of the information generated during the course of a grant are enormous. Technology holds the hope of significantly reducing the costs for all parties involved in the research enterprise.

1905.2 Agency-Specific Grants Management Systems

There are a variety of agency-specific ERA systems utilized within the federal government and some private funding agencies.

NSF’s FastLane and Research.gov

The National Science Foundation (NSF) system, FastLane, is the first of all federal ERA systems. Of the federal systems, FastLane is the most mature system and encompassed all of NSF’s business transactions, until the rollout of Research.gov. Research.gov will become the replacement for FastLane, and, as of this writing, is integrating with FastLane as the NSF begins to provide the next generation of grants management capabilities. The following services are available in FastLane/Research.gov and will transition to a common NSF look and feel over time:

◆ Proposal Submission and Status
◆ Financial Services
◆ Project Reporting
◆ Notifications and Requests
◆ User Management

While NSF proposals via Grants.gov, many institutions and investigators still choose to use FastLane instead. FastLane is such a mature system that Grants.gov cannot handle all of NSF’s proposal submission scenarios. A prime example is collaborative proposals. While Grants.gov is able to accept subaward budgets, Grants.gov has no mechanism, at this time, to link collaborative proposals together.

NIH eRA Commons and ASSIST

The National Institute of Health (NIH) has two systems that handle eRA transactions: the eRA Commons and ASSIST:

◆ The eRA Commons is not an application submission system but accepts proposals via Grants.gov. The eRA Commons also includes the ability to submit progress reports, financial reports, manage trainees, submit “just-in-time”
information, and status checking.
◆ ASSIST (Application Submission System & Interface for Submission Tracking is the NIH’s new system for the preparation, submission, and status tracking of grant applications through Grants.gov. ASSIST is a web-based system that allows multi-users to work on a single application, provides validation of NIH and Grants.gov business rules, and offers submission status tracking for both Grants.gov and eRA Commons. As of this writing, ASSIST is available for multi-project grant applications and is an option for some single project competing grant applications.

NASA NSPIRES
NSPIRES is the NASA Solicitation and Proposal Integrated Review and Evaluation System. This system includes NASA solicitations announcements and Notice of Intent (NOI) and proposal submissions in a web-based environment. Proposals are submitted either through NSPIRES or via Grants.gov

Other Systems
The Department of Energy has a number of systems for application submission and award management:
◆ Portfolio Analysis and Management System (PAMS): used to apply for and track proposals to the DOE Office of Science
◆ ARPA-E eXchange: required for proposals to ARPA-E
◆ EERE eXchange: required for concept papers and applications to EERE
◆ FedConnect: used to accept/administer awards for the DOE and the Department of Interior (among others)

The Department of Education (ED) G5 system allows for proposal file upload and submission, but ED proposals may also be submitted via Grants.gov. The agency also allows for submission of progress reports and some post-award notifications. Other federal agencies have some capabilities in certain business transactions. However, with the introduction of Grants.gov, many have put their efforts in working with Grants.gov to be able to accept proposals via Grants.gov.

Non-federal agencies and non-profit sponsors have also implemented proposal and grant management systems, including (but not limited to):
◆ The American Heart Association
◆ Juvenile Diabetes Research Foundation
◆ March of Dimes
◆ ProposalCENTRAL: includes functionality for the American Cancer Society, Cystic Fibrosis Foundation, the Alzheimer’s Association, and more.
◆ FLUXX: includes the Leukemia and Lymphoma Society, Knight Foundation, the Kresge Foundation, and others.

It is also likely that your state has some systems for procurement and respond-
ing to bids for state agencies. Keeping track of eRA systems, rules, and changes has become a full-time occupation for many research administrators.

1905.3 Background of the Federal ERA Initiative

The federal ERA initiative was born as a result of pressure within the federal government to downsize and streamline operations. While many agencies had already invested in ERA activities, the university community was concerned about the number of disparate federal ERA systems. There were proposal preparation systems at NSF, NASA, DOE, and ED, among others. University investigators and administrators had to learn a plethora of systems that seemed to emerge daily and change often. Many had to hire dedicated staff just to learn the variety of systems in order to train and to assist faculty and other university employees that had to interact with these systems.

The agencies were attempting to solve their internal needs without fully understanding the extreme burden these systems were placing on their external community. Initial attempts at getting all 26 grant-making agencies to agree upon a single solution failed. These initial attempts were the result of university and federal colleagues attempting to solve the problem with no driving force pushing the agencies to participate.

P.L. 106-107

In 1999 Congress passed the Federal Financial Assistance Management Improvement Act of 1999, Public Law (P.L.) 106-107, which was a key driving force behind ERA at the federal level. The purposes of P.L. 106-107 are to

1. improve the effectiveness and performance of federal financial assistance programs,
2. simplify federal financial assistance application and reporting requirements,
3. improve the delivery of services to the public, and
4. facilitate greater coordination among those responsible for delivering the services.

In 2001, 26 Federal agencies presented a plan to Congress to address application submission and reporting. The original scope of P.L. 106-107 was find, apply and report. The find and apply piece of the plan became what is now Grants.gov. The report piece include in the original legislation was not accomplished before the sunset of P.L. 106-107 in 2007.

P.L. 106-107 was not reauthorized by Congress when it sunsetsed in 2007. As shown above, the number of agency systems handling common features such as proposal submission has only grown since then. This remains an ongoing concern for eRA and institutions attempting to streamline solutions.

Some Legislation that impacts ERA:

◆ Privacy Act of 1974 (P.L. 93-579) and Amendments — establishes the foundation of federal policy for protecting and sharing personal information
◆ Government Performance Results Act of 1993 (P.L. 103-62) — strives to improve federal program effectiveness by focusing on measurable results and service quality
◆ Information Technology Management Reform Act (Clinger-Cohen Act) of 1996 (P.L. 104-106) — calls for sound investment through capital planning that is tied to agency missions and strategic goals

◆ Section 508 of the Rehabilitation Act of 1998 (P.L. 105-220) — ensures accessibility for all users

◆ E-Government Act of 2002 (P.L. 107-347) — furthers the President’s Management Agenda that promotes electronic government services

◆ Federal Information Security Management Act of 2002 (Title III of P.L. 107-347) — mandates attention to security in all agency applications and accountability to OMB and Congress

◆ Government Paperwork Elimination Act (GPEA) (Title XVII of P.L. 105-277) requires that Federal agencies use electronic forms, filing, and signatures to conduct official business with the public.

◆ Federal Funding Accountability and Transparency Act of 2006 (P.L. 109-282) — requires full public disclosure of all entities/organization that receive federal funds

◆ Digital Accountability and Transparency Act of 2014 (P.L. 113-101) — requires common standards for financial data provided by federal agencies and expands what is reported on USASpending.gov.

Looking to the Future

The qualities and attributes of a good ERA system from the investigator’s perspective are often quite different from the central administration, vendors, Grants.gov, and other agency-specific systems. Federal ERA systems primarily are designed to promote and protect the interests of federal agencies, not grantees, while grantee ERA systems primarily are designed to promote and protect the interests of grantees (institutions and individual investigators), not federal agencies.

However, in all these systems, the ultimate solution must keep in mind the goal of the principal investigator, which is to do research and not become a data entry operator and spend too much time on “administrivia.” At times an institution may need to shift the burden to the federal government or to the central offices at the university if doing so will allow faculty to spend more time doing science and mentoring students. The goal of any ERA system should be to manage the sponsored programs life cycle more efficiently for the investigator.

Collaborative Effort

The development and/or implementation of any federal ERA system should be a collaborative endeavor of all parties involved. Partners should include the scientists and administrators of the institution as well as the vendors that provide ERA software and services to assist investigators with application submission and other grant-related transactions. The goal of these working partners is to help develop a creative and innovative environment that strives to improve all aspects of the ERA enterprise. Successful organizations will see beyond existing procedures and consid-
er entirely new approaches that may bear little resemblance to the current business model or systems in place.

Federal agencies and universities alike seek to use ERA to lower costs and administrative effort, expedite grants processing, and provide better quality information to their respective constituents. Today ERA is a collaborative endeavor between the federal government and the communities it serves, which has the potential to benefit all parties involved resulting from the ERA-enabled secure, interactive business processes.

¶905.4 Grants.gov

Grants.gov — an initiative that has had unparalleled impact on the grants community — is one of the 24 federal cross-agency “e-government” projects focused on improving access to services via the Internet. Grants.gov is the single access point for over 900 grant programs offered by the 26 federal grant-making agencies and allows organizations to electronically find and apply for competitive grant opportunities from all federal grant-making agencies. The Department of Health and Human Services (HHS) is the managing partner for the initiative.

Grants.gov FIND Function

All discretionary grants offered by the 26 federal grant-making agencies can be found on Grants.gov. The FIND functionality carries a program synopsis with relevant links to an individual agency’s full program announcement, version history to track changes to the announcement, and information on how to APPLY.

For more on the Grants.gov FIND Function, visit: www.grants.gov. Click on “Find Grant Opportunities.”

Grants.gov APPLY Function

The APPLY function is the actual application for federal financial assistance (the proposal). Grants.gov allows organizations (and individuals in the case of some fellowships) to electronically apply for competitive grant opportunities from all federal grant-making agencies. Grants.gov is the single access point for over 1,000 grant programs offered by the 26 federal grant-making agencies.

Applying for assistance awards involves “core” and “noncore” application data elements. “Core” elements include those defined by the SF 424 R&R form set, a government-wide standard form for grant applications, a piece of data required by two or more agencies, and the institutional Dun and Bradstreet number, which has emerged as the universal identifier recognized by OMB. (Once registered with Dun and Bradstreet, an institution receives a unique nine-character identification number, a Data Universal Number System (DUNS) number.)

All other data elements would be “noncore.” These include agency-specific, program-specific, and solicitation-specific data elements. Grants.gov, supported by OMB, has requested that agencies look at the core data elements and identify those that are agency specific. The process of identifying agency-specific data elements involves comparing agency-specific forms with the core form, identifying and consolidating agency-specific application packages, and filling out tables in common
formats for agency-specific-data to be implemented in the Grants.gov storefront.

For more on the Grants.gov APPLY Function, visit www.grants.gov. Click on “Apply for Grant.”

Application Submission

There are essentially two options for universities to submit applications to Grants.gov:

1. Submit proposals directly to Grants.gov using an electronic system that is capable of a “system-to-system” (S2S) exchange.

2. Submit proposals using electronic Adobe forms.

The Grants.gov S2S project is very important. The goal is to develop a standards-based interface using industry-leading practices that can be adaptive to changes driven by legislation and agency-specific requirements. Because each agency may require unique forms for its opportunities, and Grants.gov must comply, the challenge is to manage the burden on the applicant’s systems that result from these changes. Both vendor and homegrown systems can electronically transmit data directly from one’s institutional computer system to the Grants.gov system. Many vendors, institutions, and consortia of institutions have worked to create or modify their systems to be able to interact directly with Grants.gov.

The second option, using Adobe forms, allows applicants to download the application package to their local desktops and complete the application offline before submitting the completed package to Grants.gov.

As of this writing, the Grants.gov team is working on defining a web-based system for completing and submitting application packages. This new system will allow collaboration by multiple users and the re-use of data elements from previous submissions.

(For more on using the S2S interface and Adobe forms, see Figure 905.4-1.)

After completing the Adobe forms, the user must forward the completed forms to an Authorized Organization Representative (AOR) at the institution. (This safeguards an institution from individuals who may attempt to submit grant application packages without permission.) These form packages can often exceed the limitations on the size of e-mail attachments allowed by the institution’s mail servers. In that case, the Adobe forms will need to be copied to a Web server, stored on a thumb drive, or burned to a CD to forward the completed application package to the central office. Once the AOR approves the application, he or she will use the user ID and password obtained during the Grants.gov registration process to upload the proposal to the Grants.gov Web site.

System-to-System (S2S) Exchange

Grants.gov has defined a system-to-system (S2S) interface with universities and vendors to submit proposals to Grants.gov without the use of the Adobe application packages. Institutions have long voiced their desire to have an S2S capability for transmitting proposals to Grants.gov. The application error rate for S2S submissions is quite low compared to submissions with Adobe forms.

Equally important is the concept of “key once, at its inception, use many.” Or-
organizations want to capture the data within their own ERA systems without having to re-key that data into Adobe forms. In the current version of the Adobe forms, the data submitted in one application cannot be transferred to another Adobe form and used again; all data must be re-keyed into each Adobe submission.

Because Grants.gov technical staff resources are limited and the demand for access by institutions and other interested parties is unknown but potentially significant, it was imperative for Grants.gov to identify a solution that potential users could implement with a minimum level of technical support from Grants.gov. Therefore Grants.gov has created a Reference Implementation (RI) that allows an organization to conduct the entire S2S process at its home institution.

The RI provided by Grants.gov is basically a toolkit. This toolkit provides both the client side and server side of the exchange. That is, once an organization has successfully installed the RI, it not only can see what is happening on its end of the process, but it can also see the process from the Grants.gov side since both pieces of the puzzle are installed locally. This greatly enhances the understanding of the entire process and gives the organization the ability to have a meaningful dialog with the Grants.gov staff when issues surface.

Grants.gov uses Web services to conduct the S2S exchange process. From the applicant’s point of view, the following Web services are currently implemented:

---

**Figure 905.4-1. The Grants.gov Process**

The first step in submitting an application to Grants.gov is to locate the opportunity using the FIND function. There are three pieces of data that uniquely identify an opportunity:

1. **Catalog of Federal Domestic Assistance (CFDA) number**
2. **Funding Opportunity Number**
3. **Funding Opportunity Competition ID**

One will need these pieces of information to apply for a grant. Generally, one can use the CFDA number and/or the Funding Opportunity Number and Grants.gov will display a list of all opportunities that match the criteria. The Funding Opportunity Competition ID is not used by all agencies.

Once a grant opportunity has been located, select “Application Package” tab at the top of the page to download the Adobe application package and instructions. For those institutions implementing the S2S interface (see below), the institutional system will need to store the three pieces of information listed above in order to initiate the Web service call to Grants.gov for subsequent transmission of the proposal from an internal system.

Adobe

In order to view application packages and instructions, one will also need to download and install the free Adobe Reader software which is available at the Grants.gov Web site.
Regardless of the transmission vehicle, OSPs should urge all persons responsible for the preparation of proposals to get fully trained on the use of one of the new proposal preparation tools (either the university’s internal system with S2S capabilities or the use of the forms package provided by Grants.gov). Adequate training will ensure that when a required Grants.gov submission is encountered, everyone is fully prepared.

Streamlined System

One important outcome from P.L. 106-107 and Grants.gov is that the federal agencies are beginning to realize that the university community deals with many federal
agencies and everyone agrees that having multiple, disparate systems and processes is costly to both universities and the government. In addition everyone is beginning to accept the folly of having universities learning how to use multiple and divergent federal agency systems that have been developed and paid for at public expense. Moreover this explosion of federal systems prevents effective development of third-party solutions since no system-to-system interface is clearly defined. Now, everyone is talking standardization, and that is an encouraging sign.

**Authorized Officials**

An institution must be registered with Dun & Bradstreet (D&B) in order to apply to Grants.gov. D&B provides the institution a unique nine-character identification number, a Data Universal Number System (DUNS) number (see www.dnb.com/us). Most universities already have a DUNS number; in fact, many universities have multiple DUNS numbers. Each organization must decide upon one DUNS number that will be used for all applications to Grants.gov, because each user’s authorization to submit to Grants.gov is linked to the DUNS number.

**SAM.gov**

After obtaining a DUNS number, the institution must register with the System for Award Management (see www.sam.gov). This is a one-time process. When registering with SAM, the institution will be required to designate an “E-Business Point of Contact” (POC). This individual will become the sole authority at the institution with the capability of designating, or revoking, an individual’s ability to submit grant applications on behalf of an institution through Grants.gov.

SAM.gov consolidated the functionality in CCR, ORCA, and EPLS. SAM validates applicant information and electronically shares the secure and encrypted data with federal agencies’ finance offices to facilitate paperless payments through electronic funds transfer (EFT). SAM houses organizational information, including representations and certifications and allows Grants.gov to use that information to verify an institution’s identity.

**Institutional Representatives**

Prior to submitting grant application packages, representatives of the institution need to register to submit on behalf of the institution. The institution’s POC, identified during SAM registration, must authorize someone to become an Authorized Organization Representative (AOR). This safeguards an institution from individuals who may attempt to submit grant application packages without permission.

When an AOR registers with Grants.gov, the institution’s POC will receive an email notification. The POC must then log into Grants.gov (using the DUNS number user ID and the “MPIN” password provided by SAM) and approve the AOR, thereby giving someone permission to submit applications. When an e-business POC approves an AOR, Grants.gov will send the AOR a confirmation e-mail.

For institutions planning on or currently implementing an S2S solution, the institution will need to register its server’s digital certificate with Grants.gov. For S2S solutions, the server “signs” the application on the institution’s behalf.
gov assumes that only authorized institutional officials can “push the button” that causes the server to initiate the exchange with the Grants.gov server.

905.5 E-Authentication

OMB issued guidance to the federal agencies to implement the Government Paperwork Elimination Act (GPEA). GPEA requires federal agencies to allow individuals or entities the option to transact business with the government electronically and to maintain those records electronically as well. According to GPEA, the agencies had until October 21, 2003, to comply with the act. OMB asserted that in enacting GPEA, Congress addressed the legal effect and validity of electronic signatures or other electronic authentication:

GPEA, Section 1707

Electronic records submitted or maintained in accordance with procedures developed under this title, or electronic signatures or other forms of electronic authentication used in accordance with such procedures, must not be denied legal effect, validity, or enforceability because such records are in electronic form.

Public trust in the security of information exchanged over the Internet plays a vital role in the government’s transition to computer-based exchanges. The “e-authentication” initiative is another one of the government’s priorities. E-authentication makes that trust possible.

Standards for ‘Identity-Proofing’

E-authentication sets the standards for the identity proofing of individuals and businesses, based on the risk of a particular business transaction. The initiative focuses on meeting the authentication requirements of the e-government initiatives by building the necessary infrastructure to support common, unified processes and systems for governmentwide use. For each business transaction and ERA system, the agencies must conduct a risk assessment. The risk assessment measures the relative severity and the potential harm in the event of an identity authentication error.

Authentication Levels

There are four potential levels of authentication that a federal agency can apply to a particular electronic transaction:

- **Level 1** — Level 1 is used when little or no confidence exists in the asserted identity. For example, Level 1 credentials allow people to bookmark items on a Web page for future reference.

- **Level 2** — On balance, where confidence exists that the asserted identity is accurate, Level 2 is used. Level 2 credentials are appropriate for a wide range of business with the public where agencies require an initial identity assertion (the details of which are verified independently prior to any federal action).

- **Level 3** — Level 3 is appropriate for transactions needing high confidence in the
asserted identity’s accuracy. Users may use Level 3 credentials to access restricted Web services without the need for additional identity assertion controls.

◆ Level 4 — Level 4 is appropriate for transactions needing very high confidence in the asserted identity’s accuracy. Users may present Level 4 credentials to assert identity and gain access to highly restricted Web resources, without the need for further identity assertion controls.

For the APPLY function in Grants.gov, for example, the application for federal assistance has been scored at a Level 2. The DUNS/SAM registration process meets the requirements of a Level 2 assertion. This is good news for the agencies and for the university community since this helps pave the way for the university community to use strong authentication for electronic signatures in lieu of a true digital signature on electronic documents.

**Strong Authentication**

So, what constitutes strong authentication? One of the most important rules is that a user’s password must never travel across an open network as clear text. Clear text means that the data is not encrypted. The Internet is an open network and more than likely, a campus’ network is open. When developing or installing third-party ERA systems, one should ensure that the system will comply with a Level 2 assertion and that the password is protected at all times on the open network.

Software programs are readily available to grab pieces of information off of the network. This is known as packet sniffing. Many companies and universities deploy firewalls to help prevent these types of attacks. The problem with a firewall is that it assumes the “bad guy” is on the outside. Most of the really damaging incidents of computer crime are carried out by insiders. Firewalls also have a significant disadvantage in that they restrict how users can use the Internet. Firewalls may prevent researchers from accessing the ERA system while away from the campus network. For the university environment, this is often unacceptable.

**Cross-Authentication**

Identity management is now perceived as one of the major information technology challenges. The e-authentication project is creating technologies that will allow for access to multiple applications via single sign-on capability. The project aims to build an infrastructure and policy foundation for common authentication services. This service is authorized to issue authentication credentials for use by the FirstGov (Grants.gov is a partner) and other participating federal government agencies.

The long-range goal is to move to an enterprise identity management solution and federated identity. In effect, a “web of trust” will be created. Some federal agencies (like the NSF with Research.gov) are using InCommon for federated identities, which means that if your institution uses InCommon, you can login to the federal site using your institution’s credentials. Eventually, the hope is that PIs and research administrators will be able to use the same log-in credentials for all agency systems. Gone will be the days of trying to remember multiple user ID/password combinations for the variety of ERA systems with which organizations must interact.
Figure 905.4-3. Electronic Signature Options

The Government Paperwork Elimination Act (GPEA) of 1998, P.L. 105-277, offers the following two options and guidance on electronic signatures.

(1) Non-Cryptographic Methods of Authenticating Identity — Personal Identification Number (PIN) or Password: A user accessing an agency’s electronic application is requested to enter a “shared secret” (called “shared” because it is known both to the user and to the system), such as a password or PIN. When the user of a system enters her name, she also enters a password or PIN. The system checks that password or PIN against data in a database to ensure its correctness and thereby “authenticates” the user. If the authentication process is performed over an open network such as the Internet, it is usually essential that at least the shared secret be encrypted. This task can be accomplished by using a technology called Secure Sockets Layer (SSL), which uses a combination of public key technology and symmetric cryptography to automatically encrypt information as it is sent over the Internet by the user and decrypt it before it is read by the intended recipient. SSL currently is built into almost all popular Web browsers, in such a fashion that its use is transparent to the end user. Assuming the password is protected during transmission, as described above, impersonating the user requires obtaining the user’s password. This may be relatively easy if users do not follow appropriate guidelines for password creation and use. Agencies should establish adequate guidelines for password creation and protection.

(2) Public/Private Key (Asymmetric) Cryptography — Digital Signatures:

(a) To produce a digital signature, a user has his or her computer generate two mathematically linked keys — a private signing key that is kept private, and a public validation key that is available to the public. The private key cannot be deduced from the public key. In practice, the public key is made part of a “digital certificate,” which is a specialized electronic file digitally signed by the issuer of the certificate, binding the identity of the individual to his or her private key in an unalterable fashion. The whole system that implements digital signatures and allows them to be used with specific programs to offer secure communications is called a Public Key Infrastructure, or PKI.

(b) A “digital signature” is created when the owner of a private signing key uses that key to create a unique mark (the signature) on an electronic document or file. The recipient employs the owner’s public key to validate that the signature was generated with the associated private key. This process also verifies that the document was not altered. Since the public and private keys are mathematically linked, the pair is unique: only the public key can validate signatures made using the corresponding private key. If the private key has been properly protected from compromise or loss, the signature is unique to the individual who owns it; that is, the owner cannot repudiate the signature.

In relatively high-risk transactions, there is always a concern that the user will claim someone else made the transaction. With public key technology, this concern can be mitigated. To claim he did not make the transaction, the user would have to feign loss of the private key. By creating and holding the private key on a smart card or an equivalent device, and by using a biometric mechanism (rather than a PIN or password) as the shared secret between the user and the smart card for unlocking the private key to create a signature, this concern can be mitigated. In other words, combining two or three distinct electronic signature technology approaches in a single implementation can enhance the security of the interaction and lower the potential for fraud to almost zero. Furthermore by establishing clear procedures for a particular implementation of digital signature technology — so that all parties know what the obligations, risks, and consequences are — agencies can also strengthen the effectiveness of a digital signature solution.
The reliability of the digital signature is directly proportional to the degree of confidence one has in the link between the owner’s identity and the digital certificate, how well the owner has protected the private key from compromise or loss, and the cryptographic strength of the methodology used to generate the public-private key pair. The cryptographic strength is affected by key length and by the characteristics of the algorithm used to encrypt the information.

**Digital Signature**

Electronic signatures underlie most ERA activities at this time. What is a signature? Simply stated a “digital signature” is a method to package all the bits and bytes in an “encrypted” form for subsequent use by a third party. To encrypt data, the bits and bytes are sent to a mathematical formula, which turns readable text into, what appears as, random characters. Only the intended party is able to unscramble, or decrypt, this information. The mathematic formula uses a “key” to start this process. Often this key is stored by software and is accessed by the user typing his/her password. The digital signature ensures that only the intended receiver can “decode” (“unencrypt”) the data and that the data was not altered in transmission. The term “nonrepudiation” is used often when talking about digital signatures. With a true digital signature, the PI could not argue that the science was altered. The PI would not be able to say, “I didn’t write that” or “That is not the text of the proposal that I sent.” This is very important in the event that falsifications of data or plagiarism charges are filed.

The digital signature proves that the science was encrypted and was not altered during transmission and, most importantly, that the originator of the data was the “signer” of the digital file. While digital signature technology has been around for several years, the technology associated with its use has a large learning curve. Additionally, there are different algorithms used to generate digital signatures and not all are compatible. The GPEA offers two options and guidance on electronic signatures, both of which are discussed in Figure 905.4-3.

¶905.6 Other Data-Sharing Opportunities

**iEdison**

Interagency Edison (iEdison) has been designed, developed, and implemented to enable organizations to directly input their invention data as well as update information in real time on a fully interactive basis. According to the iEdison Web site (www.iedison.gov):

**iEdison Web site**

New provisions to the Code of Federal Regulations (CFR) came with the enactment of the Bayh-Dole Act of 1980. These provisions stipulated the need for all grantees or contractors to report on activities involving the disposition of certain intellectual property rights that result from federally funded research (37 CFR Part 401). With the growing emphasis that is being placed on technology transfer, it is now common for universities and research organizations to have offices devoted to trans-
fer of research results to the commercial sector, in addition to fulfilling government-reporting requirements contained in 37 CFR Part 401.14.

A Web-based front end is provided for data input. For larger organizations with high numbers of inventions to report, iEdison allows organizations to submit information in a plain, ASCII text file. iEdison does not make use of Web services for the exchange of information.

**eSRS (SF-294/SF-295 Reports)**

The Integrated Acquisition Environment (IAE) initiative will create a secure business environment that facilitates and supports cost-effective acquisition of goods and services by federal agencies, while eliminating inefficiencies in the current acquisition environment.

A number of agency partners collaborated to develop the next generation of tools to collect subcontracting accomplishments. This government-wide tool is known as the “eSRS.” This Internet-based tool will streamline the process of reporting on subcontracting plans and provide agencies with access to analytical data on subcontracting performance.

Specifically the eSRS eliminates the need for paper submissions and processing of the SF-294, Individual Subcontracting Report, and SF-295, Summary Subcontracting Report, and replaces paper with an easy-to-use electronic process to collect the data. With the first generation of eSRS, contractors and their business associates will report data through the Web browser of choice, visiting this site and logging on to report accomplishments using an easy data-entry process. Future plans for the full operational capability include the development of a back-office interface for those businesses collecting accomplishments electronically. Like iEdison, plans are being made to allow for system-to-system transmissions from university accounting systems into government-wide eSRS system.

**Items to Watch**

**DATA Act**

The Digital Accountability and Transparency Act was signed into law in May 2014. This act expands FFATA and moves to provide consistent spending data for all federal agencies via USASpending.gov. It requires common standards for financial data, and more data elements, which will impact institutions of higher education. The goals are to produce consistent and comparable data, reduce fraud, waste and abuse, and streamline reporting.

**SciENcv**

The Science Experts Network and Curriculum Vitae (SciENcv) is a researcher profile system built to assist researchers in completing the biosketch information required in federal applications. SciENcv gathers information from a variety of sources to build profile information, including education, employment, expertise, and scholarly works. As of this writing, SciENcv is in a testing phase for both the NIH and
NSF biosketches. Researchers can use the tool to generate this information in the appropriate federal format for the two agencies, and can store multiple biosketches to tailor the information for various applications.

**ORCID**

The Open Researcher and Contributor ID (ORCID) is an effort to provide a persistent identifier for individual researchers. This ID can follow the researcher throughout their career to reduce the name ambiguity problem in scholarly works. ORCID links with SciENcv and many other profile systems to create a link to the researcher’s works.

http://orcid.org

**Conclusion**

What does the future hold for ERA and the research enterprise? Any researcher, their staff, university central administrators, and colleagues at the funding agency will access various research administrative transactions from many different kinds of computing devices. PIs will learn about funding opportunities that seamlessly transfer information to a grant proposal. The proposal then will be electronically submitted to the potential funding agency. Compliance issues will be automatically sent to the appropriate individuals. The funding agencies will receive the proposal, which will be automatically inserted into their management systems and routed to the reviewers. Successful proposals will be sent to the recipient organization where the award data will be automatically inserted into the institution’s award management and financial accounting systems. All reporting and post-award activities will be done electronically. Many of these transactions are just on the horizon.

To be successful in the full range of business transactions required for ERA, OMB, Grants.gov, and the federal agencies must improve interagency and intergovernmental coordination, including consultation with the public and grant recipient representatives.

When implementing a new ERA system intended to interact with Grants.gov, the new system will be overwhelming at first. Given the complexities that arise from a university’s vast portfolio of sponsors, these ERA systems must be able to handle a variety of complex agency-specific requirements. Not every system will be able to handle 100 percent of the proposals that leave a given university. The idea is to use ERA for routine proposals so that the administrators can use the time saved from routine proposals for more complex tasks and services associated with uncommon proposals. Over time, and with proper feedback from the user community, the ERA system should provide substantial benefits to all users involved in the proposal process.

ERA is mainstream at almost every organization. As with any change, acceptance is a long process. Organizations need the buy-in from senior level officials that must make the commitment to move forward with any ERA system. It is not quick. It is not easy. But it is well worth the investment and it is essential, as it will position any organization with the tools needed to interact with the changing landscape of federal funding.
This section includes expanded coverage of topics relating to electronic research administration (ERA). These materials are culled from a variety of authoritative sources.

**The Council on Financial Assistance Reform (COFAR)**

The Council on Financial Assistance Reform (COFAR) was formed by the Office of Management and Budget in 2011, and is an interagency group of Executive Branch officials who have the charge of coordinating financial assistance activities. The COFAR replaces both the Grants Policy Council (GPC) and Grants Executive Board (GEB), which previously managed activities for the Federal Grants Streamlining Initiative. The GPC and GEB were formed in response to P.L. 106-107.

**Uniform Guidance**

The COFAR continues the goals of streamlining and simplifying federal financial assistance processes, improve standardization and transparency, and provide outreach to gather community input on federal financial assistance processes. As part of the effort to increase efficiencies and reduce waste, the OMB published significant reform to the eight circulars that apply to financial assistance: A-21, A-50, A-87, A-89, A-102, A-110, A-122, and A-133. This reform is known as “Uniform Guidance,” and effectively replaces the eight circulars to provide single guidance for administrative requirements, cost principles, and audit requirements for federal awards. The Uniform Guidance was published on December 26, 2013.

**Digital Accountability and Transparency Act (DATA)**

Federal spending transparency is a priority of the COFAR. The DATA Act, signed in May 2014, places additional focus on this goal. This act is meant to make information on federal expenditures more easily accessible and transparent. It requires common, expanded standards for financial data provided by federal agencies that is subsequently reported on USASpending.gov. The DATA Act expands the goals and purpose of the Federal Funding Accountability and Transparency Act (FFATA).

Both Uniform Guidance and the DATA Act have implication for the collection of data elements in institutional ERA systems.

**The Integrated Award Environment (IAE)**

The Integrated Award Environment (IAE) is managed by the General Services Administration (GSA). Information on this initiative is at: http://www.gsa.gov/
The IAE combines ten federal information technology systems related to searching, applying, and tracking federal awards. It also includes SAM registration and the Federal Service Desk. The systems under the IAE are:

- Catalog of Federal Domestic Assistance (CFDA)
- Contractor Performance Assessment Reporting System (CPARS)
- Electronic Subcontracting Reporting System (eSRS)
- Federal Awardee Performance and Integrity Information System (FAPIIS)
- Federal Business Opportunities (FedBizOpps)
- Federal Funding Accountability and Transparency Act Subaward Reporting System (FSRS)
- Federal Procurement Data System (FPDS)
- Past Performance Information Retrieval System (PPIRS)
- System for Award Management (SAM)
- Wage Determination Online (WDOL)

920.3 Science Experts Network and Curriculum Vitae (SciENcv)
SciENcv is a web-based system that helps researchers assemble biographical information that is required for federal funding applications. Researchers can use SciENcv to create and maintain biosketches to submit with grant applications and progress reports. As of this writing, SciENcv is in testing with both the NIH and NSF biosketch formats.

SciENcv began as a pilot for the Federal Demonstration Partnership (FDP). In collaboration with the FDP and its members, SciENcv was built and is maintained by the National Center for Biotechnology Information (NCBI) at the NIH. The interagency working group convened to work on this issue includes the Department of Defense, the Department of Energy, the Environmental Protection Agency, the National Institutes of Health, the National Science Foundation, the Smithsonian, and the US Department of Agriculture.

IT Solutions for Sponsored Research Administration: Colorado State University as a Case Study for a Collaborative Approach to Implementing a Research Management System

Ron Splittgerber, Colorado State University

Introduction

Beginning with the “eRA I” in 1996, NCURA offered a series of six conferences focusing on developing and sharing information technology (IT) solutions to support research administration. Few commercial vendors offered solutions able to conform to the varied business practices at diverse institutions that make up the higher education community. Collaboration at the NCURA eRA conferences encouraged many participants to develop software applications specifically tailored to existing business rules for their own organizations. In many cases, these efforts simply moved paper workflow to some form of electronic routing without the benefit of a process analysis to take advantage of potential efficiencies when replacing paper processes. Few projects were disciplined enough to create a requirements document to define boundaries, examine current business practices, or identify specific costs.

Phillip J. Goldstein, an ECAR Fellow at the EDUCAUSE Center for Applied Research and President of Philip J. Goldstein & Associates, examined the issue. In a paper titled “IT Collaboration: A Preview of Findings from the 2007 ECAR Study,” Goldstein identified three benefits of collaboration. Those benefits included speed of adaptation, quality of service and reduction of cost. The Goldstein study found that large, multi-campus environments tend to accept the benefits of collaboration, while smaller and private institutions are identified as “non-collaborators.” (Approximately one-third of the institutions surveyed were identified as “noncollaborators” and two-thirds as participating in “limited to extensive” collaboration in IT projects with other institutions.)

While information from the Goldstein study is not final and details unavailable to compare fully with the membership of NCURA, the preliminary findings clearly show the strength of collaboration as a viable alternative to vended products. Considerations of both options may be useful as we lead or are involved in efforts to develop and rollout IT solutions to support research administration at our campuses. This article focuses on one such exercise at Colorado State University.

The Dilemma

Collaboration encouraged by the NCURA eRA conferences gave birth to countless software applications designed to move paper-based processes to those using electronic resources. Many of the “home-spun” applications developed in the 1990’s are not institutionalized in the sense that support from the university central IT group is

2 Ron Splittgerber also serves on the Executive Board and as co-chair of the ERA Committee of the Federal Demonstration Partnership.
required or that sustainability is a consideration should lack of local resources force constraints. The advent of electronic submissions using FastLane, followed by NIH Commons and later Grants.gov created another layer of complexity for these home-spun implementations.

Certainly many organizations face the problem of scaling the software to meet the challenges of managing a portfolio of grants and contracts expending millions of dollars annually. Large commercial vendors are able to re-factor both financial management and human resource services applications designed for industry solutions to marginally meet the needs of higher education, as long as the institution is willing to bend existing business rules. Few of these commercial vendors focus specifically on the needs of research management for the same customers. All of these factors encourage and sustain the ‘home-spun’ and locally developed applications that have emerged over the past 15 years, many originating as a result of collaboration during the six NCURA eRA conferences.

**Other Institution’s Challenges**

Colorado State University (CSU) uses a series of home-spun applications developed over the past two decades centered on the “cradle-to-grave” responsibilities of grants and contract management under the Vice President for Research. According to the National Science Foundation’s “R&D Survey,” the university’s expenditures for federally financed R&D in 2006 was $182.7 million, ranking the institution 31st among U.S. state-financed, public universities. The university’s Office of Sponsored Programs manages about 1,900 new awards annually.

Research Services is a separate IT unit at CSU which reports to the Vice President for Research. The department’s mission is to “provide innovative services for the research community that will enable and assist their research, instruction and diversity.” The department focuses on the following responsibilities:

- **Help Desk** supporting the 2,000 research faculty and staff, as well as division staff reporting to the Vice President for Research
- **Network infrastructure** in collaboration with central IT: managing cabling, switches, firewalls for the research division
- **Network resources**: hardware and software associated with authentication, domain services, file services, Oracle data services, Citrix resources and Windows Forest & Domain services
- **Application resources**: Microsoft Exchange, desk top, mobile - OWA (Outlook Web Access)
- **Software development & support**
- **ASP (Application Service Provider) support**: Topaz GRANITE, ProIRB, Key Systems eProtocol
- **Licensing and desktop security**: Microsoft Active Directory support
- **Web services**: research branding and web development
Portal services: research tab and channels on university RamPoint portal

Research Services staff at CSU attended all six of the NCURA eRA conferences, creating and sharing many ‘home spun’ applications from these meetings. The applications are tightly coupled to a 20-year-old accounting system that is no longer supported by the vendor and that is run on a mainframe computer — also long past normal life expectancy. The home-spun applications named PASS (Proposal Award Support System) support research management from cradle to grave and include:

- Pre-proposal information and routing: The system’s Web applications collect limited data to determine if routing should include the Development Office to assure recent guidelines are available and to enable proactive contact for proposal development.

- Proposal development, submission and routing: Web applications enable staff to gather research and compliance approval forms and provides tools to create and upload budget templates and route these items for appropriate approvals.

- Award Information: Based on sponsor award notice, the system is able to gather additional information and create necessary accounts in the financial management system.

- Award life-cycle (amendments etc.): The system enables staff to collect and distribute changes to award such as budget modifications, date changes, compliance information.

- Financial reporting: The system generates reporting for faculty and staff as well as required financial reports to sponsor.

- Sponsor billing, ledgers and invoicing: System creates and generates necessary billing information, track draws, accumulate information on typical 30-60-90 day invoice information, past due accounts, etc.

- Technical reporting and closeout: Based on award notice requirements, system enables staff to notify appropriate contacts when technical and scientific reports are due and track appropriate closeout action items.

In 2004 the university made a decision to replace its accounting system. Given the existing integration with the home-spun research management applications, the Vice President for Research made a strategic decision to link replacement of the accounting system with a search for an application suite to manage the university research portfolio. There were a number of factors supporting this decision. It was clear that replacement of the accounting system would require a complete re-write of most all home-spun software. Additionally, the existing software would not scale to support the increase in volume ($152 million in FY2001 to an estimated $350 million in FY2008) or “system-to-system” submission to Grants.gov. There were also resource limits for Research Services IT staff to meet an aggressive timeline for a new accounting system. From a budget standpoint, it was anticipated that a request specifically for research management software would not have sufficient campus support on its own.
The Survey
With the decision to link the future of research management to a new accounting system, determining the requirements for a new research management system seemed the first logical step. An online web survey instrument provided separate question sets for the accounting and research requirements with the capability of generating an RFP based on the responses from the campus community. The research portion of the survey found a series of gaps in the existing home-spun applications. These gaps included compliance support to allow web creation and submission of protocol applications. There was also concern about tracking future commitments with respect to dollars, facilities and related central, college and department resources, as well as college/departmental reporting related to faculty investment and return. Responses to the survey revealed concern about future years’ budgets, time-and-effort reporting, tech transfer and export control.

From a faculty perspective, the survey provided useful information for research management. Respondents indicated a need to capture proposal information at inception; provide proactive contact for submission guidelines; eliminate duplicate data entry; provide single point-of-entry and sign-on for all modules; and the desire not to decrease existing functionality with a new research management system.

Financial Management System Discovery
Even though the university strategically combined the financial and research management projects, two separate teams were enlisted. A parallel discovery process ensued, with one team looking at vendors for the financial system and another for the research system. The financial system team anticipated the vendor list based on interviews with other institutions going through the same process. Vendors that popped up on the list included Oracle, PeopleSoft, SCT Banner, and SAP.

Research Management System Discovery
With requirements in hand, the team decided that the next step in the process should include an examination of how other institutions were meeting the need for research management. Phone interviews indicated that universities such as UCLA, Johns Hopkins, Hawaii, Pittsburg, and Illinois leaned toward a commercial system, InfoEd. On the other hand, MIT, Penn State, Princeton, Duke, and Baylor utilized Coeus, a system developed at MIT. The team also found several other vendors whose products were being utilized, including InfoEd, Universal Data, the Banner Grants Module, Webridge (by Click Commerce), GAMS, Grantslam (from Cayuse), RAMS, IT Works, and eProtocol Key Systems.

Each vendor provided a demonstration of their product and responded to the requirements document through a web interface. Based on the discovery process, it was estimated that a new system would cost approximately $1.2 million, which would include software licensing; installation, consulting and training; hardware; and back-fill staff to support legacy systems. An additional $185,000 was added to the cost estimate for annual maintenance.
Release of the RFP (Almost)

After nearly two years of effort, the RFP document from the purchasing department was ready for release. A single RFP allowing different vendors for the financial and research management systems was constructed and routed for final review. However, a few days before the release of the RFP, one of the key sponsors, the Vice President for Finance, resigned. Without endorsement from this sponsor, the RFP was dead.

Both teams expressed concern that the campus-wide effort covering several years appeared in jeopardy. Yet that concern seemed to be balanced by findings in the discovery processes, especially the one focused on the financial management system. The interviews with other institutions completing their search indicated that many were facing delays, unmet requirements, and over-budget estimates as systems are evaluated. Other institutions in the implementation phase of projects also experienced problems when vendor sales meetings seemed to promise more than the actual application delivered. Did the setback signal an appalling end to a long, tedious discovery process? An indication of the mood at the time became evident when a team member quipped, “Perhaps we prevented the university from committing resources to a quest doomed from the start.”

New Direction

During the search for a new vice president for finance, both teams considered other options. Several members of the review team found another potential solution from Kuali. This community source development software offers integrated solutions for both the financial and research management needs — Kuali Financial System (KFS) and Kuali Research Administration (KRA).

Once again, the teams spent another year moving through the approval process, focusing on issues such as The Board of Governors’ interest in a single solution for all campuses and an administration directive to implement a new system with a two-year timeline. In addition, the teams discovered that KFS financials had yet to be installed in a large, research institution and KRA was just starting development based on Coeus functionality. It was not a finished product with “tires to kick”.

Lessons Learned

There are lessons to be learned in every venture, including those which do not meet intended objectives. Such is the case with our efforts at Colorado State. So, we offer the following observations.

Remember to obtain the support of key administrators early in the process, including those from the finance division. If the university uses a strategic plan that impacts the budget and software acquisitions, work with others for inclusion of a research management system. Consider a parallel software project with a new financial management system if the university is considering a replacement. Often it is difficult to gain sufficient support outside main systems — finance, student and human resource. Linking a research management system to one of the ‘big three’ may increase the likelihood of approval and funding.

Once approval has been obtained, use a focused survey, meetings and interviews to
determine requirements for your system, as well as to determine any gaps in your current system. Engage the campus in a discovery process using central, college and department stakeholders. Consider both vendor and community source solutions in the discovery process. Construct a requirements document based on information gathered from the survey and discovery process that describes a complete system.

One tool that may prove useful is a Wiki. The Wiki can be used as a focus of project design and management to assist formulation of requirements, construct documentation and conduct surveys. Anyone can contribute to the content, and versions of the information are tracked over time, easing documentation of change in a requirements document.

Collaboration involving institutions with similar business management requirements focused on managing an individual research mission is an effective resource. Given the latitude to determine gaps in existing management strategies through the use of interviews and surveys, the university IT staff has the tools to construct a requirements document able to guide efforts toward more effective software applications impacting research management. However, the construction of any such document and assessment effort must be done in concert with research administration.

References

Figure 920.4-1. The Requirements Document

What is a requirements document? Certainly some of the team argued that the effort required to create the document was beyond the scope of their responsibility. After all, what would you do with a requirements document if one suddenly appeared on your desk? So the team first asked, “What is a requirements document?” It is:

◆ Written statement of what the application will do
◆ Basis for agreement between the team and those who will use the application
◆ Resource for team developers as well those implementing the application
◆ Means of estimating effort and establishing a timeline
◆ Serves as basis for the project plan
◆ Guideline for Quality Assurance Testing

Second, the team wondered “Can we do without a formal requirements document?” Perhaps, but only if a single developer is involved, one small workgroup will be using the application, there is a common understanding of what the application will do without a written list, and it takes less than a calendar month from idea to production. Clearly the team would need a requirements document! The plan would be to use the document as a reference for the following:
**Project Leader**
- Determine Scope
- Split into phases or modules as needed
- Help collaborate timeline with sponsors, managers System Analysts
- Document the business requirements
- Develop written documentation
- Organize QA (Quality Assurance) testing
- Establish integration with legacy systems
- Create maintenance requirements

**Project Managers**
- Understand the phases or modules
- Coordinate integration with other applications
- Track development progress

**Project Sponsors**
- Help overall motivation for project
- Sign off on various phases or modules
- Confirm that requirements reflect business processes

When constructing a requirements document, the team found the following hints may to be of value:
- Verify requirements by meeting with users with different points of view
- Write simply
- Use short sentences, ample paragraphs, and bulleted lists
- Write in active voice “The application will list all investigators,” rather than “The investigators will be listed by the application”
- Illustrate points with charts and tables when possible
- Avoid acronyms or jargon
- Include a glossary to define acronyms you must use
- Partition requirements into separate documents for various modules (Proposal, Award, Compliance, etc.)

Many templates are available to guide a team through the construction of a requirements document. If none of the team members have experience designing such a document, sage advice might be to pick a complete outline then drop topics not appropriate for the project at hand.
John Caruso, Oregon Health & Science University and Naomi Schrag, Columbia University

Ah, Effort Reporting! It’s been a fact of life in research administration since the days when we did everything on paper (before computers!), and no matter how automated we become effort is not going away any time soon. But the current question facing many research administrators as they drag their feet reluctantly into the 21st century is this: Will the transition to an electronic system for effort reporting and certification make things any easier or will it just compound our headaches?

Well, we’re glad you asked. We might not have all the answers for you, but we have a number of handy suggestions that can help you navigate a few roadblocks and avoid some common pitfalls as you begin your journey down the road to electronic effort reporting.

However, if your institution is still clinging to the ancient comforts of paper effort certifications, you’re well aware of the challenges already presented by the creation, distribution and collection of said documents. Sadly, we can’t tell you that you’ll experience complete relief on this front. Yes, there will be fewer stacks of paper and the birdies in the forest will have a few more trees to perch on while they sing their songs. But you’ll still be back in your office dealing with many of the same issues.

As we see it, here are the core issues you’ll need to consider long and hard before deciding which electronic option is best for you:

Data. Where do you get the information used to populate your effort statements? Where does data go in and how does it come out? Does it come from multiple sources and maybe even from multiple systems? Who has access to this information apart from what is shown in the effort statements? What if changes in allocations need to be made before the statement is certified? While you’re revisiting this topic, it may also be worthwhile to reconsider some of the things you’ve been taking for granted for a while, like why you’ve chosen the effort period you have (monthly, quarterly, etc.).

Distribution. Once they are created, how are effort statements distributed? Who maintains oversight of the full effort reporting process? Who assists with this process at the department level? How are they trained? How are effort statements presented to those being asked to verify and sign them? Is there effort certification training (whether optional or mandatory) for faculty, or are department administrative staff queued to provide assistance at this level? And again, keep going back to your fundamental decisions, like who signs effort certifications — does the PI sign for everyone on the project or do individuals sign for themselves?

And a new question as you go electronic — do you need institutional policies

---

3 This article is reprinted from the NCURA Magazine, Vol. XL, No. 5, December 2008/January 2009, published by the National Council of University Research Administrators. It is used with permission of the publisher.
regarding electronic signatures?

**Collection.** How are effort statements collected? And once collected, how are they reviewed, logged, and stored? How are returned (and outstanding) effort statements tracked? What is the procedure if statements are not returned in a timely manner? How many times do you remind folks and who do you escalate to when you face compliance challenges? And do you have the reporting capability you need in your electronic system to track compliance across your institution?

**Communication.** Like any new initiative, implementing an electronic effort reporting system may require a communication campaign to let people know that change is coming and to explain what’s in it for them. Of course, at many of our decentralized institutions making sure you reach the right audience can be a challenge in and of itself, especially since in all likelihood you have to reach many different audiences. The key questions here are: who do you need to reach? Departmental administrators? PIs? All researchers? Deans? Chairs? Which channels of communication best reach these audiences? Who do they listen to? What do they need to know? When do they need to know it? How often should you communicate? And when you really need to get their attention, what’s the best way? No single way will reach everyone, so you may need to think about putting together some sort of communication variety pack. For a large implementation plan, developing a communications calendar early in the process, and drafting communications up front, will save a lot of time and headache when you are under the gun.

Yes, many of the questions in these categories may be the same basic questions you (or the someone who came before you) have always wrestled with in implementing your paper solution, but they’re especially important to revisit now. And you shouldn’t revisit them alone. It’s time to load up the research administration station wagon and take everybody along for the ride. Or, to skip the snappy metaphor, it’s time to form yet another committee. Oh, joy of joys!

But before you book standing meetings in the conference room and round up the usual suspects, remember that the key to putting together a successful work group around this topic is to make sure you’ve got all your key players represented. Yes, you’ll need a central administrative manager or two and some department administrators, including the folks who are actually working where the rubber hits the road. Being the department effort coordinator tends not to be a glory job, so make sure the poor admin assistants who get tasked with pester pester the faculty and really rounding up the statements are in the room when you’re talking process. You’ll also need some tech people there, and probably one from every system that’s likely to be involved. You might as well start with them involved in the conversation, since they’ll need to be involved later anyway. If you can swing it, it’s also a good idea to have a couple faculty members there to provide a reality check. These are the folks being asked to do the certification — they ought to know what’s heading down the pike. And for faculty representation it’s always nice to balance things out by having some fresh faced junior faculty members to go with your curmudgeonly old school researchers.

And finally, make sure you’ve got executive sponsorship. Even if the VP isn’t go-
ing to sit through the nuts and bolts conversations, having that level of the institution dialed into what you’re undertaking will pay dividends later on when you’re trying to roll the thing out to campus. Besides, you’re probably going to need some capital and that means higher level buy-in anyway.

Once you have your group together and work your way through the key issues you’ll be considering for what you need (see the sidebar “Ye Olde Effort Checklist”), you’ll need to decide what your best solution will be for satisfying your system requirements. In its simplest form, this decision boils down to either building your own system or buying one off the shelf. Given adequate institutional resources, a customized system can be a good alternative, though this road-less-traveled is not without its own challenges. The more common approach is to buy a system from one of the vendors offering such things and then either compromising where the system doesn’t meet your initial specs or working in-house (with or without the aid of the vendor) to customize the system. (A number of vendors offer electronic effort reporting systems.)

Fast forward now to that day when you’ve picked your system and started getting it installed. You’ve already thought about how to roll it out to your audience. And you’re beginning to send some of those canned communications your carefully prepared. Maybe you’re even archiving communications onto a dedicated webpage. Now is the time to start turning all those random questions you keep fielding into campus resource gold — a Frequently Asked Questions document. FAQs help by providing one-stop shopping for those struggling with the new system, but they also cut down on one-off phone calls and make sure the answers people are getting are more consistent than they might otherwise be. But don’t forget to run a draft of the FAQ document by your implementation committee, so you can make sure the answers make sense to all manner of potential readers.

Converting to an electronic system for effort reporting has many advantages, and careful planning can help you avoid most pitfalls and many migraines along the way to implementation.

---

**Ye Olde Effort Checklist**

- Read Guidance Documents
- Decide Effort Period
- Determine Sources for Effort Statement Data
- Develop Effort Statement Template
- Assign Signature Authority for Statements
- Review and Update Policies and Procedures
- Review Effort Reporting Business Practices
- Prepare Resource Documents
- Train Signers and Coordinators
- Coordinate Distribution/Collection
- Track Distribution/Collection
- Reward Compliance and Address Noncompliance
Electronic Research Administration: The New ‘Town Square’
Sheila Lischwe, Saint Louis University

Introduction

greening: Restoration of vitality or freshness; rejuvenate. —Answers.com

Convenience and cost-savings: These are the benefits that electronic research administration (eRA) promised to deliver, in return for all the bumps and stresses we all suffered through in its adoption over the past decade. At Saint Louis University (SLU), our own internally–crafted electronic research administration system, known simply as “eRS” (electronic Research Services) is proving true to these anticipated benefits, but more importantly, has given back considerably in unexpected ways that are positioning the institution to confidently embark upon the goal of doubling research revenue in the next five years. It has created a new centrality – a “Town Square,” if you will – around which all parties in the research community now gather on a daily basis, in order to transact grant and contract business. Chairs, deans, investigators, support personnel, compliance officers, and collaborators “meet” to work on grants-related tasks. Despite early fears and skepticism, eRS has become part of the SLU lexicon, with people asking, “Should that go up in eRS?” or “Can we have eRS handle this?”

eRS has also allowed more efficient organizational structures to form, fostered cross-departmental collaborations, and most surprisingly of all, transformed the on-campus image of the pre-award office from an isolated, placid administrative backwater to a fast-paced, front-and-center, in-the-know, cutting-edge department. It is in this spirit that eRA truly has restored vitality to research administration at SLU, which this article will attempt to describe.

Electronic Research Administration at Saint Louis University

In preparation for the transition to grants.gov in 2006, SLU determined that it needed a more efficient and dependable means of routing and transmitting the sizeable electronic grants.gov application packages than relying on the institution’s email and internet connection. SLU receives approximately $60 million through grant and contract transactions annually, more than 80 percent of which is generated by our biomedical campus. Additionally, ever-increasing compliance requirements demanded a more systematic way of identifying when IRB, COI, IACUC, or Export Controls are involved in a proposed project.

As such, SLU built a web-based “tool-kit” that would store grant applications and provide for simultaneous internal routing, review, and approval from the investigator to his/her department chair, dean, compliance officials, and the pre-award Office of Research Services. Development and testing occurred throughout 2005 and 2006, and usage was required for proposal review and submission effective July 1,

This article is reprinted from the NCURA Magazine, Vol. XLII, No. 4, July/August 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
2007, replacing the existing paper-based transmittal that required manual signatures obtained in a linear fashion.

Over the last several years, as the basic system has been refined, additional components and functionality have been added:

◆ effort reporting
◆ a keyword selection mechanism that polls the grants.gov FIND database and returns matching funding opportunities to an investigator’s dashboard
◆ a free-text “research interests” field that can be searched to identify other investigators on campus for collaborative purposes
◆ a clinical trial contract review mechanism
◆ functionality to administer the submission, review and management of internal grant programs

The impact of eRS became crystal clear earlier this spring when the Medical Center location of the pre-award Office of Research Services prepared for a move to co-locate with its sister office on the main campus. As we archived all files that were current or had terminated in the last three years, only three shelves of a possible 36 shelves remained. With 1,913 proposals having been submitted since July 1, 2007, and 1,344 awards received during the same time, the substantial savings in paper, reproduction, energy and staff time to administer and maintain became very apparent.

Magnify this by the fact that the same paper file was kept at the investigator, department, and compliance office level, and the impact is even more substantial. When you factor in the equipment and furniture used to house this paper file system, even greater savings are realized. These improvements were expected; what was more astounding, however, were the unanticipated operational/behavioral improvements that eRS made possible, well-positioning SLU to achieve its research goals.

**Enhanced Working Relationships**

**With the Research Community**

Electronic research administration was greeted with great skepticism at SLU, with fears that delegating grantmanship tasks to computers would reduce us to a faceless office with only cursory interactions with investigators and administrative personnel. However, the exact opposite occurred! New systems required new training and new policies, particularly at the Medical School, traditionally an arena steeped in well-defined hierarchies that separated interactions between those who did research and those who administered it.

eRA training sessions provided the opportunity to become a much more visible office on campus and in fact, increased the number of face-to-face contacts we had with our clientele. We delivered six (6) two-hour sessions, during the spring of 2005 at which we introduced the new grants.gov application packages for NIH, as well as the new internal eRS system. The Provost strongly endorsed attendance at the sessions, so we had a captive audience of both administrative personnel and inves-
tigators, with the spotlight on the Office of Research Services (ORS) as the resident experts. This dynamic played an important role in the shift to a more peer-to-peer relationship with investigators: we had gained an important advantage in this relationship – control of information - and the shift of responsibility for grant submission to ORS placed us in a position of authority that we had never before enjoyed. Since then, our office has risen in stature in terms of influence across campus.

Thanks to the complexity of electronic research administration and the labyrinth of policies and additional compliance requirements that has seemed to accompany it, the ORS office is highly regarded as a warehouse of specialized expertise. We are continually asked to present at departmental meetings and to conduct refresher sessions on the use of eRS. Our public persona has grown in prestige and influence, both of which are key to successfully lobbying for additional resources.

**Within the Central Research Office**

eRS has enabled the spawning of new organizational arrangements that allow us to enjoy synergies that improve effectiveness and service to our clientele. The electronic approval routing system in eRS has eliminated the need for manual signature gathering, allowing the biomedical campus office to co-locate with our sister office on the main campus, as well as with the post-award staff. Co-locating has enabled an improved workflow, as departmental assignments were revised so that all six pre-award grant professionals have responsibility for portions of the high-volume medical school/public health areas, formerly only the responsibility of three staff members housed at the medical center, due to the physical location of hard-copy files on the biomedical campus. This has expanded the skillset of all employees, as our main campus staff expanded their knowledge of new sponsors and systems (NIH and the disease-related associations – AHA, ADA, etc.).

While those biomedical sponsors were formerly assigned exclusively to medical school departments, all employees are now gaining skills in budget development and funding source identification with assignments to lesser volume arts and sciences departments that do not enjoy the same type of administrative support as well-funded School of Medicine departments. The peer-to-peer teaching within the ORS has been a positive byproduct for this young office, providing opportunities to develop presentation skills and team collaboration as never before available.

**New Organizational Structures**

Adding the contract review function for clinical trials allowed SLU to pursue a much-desired spin-off of the clinical trials contract review function from the pre-award office, to its rightful place in a centralized clinical trials office reporting to the School of Medicine. As a primary function of the medical campus, it made no sense to have moved it to the main campus. eRS made this relocation possible. Data entry was shifted to the department, and the auto-assigned eRS number facilitates communications with investigators and support personnel. Departments can readily login and view the status of their contract and see what issues are being negotiated.

Simultaneous review by all parties eliminates delays and has significantly re-
duced the time to contract execution.

**Challenges & Opportunities**

As we continue to refine eRS, challenges do, indeed, remain, but we also foresee unlimited potential for ways that eRS, and electronic research administration can help facilitate the SLU goal of doubling research in five years.

**Challenges That Remain**

◆ People do not like to give up paper. While several staff members function nearly “paperlessly,” there is still a reliance on hard copy for the majority of staff members, so we continue to tolerate individual reliance on paper with the steady and regular directive to rely on eRS viewing of files as the “greener” solution.

◆ While the focus on eRS has initially been on the pre-award tasks with the exception of effort reporting, our post-award colleagues remain primarily paper-based. Now that we are co-located under one roof, and face-to-face eRS training is more readily available on an ad hoc and formal basis, we will work on moving that office to formal reliance on eRS, which will further enhance processing time for account creation and other post-award financial tasks.

◆ The greatest advantage of eRS and electronic research administration – its accessibility from anywhere, anytime – is perhaps the greatest curse for ORS: expectations that the staff is also readily available 24/7. Policies and work habits need to be made clear and managed to avoid burnout.

**Opportunities**

Perhaps the greatest opportunity that electronic research administration has afforded Saint Louis University and the profession of research administration as a whole is the rise of research development as a sub-specialty, which is key, at least for SLU, in its plan to expand research funding. Electronic research administration has shifted the burden of data entry, compliance tracking, and file management from the central research office, freeing up time for staff to spend more time identifying funding opportunities suitable to the institution’s strategic initiatives and cultivating collaborative groups to respond to these opportunities, which is exactly what the true essence of a pre-award office is.

**Conclusion**

Contrary to early fears that eRA would dilute interactions within the research community, eRS at SLU has enabled the research administration office to provide higher-quality and more frequent face-to-face service than had ever been possible with the former paper-based grants management system. With no reason to be linked geographically to one campus or another, the pre-award staff is now all located in one location, facilitating communication that, comes with hallway conversations.

Also, being co-located with our post-award colleagues, enabled a true “cradle to grave” service now possible, further enhancing our services to investigators and departmental personnel.
The complexity of policies and regulations that spawned these new systems and procedures has ultimately positioned the pre-award office as a trusted, respected center of expertise on campus. Finally, with the workflow improvements that emerged as a result of eRS’s adoption, we can now pursue more proactive research development activities which will be key to growing research. eRS has allowed us to become an enabler for research, which should be the true essence of a pre-award office. Most town squares pay tribute to citizens whose contributions form the foundation of that locality – in the research “town square” at SLU, that monument would be eRS.

About the Author

Sheila Lischwe is the Director of the Office of Research Services at Saint Louis University, where she oversees a staff of seven grants professionals in the management of pre-award activities for SLU’s main and biomedical campuses. Dr. Lischwe received her Ph.D. in higher education administration and an M.A. in Urban Affairs from SLU, and an MBA from Southern Illinois University at Edwardsville. She has previously worked in research administration and development at Webster University in St. Louis, Missouri and Southern Illinois University at Edwardsville, in Edwardsville, Illinois.
Choosing the Best Electronic Research Administration (ERA) System for Your Organization

Hope C. Grant, Clark Atlanta University

As organizational trends continue to move towards paperless environments and process efficiency, research entities are becoming more focused on automated procedures for the various aspects of research and sponsored programs management. This prominent issue has shifted quickly to the forefront as organizations jostle to reposition themselves as leaders in the research realm by eliminating redundant and antiquated approaches to managing and tracking project proposals and awards. Thus, we witness the ascension of electronic research administrative (ERA) solutions for organizational functions that support these sponsored programs. These emerging ERA companies promise one-stop shopping for all occupational areas of program management, providing hope for the intricate and sensitive aspects of research administration that outsiders rarely comprehend. The question surfaces: Which ERA system is best for our organization? The answer is not simple, though in research administration we find it never is.

It is easy to become overwhelmed with the many ERA systems available offering easy solutions to your program management dilemmas. However, there is a logical method to distinguish between the perceived and actual benefits that an ERA system can provide an organization. The process of determining an ERA system begins long before you contact any provider. In this article you will find best practices in determining which ERA system is best for your organization.

Analyze the Current Research Administration Process

Most institutions already have policies and procedures in place for tracking proposals and awards. The first step is to define the current processes and determine which successful aspects will remain and which new components will need to be added, not just in terms of the ERA software but regarding the general procedures as well. Assess what strengths and weaknesses the organization has and establish the capabilities that the ERA software should present to support the organization needs. Bear in mind not only where your organization is now but where it needs to be in the short-term and where it is going in the long-term. It is important to envision what the organization wants to accomplish through the ERA system and how it will incorporate future development.

Examine Each Functional Area of Organization Process

Many ERA Software providers began with a particular module as a resolution for certain issues. From there it grows into a fully functional ERA system for all program management areas. However, while they may specialize in a particular area such as Human Subjects or Proposal Submission, the appending modules may not be the best solution for your organization.

1 This article is reprinted from the NCURA Magazine, Volume XLIV, No. 2, March/April 2012. It is used with permission of the publisher.
Therefore, we should address all areas and find out what will work best for each area of your organization. You may have to combine modules from different vendors to deliver the best possible solution for the organization’s electronic research administration needs. These functional areas include Pre-Award, Post Award, Compliance, etc.

**Research all Alternatives**

After you have examined your organization and developed internal measures, it is now time to look to outside sources for information that will aid in selecting the best ERA System. Consult with your colleagues at other organizations. Find out what software people are using and what they are saying about the software. It is important to understand that what may work for one organization may not be the best for others, and vice versa. However, you do want to gather feedback from current users to evaluate whether the ERA solution will be mesh well with your organization’s functional environment. Additionally, utilize online resources to develop a comparative schedule evaluating the pros and cons of each potential ERA solution. This will undeniably serve as a valuable tool in your final decision.

**Involve All Stakeholders**

While the ERA system is primarily designated for research administration there are others who will be affected by it. This includes the faculty, staff and administration within the organization. The faculty will have to be familiar with the new methods and how it will affect them. The administration will need to know how these costs will benefit the organization and produce effectiveness in sponsored programs management. The support staff outside of the sponsored program office must buy into the new system because interdepartmental procedures will change and valuable training should be made available to them. As a result, it is only sensible to include faculty and department administrators in the decision making process, gathering input from all parties and addressing current technical issues that they may face and how the new ERA system can be an improvement for them as well. While everyone may not be satisfied with the overall outcomes, the act of allocating time to receive feedback from all parties will build rapport and garner support for the final product.

**Guarantee Technical Integration**

The ERA solution should ultimately align with current processes without requiring major changes in previously efficient procedures. There are many other phases to program implementation outside of the actual installation of the ERA software. You also have to consider data migration, current resources available for integration as well as the other functional areas. Many organizations employ a number of technical platforms across the entire organization for supportive services such as human resources, payroll, financial management, and information technology and student records. The ERA System chosen will interrelate with all of these areas in some way so it is imperative that these can be integrated with ease and accuracy.
Consider and Prepare for Total Cost

Implementation of any new software can be extensive and expensive. Not only will you have to pay for the software itself but many times an organization’s Information Technology Department may not be equipped to handle the installation itself so you may have to rely on the software provider for additional support that was not included in the regular schedule of fees. Additionally, these ERA systems are very large and process so much data that it is possible that the current hardware will also need to be upgraded to support the amount of information use. These systems are frequently upgraded and there may be modifications needed to assure full functionality and the optimal operation, which generally affix additional costs. Often times there are recurring expenses such as annual subscription and software maintenance fees as well. Usually, these systems are sold as package deals which include a fixed amount of support and training. So if there is additional training or support needed these will drive the implementation costs up as well. Finally, consider the human resources needed to execute the system installation. Utilizing the research administration team for the implementation project may cause the daily routine operations to become secondary tasks. How much employee time will you have to dedicate to this project? Will there be a need to bring in temporary support staff to maintain the standard level of operation? Contemplate all of these hidden costs and bring them to the forefront in negotiations with the team and software provider.

Plan for Implementation

Seldom do implementation projects go according to plan. Ultimately, these projects will take more time and money than originally intended. Consequently, it is important to develop a sensible plan and timeline for execution. While it is expected that Murphy’s Law will affect all events, it is advantageous to anticipate roadblocks and consider possible obstacles that will prevent a smooth transition. Failure to do so will indubitably result in extended timelines, increased frustrations and higher costs.

Recognize Probable Benefits

During the sales pitch the software representative will probably provide some statistics regarding the benefits of purchasing their ERA system. However there are additional benefits within your department that they may overlook. It is advised that goal setting be completed to forecast concealed benefits and develop a vision. A simple way to do this is by incorporating the SMART Technique: Specific Measurable Attainable Realistic and Timely goals for the program. If several of these goals cannot be achieved with the prospective ERA System then it is possible that it is not the right solution for your organization.

Remain Open Minded

Throughout the process the team and all stakeholders should remain flexible there are goals that need to be achieved but it may not be done in the manner or timeframe that was originally proposed. But this does not mean that it is not the best solution. As stated in Step 2, a combination of modules from different providers may be the best fit for the objectives set out. You are not required to obtain all systems for
each function from one provider. At times it may be best to keep certain technical features in place that have been proven in the past within your organization. Also, it is not always beneficial to go with the first provider that contacts you or the one that is most popular. There will be deviations from the original path but the detours maybe well worth it.

**Aftermath**
Lastly, as your organization continues to grow, so should the capabilities of the ERA system. The system chosen should sustain itself with new compliance requirements and improved technology. Additionally, incessant training and support is needed to address turnover, process improvements and technological innovations.

Hope C. Grant is a Research Administrator at Clark Atlanta University. Hope has seven years of experience in research administration including pre award, post award and financial compliance. She has been fundamental in electronic research administration matters throughout her career supervising data conversions, system modifications, process assessments as well as training end users. Additionally, Hope’s is interested in policy development and process improvement. Her current responsibilities include electronic documentation and data management, preaward services, proposal development and organizational strategic planning.
Faculty Profiles and the Federal Demonstration (FDP) SciENcv Pilot

Lori Ann M. Schultz, University of Arizona and Ron Splittgerber, Colorado State University

Faculty Profiles. We all understand the importance of maintaining a current résumé, curriculum vitae, or faculty profile. We see them every day in grant applications and progress reports, evaluate them to hire new staff, and use them to advance our careers. We add new information to our own résumés when we change jobs, publish research results, earn advanced degrees, present at professional organizations, and take on new responsibilities. A lot can happen in one year, so imagine when that year becomes ten, or twenty, or forty years. The work to maintain accomplishments over a decades-long research career is significant. Faculty Profiles are constantly changing because they include all of the biographical information related to a faculty member’s career and professional achievements, including employment and educational history, collaborators and students, publication citations, patents, presentations, grant activity, and more.

Managing this information is both a burden and an opportunity. The administrative burden in maintaining and reporting profile information is clear: profile information is not kept in one place. It exists across multiple systems at universities, research institutions, and federal granting agencies. As a result, there is substantial effort required to assure each location contains accurate and up-to-date data, and resulting duplication of effort associated with keeping data up-to-date over multiple platforms and providing it in multiple formats.

Faculty and institutions struggle with multiple profiles and authentication mechanisms. The data are not consistent, and there is little perceived incentive to maintaining and updating the data. Yet profiles can also provide an opportunity to promote a scientist’s career. A well-advertised profile can serve as a vehicle for enabling discovery about researcher expertise and professional accomplishments. As such, it can provide a voice for researchers to document the results of the grants they have received and for agencies to describe the impact of their science investments.

In her July 2011 Rock Talk blog, Dr. Sally Rockey (Deputy Director of Extramural Research at the National Institutes of Health [NIH]) introduced the kick off of a federal-wide research profiles project. The Research Business Models interagency working group, the Science of Science Policy Working Group, and the Federal Demonstration Partnership (FDP) are working together to initiate a pilot of a federal-wide profile system (Rockey, 2011). The system is called SciENcv – the Science Experts Network Curriculum Vitae. The FDP pilot of SciENcv will capture information from existing systems to demonstrate how typical researcher tasks such

---

as completing a biosketch could be accomplished from a connected system (Lane, Schaffer & Schultz, 2012).

In 2005, the Federal Demonstration Partnership (FDP), a collaborative initiative among 10 federal agencies and 119 institutional federal award recipients, funded the Faculty Burden Survey. This survey measures administrative burden on faculty research investigators conducting federally funded grant work and is often referenced when we talk about changing regulations, accounting standards, the demands of compliance activities, and their impact on a faculty member’s ability to devote time to federally funded research (Decker, Wimsatt, Trice & Konstan, 2007).

Rockwell (2009) shows that 42% of federal research time is devoted to pre/post-award administrative activities. Progress-report submissions are listed as one of the top research-related burdens (Rockwell, 2009). While progress report formats are different across funding agencies, they have in common a requirement for biographical information for the Principal Investigator and key personnel, such as contact information, employment and educational history, and publication citations.

Before the 2005 workload survey and 2007 report, the FDP recognized that standardizing an investigator’s profile, including curriculum vitae, would create efficiencies for both the faculty member and federal agencies, if the profile is based on a common template and standard components. In 1995, the FDP initiated the Electronic Grants Business Forum with that goal in mind. The FDP SciENcv pilot builds from that early work of identifying data elements common to an individual’s profile. In August 2011, the FDP Executive Committee, in collaboration with five federal agencies, approved a demonstration (pilot) to begin work on a centralized common profile system, which has the potential to reduce faculty burden by:

◆ Importing data from existing systems,
◆ Reducing duplication of effort for the association of personal information with applications for grants and contracts from multiple agencies,
◆ Generating agency-specific formats for common items like biosketches and current & pending support, and
◆ Auto-populating applications and progress report forms.

The federal agencies are responding to administration mandates. The White House Office of Management and Budget (OMB) and Office of Science and Technology Policy (OSTP) have requested that federal agencies develop outcome-oriented goals for their science and technology activities (Orszag, 2010).

“Agencies, in cooperation with OSTP and OMB, should develop and sustain datasets to better document Federal science, technology and innovation investments, and to make these data open to the public in accessible, useful formats. Agencies should develop and regularly update their data sharing policies for research performers and create incentives for sharing data publicly in interoperable formats to ensure maximum value, consistent with privacy, national security, and confidentiality concerns.
Agencies should develop outcome-oriented goals for their science, technology and innovation investments; establish timelines for evaluating the performance of these activities, and target investments towards high-performing programs in their budget submissions. Agencies should support the development and use of ‘science of science policy’ tools that can improve management of the R&D portfolios and better assess the impact of their science, technology, and innovation investment” (Orszag, 2010).

Existing agency approaches are not adequate to respond to this request. The Science of Science Policy Interagency Working Group, a subcommittee of the National Science and Technology Council’s Social, Behavioral and Economic Sciences subcommittee,3 summarized current agency practice in a report entitled the Science of Science Policy: A Federal Research Roadmap (OSTP, 2012). The roadmap found that agencies and departments across the Federal Government face similar challenges when setting scientific priorities and assessing the effectiveness of current and planned investments.

One of the Roadmap’s key findings was that the current data infrastructure was inadequate for decision-making. It recommended that federal government agencies should work in concert to establish a theoretical and empirical framework to understand the science and engineering enterprise within the context of the science of science policy. It encouraged investment in the development and use of emerging tools, methods, data, and data infrastructure to enable science policy decision makers to base investment decisions on more rigorous and quantitative analyses.

The passage of ARRA, and the focus on reporting the jobs associated with science investments, led to two agency concerns. The first was the accuracy of the approach used in the reporting process. The second was the limited nature of that reporting requirement, since science investments have been documented to have longer-term impact in many areas, including scientific outcomes. At the same time, it was clear that continuing to require research institutions and principal investigators to manually report the outcomes of research was neither practicable nor desirable (Lane, 2010). A recent study titled, “Reforming Regulation of Research Universities,” provides a good summary of the challenges; it finds that poorly integrated federal reporting and other regulations are imposing a heavy and growing administrative burden on federally funded research. The report argues that this “regulatory overhead” is both large (and getting larger) and often inefficient, with many federal reporting requirements overlapping and even conflicting. It estimates that 42% of faculty time relating to federally funded research is spent on administrative duties, rather than on the research itself (Smith, Trapani, Decrappeo, & Kennedy, 2011).

Approach

As the first step in this pilot, stakeholder groups from the research community were invited to respond to specific questions focusing on the needs of their respective groups. At the beginning of November, 2011, the FDP SciENcv working group sent questionnaires to institutions and organizations all over the country to solicit feedback from targeted groups including: new and seasoned research faculty, research administrators, and technical staff responsible for research information technology (IT) systems. The group sent questionnaires to FDP member institutions, American Association for the Advancement of Science (AAAS) fellows, National Institutes of Health’s (NIH) President’s Early Career Award for Scientists and Engineers (PECASE) nominees, National Science Foundation (NSF) Faculty Early Career Development (CAREER) Awardees, the Association of American Universities (AAU), Association of Public Land Grant Universities (APLU), National Academy of Sciences (NAS), Association of American Medical Colleges (AAMC), and American Association of State Colleges and Universities (AASCU), and many others.

A review of the questionnaire results provides a foundation for the work of the SciENcv pilot team. Since its release in early November, over 600 individuals have completed the questionnaire – a response rate well above the team’s expectation. Initial results indicate the following:

◆ Research faculty strongly desire a resource reducing the requirement to provide repetitive information in applications and reports, with nearly 3/4 of the respondents citing the need to repeatedly enter current and pending support information (when agencies already have the information) as the ‘most burdensome’ requirement.

◆ Research faculty indicate a need for a common platform to maintain profile information, with over 2/3 of the respondents wanting an automated repository of Biosketch information.

◆ None of the existing CV Profile Systems shows widespread use among respondents – the most often mentioned available system shows fewer than 10 respondents’ adopting it.

◆ Research faculty show a desire to be involved in the development process, with over 2/3 of the respondents indicating a willingness to be involved in a more intensive discussion to provide detailed feedback in the development process.

◆ Those from the technical community show a high interest in continuing to be involved in the pilot (over 2/3 of respondents) with the administrative group at a slightly lower rate (just under 60%).

Based on these initial results and further conversations with stakeholders, the goal of the SciENcv pilot is to capture individual profile information from a variety of existing resources and make it available to the investigator on a voluntary basis. Similar to LinkedIn and other social and professional networking opportunities, the service will allow individual control of profile information and its visibility to the scientific community and granting agencies. In addition, the service will allow
the individual to link ownership of existing reports and publications to a unique, persistent identifier for the researcher, making it transportable from one institution and one agency to another. This resource will assure that only the most accurate and current information is presented when the researcher opts to share it (ORCID, 2012).

The groups collaborating on the SciENcv pilot know that a quick turnaround of results is critical to demonstrating reduced investigator burden, increased data quality, and the future success of the SciENcv profile system. All stakeholders stand to benefit from the near- and long-term benefits of the SciENcv project; collaboration and support of the FDP, the Research Business Models and Science of Science Policy Working Groups are crucial steps in improving the way faculty, institutions, and funding agencies interact with profile data. This work has the potential to revolutionize the grant lifecycle and provide decision support information for institutional and agency leadership. For more information and pilot progress, please visit the FDP web site at http://www.thefdp.org.

Implementing Election Research Administration Systems: Lessons Learned

Lynda S. Wolter, The University of Chicago

Electronic Research Administration (eRA) systems are becoming commonplace in our field, and successful eRA projects require clear direction and planning. Institutions considering a new system face a range of options, from off-the-shelf, vendor-maintained systems to fully-customized solutions. In any scenario, an eRA project is a complex undertaking that will bring together functional users, programmers, and senior management sponsors, among others, to meet the task. This article, which is based on a discussion group led at the NCURA 54th Annual Meeting, lists some considerations for planning an eRA system implementation and some lessons learned from past implementations. Careful upfront planning can help ensure a successful outcome.

Define the Scope
“eRA system” may mean different things to different people. Some may envision a grants-only system for review and approval, while others may see a soup-to-nuts system for multiple award types that incorporates system-to-system submission and post-award accounting. Defining and documenting the project scope allows for a common understanding of the solution, and it can be used to explain the future vision to end-users. A high-level scope document is the first step.

A scope-of-work (SOW) should include a description of the solution, key goals or outcomes, expected benefits, and define the executive sponsors and other key players responsible for the project. If there are known implementation deadlines, it should include these. It should explicitly identify any specific activities that are not in scope as “out of scope.” And, it should identify the party or group responsible for long-term maintenance of the eRA solution. Pulling all of this information into one document at the outset provides the project team with a reference document and draws a broad outline of the tasks involved in the successful solution implementation. Thus, the SOW is a powerful tool for discussion with end-users and constituents of the project. It lays out expectations, starts the overall communication strategy, and keeps the project on task.

The scope also is the launching point for defining more specific requirements and solution needs. The document will help the IT team understand the project goals, and it can be used to educate them on the specific solution. A particular eRA solution may use cutting-edge technology, so the value of the scope document for educating IT personnel should not be underestimated.

1 This article is reprinted from the NCURA Magazine, Volume XLV, No. 1, January / February 2013. It is used with permission of the publisher.
Define the Solution Requirements

Once the scope document is set, the next step is to define the specific solution requirements. This is where the specific details take shape, and tough questions are required to ensure that the guiding documents lead to the desired system functionality.

◆ What is the budget?
◆ What are the “must-haves?”
◆ Should the system include a particular feature or function simply because it can be programmed? How often will that particular feature or function be used?
◆ What are the institutional requirements for security, interoperability, accessibility, etc.?
◆ Will the new system require a redesign of the current business process?
◆ Is the new system supported by organizational policy changes, or is it meant to drive them?

There are many hard conversations to have early on, and a key lesson is to learn to say “no.” Whether pushing back on sponsors pressing to do more with less or pushing back on stakeholders who simply want more functionality, managing expectations helps to ensure that the final requirements can be met with the available resources. Scope creep takes up resources and may detract from the real project requirements, so difficult choices made early will generally result in a smoother project in the long run.

Identify the Key Players and Required Staff

A successful eRA project will involve numerous functional participants and stakeholders, so it is important to outline the project team and develop the organizational chart. It’s best to start from the top and clearly identify the executive sponsors and business owners of the project. This illustrates the ultimate institutional support for the project and shows who is ultimately accountable for the budget and can make the tough decisions. From there, appoint the advisory and steering committees, and the technical and business teams. Don’t forget to include the specific project-oriented teams: testing, quality, training, and communication. Creating an organizational chart with all the team members and making it part of your overall communication strategy, will let everyone know their role in the effort.

As an organization chart is created, staffing needs will become apparent, and there will be multiple considerations to ponder. Will there be staff from the research administration office dedicated to the project? If so, how much of their time will be committed. Who are the technical staff and how much of their time is needed? The scope and timing of the project will help in determining whether full-time dedicated business and technical staff are required or whether part-time staff is sufficient. Larger projects tend to benefit from dedicated project management staff – project managers and project assistants to keep all the logistics of the project, coordinate meetings, project reports and updates and keep the project plan. The end-users of the system/process are also essential members of the project team, so involve them early on in requirements gathering, design sessions, and testing and communication.
plans. As the chart is fleshed out, clearly identify lines of authority for decision-making. For example, specify which decisions rest with stakeholders and end-users and which can be made by IT.

**Use Available Software Tools**

While the overall goal of an eRA project is to develop a customized enterprise software application, the effort often benefits from using available off-the-shelf software. For example, scheduling or project management software can be useful to help understand the project phases – requirements gathering, design, development and build, testing, training, and deployment. The project manager needs to keep track of the inter-dependencies of all of the tasks and manage the overall project deadlines, so such software will make their life much easier.

Accounting and budgeting software can help manage project costs. As in developing a sponsored project budget, thoughtful consideration must be used in developing an eRA project budget. Whether with an enterprise accounting software, a small business accounting package, or an Excel spreadsheet, tracking and managing costs is key. The successful eRA project must have a mechanism to track implementation and operation costs versus the initial budget (for hardware and software costs of implementation, annual licensing costs, ongoing staff costs for operation, etc).

Finally, other technologies, such as web sites, SharePoint sites, and document repositories, can be used to organize and share project documentation. As a basis for project communication, these tools can ensure that all team members are regularly informed of project status and that the particular functions are aware of changes that impact their deliverable. In addition to high-tech solutions, old-fashioned low-tech face-to-face communication is a remarkably effective means of sharing information. So, regular town hall, staff, or stakeholder meetings should be part of any communication strategy.

**Test and Commission the System**

Once the eRA solution is operational, it should be stress-tested prior to deployment. Such tests should be based on real-world scenarios at the particular institution. A dedicated testing group can test and document a system. However, tests of actual business scenarios run by actual end-users can identify the not-so-obvious system bugs. This will demonstrate system performance under work-day conditions. Be aware, testing with end-users should be done prudently. The system should be largely functional and de-bugged prior to their use, as this will be their first impression of the system.

**Train the Users**

As part of the overall project plan, spend some time developing a training strategy and resources. Consider the current business process and how they will change with the eRA system, then develop specific training for the changes. Understand what resources already exist (e.g. trainers, computer classroom space, training scripts, etc.) and use them. Remember that adults learn in different ways, so tailor training materials to match skill levels, to the extent possible. Quick reference
guides and a “live” training environment are helpful. Finally, consider basic research administration orientation for the IT staff, to help them understand the business and appreciate how the business drives the eRA solution.

**Convert Legacy Data and Build Reports**

Converting data for use by a new eRA system will allow the retirement of an existing system. However, converting data can be a project unto itself, with requirements for timing, resources, technical staff, and costs. Do not make assumptions when converting data and carefully consider what portion (if not all) of the legacy system that will be converted. Practice the data conversion with mock conversions to understand how the conversion will work. Test both native and converted records. Lastly, include the conversion plans in the overall communication strategy, to help end users understand what is and is not included in the solution.

With a repository of converted records and a stream on incoming new records from the new system, the next concerns are data management and reporting. The sudden wealth of data can promise reporting options that did not previously exist. However, while data management and reporting begin in earnest near the end of a project, the management and reporting needs should be part of the solution design from the beginning. This will ensure that the data elements are included in the production system. It will also allow definition of individual elements, their use, their expected evolution over time, and their optimal configuration for warehousing. For example, if system metrics are envisioned, then the data elements to support them should be part of the initial design. Similarly, the decision of whether to generate reports from the live production system or from a standalone data warehouse is best considered early in the system design process. Like data conversion, constructing a data warehouse is itself a significant project with the similar considerations.

**Conclusion**

The preceding list is by no means exhaustive with respect to developing an eRA system. The points identified are more like the tips of an iceberg. However, as with an iceberg, knowing it’s there (i.e. knowing what to expect) provides a huge advantage in dealing with it. eRA systems are here to stay, and it’s only a matter of time before an implementation is likely to begin at any particular institution. For those charged with managing such a project, following the steps outlined above can help them navigate the most treacherous aspects to arrive safely at the other side.

**About the Author**

**Lynda S. Wolter** is currently the Deputy Director of University Research Administration at The University of Chicago, and she has spent her entire twenty-plus-year career at the institution. She began as a departmental administrator, and she has since worked in a variety of settings including department, research institute, and Dean’s and central offices. She was recently business lead for implementation of the University’s first eRA module for grant/contract management. You can reach her at lswolter@uchicago.edu.
¶920.10 Do You Have the Right NIH Forms?
National Institutes of Health

We are required to update our application forms from time to time to implement new regulations and requirements. When substantial changes are made in our applications, all applicants must use the same forms and instructions (referred to as an application package) to ensure a fair review.

How can I tell old application packages from new ones?
Each application package we post in Grants.gov has a “Competition ID”. We use this field to identify the version of forms and instructions included in the application package. Application packages are designated alphabetically to indicate the most recent version (e.g., FORMS-C, FORMS-D). The Competition Title, which often accompanies the Competition ID, provides additional guidance to help you choose the appropriate application package (e.g., Use for due dates on or after 5/25/2016).

We’ll alert you to upcoming form changes through notices in our NIH Guide for Grants and Contracts and other channels. These notifications indicate the appropriate Competition IDs and timelines for their use.

Examples:
◆ NIH and AHRQ applications submitted to due dates on or after May 25, 2016 must use application packages with a Competition ID of FORMS-D (NOT-OD-16-004).
◆ Impact of Grant Application Form Update (FORMS-D) on Late and Continuous Submission Applications (NOT-OD-16-064)
◆ Plan to Move to Updated Forms (FORMS-D) for Administrative Supplement, Successor-In- Interest and Change of Institution Opportunities (NOT-OD-16-068)

Most of the time, FOAs have a single application package – just the one you need. During a transition to updated forms, there may be multiple application packages listed for a single FOA.

When more than one application package is available, you should typically choose the most recent one. However, exceptions do exist. For example, if you are applying late or under our continuous submission policy and the older version was used for the intended due date, then you may need to select the earlier application package.

Where will I see the Competition ID when preparing my application?
The Competition ID is visible in different places depending on your submission method:
◆ ASSIST
◆ Grants.gov downloadable forms
◆ Grants.gov workspace
◆ System-to-system solutions

ASSIST

ASSIST Application Initiation
You will see the Competition ID and Competition Title when initiating your application. If more than one application package is available, you will be presented with a pop-up window to select the appropriate application package.

Figure 920.10-1

ASSIST – Work In Progress Applications
After initiation, you will find the Competition ID in the FOA Information found on your Application Summary tab.
Grants.gov Downloadable Forms & Workspace

Downloading Application Forms
You will see the Competition ID and Competition Title when downloading your application package from Grants.gov.
After clicking the appropriate “Select Package” link, you will again see the Competition ID in the summary information provided for the FOA.
Grants.gov Downloadable Forms – Work In Progress Applications

After downloading your application package and opening it in Adobe Reader, you will find the Competition ID in the header information at the top of the set of forms.

Figure 920.10-5

Grants.gov Workspace – Work In Progress Applications

You will find the Competition ID in the FOA Information on the Workspace Details tab.
Where will I see the Competition ID in my submitted application image?

The Competition ID is not visible in the application image we assemble after you submit since it is not actually part of the forms or data.

However, once your application moves forward to NIH staff for further processing (after the two-day viewing window), we automatically generate an application summary page and prepend it to your application image. The Competition ID is available on that summary page.
System-to-System Solutions

Most system-to-system solutions for application preparation and submission allow users to see the Competition ID and Competition Title. However, the details for where to find that information vary by solution. Contact your administrative office or solution provider for guidance.
¶920.11  **NIH Application Forms Update: FORMS-D**
National Institutes of Health

The NIH periodically updates grant application forms in order to remain current with the most recent form sets available through Grants.gov and approved by the Office of Management and Budget. NIH and other agencies serviced by NIH’s electronic Research Administration (eRA) use the ‘Competition ID’ field of Grants.gov application packages for quick and easy identification of the forms being used for a particular Funding Opportunity Announcement or individual application package.

NIH will introduce application packages with a Competition ID of ‘FORMS-D’ for due dates on or after May 25, 2016.

**Changes to PHS forms included in ‘FORMS-D’ application packages**

*PHS 398 Career Development Award Supplemental Form*

- New “Candidate Information and Goals for Career Development” attachment
  - Combines “Candidate’s Background”, “Career Goals and Objectives”, and “Candidate’s Plan for Career Development/Training Activities during Award Period” attachments into a single attachment
- New “Data Safety Monitoring Plan” attachment
- New “Authentication of Key Biological and/or Chemical Resources” attachment
- Updated Citizenship selections
- Reorganization of attachments
- Field order and label changes
- Added/updated burden statement and form expiration date
- Updated form instructions

*PHS 398 Cover Page Supplement*

- New Vertebrate Animals section added
  - New questions
    - Are animals euthanized? Yes/No
    - If Yes, is method consistent with AVMA guidelines? Yes/No
    - If No to AVMA guidelines, describe method/provide scientific justification
- Ability to add Program Income information for 10 budget periods (previously 5)
- Field order and label changes
- Added/updated burden statement and form expiration date
◆ Updated form instructions

**PHS 398 Modular Budget**
◆ Indirect (F&A) Costs section changed to dynamically add indirect costs rather than providing static fields for four entries
◆ Minor label changes
◆ Added/updated burden statement and form expiration date
◆ Updated form instructions

**PHS 398 Research Plan**
◆ New “Data Safety Monitoring Plan” attachment
◆ New “Authentication of Key Biological and/or Chemical Resources” attachment
◆ Minor format and label changes
◆ Added/updated burden statement and form expiration date
◆ Updated form instructions

**PHS 398 Research Training Program Plan**
◆ Removed “Background” and “Recruitment Plan to Enhance Diversity” attachments (information previously included in these attachments moved to existing “Program Plan” attachment)
◆ New “Plan for the Instruction in Methods for Enhancing Reproducibility” attachment
◆ New Data safety Monitoring Plan attachment
◆ Format and label changes including categorizing attachments into sections
◆ Added/updated burden statement and form expiration date
◆ Updated form instructions

**PHS 398 Training Budget**
◆ Minor label changes
◆ Added/updated burden statement and form expiration date
◆ Updated form instructions

**PHS 398 Training Subaward Budget Attachment(s) Form**
◆ Streamlined instruction text
◆ Added/updated burden statement and form expiration date
◆ Updated form instructions

**PHS Assignment Request Form**
◆ New, optional form
Used to provide structured information to NIH referral staff regarding: funding component assignment preference, study section preference, individuals who should not review your application due to conflicts, and scientific areas of expertise needed to review your application

Complements existing “Cover Letter Attachment” on SF424 (R&R) form

Added/updated burden statement and form expiration date

Updated form instructions

**PHS Fellowship Supplemental Form**

- New “Applicant’s Background and Goals for Fellowship Training” attachment
  - Combines “Doctoral Dissertation and Other Research Experience”, “Goals for Training and Career”, and “Activities Planned Under Award” attachments into a single attachment
- New “Letters of Support from Collaborators, Contributors, and Consultants” attachment
- New “Description of Institutional Environment and Commitment to Training” attachment
- New “Data Safety Monitoring Plan” attachment
- New “Authentication of Key Biological and/or Chemical Resources” attachment
- New Vertebrate Animals questions added
- New questions
  - Are animals euthanized? Yes/No
  - If Yes, is method consistent with AVMA guidelines? Yes/No
  - If No to AVMA guidelines, describe method/provide scientific justification
- Updated list of values for the “Field of Training for Current Proposal” field; changed from 4-digit codes to 3-digit codes
- Updated Citizenship selections
- Reorganization of attachments
- Format and label changes
- Added/updated burden statement and form expiration date
- Updated form instructions

**PHS Inclusion Enrollment Report**

- Combines Planned Enrollment Report and Cumulative Inclusion Enrollment Report forms into a single form
- Questions used to identify type of report:
◆ Delayed onset study? Yes/No
◆ Enrollment Type? Planned/Cumulative (Actual)
◆ Using an Existing Dataset or Resource? Yes/No
◆ Enrollment Location? Domestic/Foreign
◆ Clinical Trial? Yes/No
◆ NIH-Defined Phase II Clinical Trial? Yes/No
◆ Added/updated burden statement and form expiration date
◆ Updated form instructions
This section includes practical guidance and tools — charts, checklists, etc. — relating to electronic research administration. This material is culled from a variety of authoritative sources.

**Grants.gov Implementation**

AIS editors

Research administrators should regularly check the Grants.gov Web site for system and deployment updates. Grants.gov “alerts” provide users information on such things as when the system is experiencing high-volume processing delays and when it is shutting down for maintenance. Quarterly stakeholder meetings/Web casts on a variety of topics also are being held throughout the year.

To avoid having to submit corrected applications, applicants are reminded to read and follow all application guides and announcement instructions. Research administrators are reminded that agencies generally publish their own electronic submission guidelines, which should be followed. (See ¶130.3 for a listing of Web sites for all 26 major funding agencies.)

Grants.gov users are encouraged to submit comments to Grants.gov on problems encountered, and also to make individual agencies aware of application-specific problems.

NIH offers the following advice to PIs who might experience problems with Grants.gov that could interfere with timely submission of an application:

1. Contact the Grants.gov Contact Center to document and help resolve the submission issues.

2. Document the issue with the eRA Commons Help Desk, making sure to include your Grants.gov support ticket number.

3. If the eRA Commons Help Desk “is able to verify a system issue that is be-

---

**Grants.gov Contact Center**

- The Contact Center is open 24/7, except for federal holidays (it is closed). Contact the center at 1-800-518-4726 or via email at support@grants.gov.

- The Contact Center is staffed with Customer Service Representatives who can answer general questions related to Grants.gov and technical questions about the submission of a grant application. The Contact Center does not answer questions or deal with issues pertaining to a specific grant opportunity.

- Grants.gov has set up a self-help Web portal (iPortal) that offers 24-hour assistance: www.grants.gov/iportal. You can access the iPortal from the Grants.gov homepage or Contact Us page. The feature includes the top-10 requested help topics, a searchable knowledge base (400 answers to common topics), self-service help ticket generation, live one-on-one help via Web chat (available 7:00 AM – 9:00 PM Eastern Time), as well as alerts and updates.
beyond your control, you will be placed on a Systems Issues list that is shared with NIH’s Division of Receipt and Referral and your application will not be considered late, as long as the submission process is completed within the two-day error correction window. If you are unable to complete the submission within the error correction window, you will need to provide sufficient justification for additional time.”

Usage Trends. In its fiscal year 2009 annual report, Grants.gov provides a number of statistics on usage trends that are well worth reviewing. Federal grant-making agencies are required to post a significant amount of their grant opportunities and application packages on Grants.gov. As such, those institutions wanting to apply for federal grants are forced to use the system.

Figure 930.1-1 shows the number of grant opportunities posted to Grants.gov by fiscal year; figure 930.1-2 illustrates the number of closings. (Note: Some agencies chose to use alternate systems to process grant applications during the heightened period of demand in FY 2009 resulting from the Recovery Act.)

**Figure 930.1-1: Submissions Received at Grants.gov**

![Bar chart showing submissions received at Grants.gov from FY2005 to FY2009](image)

Source: Numbers supplied by Grants.gov.

As seen in Figure 930.1-3, the growth of registered users — authorized organization representatives (AORs) — continues. The system-to-system community (S2S) is also continuing to grow, as seen in Figure 930.1-4.

Forms Development. Information on forms under development, including the SF 424 family of forms, is accessible from the “Forms Factory Control Log” button on the Grants.gov Blog site (grants-gov.blogspot.com).

Update on Adobe. Grants.gov reminds applicants that the Grants.gov “compatible version of Adobe Reader” is required for viewing, editing, and submitting a complete grant application package to Grants.gov and is available for free.
downloading on the Grants.gov site. Further, “Any and all edits made to the Adobe Reader application package must be made with the compatible version of Adobe Reader. Grants.gov does not guarantee to support versions of Adobe Reader that are not compatible with Grants.gov.” Available to assist applicants is an Adobe Reader “test package” used to verify if you have the correct version installed on your computer. You can access the test at www.grants.gov/applicants/AdobeVersioningTestOnly.jsp.
NIH reminds applicants that “the overall electronic submission process of finding opportunities, downloading application packages, preparing forms, preparing attachments, and submitting applications remains the same. Although the new Adobe forms have a slightly different look and feel from the PureEdge forms, the changes are mainly cosmetic.” Grantseekers may wish to bear this mind when working with Adobe application forms from other agencies as well.

**Resources for Applicants.** Grants.gov has put together an online resource for the applicant community called “All About Grants.” The Web page — www.grants.gov/applicants/all_about_grants.jsp — includes information on Grants.gov webinars and upcoming events, tips and resources from grantors, and articles and links to related associations and organizations. A separate applicant resource, in the form of a handy flowchart, is provided by Grants.gov and included as Figure 930.1-5, page 930:7.

Also available is a “Troubleshooting Tips” page (at www.grants.gov/help/trouble_tips.jsp) that includes help verifying your Authorized Organization Representative (AOR) status, using your E-Business Point of Contact (E-Biz POC) login, accessing search results, among other things.

**Grants.gov Redesign.** “Grants.gov conducted a study on the site’s usability and has identified key areas of confusion and difficulty” with the current site, according to the latest issue of the system’s newsletter, *Succeed*, and an upcoming redesign “answers those usability issues.” Some of the promised features are a “quick and easy login located in a universal header” to appear on every page of the site; an easier way to search for opportunities; a “feature module” for Find, Apply, Register

and Track; and new navigation tools. There is currently no “anticipated go-live date,” although it’s likely to be sometime in fiscal year 2012.

**Tips for Last-Minute Proposal Reviews.** When you as the proposal reviewer only have a short period of time available before an impending deadline, you may have to ask yourself, “What are the most important items to review?” Electronic submission guidelines aside, a quick focus on the following may be helpful:

- Are the correct forms being used?
- Are there certifications and assurances that need to be made?
- Are the correct rates (F&A, fringe benefits) applied as appropriate in the budget?
- Does the budget add up, and does it conform to limitations set by the funding agency?
- Are there cost sharing and matching requirements, and if so, have the commitments been endorsed by the appropriate institutional official?
- Have the required institutional approvals been received?
- When required by the proposal, are the appropriate animal and human research requirements being met?
- If there are subawardees, have those organizations endorsed their participation?

**Troubleshooting Application Errors**

At a recent Grants.gov webcast, Grants.gov’s Keenon James offered the audience various tips, many of which are likely familiar to users, including the following on avoiding common rejection errors:

- Be sure to use the correct DUNS number on your application and be sure the authorized organizational representative has registered to submit on behalf of your institution.
- Do not use special characters in either your application form or attachment names.
- Do not submit multiple applications for the same opportunity. (If you do, contact the agency, not Grants.gov, to remedy the situation.)

James also mentioned that S2S users should submit their certificate installation requests using the “Certificate Request Form” on the Grants.gov Web site. Renewals, he emphasized, should be submitted at least two weeks prior to their expiration date. Link to webcast and materials: www.grants.gov/help/stakeholder_communications.jsp.
**GAO Identifies Governance, Funding Problems**

In its report released in July 2009, the Government Accountability Office said that one of the key problems for Grants.gov was its “governance, responsibility, and funding.” The lack of coordination of these functions was behind many of Grants.gov’s performance difficulties experienced at the time, according to GAO.

Oversight of Grants.gov is shared by its Programs Management Board, the federal Grants Executive Board, and the Department of Health and Human Service’s Office of the Chief Information Officer, its managing partner. Various federal agencies are responsible for funding its operations.

The report also discussed application deadlines and, in particular, closing times for receipt of applications. GAO pointed out the disparity across federal agencies with respect to such times, which has resulted in confusion for the applicant community. Likewise, there is also a difference among agencies as to what constitutes meeting a deadline, such as is it when the application was actually submitted to Grants.gov or when it was validated by the system?

GAO concluded that the Recovery Act has highlighted the importance of Grants.gov in the proposal submission process and made four recommendations that it thought would improve the process and Grants.gov itself: (1) Develop performance measures. (2) Coordinate funding and management. (3) Establish a user group. (4) Work to create standards for application processing.

A May 2011 GAO report concluded that improvements are still needed in Grants.gov’s “economic efficiency” and to further its “effective management.” GAO was asked to examine factors that should influence HHS’ proposal for a Grants.gov funding model and how its various governing bodies could address the system’s “previously identified governance challenges.” Such challenges include “untimely contributions, a lack of performance metrics, unclear lines of authority, and confusion over roles and responsibilities among Grants.gov’s governance bodies.” Accountability and responsibility for Grants.gov performance among its three governance bodies “remains unclear,” GAO said.

GAO made four recommendations to HHS aimed at improving Grants.gov’s funding calculation, cost tracking, annual and strategic planning, and its knowledge sharing with other electronic government initiatives.

Figure 930.1-5: The Life of a Grants.gov Application Package

The Life of a Grants.gov Application Package

**Grantor**
- Grants.gov is a central storehouse for information on over 1,000 grant programs and provides access to approximately $400 billion in annual awards.
- Grants.gov is the central repository for grant information, offering access to over 1,000 grant programs totaling approximately $400 billion in annual awards.
- Grants.gov is a one-stop-shop for grant information, providing access to over 1,000 grant programs totaling approximately $400 billion in annual awards.

**Applicant**
- Grants.gov screens the application package for technical errors (e.g., virus) and transmits the package to the grantor agency.
- Grants.gov hosts the application package online in a searchable database.
- Grants.gov is a central repository for application packages, where applicants can find and submit their applications.

**Grants.gov**
- Grants.gov hosts the application package online in a searchable database.
- Grants.gov screens the application package for technical errors (e.g., virus) and transmits the package to the grantor agency.
- Grants.gov is a central repository for application packages, where applicants can find and submit their applications.

**FIND**
- Applicant visits Grants.gov to find grant opportunities.
- Applicant gets registered with Grants.gov (required in order to submit an application package).
- Applicant downloads and completes a grant application package (this process can occur during registration).

**APPLY**
- Applicant submits completed application package via Grants.gov.
- Applicant visits Grants.gov to find grant opportunities.
- Applicant gets registered with Grants.gov (required in order to submit an application package).
- Applicant downloads and completes a grant application package (this process can occur during registration).

**SUCCESS**
- Grantor selects and notifies applicant of grant award.
- Grantor reviews the application package.
- Grantor publishes the application package for grant opportunity on Grants.gov.
- Grants.gov establishes a grant opportunity, funding criteria, and Funding Opportunity Number (FON).

Source: www.grants.gov
¶930.2 **Institutional Response to Grants.gov**

AIS editors

As federal agencies are under a mandate to transition their funding opportunities and applications to Grants.gov, research administration Web sites at colleges and universities, in turn, are busily incorporating Grants.gov information and training as an integral part of its services to constituents. (For background on Grants.gov, see ¶905.4.)

Many have developed their own Grants.gov Web sites and training manuals to provide its community with

◆ updated information,
◆ links to agency Grants.gov implementation packages,
◆ institutional instructions and tips, and
◆ training tools and schedules.

Some host in-depth training manuals and presentations for researchers and support staff that contain more than 100 pages or slides. Institutional responses to Grants.gov often vary as a result of many factors including how and when an institution’s funding agencies are transitioning to Grants.gov and different levels of institutional resources available, but they all have certain common themes.

Some institutions, like the University of Michigan, have developed Grants.gov committees to assist in the implementation and training to the campus community. Members of the committee include representatives from information technology (IT) departments, grants officers, support staff, and other individuals involved in the program. The university is using several different communication venues to disseminate information on Grants.gov. Examples include campus newsletter articles, e-mail groups (listservs), meetings with research deans, assistant chairs, and faculty, in addition to creating a Web site specifically for Grants.gov.

Regardless of what method your institution is using to cope with Grants.gov, colleges and universities are strongly urged to contact Grants.gov with user feedback on a continuing basis. Grants.gov also plans to host quarterly stakeholder meetings/Webcasts throughout the year. Research administrators also should consider submitting comments to a Grants.gov “self-help group” coordinated for NCURA by Bob Beattie at the University of Michigan (beattie@umich.edu).

**Training**

Many universities are creating their own training manuals on Grants.gov with content specifically pertaining to policies and issues unique to the institution. The length of introductory material about Grants.gov varies considerably across different manuals. New York University (NYU) posts an eight-page manual, “OSP Procedure: End-User Guide to Grants.gov” at its Web site (www.nyu.edu/osp). A
short paragraph introduces the program and its purpose and also provides links to the portal’s customer support.

Some institutions choose to provide a comprehensive briefing about the development of the program, which usually references Pub. L. 106-107 that created the portal. (See ¶905.3.) Much of the material chosen by institutions is taken from the Grants.gov Web site.

Research administrators will need to update training materials, as institutional needs dictate, once agencies complete the transition to Adobe forms.

**Technical Requirements.** Technical requirements for Grants.gov and related IT issues are leading sections of training manuals. It is important, however, to keep abreast of the numerous changes Grants.gov has undergone or will undergo regarding its IT infrastructure and how that will affect institutional grant seekers.

**Agency Timelines.** Some institutions may be at different stages than others in developing training materials due to the different timelines when certain federal agencies will convert to the system. This affects each institution’s timeline to begin training based on the specific research areas and activities of the university. Most research administrators cover the varying transition dates and timelines of different federal agencies involved in grantmaking in the introductory section of their training and maintain updated information and links to agency transition timelines.

The University of Michigan hosts comprehensive links to agencies at www.research.umich.edu/era/grantsgov/index.html and the University of Maryland at www.umresearch.umd.edu/ORAA/era/systems.html, which contains information on specific e-submission systems used by campus researchers and in-house contacts for each specific system.

Often institutions, like the University of South Carolina, offer training in general or “overview” Grants.gov and agency-specific training, such as for “Grants.gov and NIH.” Other institutions offer agency-specific Grants.gov help upon request.

**Resources Available at Grants.gov**

Linking directly to Grants.gov and using its images and forms in slides is a popular technique used by many institutions in their training manuals. The portal itself is a natural place to begin in constructing a guide. On the front page of Grants.gov, the link “Check out our Webcast: Get Started With Grants.gov,” may seem like a good starting point. However, the Webcast is most useful for obtaining information on how to register the institution for Grants.gov. Detailing this information in an institutionwide training manual or Web site is unneces-
sary since these steps do not involve individual researchers and may even add confusion if included.

The Webcast is designed specifically to instruct research administration staff on matters such as receiving a data universal number system (DUNS) for the institution, registering with the Central Contractor Registry (CCR), and designating an e-business point-of-contact and authorized organization representative (AOR). Several institutions emphasize strongly to constituents that registration by researchers or business managers is unnecessary at Grants.gov since the institution itself should already be registered.

Grants.gov does have an official “User Guide” located at www.Grants.gov/help/user_guides.jsp. This guide can also be tailored to include specific messages and instructions by institutions. A good example of this practice is University of Maryland’s training guide located at www.umresearch.umd.edu/ORAA/era/grantsgov_docs/sept_ggov.pdf. Other institutions, like Johns Hopkins University School of Medicine, have incorporated the information into their own training manuals rather than using the Grants.gov user guide as a template. (www.hopkinsmedicine.org/Research/ora/index.html).

After the introductory comments and software instructions for Grants.gov, most institutions’ training manuals follow somewhat closely the outline and pattern of the instructions posted under the “Apply For Grants” section on Grants.gov, which lists the remaining steps as “Download a Grant Application Package and Instructions,” “Complete the Selected Grant Application Package,” “Submit a Completed Grant Application Package,” and “Track the Status of a Completed Grant Application Package.”

Several training manuals at universities include pictures of forms taken from these sections with detailed instructions and other information written in the margins that directly pertains to the institution. The University of Michigan’s Division of Research and Development Administration training guide sums up the remaining training topics as searching for applications on Grants.gov, opening the application, filling out the application, sending the application to the research administration office, and detailing what happens once an application is submitted.

Deadlines and Other Policies
To address concerns about technical errors and other issues in the submission process, many universities are changing their deadline policy in regards to when proposals are due to the research administration offices. Research administrators are now requesting that researchers and their staffs submit applications sooner to their offices to create a longer lag time before the submission deadline to Grants.gov. Extra time is needed to deal with technical and other issues that may arise with this new system.

Document Storage. Several institutions have IT systems where an applica-
tion or proposal is electronically submitted to the research administration office for review before its submission to Grants.gov. The use of these systems or servers has created new IT challenges for research administration offices to deal with issues such as the storage of these documents and naming conventions for them. These challenges reinforce the importance of having IT staff an integral part of a Grants.gov committee.

**Earlier Internal Deadlines.** Stanford University, for example, has implemented a new five-day internal deadline requiring final copy of a completed proposal to be submitted to the research administration office five business days before the sponsor agency’s deadline. Stanford has also assigned an institutional official that is responsible for verifying that a proposal has been accepted and validated in Grants.gov, in addition to verifying with the sponsoring agency that the application has been received and accepted in their system as well. Research administrators play a vital role as a liaison to their researchers during the two-day “window periods” that occur once a proposal is submitted to Grants.gov, and then when it is submitted to the sponsoring agency. These periods are the timeframes when either Grants.gov or the agency verifies receipt of the application and reviews them for any errors.

**Other Topics Addressed**

Stanford’s policy reinforces the concept of Grants.gov serving as an administrative portal where its main functions are to provide researchers one area to search and apply for grants. However, its scope after those functions is narrow. Specific agency systems such as NSF Fastlane and NIH Commons are still playing a major role in the application process. Researchers need to understand that Grants.gov is currently an administrative portal that forwards applications onto the specific agency for review.

The University of Michigan encourages its researchers to register with the sponsoring agency, in addition to applying through Grants.gov. Its training manual includes a “Do’s and Don’t’s” checklist for the program.

It is beneficial to maintain contact with sponsoring agencies and subscribe to their e-mail listservs, which may provide more in-depth and timely alerts for researchers and administrators. (For example, for NIH go to era.nih.gov/ElectronicReceipt and click on the “Subscribe to the latest eSubmission News!” box.) Similarly, some universities also have developed in-house listservs to keep their communities informed on changes to Grants.gov implementation.

In addition to a full training manual, several universities also post a one-page reference document that takes users through the five main steps of Grants.gov. One example can be found at Texas Tech University’s Web site (www.ors.ttu.edu/NEWORS/NewHome/Grants_gov/Grants_gov.html). Many universities use the same or a similar document, and it provides a brief overview of the entire process that may be a useful tool in terms of developing a larger and more in-depth training manual. The contact information for a university’s research administration office can also be posted on this document.
Some institutions offer training in a classroom or computer-lab setting with some supporting material and information about Grants.gov on their Web sites. Some such as Wayne State University (www.spa.wayne.edu/grants.html) offer online registration for the sessions and strongly encourage all stakeholders in research areas to participate in a session in the near future. Texas Tech University offers a Webcast of a training seminar for staff who are not able to attend an in-house session (www.ors.ttu.edu/Newors/newhome/Grants_gov/GG_Training.html).

**Ongoing Refinement**

The development of Grants.gov is a continuing process that requires monitoring the Web site for new and additional information and tools that may develop over time. Institutions will likely refine their training manuals and tools in response to changes to Grants.gov and agency-specific implementations, as well as in response to the evolving needs of their constituent groups. It is important to stay abreast on how other universities are developing and refining their training as well.
Knowledge Check

The Q&As at ¶990.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 900 has been understood. Note: For the answer key for ¶990.1, see ¶990.3, which appears on a separate page (page 990:5) for testing purposes.

Discussion topics at ¶990.2 are designed to engender dialogue among staff on general issues of importance in the field.

Q&As

1. NSPIRES is an electronic research administration system used specifically by which federal agency(ies)?
   (a) NIH
   (b) NASA
   (c) NASA and Department of Energy
   (d) NSF

2. Activities of the P.L. 106-107 “work groups” include development of all of the following EXCEPT:
   (a) Uniform administrative rules across agencies
   (b) Common electronic processes
   (c) Uniform terms and conditions for all federal contracts
   (d) Common data elements for applications and reports

3. According to ¶905, what does S2S stand for?
   (a) Science-to-science
   (b) Science-to-system
   (c) System-to-software
   (d) System-to-system

4. A DUNS number is obtained from what organization?
   (a) Dun & Bradstreet
   (b) Office of Management and Budget
   (c) Central Contractor Registry
   (d) Adobe Software
5. “Bits and bytes are sent to a mathematical formula, which turns readable text into what appears as random characters.” This is a brief definition of
(a) Signing on
(b) Decoding
(c) E-signature
(d) Encryption

6. What does the FFATA do?
(a) It appropriates grant award funding for federal agencies for FY 2007.
(b) It requires the creation of a public Web site that provides searchable funding information on federal awards.
(c) It was the legislation that mandated the creation of Grants.gov.
(d) It funds the Federal Grants Streamlining Initiative.

7. According to Grants.gov, PureEdge forms will eventually be replaced by
(a) Adobe forms viewer
(b) Google forms viewer
(c) Microsoft Office forms viewer
(d) Nothing; forms are being phased out.

8. The system that implements digital signatures and allows them to be used with specific programs to offer secure communications is called
(a) Public Sector Authorization
(b) Electronic Signature Authorities
(c) Public Key Infrastructure
(d) Personnel Key Infrastructure

9. Now that Grants.gov appears to be firmly established, which of the following statements is TRUE?
(a) Use of NIH Commons will be phased-out in the near term, likely by the end of FY 2007.
(b) Use of NSF FastLane will be phased-out in the near term, likely by the end of FY 2007.
(c) Neither (a) nor (b)
(d) Both (a) and (b)
Discussion Topics

1. What system do you have in place to help ensure that faculty are aware of all the changes that are taking place with respect to Grants.gov and the necessary specific forms required for each application submitted?

2. What is the proper role for the office of research administration at your institution with respect to the development, refinement, and application of software for tracking award applications, acceptance, monitoring, etc.?

3. How effectively does your electronic research administration system interact with or integrate with other systems at your institution, such as payroll, human resources, etc.? What role can you play in ensuring a helpful integration?

4. How is your ERA system adapting to the special reporting challenges arising from the Federal Funding Accountability and Transparency Act and American Recovery and Reinvestment Act?

5. How are you navigating through the various application systems, now that agencies such as NSF are bypassing use of Grants.gov? What special challenges have confronted you and what has been your response? Are there process changes you need to yet make in order for your office to improve your response?

6. Did you participate in the latest flurry of applications submitted for American Recovery and Reinvestment Act funding? How/what can you learn from the experience?

7. What, if any, services at your institution have yet to transition to “electronic” research administration? Can they/will they ever become ERA services? If not, why not?
1990.3  **Answer Key**

Following are the correct answers to the questions included at ¶990.1.

1. (b) NASA
2. (c) Uniform terms and conditions for all federal contracts
3. (d) System-to-system
4. (a) Dun & Bradstreet
5. (d) Encryption
6. (b) It requires the creation of a public Web site that provides searchable funding information on federal awards.
7. (a) Adobe forms viewer
8. (c) Public Key Infrastructure
9. (c) Neither (a) nor (b)

Introduction

AIS editors

Institutional training programs have grown from periodic individual classes to comprehensive curricula, often with mandatory requirements, in order to meet the demands of an ever-changing sponsored program environment. Increases in federal funding coupled with significant growth of regulatory oversight have combined to prompt institutions to consider how best to train and prepare their research administrators to meet these challenges.

Julie Cole, of Duke University, examines the basic concepts to be considered when developing training programs, both from the perspective of building the training “in-house” and/or partnering with professional organizations to meet training needs. She discusses the considerations that help to shape institutional strategies and factors that influence the format and resourcing for training programs. Also discussed is the important link between institutional drivers and training outcomes. This chapter identifies the foundational steps in building training from the ground up.

In tight budget times, college and university leaders expect a return on the resources and the faculty/staff time invested in training. Training programs have grown significantly in the past decades, whether prompted by increased compliance requirements, growth in sponsored program funding, need for increased faculty support in grant management, or simply the ability to prepare and retain skilled professionals. Training programs succeed when they are closely associated with institutional needs, and when content and delivery is correlated to specific institutional dynamics and especially to the audience the training intends to serve.

This chapter will continue to respond to the information needs of research administrators over time. Future editions will provide additional detail and discussion points to help guide institutions in developing and refining their training initiatives.
Training and Education

Julie Cole, Director of Research Costing Compliance, Duke University

In recent decades, both the number and diversity of universities and colleges receiving external dollars for research and related endeavors have expanded dramatically. While the investment, mostly from federal agencies, has sparked exciting scientific and medical advances, securing and managing it is baffled by ever-changing guidelines, program requirements, rules, and regulations. The issuance of the Office of Management and Budget Uniform Guidance, among several other federal changes, provides an opportunity to rethink institutional processes and policies and the most appropriate means of communicating these significant changes to various grant management constituencies.

Many institutions are turning to training/professional development to ensure a vigorous and compliant environment. Most recognize that well-trained specialists in grant management are essential to the success of sponsored programs. The consequences of limited compliance knowledge and poorly informed award management can be severe — from proposals that are rejected because of formatting or missed deadlines to major institutional audits resulting from noncompliant policies and practices. Faculty are well prepared for teaching and research but not for the demands of regulation and financial management. They must rely on the grant manager to relieve them of this time-consuming burden and to protect the institution from noncompliant actions.

In the past, grant managers acquired their knowledge of sponsor rules and regulations “on the job.” With greater responsibility for the growing complexity of the field, interest in developing training programs — both institutionally and among national professional groups — is an obvious outcome.

This chapter examines the pros and cons of building the training “in-house” and/or partnering with professional organizations to meet training needs. Certain federal mandates require specific training for faculty in areas of research development and conduct which are generally managed by dedicated institutional units related to the research area. Thus, the focus of this chapter is on the training of research administrators — those professionals who provide support and technical expertise in developing and submitting proposals and managing compliant funded projects. Topics address the decisions, planning, resourcing, and deployment actions that must be considered in creating and/or enhancing research administration training.

Why Develop Training Programs?

What factors prompt an institution to develop training and professional development activities for faculty and staff who manage grant traffic? They fall into four broad categories:

1. ensuring compliant grant management and maintaining currency in a rapidly changing funding environment;
2. improving service and support to faculty;
3. adopting related technologies, processes, and policies; and
4. developing and maintaining a skilled workforce.

Each of these factors will be discussed in turn.

**Reason #1: Compliance Management**

For many institutions, the impetus for training programs comes from compliance concerns and sponsor mandates. Historically, the U.S. Federal Sentencing Guidelines (§8B2.1, www.ussc.gov), established in 1987, had significant impact. They list seven elements that constitute an “effective compliance and ethics program”:

- compliance standards and procedures (e.g., a code of conduct or ethics);
- oversight by high-level personnel (e.g., a compliance or ethics officer and/or committee);
- due care when delegating authority and responsibility;
- effective communication of standards and procedures (e.g., training);
- monitoring systems and reporting mechanisms;
- enforcement of disciplinary mechanisms; and
- appropriate response after detection.

A series of proactive site visits conducted by the National Institutes of Health (NIH) in the early 2000s reinforced the concept of training as a way to mitigate non-compliance. NIH “subject area descriptions and observations” demonstrate the need for a skilled cadre of grant management personnel:

**Description of Subject Area**

_The institution should have a program of ongoing institution-wide training and education of all responsible staff involved in NIH-supported research to ensure consistent and accurate guidance on policy interpretation is provided to faculty and staff. The institution should be committed to sustaining the training and education program to meet the needs of new employees and provide appropriate updates for all employees. Roles and responsibilities of PIs, departmental administrators, sponsored projects officials and other institutional offices that have responsibility in the areas of grant compliance and Institutional oversight should be clearly defined and communicated. See http://grants.nih.gov/grants/compliance/compendium_2002.htm#desc._

Many institutions have taken NIH guidance as a framework for developing their training initiatives. Key points include:

- training everyone engaged in research on policy interpretation and applying policy to devise best practices;
- sustaining training to include updates as internal and external policies and procedures change;
- ensuring that new employees receive appropriate initial and continuing training;
- clearly defining roles and responsibilities, so content is customized to target
audiences; and

◆ establishing an institution-wide blueprint for communication.

Appropriate management of sponsored activities is a stated federal government priority and expectation, both among recipients and within federal agencies. Most recently, grant management training has become a focal point for the Chief Human Capital Officers Council (http://www.chcoc.gov/index.aspx) which aims to serve “a highly qualified, well-trained workforce with the right set of skills for the missions.” The Council is working with stakeholders to ensure that the federal workforce responsible for managing grants has uniform knowledge, core competencies, training, and proficiency standards. A competency chart guides the Council in developing and delivering grant management training to the federal community. (http://www.chcoc.gov/Transmittals/TransmittalDetails.aspx?TransmittalID=2515).

This federal interest in appropriately training internal staff is being mirrored throughout the recipient community as well.

A concrete impetus for training at the institutional level is the increased emphasis on transparency and accountability that often translates into more numerous audits. Institutions are seeing an expanded number of focused audits beyond the annual A-133 requirement. Stimulus funding, awarded under the American Recovery and Reinvestment Act of 2009 (www.Recovery.gov), heightened emphasis on accountability and performance, bolstered by additional federal requirements. Meanwhile, the Government Accountability Office (GAO) and certain congressional committees continually monitor the sponsored programs process for ways to conserve federal funds and ensure productivity in the research enterprise. This “perfect storm” of shrinking dollars and increased vigilance is prompting many universities to consider how well their faculty and grant management staff are trained in financial compliance and oversight. They have only to look at audited peer institutions for cautionary tales.

Another justification for grant management training programs is the growth of qui tam lawsuits. An individual who observes potential violations in managing federal awards (deemed to be “false claims”) can bring such a suit on behalf of the federal government and may receive 15–30% of the damages recovered. On May 20, 2009, President Obama signed legislation containing a number of significant amendments to the False Claims Act (FCA); several of these strengthened whistleblower or qui tam actions. Many institutions believe that these actions can be avoided by well-trained and knowledgeable personnel and a well-communicated internal escalation process for compliance concerns.

How should institutions weigh their compliance management risks and create the training programs necessary to offset potential problems? Many monitor audits of peer institutions for insights into compliance and conduct internal audits and institutional risk monitoring. The National Council of University Research Administrators (NCURA; www.ncura.edu), Council on Governmental Relations (COGR; www.cogr.edu), and the Society of Research Administrators International (SRA; www.srainternational.org) are good sources of information; in particular, NCURA’s
Regulation and Compliance 2014: A Compendium of Regulations and Certifications Applicable to Sponsored Programs (http://www.ncura.edu/PublicationsStore/ProductInfo.aspx?productcd=40675-037) and Report on Research Compliance (www.reportonresearchcompliance.com) are current reference tools. In addition, an excellent audit analysis tool is prepared by Charlene Blevens, University of Miami, on an annual basis (http://www.costaccounting.org/audits.html) as a service to the research management community.

Many institutions develop their own in-house monitoring/oversight teams to identify potential high risk areas and then create training classes to address these potential weaknesses. The University of North Carolina system has developed a comprehensive process for assessing compliance risks throughout its multiple campuses.

Reason #2: Improve Service and Support to Faculty

Colleges and universities rely on external support to sustain and to expand their research activities. Their success helps them to compete for students, faculty, and national recognition. Under increased pressure to submit proposals even as they manage current projects, faculty frequently express the need for informed support staff to relieve their administrative burden. The recent FASEB/NSB/FDP Survey on Administrative Burden confirmed this need: 83% of respondents were principal investigators (PIs); most had NIH funding and worked at institutions with medical schools. Those with active federal projects spent an estimated 42% of their time in meeting federal requirements. They indicated that addressing the many tasks that comprise the grant life cycle posed their greatest administrative burden. Suggested improvements included standardization of requirements, regulations, and information input methods and more flexible effort reporting, spending plans, and funding mechanisms.

The process of proposal development and submission has never been easy for academicians. With the advent of electronic research administration, guidelines and submission standards have been in a state of flux. Sponsors now prioritize collaborative projects that require complex coordination of submission elements. Faculty often feel challenged to stay current in this evolving grant world, and most rely on either central office staff or departmental research administrators to develop and submit budgets, various types of abstract, biosketches, subcontracts, consulting agreements, and/or data management plans, not to mention the proposal.

Once a project is funded, sound fiscal management is essential, but faculty rarely have the experience or expertise. They are focused on their research and teaching. Larger universities generally employ departmental grant managers, who serve as dedicated support staff to ensure that the project remains on budget, reconciliation and adjustments are done on time, and charges are consistent with sponsor and institutional policies. Departmental grant managers are charged with interpreting rules and regulations for their assigned faculty and may be challenged to demonstrate their knowledge of policy and process on a regular basis. Without skilled support staff, researchers are hard pressed to remain competitive. Training support personnel to facilitate proposal submission and manage funded projects is an es-
sential element of the institution’s strategy for building and sustaining its external funding base.

In less research-intensive institutions, central office staff may provide these services, or they may be performed directly by faculty who have little experience with sponsor fiscal requirements. Training in post-award functions, fiscal management, sponsor rules and regulations, policies and program guidelines is critical to faculty support and compliance management.

Significant changes in how sponsored programs are developed, submitted, and managed generally follow major sponsor policy and process revisions. The implementation of new technologies and systems, like Grants.gov or program progress reporting may mandate the development and deployment of new or upgraded grant submission and management systems. Constantly evolving sponsor regulations and guidance may prompt the deployment of internal policies and processes developed in response. Clearly institutions throughout the nation will have to revise and update their internal policies and processes to address the new uniform guidance issued by OMB. The institutional burden to address such significant change will likely require training for grant management personnel, and increased communication to all aspects of the research community.

**Reason #4: Maintain a Skilled Workforce**

Underlying all of these challenges are two basic requirements: training newly hired personnel and keeping current personnel up to date. Throughout academia, the need to support and to improve services to maintain or to grow research endeavors drives both emerging and mature training programs. Typically, institutions with small research volume do not have extensive departmental research administration structures, and training focuses on central office staff who help PIs to submit and to manage their own projects.

The close relationship between grant managers and faculty make personnel transition in research administration a serious concern. The demand for skilled grant managers has significantly increased over the past several decades. The challenge to find such highly skilled individuals is compounded by the scarcity of formal degree programs that prepare individuals for a career in research administration. Research Administration is a growing international profession, complete with a recognized body of knowledge, professional credentialing through a national testing and validation program, and emerging academic degree programs. Currently there are four formal degree programs: the University of Central Florida’s Master of Research Administration; Emmanuel College’s Master of Science in Management with specialization in Research Administration; Johns Hopkins University’s Master of Science in Research Administration; and Rush University Medical Center’s Master of Science in Research Administration.

As vital as these emerging programs may be, they provide the foundational knowledge that must be customized to specific institutional dynamics. Thus, hist-
torically almost all research administration training related to the internal processes of the institution is done in-house and on-the-job.

Developing an in-house training program from scratch can be a formidable challenge. Fortunately, NCURA provides an extensive menu of meetings, training conferences, webinars, online tutorials, on-site workshops, and publications in support of the research administration professional. Other professional associations, such as SRA International, also provide training opportunities. Many institutions find these programs of benefit, especially when supplemented with training specific to their own policies and systems. When matched to internal processes and policies, external training can be an effective springboard for baseline preparation of in-house grant managers.

**Summary: Focus on Why**

The rapid growth of electronic requirements for sponsored program submissions, changes driven by technology and information systems, and the expansion of regulations and regulatory oversight have prompted exponential growth in training and professional development programs for faculty and research managers.

An essential element in designing and deploying these programs is a clear understanding of why the institution needs them, as outlined in Figure 1105.1-1. Understanding why is the basis for all future decisions about training development.

**Figure 1105.1-1. Reasons for Training**
1105.2 Creating Institutional Buy-In

Institutions tend to support research administration training programs based on their perceived needs and outcome expectations. College and university leaders expect a return on the resources and faculty/staff time invested in training. Generally, these expectations are directly related to the rationale for creating the training programs. As institutions plan and implement training, its content, delivery, and evaluation should always be tied to expected outcomes.

Institutions that have developed training initiatives often report that having buy-in from their leadership was essential to achieving success. Consider the following: Is the proposal submission process improved? Do faculty feel better supported in the management of their funded projects? Are system and policy changes adopted with minimal revision or need for technical assistance? Are there improvements (both perceived and documented) in compliance?

First, Conduct an Assessment

The creation of mandatory training at Duke University demonstrates the importance of institutional buy-in. In 2004, Duke wanted to know the current state of its growing grant management and compliance structure, and to create a vision for where it should be in order to remain competitive and compliant.

An external assessment provided credibility and a fresh, impartial comparison to other institutions on a national scale. A task force charged with implementing task force recommendations piloted program development within the Financial Services division in conjunction with the pre-award offices. Senior management stakeholders endorsed this approach based on clearly stated expected outcomes, and follow-up meetings discussed process, objectives, training plan, roles, and responsibilities before the program was implemented.

The process is ongoing. As Duke’s grant management base changed, the program was significantly revised in 2007 and again in 2014. Mandated by senior leadership, training now supports technological advances, policy and process development and deployment, and a cadre of specifically affiliated grant managers whose performance is monitored according to metrics and analyzed.

Other institutions have embarked on similar paths. Emory developed a strong partnership between Human Resources and Research to identify mechanisms to “pod,” or “regionalize”, their research support structures. Like Duke, Emory requires grant management personnel to become certified in institutional processes and compliance.

The NCURA Peer Review Program is an excellent assessment mechanism. While not designed specifically to identify training needs, this comprehensive service provides an intensive analysis of the institution’s capacity to support and manage research. Institutions can derive a wealth of useful information from the Peer Review report, including identification of areas where training would be an asset or even a necessity. See http://www.ncura.edu/InstitutionalPrograms/PeerReview/PeerReviewProcess.aspx
See Problems as Opportunities

Sometimes adverse events present opportunities for improvement. Troubling audits and faculty feedback on perceived needs can prompt training interventions to remediate problems and strengthen skill levels among support personnel. An institution-wide initiative to increase sponsored program funding can be logically linked to training that supports faculty in seeking grant and contract opportunities. The creation of new policies, processes, technologies, and systems present opportunities to suggest new or enhanced training to senior leadership.

While leadership buy-in is a major component of a successful training program, buy-in and active participation of collaborating offices and end-users are also essential. At institutions with many grant managers, participation/graduation from in-house training programs is often seen as a résumé builder, and verification that skills and knowledge specific to the institution have been acquired. Some institutions require staff to complete training; others may make the training optional, while some may provide salary or supplemental pay incentives.

Is institutional training best accomplished by a single office? While there has been a steady growth in units dedicated solely to training, or associated with monitoring and metrics related to performance measurements, still others feature collaboration among a variety of university offices in developing training content. Whatever the approach, effective training requires a comprehensive menu of offerings that includes both content and interpretations from several perspectives. There are some training programs that incorporate trainers who are themselves research administration practitioners. They may be departmental personnel who clearly understand the day to day activities that departmental personnel encounter and can this provide a realistic perspective. In such a collaborative setting, all units benefit by developing skill sets among current personnel and assuring that other constituencies are aware of the institution’s rules and requirements.

Other institutions create training offices directly tied to an overall research management organization, so trainers become early participants in policy and process discussions and can provide feedback on questions that should be addressed at the central office level.

Summary: Focus on Outcomes First

Buy-in and active endorsement of training initiatives should be developed on the basis of outcomes and benefits to the institution, the collaborating partners, consumers (faculty), and research management personnel. As these outcomes are defined, they will provide a framework for content, who should be trained, and other similar considerations (see Figure 1105.2-1).
Figure 1105.2-1: Defining ‘Outcomes’

- Compliance management as evidenced in audits and monitoring
- Improved processes for proposal submission/increased faculty satisfaction
- Adoption/Application of policy, process and systems
- Retention/Improved performance by skilled personnel

Who Should Be Trained?

The next logical step in building a training program is to define recipients. Research administration is practiced in many venues with diverse functions. As NIH suggests, institutions should develop and/or update their “roles and responsibilities”, which are essential in identifying not only who should be trained but also what the training content should be.

Examples of “roles and responsibilities” (R/R’s) grids may be found at many colleges and universities. For example, the University of Minnesota not only defines R/R’s but their constituent layers of accountability:

Responsibility is defined as the authority to make a decision and be accountable for any outcomes associated with that decision. To the extent possible responsibility is maintained locally so that decisions are made by individuals with the best information. Oversight is always distinct from the operating unit that makes the decisions. See www.research.umn.edu/regulations/sproles.html.

By further defining responsibility and related oversight, Minnesota provides a framework for distinct roles and differentiated training. Its comprehensive website includes resources, guidance, and other critical links in support of its training initiatives, and it has also developed and implemented a certification process designed to provide targeted training through core learning and electives. See http://www1.umn.edu/ohr/trainingservices/spa/spectrum/index.html.

When Duke University revised its training program in 2014, the change focused on providing core knowledge and function competencies that all research administrators should know. It then developed a “decision matrix” to enable supervisors to identify the functions specific to each grant manager. The matrix allows managers to select “electives” that most closely match the skills and knowledge needed to perform each function. Harvard University has developed a very similar document (http://osp.fad.harvard.edu/sites/osp.fad.harvard.edu/files/attachments/73/basicsponsoredadministrationtrainingguidelinesdec2012.pdf) that guides both the research administrator and the supervisor in the selection of appropriate classes and training venues.

Build Training Around Organizational Structure

In addition to identifying individual tasks and levels of responsibility and accountability, training should vary with the overall administrative organization. Many universities employ service providers in academic departments who perform both pre- and post-award functions. They should logically receive training in both areas. Other institutions have separate pre- and post-award central offices whose staffs require a slightly different training approach, as they often must opine on the approval of a submission or a charge to a funded project. While they are clearly providing a service to the institution, their role is somewhat different than those who assist in proposal development and project management at the grassroots level. Still other institutions have created “pods” or “research service” areas dedicated to a “cradle to grave” approach in support of the faculty they serve. The training for these personnel may have to be specifically customized to their respective clientele, or broad-
ened beyond the traditional research administration functions that are the standards for most training programs.

**Keep the Audience in Mind**

However the institution defines its training cohort(s), the content thus delivered must consider their respective functions and levels of responsibility. As noted in Figure 1105-3, many successful training programs go beyond the traditional focus on grant managers or central office staff. A thorough review of roles and responsibilities often reveals other audiences in need of training and information. For example, who makes decisions on whether certain charges can be allocated to a sponsored project? What role do faculty play in these decisions? Are they made by laboratory managers with no training in compliance? Are they made remotely by central offices with little knowledge of day-to-day research activities? These questions reveal audiences well beyond those typically targeted for in-house training programs.

**Summary: Satisfy the Audience’s Needs**

Good training requires targeting the audience and developing content specific to its needs to produce results directly related to anticipated outcomes. Figure 1105.3-1 posits a model for identifying “who should be trained.”

**Figure 1105.3-1. Who Should Be Trained?**

[Diagram showing categories: Compliance, Support to Faculty, Adoption of new processes, etc.]
1105.4 What Should Be Taught?

The training curriculum should grow directly from the participants’ roles and responsibilities as well as from the expected outcomes for the institution. Most training programs adopt fundamental research administration concepts, outlined in NCURA’s highly respected national traveling workshops (see http://www.ncura.edu/Education/TravelingWorkshops.aspx).

NCURA provides a broad variety of training and professional development initiatives. Many are extremely cost-effective and can be delivered both in-person and online, including multi-week tutorials and topic-specific webinars. See http://www.ncura.edu/Education.aspx.

Another source of basic content is the Society of Research Administrators’ Body of Knowledge, “a topical index to information, articles, resources and links essential to successful research management on all levels. Produced and maintained by expert research administrators from around the world, this comprehensive ‘living library’ of essential resources contains in-depth information on the six main categories of research administration.”

Less detailed Body of Knowledge matrices can be found on the Research Administrators Certification Council website. They are the basis of the national Certified Research Administrator (CRA) examination, a national proficiency test that many institutions use as an indicator of broad knowledge in research administration practice and policy (http://www.cra-cert.org/CRAbodyofknowledge.html)

The recent Pre-award Research Administrators’ Body of Knowledge focuses on pre-award knowledge only. (http://www.cra-cert.org/CPRAbodyofknowledge.html).

Workshops and program sessions at NCURA, SRA national meetings, and the various regional and chapter meetings of each organization are excellent sources of content. Federal briefings and updates are also useful. The NIH website has a broad array of helpful information that can easily be transferred to in-house training programs, while the National Science Foundation (NSF) periodically conducts outreach and webinars on compliance and program information.

A wealth of training material is readily available on the web and through professional organizations. Some institutions develop programs in conjunction with NCURA, SRA, and/or federal and private sponsors. The external resource provides generic information and the host institution translates it to its own operations. NCURA’s popular webinar and DVD series can be delivered directly to the institution and used to follow-up on discussions specific to institutional operations and policies.

Build the Program ‘Backwards’

Most successful programs build backwards — they consider what a successful graduate should know in order to meet institutional outcomes and performance expectations and then create a curriculum or a curricular approach that meets these standards. They build a framework that considers the need for the training,
the expectation of changes in performance or compliance that will result, and the impact the training will have on participants (rewards, recognition, and retention) and those they support. Some schools have created a general training framework that focuses on fundamentals and “on-the-job” training to provide the specific skills relative to the position and unit. Others combine policy, process, and training in a comprehensive approach.

**Keep Content Fresh**

Content and delivery should be continuously reviewed and refreshed. Most training initiatives have mechanisms to update their standard content by modifying and adding regulatory changes, new/updated processes or changes in policy. These updates may take many forms: brown bag lunches, web updates, and presentations at department meetings. These sessions disseminate “hot topics” quickly and broadly.

Training content is never static. To anticipate and reflect changes in research administration processes, training program managers should consider recent audits of peer institutions, important notices from sponsors, and internal developments, such as new systems and policies.

The NCURA YouTube Tuesday series (https://www.youtube.com/user/ncura1959) is fun and a highly effective way to communicate important topics.

A cautionary issue in this changing training environment is how to ensure that all research administrators have received the most up-to-date information. A class taken months ago may have been modified to include new information.

**Tailor the Training to the Institution**

Whenever possible, training content should be connected to the unique aspects and needs of the institution (see Figure 1105.4-1). What do your faculty say they need from their research administrators? What input from the Internal Audit unit and/or internal monitoring points to potential problems? Should training developers consider input from Human Resources when considering the rewards, recognition, and retention strategies of their training design? How will new systems or processes affect the roles/responsibilities that affect training requirements?

All of these perspectives should inform the content and outcome of emerging training programs and contribute excellent feedback on existing programs.
Focus on Roles & Responsibilities

As mentioned earlier, the first step in developing training content might be to review the institutional roles and responsibilities (R/R’s) associated with research administration. Note that institutions typically develop roles and responsibilities for managing compliance, but defining them by grant management function is also worthwhile. By matching these sets of performance expectations, institutions can develop comprehensive learning outcomes oriented to job performance and compliance management. Determine whether institutional job descriptions provide insight into the performance expected of research administrators at various levels sufficient to develop content.

If the correlation is not direct, then a more subjective approach might convene a group of end-users — faculty, senior departmental personnel, and central office leadership — to define what knowledge and proficiencies they expect at various levels of research administration. Ask them: Should these proficiencies be attained through training or a combination of training and on-the-job development? How should the trainee demonstrate proficiency over time? Does any logical progression correspond with HR levels? The benefits of developing a matrix are twofold: it can be used to measure learning attained through training and to provide a baseline for content. An example of a learning assessment matrix from Duke University is noted in Figure 1105.4-2. It can be found at http://finance.duke.edu/research/training/certificate/raa/ElectiveMatrix.pdf
Figure 1105.4-2. Duke Learning Assessment Matrix

Research Administration Academy Elective Decision Matrix

Instructions:

The matrix below should be used by supervisors and staff members when selecting electives for the Research Administration Academy (RAA) Certificate Program. At least four electives are required. The first column lists competencies/job skills your employee may be doing. If s/he is performing that skill, check the box. Core (required) courses where the material will be covered are in the second column. The third column lists the electives available. Only classes included in the RAA elective column count towards the Elective requirement for the RAA Certificate program. The recommended complimentary courses are not eligible to count as electives for the RAA certificate. They are courses that may be valuable to your employee if s/he is performing that duty/function.

*Classes listed with an asterisk are currently in development.

After reviewing the matrix, select at least four electives. Both supervisor and employee signature are required.

If competency is covered in more than one class, the primary source of information is **bold**.

Supervisor Selected Electives (minimum four required):
1. 
2. 
3. 
4. 

*Note: Classes noted with an asterisk are in development*

Supervisor Pledge:

I am responsible for the day-to-day oversight and performance of the RAA applicant. I used the decision matrix to select appropriate electives to fulfill RAA certificate program requirements. Only the courses listed in the “RAA Electives” column count towards the elective requirement for an RAA certificate. Complimentary courses do not fulfill the electives requirement, but may be beneficial to your employee’s job performance. The selected electives best match the current or future duties of my employee in the certificate program. If, during the course of the certificate program, I feel the need to modify the electives above, I will contact both RCC staff and the employee. It may not be feasible to deviate from the selections above, and I agree to work with RCC staff for any amendments to the curriculum.

Signature ___________________________ Date ___________________________

Employee Pledge:

I agree to register for the electives selected for me by my supervisor. I am responsible for registering for electives in the LMS. If a scheduling conflict exists, or I find I am unable to complete the assigned electives in the prescribed timeframe, I will notify my supervisor and RCC staff immediately. I understand that neither RCC nor my supervisor is obligated to deviate from the selections above. I will complete the required courses within 12 months of enrollment in the RAA Certificate program.

Signature ___________________________ Date ___________________________
Training content may vary from basic research administration concepts to specific “hands-on” training directly related to institutional practices. Figure 1105.4-3 presents a basic model of training content that connects the expected outcome to the training provided.

![Figure 1105.4-3. Program Model](image)

Training can often provide a venue for economies of scale and improved processes. North Carolina State University (NCSU) has moved away from their original “retreat” approach where grant managers met for five days with central office staff to discuss a variety of grant management functions. Instead, it created a web portal for access to policies, process guidance, continuing education, and class registration. This model allows delegation of signature authority at the most distributed level reasonable, making the review and approval process on proposals and agreements far less bureaucratic and more value-added. In this environment, continuing education is critical, and NCSU has made it mandatory for all signatory delegates. At least annually, the signatory delegates hold a meeting to discuss what their signature represents, what the signatures of the PIs, department heads, and center directors represent, what the consequences of false or inappropriate representations are, and what challenges have been observed by central administration. Delegates’ signature authority is suspended if they fail to attend a continuing education session on the subject. See [http://research.ncsu.edu/sparcs/training/](http://research.ncsu.edu/sparcs/training/)
Consider the ‘Whole’ when Constructing the Program

In addition to content decisions, training developers should consider how the program will be constructed. Many institutions have opted for a combination of certificate programs and stand-alone classes, largely depending on the target audience. Duke University offers three progressive certificate programs supplemented by optional individual classes. For examples of such programs, see Figure 1105.5-4.

If an institution decides to offer and/or require a certificate program, certain HR considerations come into play. Mandatory training requires performance evaluations and carries career advancement implications. The institution’s HR policies must be considered when mandating training.

Figure 1105.5-4. Samples of Training Curricula

The following universities provide examples of training and training curricula for those seeking to develop and/or to refine their current programming.

Harvard University
http://osp.fad.harvard.edu/content/training

The University Research Administration Training Team (URATT) has developed a series of courses designed to cover basic information about the world of research administration at Harvard. This course series begins with the Overview of Sponsored Projects Administration course, and is complemented by a sequence of online courses. Research administrators looking to further their practical knowledge of the field may be interested in the Research Excellence in Administration Certificate at Harvard (REACH) program.

University of North Carolina at Chapel Hill
http://research.unc.edu/offices/sponsored-research/training/

The Tarheel Curriculum is a series of classes for staff who support the sponsored research enterprise at UNC-CH. The classes help them to build their competencies and knowledge with the overall goal of increasing efficiency and effectiveness in daily administration. Presented twice a year, this program is intended for any staff member who currently performs or expects to assume duties and responsibilities related to the administration of research contracts and grants. Both Level I and Level II certificates are offered.

University of Maryland
http://www.ora.umd.edu/sites/default/files/documents/training/certificate-program/certificate-program-policies.pdf

The Office of Research Administration (ORA) and the Office of Contract and Grant Accounting (OCGA) are committed to providing guidance to the university community on Federal, State, and University policies and regulations for sponsored research. To enhance this effort, the two offices have combined to offer a series of courses, each intended to give a deeper understanding of a specific aspect of con-
tract and grant administration. Courses may be taken in any order, and participants may choose to take as many or as few as they like. Completion of module quizzes and attendance at all 14 lectures is mandatory to receive a certificate in sponsored project management. Course modules are offered at least once a year.

University of South Carolina
http://grant.sc.edu

Gamecock Research Administrators Network Training (GRANT) is a “comprehensive training program developed to meet the research administration needs of University of South Carolina faculty and staff.” Launched in 2005, it provides a deeper understanding of regulations, policies, and procedures; a fundamentally more unified and streamlined sponsored projects system; and access to vital resources and contacts for further assistance. The program has expanded to include faculty assistance and programming, on-line access to modules, and similar enhancements.

Stanford University
https://doresearch.stanford.edu/training

Stanford developed one of the first comprehensive training programs for research administrators and has expanded its content and potential audiences to include PIs, research managers, and others. The Cardinal Curriculum can lead to certification in internal policy and process. It has two levels to address individual development from novice to expert. Level I classes should be completed before attempting Level II. Training modules are publicly available and integrated with campus policies, procedures, and other reference tools throughout.

In-House Policies Parallel Federal Ones

An important component of training content is the institution’s corpus of policies, process documentation, information resources on financial and proposal submission systems, and internal directives. Recently, a major university embarked on a review and upgrade of its research management documentation. Officials report significant progress but note the need for comprehensive training content management to ensure consistency. Training must flow through policy and process layers to maintain both currency and continuity.

In-house training programs greatly benefit by incorporating specific institutional policies and processes. Most learners will want to know how to manage research at their home institution and why it is done in this way. When institutional policy and practice are linked to training, participants come away with useful skills and explanations for their workplace colleagues and clients.

Training Program Development: One Institution’s Story

In 2009, as part of a campus-wide strategic plan, Auburn University hired outside consultants to assist in evaluating and assessing not only its Office of Sponsored Programs but the research enterprise as a whole. In March 2010, the comprehensive final report included extensive comparisons to peer institutions and over 40 recom-
mendations for the research administration functions alone. Among them, a need for a formal education program to assist faculty and staff in understanding their compliance responsibilities and navigating the process was identified.

In response, the office developed its Compass curriculum in spring 2012. It guides research administrators through the myriad channels toward compliance expertise, including minimizing and hopefully avoiding errors. Proceeding from a quote from Henry St. John, “Truth lies within a little and certain compass, but error is immense,” the Compass curriculum instills a heightened sense of responsibility, inspiring participants to perform their jobs at the highest level.

Over two years, 88 employees enrolled in Compass, which has evolved from a nine-week certification course to a robust curriculum composed of an introductory prerequisite class, a ten-week certification course, two advanced classes with prerequisites per semester, and a refresher class held during the summer. It also hosts brown bag lunches for faculty and presents selected research administration topics at the departmental level on invitation. See Martha Taylor, “Assessing Your Sponsored Programs Office” NCURA Magazine (August 2011) for more information.

Summary: Outcomes Drive Content Decisions

Basic functions in grant management are fairly well established and available from a variety of sources. They can be customized to meet the unique needs of, and outcomes anticipated by, individual institutions: improved service to faculty, improved compliance, increased proficiency, and skilled workforce retention. Mechanisms to update information should also be considered.
1105.5 Who Should Be a Trainer?

Not every content expert is a good trainer, nor do good trainers always have the nuts-and-bolts expertise to answer workplace questions.

As mentioned earlier, some institutions combine dedicated trainers with skilled practitioners who provide a “reality check” on how processes are actually implemented at the departmental level. Other institutions have helped knowledgeable research administrators to develop training skills. Many institutions look to research administrators with a proven background as presenters at NCURA and/or SRA meetings when developing their in-house training programs.

The Importance of Program Structure

The choice of training personnel can also depend on the structure of the training program. Many institutions combine classes taught by various units to form a comprehensive program. For example, classes taught by pre-award offices, post-award offices, and compliance offices may contribute to one certificate program.

Other institutions have a formal training unit, with dedicated leadership and support staff; for example, Auburn University, Stanford University, Duke University (https://finance.duke.edu/research/training/index.php), Harvard University, the University of Utah, and the University of Miami (http://www.miami.edu/finance/index.php/ora_homepage/training/)

Duke University teams respected departmental grant managers with central office personnel to lead classroom discussions of best practices. Their performance is evaluated throughout the year, and feedback solicited to enhance the training product.

Selecting the Proper Oversight Office

Beyond the identification of good trainers, training programs require significant coordination. Many operations must be considered. How will registration be managed? How will training be tracked, particularly if it is offered as a certificate program or as required continuing education? For these and other reasons, a dedicated office with expertise in registration and tracking may be beneficial.

Alternatively, numerous “off-the-shelf” learning management systems (LMS) provide these functions.

Summary: Focus First on Expertise

Research administration training requires extensive knowledge of the field, not always readily available to trainers from outside the profession. When selecting trainers, institutions should consider research administrators with presentation experience gained through professional organizations, such as NCURA and SRA; trainers from a variety of institutional offices who bring specific topical knowledge; and/or departmental personnel with first-hand practical expertise.
Training Delivery Mechanisms

The same linear approach applied to training and trainer development is useful when considering effective delivery mechanisms. Options include, but are not limited to, classroom lectures, interactive laboratory classes, webinars, focus group discussions, streaming video broadcasts, on-line modules, large auditorium-style presentations, department presentations, and on-line chats.

Most of these options depend on the resources available and the content. Both NCURA and SRA offer excellent on-line/broadcast programming that can be used alone or in conjunction with institution-specific follow-up. NCURA provides on-campus workshops that can be combined with specific institutional training (http://www.ncura.edu/InstitutionalPrograms/On-CampusWorkshops.aspx).

Many institutions have developed on-demand training modules, which are particularly helpful for training on important new processes, systems, and emerging ideas that must be distributed continuously to a broad audience. The University of Wisconsin-Madison offers an extensive training program and frequently captures information from meetings, webinars, and other training venues for later study (https://www.rsp.wisc.edu/training/).

Consider Various Venues

Many established training programs prefer to use traditional classrooms. Classroom instruction is labor-intensive but offers the added benefits of dialog between trainers and learners and the opportunity to clarify and to elaborate when needed. Complex topics, such as F&A or export controls, may be best discussed in a classroom.

A number of electronic training platforms provide alternatives. When exploring them, understanding the differences between a content learning system and a learning management system (LMS) is important. An LMS is a comprehensive approach that includes “classroom and E-Learning management, content authoring and publishing, communication and collaboration, assessment and evaluation, competency and performance management, reporting, analytics and integration with HR or financial systems.” A content learning system, on the other hand, is “a course creation tool. It is [usually] purchased in conjunction with an LMS.” You will have to consider how these systems will be integrated with existing institutional systems and what resources will be needed to implement them.

Stanford University’s approach integrates on-line training with desktop references. According to the site, “The online classes can serve as an always-available desktop reference. Additionally, each class has a ‘webliography’ of links to policies, tools, forms and resources. Users are encouraged to bookmark these pages and use them to guide you in your daily work.” Stanford also provides instructor-led or online classes in many topics.

As training programs expand, developing a content management process, whether through a formal purchased LMS or in-house, is very important. As processes, polices, and systems change, trainers must be able to quickly identify and to adjust/update the instructional modules affected throughout the curriculum.
Sometimes a spreadsheet of key topics will suffice; sometimes a more sophisticated content management system is needed for comprehensive changes.

Supervisors, as well as the learners themselves, will want to maintain an accurate “transcript” of classes taken, credits earned. If institutional certification is required, an accurate record of when certification is achieved, and records of any subsequent continuing education required to maintain the certificate are essential. Most LMS systems can manage this process, or smaller initiatives might develop their own in-house means of recording class completed.

**Summary: Guard Against ‘One-Size-Fits-All’**

Training may be delivered in a variety of ways. Delivery mechanisms depend on many factors: the resources available to create and deliver the content; the content’s complexity and whether or not interactive question-and-answer components are necessary; the experience and “need-to-know” level of the learners; and their comfort with delivery mechanisms beyond the traditional classroom.

Whenever possible, training should be delivered in the manner that best meets target audience learning needs and most convenient to their working environment.
¶1105.7 **How to Evaluate Training**

This chapter has explored the relationships among several factors that influence training initiatives: perceived need for training; expected outcomes; content that supports outcomes; and content-appropriate delivery mechanisms. In this section, the discussion comes full circle: How should trainers demonstrate that their program has addressed perceived institutional needs, produced meaningful outcomes, enabled trainees to meet performance and proficiency standards, and resulted in an overall return on investment?

Many institutional training programs follow each class with a test or assessment to determine if learning has taken place. How this tool will be used depends on a number of factors: Is the class/module mandatory or elective? What is the “success threshold”? Is feedback on an incorrect answer built in? Will test results be provided only to the learner or become part of the learner’s record and available to the supervisor? Who will review the test questions periodically to ensure that they measure the appropriate learning objectives?

To facilitate testing, trainers should develop their content based on quantifiable learning objectives and emphasize key concepts throughout the training process.

**Tools Can Evaluate Content, Instructors, Delivery Method**

Some evaluation tools are used to improve content, instructor performance, efficacy of the delivery mechanism, or for other purposes. NCURA uses an excellent model that uses feedback from session participants and session monitors to measure how successful the training has been. Duke University regularly polls the mentors of students participating in their certificate programs for feedback and suggestions for improvement. Some institutions have developed a 360° evaluation process that takes input from different constituencies, including trainees, supervisors, faculty, and central administration.

A content matrix might be used to measure learning in individual classes or modules or expanded to measure the success of the overall training program. For example, it might identify six core concepts that entry-level staff should know; learners would have to pass an assessment or test to confirm that they have learned these concepts; and the training office might solicit feedback from end-users (faculty or supervisors) to confirm that the expected outcome has been achieved; for example, improved faculty support or compliance management. An LMS can provide highly sophisticated evaluation tools that allow trainers to see feedback immediately as well as trending data on which to base program revisions.

How should training programs report their success? Measures might include enrollment, feedback, percentage of trainees passing the test, even percentage passing the national Certified Research Administration exam. First consider the rationale for creating the training — the institutional expectations of positive outcomes as a result of training. Success might be reported in these larger, qualitative terms: increased faculty satisfaction in services provided; internal audit or monitoring reports of improved compliance practices; or evidence of increased adoption of new technologies or systems.
Summary: Evaluate ‘Outcomes’

Training success can be evaluated in many ways — from the perspective of the individual learner to return on institutional investment. Many tools and options are available for basic to sophisticated evaluations and trending. At the highest level, institutions are concerned that their initial expectations for training outcomes are met.
1105.8 **A Word about PUIs**

At most predominantly undergraduate institutions (PUIs), research is administered by central offices, with faculty managing a good portion of their projects alone or with the assistance of a graduate student or a departmental administrative staff member. This paradigm necessitates training focused on the PI’s need for centralized support, with central office staff providing both services and approvals. It may include informing faculty about changes in proposal development and submission processes, new rules and regulations, and/or training graduate students, postdocs, or post-award central office personnel to facilitate funded project management.

Many PUIs have combined offices overseeing human subject research and proposal development. California State University at Sacramento, for example, provides on-line compliance tutorials, workshops, and seminars designed to explain such topics as human subjects’ protections, to faculty and to offer tips on proposal development and project management (http://www.csus.edu/research/workshops/index.htm).

PUIs generally host their training in central pre-award offices, as they are likely to have the information most needed by faculty to develop and manage their funded projects.
1105.9 Conclusion

Training programs have proliferated in the past decades, perhaps due to increased compliance requirements, growth in sponsored program funding, need for increased faculty support in grant management, or simply to prepare and to retain skilled professionals. A host of exemplary in-house and professional association programs have taken various approaches to content using various methods.

Training programs succeed when they are closely associated with institutional needs and when content and delivery are correlated to specific institutional dynamics. With the increased capacity of new technologies to deliver high-quality training in the workplace, training may become a constant learning environment for research administrators at all levels.

The basic concepts outlined in this chapter are provided to assist colleges and universities in considering the depth and breadth of their training programs. They are scalable to the institution — private/public and small/large. If the basic tenets described above are followed, a continuum can naturally evolve as momentum builds.

NCURA has recently supported the development of degree programs in research administration. As these programs grow and mature, in-house training may become continuing education or updating for the new research administrator. Whatever the future holds, the need for information, knowledge, and skill will remain.
Case Studies

This section includes case studies relating to training and education activities for and by sponsored research administrators. These materials are culled from a variety of authoritative sources.

Case Studies on Research Ethics Training
Office of Research Integrity, Department of Health and Human Services

Research administrators may wish to incorporate one or more of the following case studies — or similar types of such case studies — in developing training materials on research ethics.

Case Study #1: The Price of Collaboration

Dr. March walks into the office of Ethel Nightingale, and drops a packet of papers into her “in” box. Ethel takes a quick look and sees that it is a reimbursement request for the meeting that March organized among the group of researchers collaborating on a project funded by the NIH. Glancing a bit farther down the page, Ethel pauses, and then gets up and goes to look for Dr. March in her office.

Ethel asks, “Dr. March, can I ask you a couple questions about this reimbursement for your meeting last week?”

“Yes, Ethel, as long as it won’t take too long. I’ve got a meeting in a few minutes,” replies Dr. March.

Ethel continues, “I’m wondering if there’s a typo here. It says you spent $6,000 for two days’ accommodations for 10 people. This seems much too high to charge to the NIH grant. I thought that the point of using the institute’s Inn and Conference Center was that you could save money by not having your colleagues stay at local hotels.”

“Well, it could have been less, but we wanted to be sure we wouldn’t be disturbed, so rather than using just one meeting room, I rented the entire west wing of the center. Here,” Dr. March says, taking the papers from Ethel, “let me just increase the number attending to 20, and that should take care of any cost questions the bean-counters might have.

“I don’t think the accounting office will approve this expense,” Ethel responds tentatively, “and the charge for a case of wine will never fly; the NIH doesn’t allow charges for alcohol on its grants.”

“So, just make it a charge for a catered meal. Be creative. The important thing is that the meeting went beautifully and that’s critical at the start of a successful collaboration. We all got to know each other, generated some great ideas, and got a lot of planning done. Don’t worry, the NIH will get its money’s worth, and that’s all that really matters. Go ahead and do whatever you need to do to make this work,” concludes Dr. March as she hands the papers back to Ethel. “Right now, I’ve got to get to my meeting.”
Case Discussion

Interests of the Affected Parties. Ethel Nightingale has an interest in maintaining a good working relationship with researchers in her department, like Dr. March, and being seen by them as competent and efficient. She is also interested in doing her work properly so as to keep her job and avoid accusations of wrong doing or fraud.

Dr. March has an interest in facilitating a successful collaboration among those involved in this project. She is also interested in producing exciting and useful research results, minimizing the amount of time she spends on paperwork, and making efficient use of her time. While she may not be aware of it, she has an interest in remaining eligible for federal funding, and in avoiding both questions about how grant funds are utilized and time-consuming investigations.

Other members of the collaboration have an interest in a successful collaboration, in producing exciting and useful research results, and in avoiding problems associated with investigations of questionable grant expenditures.

The institute has an interest in facilitating the research conducted by its researchers. It is interested in maintaining and, if possible increasing, its national prestige and its receipt of federal research funds.

The NIH is interested in funding research projects that produce exciting and useful results. It is also interested in having the funds it awards be spent as effectively as possible within its policies.

Obligations. Ethel Nightingale has obligations to Dr. March, the collaborative team, the institute, and the NIH to check that the grant funds are used in the proper manner, and to facilitate the research of the collaborative team members. She is obligated to aid Dr. March in March’s role as the PI for this grant. Nightingale also has a basic obligation to be sure that all the forms she files are true and accurate.

Dr. March, as the principal investigator on the project, has obligations to her collaborators, the institute, and the NIH to be sure that the research project is conducted as effectively as possible, that the grant funds are spent in accord with the terms of the grant and with NIH policies, and to be honest. She also has obligations to her collaborators and her institute to avoid involving them in fraud, and to Ethel Nightingale to support Ethel as she carries out her job.

The institute, as the award institution for the collaborative project, is obligated to follow the terms of the award and NIH policies in administering the grant.

Ethical Issues. Dr. March’s actions suggest that she sees a conflict between her obligation to follow the NIH policies and her obligation to conduct the collaborative research project in the most effective manner possible. She also seems to feel that there is a conflict between her interest in spending time conducting the research and her obligations to oversee the grant with honesty and to support Ethel’s administrative role.

Right now, Ethel is confronted with a conflict between an obligation to Dr.
March to do as she is directed (and thereby facilitate the research), and an obligation to the institute and the funding agency to follow their policies and complete her work with honesty. Ethel finds herself with conflicts between her interests in maintaining a good relationship with Dr. March and facilitating the research project in the short term, and the longer term obligations Ethel has to support research by March, and at the institute as a whole, by helping to ensure that the relevant policies are followed and honesty is maintained.

**Consequences of Actions.** If Ethel simply proceeds as Dr. March has directed her, she would quickly finish with filing the reimbursement and all might seem fine, but only for a while. In addition, Ethel will be aware that the information filed is not completely truthful, and this could cause her worry and possibly a diminishment of her self-esteem. In the longer term, some of the true facts are likely to come to light when someone takes a closer look at the forms, or if an audit is carried out. In the end, there would be serious negative consequences for all those involved. Ethel could even lose her job.

If, on the other hand, Ethel immediately goes to the department or division head and openly accuses March of dishonesty in the expenditure of grant funds, there is likely to be an uproar among those in the department, and Ethel could still lose her job.

However, if Ethel does not go ahead with filing the reimbursement, but instead engages Dr. March in further conversation making her aware of the details of the policies and what has happened to people and institutions who have violated them, Ethel may be able to convince Dr. March to consider other solutions to the situation. It might also be helpful if Ethel to consulted a fellow administrator who could give her ideas about how to impress on Dr. March the seriousness of the requirements of institute and NIH policies.

**Case Study #2: A Possible Co-Author**

Yolanda, a graduate student in Prof. Zhu’s lab, is talking with Wanda, Prof. Zhu’s secretary. She notices the title page of a manuscript atop a pile of papers on Wanda’s desk. When she looks at it more closely, Yolanda is surprised to see that there are only four co-authors: her, Valerie (also in Prof. Zhu’s lab), Prof. Albert, and Prof. Zhu.

Four months ago, Yolanda spent several weeks in Prof. Albert’s lab at a different university learning an experimental technique that she needed for her research. This was a technique with which the Zhu lab had had no experience. For most of her visit, she worked side by side with Ben Brown, a post-doctoral fellow. Ben not only taught her the technique she needed to master, he also gave her good advice on her experimental design, critiqued her interpretations, and during the last week of her visit, helped Yolanda complete a series of experiments. Those experiments became an important part of the experimental section of this research paper into which
Wanda is entering various edits.

“Wanda, I think there’s an error here,” Yolanda begins. “Ben Brown’s still missing from the co-authors, and I know I put a note on the last draft about this. He was on the first few drafts, but somehow he got dropped.”

“Oh, now that you mention it, I do recall seeing his name before,” replies Wanda. “Well, what I got from Prof. Zhu before he left on his trip was what he told me was the final version. I’m supposed to finish up the manuscript, and get it sent out to the Journal of Important Research today.”

“But you can’t do that,” exclaims Yolanda. “It wouldn’t be fair. You’ve got to put Ben’s name back on the paper before you send it.”

Case Discussion

**Interests of the Affected Parties.** Wanda is interested in being perceived by Prof. Zhu, and to a lesser extent his lab, as being skilled and efficient in completing the tasks assigned to her, and so maintaining her employment. She also has an interest in there being a good, cooperative atmosphere within the research group.

Yolanda is interested in maintaining her professional relationships with Prof. Albert, Ben Brown, and most of all Prof. Zhu, her advisor. She has interests in conducting significant research, in successfully completing her graduate work, in being a co-author on publications, and in securing her next position.

Prof. Zhu has an interest in his laboratory conducting significant research and then receiving credit by publishing that research. He is interested in his graduate students and post-doctoral fellows progressing in their development as professional researchers, in establishing and maintaining productive collaborations, and in having his laboratory and its support services run smoothly.

Prof. Albert has very similar interests to those of Prof. Zhu.

Ben Brown has an interest in participating in collaborations that will benefit his career, and in receiving appropriate attribution for his efforts.

The members of the two laboratories are interested in being recognized for their contributions, in having access to beneficial collaborations, and in maintaining a cooperative, supportive atmosphere within their research groups.

The two universities have an interest in facilitating the completion of significant research by their researchers, and in avoiding controversy and confrontation among these researchers.

**Obligations.** Wanda has an obligation to complete her work as directed by Prof. Zhu, but she is also obligated to help facilitate his work and the progress of his laboratory.

Yolanda has an obligation to do all she can to see that those who have contributed to a body of research receive appropriate attribution. She also has obligations to inform her advisor, Prof. Zhu, of what occurred during her time in the Albert lab, and to seriously consider Prof. Zhu’s evaluation of appropriate co-authorship.
Prof. Zhu has obligations to ensure that appropriate attribution is given to all those who contribute to publications that originate from his laboratory, to honor agreements that he has made with colleagues, to communicate clearly with his students and staff, and to be familiar with the work of researchers in his laboratory.

Prof. Albert has an obligation to honor agreements that he has made with colleagues, but he is also obligated to protect the interests of members of his laboratory.

**Ethical Issues.** Wanda’s obligation to follow Prof. Zhu’s instructions is in conflict with her interest in maintaining a good atmosphere within the research group, particularly with Yolanda. Yolanda’s obligation to do all she can to see that Ben Brown receives what she perceives to be appropriate attribution appears to be in conflict with her obligation to honor Prof. Zhu’s decision. There may also be conflicts related to obligations to honor agreements, and communicate clearly with students and other colleagues, but there is not enough information given in the scenario to be sure of what these are.

**Consequences of Actions.** If Wanda figures that it can all be sorted out later, and so accedes to Yolanda’s demand to add Ben Brown’s name before she sends off the manuscript, she is putting herself at risk for unpleasant consequences. She will have made a change in a matter that is of great importance to researchers, authorship. As a result, Prof. Zhu is likely to be upset not only because she has made an alteration without consulting him, but because her actions would be considered to be a breach of research ethics by his lab. It is considered unethical to list someone as a co-author without his/her permission, or if he/she does not meet the criteria for co-authorship. There may be good reasons why Brown’s contributions were not considered to be significant enough to warrant co-authorship.

If Wanda simply ignores Yolanda and dismisses her concerns, Yolanda is likely to be upset and resentful toward both Wanda and Prof. Zhu. There is the potential for discord within the Zhu lab as well as between Prof. Albert and Prof. Zhu and their research groups.

However, if Wanda explains that she can’t make any changes without Prof. Zhu’s direction, but that changes might be possible later, after Yolanda has a talk with Prof. Zhu, Yolanda may realize that she needs to talk directly with Zhu and make her case through the proper channels. After all, the manuscript still has to go through the review, revising and publishing processes, and so there is still time for changes to be made. In addition, it is not clear what agreements were made between Zhu and Albert, what Zhu knows of the work Yolanda did with Ben Brown, whether Yolanda has ever done more to address this question than just put notes on drafts of the manuscript, and whether there are reasons of which Yolanda is not aware for not including Brown as a co-author. What is needed here is some frank, open communication among the researchers concerning the work presented in the manuscript and the criteria for co-authorship. Wanda may be able to catalyze this conversation.

Case Study #3: Supporting Documentation

Janet Jones is a pre-award specialist for the engineering school. She is working on putting in the final edits, and then assembling a grant application Prof. Wilson is submitting tomorrow to the NSF. In particular, she is double-checking to be sure that she has all the letters and other supplementary documents that need to be sent with the application. Unfortunately, there is one thing that is bothering her.

In the text of the application, Prof. Wilson presents, with citation, a lot of preliminary, unpublished data from a research group in a different country with whom he has worked in the past. However, Janet cannot locate either a letter giving Wilson permission to cite these data, or any sort of documentation that a collaboration with this group is planned as part of the new research project. In fact there is no mention of either of these items in the list of supporting documents, and she recalls that a letter of permission was required when Prof. Wilson included some unpublished results from a different colleague in a journal article he submitted recently. “What should I do now,” she wonders.

Case Discussion

Interests of the Affected Parties. Janet Jones has an interest in doing all she can to help the faculty with whom she works secure grant funding. She is interested in demonstrating her competency and efficiency by carrying out her duties as quickly, accurately, and independently as possible.

Prof. Wilson is interested in obtaining grant funding for his research. He is most probably also interested in minimizing the time he spends on bureaucratic matters, maintaining good relationships with his current and past collaborators, and avoiding any question of inappropriate behavior.

The members of the research group which is the source of the unpublished data are interested in furthering their research careers, something which is usually dependent upon being the first to publish a new discovery so as to receive appropriate attribution for one’s work. They are most probably interested in maintaining good relationships with their collaborators and colleagues.

The university of Jones and Wilson is interested in supporting the work and research of its faculty members so that they are able to receive grant awards.

The NSF is interested in awarding grant funding to researchers who are skilled and productive as well as ethical.

Obligations. Janet Jones has obligations to Prof. Wilson and the university to help ensure that the grant applications that are submitted are of the highest quality, scientifically and ethically. Part of her job responsibilities are to be knowledgeable concerning the policies of funding agencies and, when appropriate, to bring potential problems to the attention of the faculty members with whom she works.

Prof. Wilson has an obligation to know the policies and procedures required by the funding agencies to which he is applying. He also has obligations to his collaborators and colleagues to follow the terms of collaborative agreements, respect his
colleagues’ right to control their data, and be certain he has permission to use data that are not his own.

**Ethical Issues.** Janet feels a conflict between her interest in doing her job as efficiently and independently as possible and her obligation to ensure that the applications she helps prepare are of the highest quality. Prof. Wilson’s interest in preparing the strongest research proposal may be in conflict with his obligations to his colleagues who are the source of the unpublished data, and the interests of those colleagues.

**Consequences of Actions.** If Janet decides to do nothing further, and just send off the grant application without checking on things any further, there may be no negative consequences. However, there may be some uncertainty about the status of the unpublished data from the other research group that could lead to difficulties. The unpublished data are cited as having come from another research group, but Janet does not seem to know if these data were generated as part of the earlier collaboration, or if they belong to his colleagues and were given to Wilson along with permission to include them in his grant application, or if Wilson is using the data without permission. In addition, Janet seems uncertain as to whether the funding agency requires some sort of documentation confirming permission to use unpublished data cited as a “personal communication” the way some journals now do.

If Janet simply assumes the worst, and storms into Prof. Wilson’s office accusing him of “trying to get way with using someone else’s data” in his grant application, she would be endangering her working relationship with Prof. Wilson, and perhaps her job. No one reacts well to being accused of behaving unethically.

However, Janet could demonstrate her professionalism by doing a quick checking to see if documentation of permission to use data cited as a “personal communication” is required by the funding agency (not required by the NSF at this time). She could then follow up by inquiring of Prof. Wilson concerning his use of the data. In this manner, she would be most likely to further everyone’s interests. Asking polite questions that seek clarification of a situation, usually lead to a more productive exchange of information. If the situation warrants, Janet may be able to suggest to Prof. Wilson that he get his colleagues’ agreement to include the unpublished results in his grant before he sends it in, and so help Wilson to avoid future unpleasantness in his collaborative relationships.

**Case Study #4: Facilitating Sharing Between Collaborators**

“Oh hello, Prof. Thomas. It’s nice to talk with you,” responds Jason Reynolds, the departmental administrator after picking up the phone. “I’ve missed those long talks about fishing we used to have when you were here on sabbatical working with Prof. Simonds. Come to think of it, we haven’t talked since we closed out that grant
on which the two of you were collaborating last year. So, how are things at Enor-
mos State, and how has the fishing been?”

“It’s nice to talk with you again too, Jason. Work has been going well, and the
fishing this summer was great. Unfortunately, I’m calling about a problem in your
department. I’ve contacted Steve Simonds four times about getting some more of
antibody Ab2765 that we prepared during our research together, but he keeps put-
ting me off. In our last conversation, he actually said that there wasn’t enough left
to send, and that just can’t be true. This whole thing is holding up our work here,
and we can’t keep waiting around. So, I decided to call you. I don’t want to cause
trouble, and you know that that antibody is as much mine as Steve’s. It seems to me
that the easiest solution to this, for all of us, is for you to go to Steve’s lab, get some
of the antibody from his technician, and have it shipped to me as soon as possible.”

Case Discussion

Interests of the Affected Parties. Jason Reynolds is interested in maintaining good
working relationships with the faculty members of the department in which he
works, and in keeping his job. He may also have some interest in maintaining an
amicable relationship with Prof. Thomas.

Prof. Thomas is interested in conducting further research based on the results
of a previous collaboration. He is interested in obtaining research materials, in this
case, antibodies. He is also interested in avoiding the time, energy, and unpleas-
teness that are likely to be associated with a confrontation concerning access to the
antibodies. He may also be interested in maintaining a collegial relationship with
his previous collaborator, Prof. Simonds.

Prof. Steve Simonds is interested in furthering his research. He is interested in
maintaining control of the disposition of data and research materials from his labora-
tory. He has a reasonable expectation that others will respect his control of the data
and research materials that his research group generates. He may also be interested in
maintaining a collegial relationship with his previous collaborator, Prof. Thomas.

Members of Prof. Simonds’ research group, including his technician, have inter-
est in maintaining good professional relationships with Prof. Simonds, in further-
ing their research, in avoiding the disruptions associated with confrontations, and in
being perceived as good future colleagues by established researchers in their field.

The university to which the collaborative grant was awarded is interested in
facilitating the research of its faculty members including collaborations, in provid-
ing an environment that is conducive to winning approval of future grant applica-
tions, in providing an environment that is supportive of its staff and students, and
in avoiding scandal.

Obligations. Jason Reynolds has an obligation to act in the university’s best
interests, and to help it meet its obligations, but he also has an obligation to support
and respect the researchers in the department in which he works.
Both Prof. Thomas and Prof. Simonds, as members of a collaborative project, have an obligation to follow the terms of the collaborative agreement, and if no agreement was written, to share access to and use of the data and research materials generated by that collaboration. They also have an obligation to communicate openly and honestly with each other.

The university which administered the collaborative grant has an obligation to see that the terms of the collaborative agreement are honored, and/or that those who helped generate the research materials produced under that grant have access to them.

**Ethical Issues.** Jason Reynolds’ obligation to help the university meet its obligations is in conflict with his obligation to respect Prof. Simonds’ control of his laboratory. Prof. Thomas’ interest in furthering his research, is in conflict with Jason’s interest in maintaining a good working relationship with Prof. Simonds, with Prof. Simonds’ interest in controlling the disposition of materials from his laboratory, and with Prof. Thomas’ obligation to communicate openly with Prof. Simonds. It appears that Prof. Simonds sees his obligations as a member of a collaboration, including sharing and communicating with Prof. Thomas, to be in conflict with his interest in furthering his research and/or in maintaining control of the disposition of materials from his laboratory.

**Consequences of Actions.** If Jason Reynolds proceeds as Prof. Thomas requests, goes to Prof. Simonds’ laboratory, obtains some of the antibody without Prof. Simonds’ knowledge, and sends it to Prof. Thomas, it may be that conflict will be avoided for a short period of time. However, what happens when Prof. Thomas requests more antibody, or when Prof. Simonds finds out what has occurred? It is likely that here will eventually be an uproar in the department, a major falling out between Prof. Simonds and Jason Reynolds, and a general loss of trust in Reynolds by members of the department. It could cost Jason Reynolds his job.

If Jason Reynolds refuses to help Prof. Thomas and does nothing further about the situation, he is most likely only delaying the day when conflict and disruption affect the department. The longer this situation continues, the more polarized the two researchers probably will become, and the more difficult the conflict will be to resolve.

However, if Jason Reynolds alerts some key people to the situation it may be possible to resolve it before communication between the two former collaborators deteriorates further. As the recipient of the collaborative research grant, the university, through its personnel, is obligated to act to resolve this situation, but some basic information needs to be gathered: Was there a collaborative agreement and if so, what were its terms? What is the reason for Prof. Simonds’ refusals? (It could be just a communications failure. Maybe Prof. Simonds really has no more antibody left from the collaboration. Maybe Prof. Thomas has already used all the antibody to which he is entitled.) Precisely whom Jason Reynolds contacts will depend on the details of the situation, and the personalities and relationships of the people involved. Some possibilities are the department chair or a faculty member who has worked with both of the collaborators. However, this is a situation that needs to
move to mediation by faculty, with the assistance of administrative staff like Jason Reynolds on matters such as agreements, guidelines, and policies.

¶1190  Knowledge Check

AIS editors

The Q&As in ¶1190.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 1100 has been understood. Note: For the answer key for ¶1190.1, see ¶1190.3, which appears on a separate page (page 1190:5) for testing purposes.

¶1190.1  Q&As

1. Training programs for research administrators are often undertaken for all of the following reasons EXCEPT:
   (a) To ensure appropriate compliance and grant management
   (b) To improve the service and science of faculty
   (c) To adopt related technologies, processes, and policies
   (d) To develop and maintain a skilled workforce

2. Driving the need for rigorous training programs are all of the following EXCEPT:
   (a) Rapid growth of sponsored program funding
   (b) Significant expansion of regulations and regulatory oversight
   (c) Office of Management and Budget
   (d) Changes in technology and information systems

3. Who benefits from research administration training programs?
   (a) The institution
   (b) The collaborating partners
   (c) The consumer (faculty)
   (d) All of the above

4. When developing training programs, ask yourself:
   (a) What do faculty say that they need from research administrators?
   (b) What is the federal baseline requirement for training?
   (c) Both (a) and (b)
   (d) None of the above
5. If you were to form a group of end users to develop a training program, which of the following should be part of the group?

(a) Senior department personnel  
(b) Central office leadership  
(c) Both (a) and (b)  
(d) None of the above

6. Training delivery mechanisms are dependent upon many factors including all of the following EXCEPT:

(a) The resources available to create and deliver the content  
(b) The content complexity and whether or not opportunity for interactive question and answer components are necessary  
(c) The “need-to-know” level of the teachers  
(d) The systems available to facilitate delivery mechanisms beyond the use of traditional classroom settings

7. Effective training programs should match:

(a) The time devoted to completing assessment drills  
(b) Perceived needs and expected outcomes  
(c) Both (a) and (b)  
(d) Neither (a) nor (b)

8. A positive “return on investment” with respect to training programs would produce which of the following?

(a) Meaningful outcomes  
(b) Cost savings in budget preparation activities  
(c) Enable trainees to meet performance and proficiency standards  
(d) Both (a) and (c), but not (b)

9. Which statement is TRUE?

(a) Training programs have grown significantly in the past decades.  
(b) In-house training programs are the most effective training option.  
(c) Training programs succeed when they are closely associated with the leading institution in the field of research administration.  
(d) Training programs succeed when they employ the most sophisticated technology solutions.
10. Which statement is FALSE?

(a) Training programs succeed when they are closely associated with institutional needs.

(b) Associations, like NCURA, are an excellent source for recruiting faculty trainees.

(c) Content and delivery of training programs should be correlated to specific institutional dynamics.

(d) It is important to create a continual learning environment for research administrators.

\section{1190.2 Discussion Topics}

1. Where would you go to look for training professionals? What qualifications would you be looking for in such individuals?

2. Why are evaluation and assessment such essential components of any training program? In the discussion, be sure to enumerate exactly what aspects of the program you would be evaluating/assessing.

3. Does your training program make use of changing technologies? If not, why not? If yes, how is this done?

4. Discuss the role training plays in developing, maintaining, and, especially, retaining a skilled sponsored research administration workforce.

5. What are the contributing factors that initially prompted your institution to develop training and professional development activities for faculty and staff? Have the factors changed over time? Is the program at your institution adequate at this time? Why, or why not?
¶1190.3 Answer Key

Following are the correct answers to the questions included at ¶1190.1.

1. (b) To improve the service and science of faculty
2. (c) Office of Management and Budget
3. (d) All of the above
4. (a) What do faculty say that they need from research administrators?
5. (c) Both (a) and (b)
6. (c) The “need-to-know” level of the teachers
7. (b) Perceived needs and expected outcomes
8. (d) Both (a) and (b), but not (c)
9. (a) Training programs have grown significantly in the past decades.
10. (b) Associations, like NCURA, are an excellent source for recruiting faculty trainees.

Introduction

This chapter describes the regulatory environment in which institutions that accept sponsored research awards must operate successfully and offers strategies for managing sponsored programs offices to meet this challenge.

Finding one’s way through the multitude of federal regulations applicable to the world of research administration could be an extremely daunting challenge. With the help of Rebecca Hunsaker of the University of Maryland, College Park, however, the task has become much easier and the journey far more pleasant. She presents a most thorough, down-to-earth discussion of the contents of the major regulations that are applicable to the administration of grants, contracts, and cooperative agreements.

Hunsaker’s review of the regulations is much more than just a recitation of their contents, although that, too, is accomplished in a very clear and helpful fashion. She goes on to relate the regulations and their contents to real-life day-to-day issues that confront research administrators. Hunsaker leaves the reader with a much better appreciation of what one needs to know about the requirements and how this knowledge and understanding can contribute to the improved effectiveness of the research administrator. Hunsaker effectively illustrates the relationship that should exist between the OMB requirements and the financial management policies and procedures adopted by grantee institutions.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶1305, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶1320), practical tools (at ¶1330), and case studies (¶1340) to aid in understanding and complying with the requirements. A “knowledge check” containing Q&As and discussion topics is included at ¶1390.
Sponsored programs administrators are faced with the challenge of understanding a myriad of federal regulations that govern how awards are managed in their organizations. The key to effective management is the ability to focus on which of these regulations has the most impact on the daily operations and management of sponsored programs at both the department and central administration levels.

This effective management must start with an understanding that institutional policies and procedures for managing sponsored programs need first to comply with state and federal regulations governing these funds. While regulations may vary from state to state, the federal government has charged the Office of Management and Budget (OMB) with the responsibility for overseeing the regulations most commonly associated with managing federally sponsored research. This chapter focuses on understanding the most important aspects of the Uniform Guidance and its impact on managing sponsored projects.

**1305.1 Types of Funding Agreements**

The first step in understanding which rules apply to a particular sponsored program is knowing what kind of agreement the institution has with the funding agency. Simply stated the institution should ask: Is the award a contract, a grant, or a cooperative agreement? The answer to this question will help determine where to go for guidance on managing the award and which regulations must be adhered to in doing so.

The Federal Grant and Cooperative Act was signed into law to stipulate the circumstances under which agencies are to use procurement contracts, grant agreements, and cooperative agreements to properly reflect the relationship between the federal government and other entities.1

The three main instruments used by the federal government are defined under the act as follows:

◆ **Procurement contract**: The legal instrument used whenever the principal purpose of the agreement is the acquisition by purchase, lease, or barter of property or services for the direct benefit or use of the federal government.

◆ **Grant agreement**: The legal instrument used when no substantial involvement is anticipated between the agency and the recipient whenever the principal purpose of the relationship is the transfer of a thing of value to the recipient to carry out a public purpose of support (often referred to as an “assistance award”).

◆ **Cooperative agreement**: The legal instrument used when substantial involvement is expected between the agency and the recipient when the principal purpose is to

---

transfer something of value to carry out a public purpose.

While the distinctions between these three types of mechanisms can be vague, the difference is sometimes described in research as follows: Grants or assistance awards are generally given to an institution for research the principal investigator (PI) wants to do, while contracts are awarded to institutions so the government can purchase or acquire items or research the government needs for its benefit.

Once the determination is made as to what type of agreement instrument is being used, it is then possible to determine which regulations apply to the agreement. The Uniform Guidance has been written to incorporate the old cost and administrative circulars into one unifying document for the administration of Federal awards. The Uniform Guidance applies to Federal contracts, grants, and cooperative agreements, with few exceptions. The Federal Acquisition Regulations (FAR) still govern the administrative policies for federal contracts.

§1305.2 Overview of Uniform Guidance

The Office of Management and Budget (OMB) issues regulations to federal agencies outlining the rules they are required to follow when issuing federal funds. In December of 2013, OMB issued the Uniform Administrative Requirements, Cost Principles and Audit Requirements for Federal Awards, commonly known as the Uniform Guidance. This document, which has been codified at 2 CFR 200, supersedes prior guidance found in the OMB Circulars. The goal of the Uniform Guidance is to simplify and clarify the sometimes contradictory and duplicative language found in the various circulars, as well as to streamline the guidance and reduce administrative burden to both the federal agencies and recipients of federal funds. It is also worth noting the increase of language regarding internal controls in the Uniform Guidance.

As mentioned previously, the Uniform Guidance was issued by the federal government in December of 2013. Federal agencies were given six months from that date to issue plans for implementing these guidelines into their own policies and procedures. In December of 2014, OMB published an update to the Uniform Guidance via the Federal Register which contained a number of technical corrections to the previous version. In addition, this update also included the implementation plans for all of the federal agencies. Of course, it is still necessary to refer to the individual federal agency’s policies and procedures, proposal guides, and award administration guides during the course of administering federal awards as not all of their policies and practices are included within the Uniform Guidance itself.

Finally, despite the fact that the Uniform Guidance has been in place for a number of years, it is particularly important to review every award document for its applicability, as agencies differ in how and when they implement the Uniform

October 2016  Sponsored Research Administration
Guidance. In some cases, the addition of incremental funding to an award previously administered under A-21, for example, may also include language instructing the recipient institution that the new funding should now be administered under the Uniform Guidance. In other cases, the agency has determined that the entire award should be administered under the guidance of the circular under which it was originally issued, irrespective of the addition of new funding.

1305.3 Organization of the Uniform Guidance

The Uniform Guidance is broken into six subparts and twelve appendices:
* Subpart A—Acronyms and Definitions (see 1305.4)
* Subpart B—General Provisions (see 1305.5)
* Subpart C—Pre-Award Requirements (see 1305.6)
* Subpart D—Post-Award Requirements (see 1305.7)
* Subpart E—Cost Principles (see 1305.9)
* Subpart F—Audit Requirements (see 1305.11)

1305.4 Acronyms and Definitions

Perhaps the most overlooked section of the Uniform Guidance is the definitions section. Here the user can find answers to many common questions. For example: What does the government mean when it talks about equipment? Should an institution include the cost of shipping a piece of equipment when determining its total cost? The definitions section gives clear-cut answers to these and other questions.

**Uniform Guidance, Subpart A**

§ 200.33 Equipment means tangible, personal property (including information technology systems) having a useful life of more than one year and a per-unit acquisition cost which equals or exceeds the lesser of the capitalization level established by the non-Federal entity for financial statement purposes, or $5,000.

§ 200.2 Acquisition cost of equipment means the cost of the asset including the cost to ready the asset for its intended use. Acquisition cost for equipment, for example, means the net invoice price of the equipment, including the cost of any modifications, attachments, accessories, or auxiliary apparatus necessary to make it usable for the purpose for which it is acquired.

The definitions section is a great place to gain a basic understanding of many of the terms and underlying principles in managing Federal funds. Some of the most commonly used terms in funds management are listed in this subpart and included below.

**Uniform Guidance, Subpart A**

§ 200.22 Contract means a legal instrument by which a non-Federal entity purchases property or services needed to carry out the project or
program under a Federal award. And § 200.23 Contractor means an entity that receives a contract as defined in § 200.22. Note that under the circulars this term used to be “vendor.”

§ 200.29 Cost sharing or matching means that portion of project costs not paid by Federal funds.

§ 200.71 Obligations mean the amounts of orders placed for property and services, contracts and subawards made, and similar transactions during a given period that require payment by the non-Federal entity during the same or a future period.

§ 200.77 Period of performance means the time during which the non-Federal entity may incur new obligations to carry out the work authorized under the Federal award.

§ 200.80 Program income means gross income earned by the non-Federal entity that is directly generated by a supported activity or earned as a result of the Federal award during the period of performance.

§ 200.83 Project costs means total allowable costs incurred under a Federal award and all required cost sharing and voluntary committed cost sharing, including third-party contributions.

§ 200.86 Recipient means a non-Federal entity that receives a Federal award directly from a Federal awarding agency to carry out an activity under a Federal program. The term recipient does not include subrecipients.

§ 200.92 Subaward means an award provided by a pass-through entity (defined in § 200.74) to a subrecipient for the subrecipient to carry out part of a Federal award received by the pass-through entity. It does not include payments to a contractor or payments to an individual that is a beneficiary of a Federal program.

§ 200.93 Subrecipient means a non-Federal entity that receives a subaward from a pass-through entity to carry out part of a Federal program.

§ 200.96 Third party in-kind contributions mean the value of non-cash contributions (i.e., property or services) that (a) benefit a federally assisted project or program; and (b) are contributed by non-Federal third parties, without charge, to a non-Federal entity under a Federal award.

¶1305.5 General Provisions

The General Provisions subpart of the Uniform Guidance begins with a discussion of the applicability of the document as a whole as well as certain subparts. Recipient institutions would do well to remember that the Uniform Guidance applies to the Federal awarding agencies, and not directly to non-Federal entities receiving Federal funds. § 200.101(b)(1) includes a table which is particularly helpful for recipient
entities in determining which parts of the Uniform Guidance apply to what types of awards. For example, Subpart D—Post Federal Award Requirements, Subrecipient Monitoring and Management apply to all Federal awards, but Subpart C—Pre-Federal Award Requirements and Contents of Federal Awards apply to all grant agreements and cooperative agreements, but not to cost-reimbursement contracts awarded under the Federal Acquisition Regulations.

This Subpart also outlines the process for a Federal awarding agency to obtain an exception to the regulations contained in Subparts A-E. As an overarching ideal behind the Uniform Guidance is consistency, OMB is only issuing exceptions in unusual circumstances.

1305.6 Pre-Award Requirements

Subpart C starts by instructing federal agencies on when it is appropriate to use a grant, cooperative agreement, or contract based on the needs of the government. Another highlight of the subpart is the provision that the government will not give money to people or institutions that have been debarred or suspended from doing work with the federal government. While the government may not debar those that commit relatively minor infractions, it can impose additional requirements on recipients or subrecipients if there is reason to believe they present a risk because they have a history of poor performance or if there are other reasons to believe that Federal funds could be in jeopardy.

This subpart also includes two additions which were not previously found in the circulars: guidance to the Federal awarding agencies on how to perform a risk-based assessment on potential recipients, and standard information which must be contained in a Federal award.

1305.7 Post Federal Award Requirements

Subpart D contains the most important concepts for managing Federal awards and is used by many entities as the baseline for establishing institutional policies and procedures. Subpart D is conceptually broken down into subsections to make it more user friendly. The breakdown is as follows:

- Performance, Financial and Program Management § 200.300-200.309
- Property Standards § 200.310-200.316
- Procurement Standards § 200.317-200.326
- Performance and Financial Monitoring and Reporting § 200.327-200.329
- Subrecipient Monitoring and Management § 200.330-200.332
- Record Retention and Access § 200.333-200.337
- Remedies for Noncompliance § 200.338-200.342
- Closeout, Post-Closeout, Collections § 200.343-200.345
Performance, Financial and Program Management

§ 200.300-200.309 highlight the importance of the grant or cooperative agreement recipient having strong financial controls and financial systems that accurately reflect how federal funds are spent, documented, and monitored. This ensures that only costs that meet the criteria of reasonable, allocable, and allowable are charged to federal awards.

Cost Sharing

A topic of great interest to research administrators is cost sharing. § 200.306 provides great detail on this issue and gives guidance on what type of costs can be used as cost sharing and how the value of donated time, supplies, and property should be calculated. Note that the term cost sharing is not defined in this section; the user must refer to Subpart A for that information.

When trying to determine what can be counted toward a cost sharing commitment to the federal government, it is important to remember the following:

1. The cost has to be documented and verifiable, meaning that receipts or other documentation must exist to prove that the cost was incurred at the price or cost claimed. This could include a statement from the donor as to the fair market value of an item or verification from a volunteer as to the number of hours worked on the project.

2. The same cost can’t be used on multiple projects as cost sharing. For example, if the institution purchases a piece of scientific equipment to be used on the project, it can’t claim the cost of the same piece of equipment as cost sharing on another project.

3. The cost has to be necessary and reasonable for completion of the project. This means that the cost must have benefited the project in some way.

4. The cost must be allowable under the cost principles. This tells the administrator that if the Uniform Guidance would have rendered the cost as unallowable, it cannot be used as cost sharing. For example, if a researcher decides to buy pizza for the team working on a project, the cost cannot count as cost sharing because paying for pizza on the federal award is not allowed in the first place. If the cost can’t be charged as a direct cost, it can’t count as cost sharing.

5. The cost can’t be paid by the federal government under another award without permission. Simply put, an institution can’t meet a cost sharing agreement on an HHS award using funds from the National Science Foundation (NSF).

This section also instructs the Federal awarding agencies that voluntary committed cost sharing cannot be used be used in the merit review of proposals. This language is particularly beneficial to recipient institutions as a method of proving to investigators that their proposals will not, in fact, be more competitive if they volunteer to cost share.

Program Income

The federal government is very clear that if a grant or cooperative agreement recipi-
ent makes money as a result of the use of resources provided by the award, during the period of the award, the government wants its fair share of that income. In § 200.307(e), the government lists three ways that program income can be handled:

1. Deduction: program income can be deducted from total allowable costs to determine net allowable costs. It must be used for current costs unless the Federal awarding agency authorizes otherwise. For example, if the Federal government issued a grant for $50,000 and income of $5,000 was earned, the recipient would only invoice the government for the net of $45,000.

2. Addition: program income may be added to the Federal award with the prior approval of the awarding agency. It must be used for the purposes of the approved scope of work.

3. Cost sharing or matching: program income can be used to meet cost sharing or matching requirements of the Federal award, only after obtaining prior approval from the Federal sponsor.

Budget Revisions and Program Plans
Understanding § 200.308 is one of the keys to effective management of Federal grants and cooperative agreements, for it is within this section that the Federal government states when a recipient must get written permission to revise budgets or program plans, and it gives recipients the flexibility to manage their awards by letting them make decisions about many routine issues.

The section states, in part, that the following items must be reported to the awarding agency and the recipient must get prior permission before changing the budget or program plans if the change results in:

1. Changing the scope of the project;
2. Changing key personnel who were named in the award document;
3. The disengagement from the project for more than three months or a reduction of 25 percent or more time devoted to the project by the principal investigator (keeping in mind that a 25% reduction is 25% of what was awarded, not 25% of 100% effort. Meaning if a PI promises to devote 50% effort to a project but wishes to reduce their effort by more than 12.5% they must obtain prior written approval from the sponsor);
4. Including costs that require approval under the Uniform Guidance Subpart E;
5. Transfer of funds for participant support costs as defined in § 200.75 to other categories;
6. Issuing a subaward or contracting out any of the work that was not agreed to as part of the original agreement;
7. Changing the amount of approved cost sharing or matching.

Expanded Authorities. Often referred to as “expanded authorities,” § 200.308(d) outlines the cost-related and administrative prior approvals that can be waived by federal awarding agencies. This allows the recipient of federal funds to better manage
its awards by eliminating the administrative steps that normally would be required if written permission were necessary. Recipients are given the following permissions:

1. The recipient can incur pre-award costs up to 90 days prior to the award being issued without asking permission of the federal agency. While this is done at the recipient’s own risk, it allows the recipient to start on a project while waiting for the formal award agreement. This can be especially useful if equipment needs to be ordered or people have to be hired to ensure the work of the project can progress according to schedule.

2. The recipient can execute a one-time extension of the expiration date by up to 12 months. However, it is important to note that the awarding agency must receive notice in writing with the supporting reason at least 10 calendar days before the award expires. The reason for the extension must be supportive of the award’s aims and not merely to spend an unobligated balance.

3. The recipient can carry-forward an unobligated balance to subsequent periods of performance.

**Period of Availability of Funds**

An important principle to understand is that only costs incurred or obligated during the period of performance are allowable under the award. Although the funding agency grants additional time for financial and technical reports to be submitted to the government, this does not mean that charges can still be placed against the award during that time. The only costs that should be paid after the expiration date are costs that were obligated before the award ended. A prime example of such a cost is an invoice from a subrecipient received after its portion of the award expired.

**Property Standards**

Sections 310-316 of Subpart D give instructions on how to manage property and equipment owned by the federal government or purchased with government funds. It speaks to insuring the property and the necessity of having good systems to track, control, report, and dispose of obsolete equipment.

*Real Property.* § 200.311 under the Real property heading states that any equipment purchased with grant or cooperative agreement funds will vest upon acquisition with the non-Federal entity as long as certain conditions are met. These conditions include agreeing to use the equipment to benefit other federally sponsored projects, taking proper care of the equipment, and agreeing to ship the equipment elsewhere if the government requests the transfer. By far the most common request to transfer equipment comes when a PI transfers from one institution to another. The government will most likely require that the PI’s former institution ship the equipment to the new institution so that the work on the project can continue.

*Supplies.* § 200.314 addresses supplies and other expendable property. It is important to note that in this section the regulations state that after the award ends, any unused supplies with a value exceeding $5,000 can be retained or sold, but in either case, the government has to be compensated. The good news is that this means
that any leftover supplies with a value of under $5,000 can be retained and used for other purposes without having to repay the federal government. This is especially useful in the case of lab supplies such as chemicals that are often purchased in bulk to lower expenses. The PI does not have to worry about returning unused portions of the chemicals and can use them in other research projects or to train students. However, the guidelines clearly state that the excess supplies cannot be used to provide services to nonfederal organizations for a fee.

It is also important to note that under the definitions found in Subpart A computing equipment and peripherals are now considered supplies, whereas under the old circulars they were primarily considered equipment. They must now be treated as any other material and supply cost, meaning they must be essential and allocable to the Federal award.

**Intangible Property.** The final highlight of the property section is the discussion of intangible property in § 200.315. This section states that the recipient can copyright or patent any work under the agreement but the Federal agency reserves a "royalty-free, nonexclusive and irrevocable right" to use the work for government purposes. The section goes on to explain what steps would have to be taken if any of the work was requested under the Freedom of Information Act (FOIA).

**Procurement Standards**

Sections 317-326 address the need for recipients to have written procedures to ensure that purchasing done with federal funds is done fairly and with open and free competition. Those involved in procurement must follow a code of ethics that ensures no real or apparent conflict of interest exists. In short, no one involved in a purchase may benefit in any way from the transaction.

These sections also stress the need to include small businesses and minority or women-owned businesses whenever possible. In addition, they set the minimum requirements a procurement system or process must include and discuss the need to document why a contractor or vendor was chosen, what bids were received or an explanation of why competitive bids were not received, and the basis for determining how the cost was agreed upon. The section echoes the cost principles in stating that costs must be reasonable, allocable, and allowable as determined by a cost/price analysis.

**Performance and Financial Monitoring and Reporting Requirements**

Subpart D § 200.327-328 lay out the responsibilities recipients of Federal funds have in managing and monitoring projects. This includes responsibilities with respect to subrecipients and their performance on the award. Final technical and financial reports must be submitted to the awarding agency either periodically as described in the agreement or 90 days after the expiration of the award as prescribed in § 200.328. Prime recipients (also known as pass-through entities) may find it necessary to give subrecipients only 30-60 days in which to submit financial reports, and perhaps technical reports also, in order to allow time for the prime to consolidate records and meet its 90-day deadline.
Financial Reports. It is important for researchers and administrators to remember that this 90-day post-expiration limit does not mean expenditures can continue to be incurred on the award during this time frame. Only obligations incurred during the period of the award are allowable as costs. Administrators must work with subrecipients, contractors, and even their own payroll departments to ensure that all expenses associated with the award are posted as quickly as possible so that a final financial report can be submitted within the required time frame.

Progress Reports. Technical or progress reports should contain brief descriptions of the accomplishments of the goals and objectives as stated in the award document and, if appropriate, an explanation of why stated goals could not be met. If the project is significantly delayed, the recipient is required to notify the agency of the problem, actions taken or under consideration to correct the problem, and any assistance needed to help resolve the problem. If the award has subawards, an institution should be sure to set the subaward due dates for progress reports prior to the sponsor’s due date for reports; this will allow time to incorporate the subcontractors’ findings into the reports and still meet the deadlines established by the federal government.

Subrecipient Monitoring and Management
Subpart D § 200.330-332 lay out the responsibilities recipients of Federal funds have in managing and monitoring subawards.

Subrecipient and contractor determinations. Institutions who receive Federal awards have the responsibility of determining the nature of the relationship with subrecipient organizations. The determination of whether a subrecipient organization is a subawardee or a contractor has far-reaching consequences for the pass-through entity so it is important for the pass-through entity to review the nature of the agreement and the work that is to be conducted via the agreement before issuing a subaward or a contract to another organization.

As outlined in § 200.330, the characteristics of a subrecipient include:
◆ Has its performance measured in relation to whether the objectives of a Federal program were met (i.e. the subrecipient will be responsible for a Specific Aim of a Federal award);
◆ Has responsibility for programmatic decision making;
◆ Is responsible for adherence to applicable Federal program requirements specified in the Federal award (i.e., the terms and conditions of the prime awardees award will be flowed down to the subawardee)
◆ The Federal flow through funds will be used to carry out a project or program for a public purpose, as opposed to providing a good or service which only benefits the pass-through entity.

The characteristics of a contractor, on the other hand, include:
◆ Provides the goods or services within normal business operations;
◆ Provides similar goods or services to many purchasers;
◆ Normally operates in a competitive environment;
◆ Provides goods or services that are ancillary to the operation of the Federal program or project

Note that under the Uniform Guidance, pass-through entities only recover F&A costs on the first $25,000 of the value of the subrecipient agreement, while contracts are assessed F&A costs on the total value of the purchase order. This perceived savings can sometimes result in an institution wanting to treat large contracts as subrecipients. Caution should be used when doing so, as the monitoring responsibilities required for subawards are much greater than those for contracts and can result in audit findings if not done adequately. As § 200.330(c) states, “the substance of the relationship is more important than the form of the agreement. All of the characteristics listed above may not be present in all cases, and the pass-through entity must use judgment in classifying each agreement as a subaward or a procurement contract.”

Record Retention and Access

Retention Periods. Record retention is an important aspect of managing federal awards. § 200.333 provides guidelines as to how long records—including financial documentation, statistical records, research data including lab books, and scientific papers—must be maintained after the award is closed by the government. In general, most records are required to be maintained for three years. Records must be maintained longer if litigation, claims, or audit findings are started before the three years is up, or if the non-Federal entity is notified in writing by the awarding agency, cognizant audit agency, or other Federal agency to extend the retention period. It should be noted that for state institutions, requirements for record retention may be longer under state laws. In such cases, state regulations should be consulted to determine specific requirements.

Methods for collection, transmission and storage of information. In accordance with recent statute, the Federal awarding agencies and the non-Federal recipient entities should keep their records in machine-readable formats rather than closed formats or paper. It is important for institutions to develop policies and practices for the disposal of electronic records. If an institution is audited, even records which are outside of their retention period are subject to audit if the organization has not yet disposed of them.

Remedies for Noncompliance

Under § 200.339, the federal government protects its interest in the award by reserving its right to allow for termination of the award in whole, or in part, under any one of the following conditions:

1. The federal agency can terminate the agreement if the recipient fails to comply with the terms or conditions of the award.
2. By Federal awarding agency or the pass-through entity for cause;
3. The Federal agency can ask the recipient to terminate the award. If the recipient agrees to stop work, the two parties must work out the terms of the termination including agreeing to what portion of the work will not be completed and when
the termination will be effective.

4. The recipient can request that the award be terminated by writing to the Federal government and explaining when it will terminate and what portion of the work cannot be completed. The government has the right to review the request and if it determines that the modified portion of the work will not accomplish the purpose for which the grant is made, it can terminate the award sooner as described in (1) or (3) above.

If a recipient does not comply with the terms and conditions of an award, the government has the right to take action to force the recipient to comply. The most common remedy an agency takes is to withhold payment of invoices until the recipient corrects the problem. Agencies will often use this measure to get principal investigators to submit technical reports. In rare cases, an agency may withhold any future funding for the project or program in order to ensure compliance. Additional steps up to and including legal action can be taken against the recipient based on the severity of the problem. The issue for recipients is that these invoiced costs have been paid by the recipient and are outstanding accounts receivable, which will not be paid until the agency is satisfied that the terms of the award have been satisfied.

Example

A post-award office at a large research university has turned the withholding of payments into a very effective tool in getting PIs to send in technical reports. If a sponsor refuses to pay because of missing technical reports, the office sends a notice to the PI and the department chair asking for a copy of the report to prove it has been filed. If the PI is not able to furnish a copy of the report, a second notice is sent explaining that the department’s operating account will be charged the amount of the unpaid invoice. If the report is still not forthcoming, the dean and the department chair are notified that the charge is being placed on the account. It is amazing how quickly reports are completed when the dean of a college personally requests a copy from the PI.

1305.8 Ensuring Compliance with Administrative Regulations

How can an institution ensure that it is in compliance with the administrative requirements of the Uniform Guidance? Compliance begins with having clear written policies and procedures that set, at a minimum, the same requirements as the Uniform Guidance itself. When establishing policies and procedures, it is important to remember that auditors will judge whether an institution is in compliance by comparing what they find in an audit to the written policies of the institution. Therefore, it is important not to write policies that are so restrictive that they result in audit findings because the policies were impossible to follow 100 percent of the time.

For example, the Uniform Guidance allows for a PI or designee to have approval authority over costs on the project. (See OMB A-21, C.4.d.(4).) If the institution writes its policy to say that only the PI has signature authority and an auditor finds an item of cost that was approved by a business manager or other knowledgeable
person on the project, the cost could be disallowed because the charge was not approved following the institution’s own policies.

The policies of the institution should be written to ensure that there are strong internal controls. This means that duties should be separated to ensure that no one person has complete control over all aspects of any financial transaction. This can be best illustrated by the control over payroll checks. If one person were in charge of placing someone on payroll, approving timesheets, and distributing paychecks, it is easy to see how fraud could occur. Auditors will insist that procedures are written and followed to ensure this does not happen.

**Award Monitoring**

Once strong policies and procedures are written, the next challenge is overseeing the awards to make sure the regulations and the policies and procedures are being followed. Discussed below are three practical ideas to help provide administrators some assurance that policies are being followed.

1. **Cost sharing**: While most institutions discourage cost sharing unless it is a requirement of the award, once the promise is made systems must be in place to ensure the commitment is met. Experience has shown that many times principal investigators will promise cost sharing without thinking through how to meet the obligation. One suggestion to ward off problems is to require any PI who submits a proposal with cost sharing to also include a cost sharing budget plan that includes the source of the funds and how the funds will be spent. This preplanning not only helps the PI to think through the entire process but also helps the institution, including the PI’s department and school, to clearly see the plan for meeting the obligation. One of the key factors is to ensure that all allowable costs are included in the cost sharing calculation.

**Example**

If a PI states that 10% of his time will be donated as cost sharing on the project, it is important to remember to include the corresponding benefits and F&A costs that normally would have been collected if the salary had been charged directly to the award. In real terms this means that 10% of a $100,000 salary is worth much more than $10,000 in meeting a cost sharing commitment. In fact, it is worth $10,000 plus the corresponding benefits; using a 25% rate, this would add $2,500. In addition, an F&A rate of 50% would add another $6,250. This would bring the value of the cost sharing to a total of $18,750. Using this type of tool at the pre-award stage helps to ensure compliance during the period of award and in reporting the commitments.

Establishing cost sharing accounts is another very effective means of ensuring that cost sharing commitments are met. While there is no regulation requiring separate accounts to capture cost sharing, many institutions require the establishment of separate accounts so that all commitments can be closely monitored. The separate accounts help to ensure that funds are set aside to meet the commitments and only allowable charges are used to meet obligations.
2. Revisions to budget: Subpart D § 200.308 outlines the expanded authorities that institutions have in administering their awards. Many institutions have created forms or electronic methods of recording the revisions and authorizations via some type of prior approval at the central level. This also allows the central sponsored programs office to record notification dates to federal agencies on changes such as no-cost extensions or changes in key personnel. For example, the central office may require the PI to provide information as to what aspect of the award they want to change (e.g., budget? expiration date? addition of a subcontractor?) and a justification to support the change. The central office can determine when it can approve the change internally or when it must seek approval from the funding agency. The documentation then becomes part of the record that can be used to answer questions should they arise during an audit.

3. Notification of expiring awards: One of the most effective tools used to ensure that reporting requirements are met is the use of notices when awards are about to expire. While this tool can take on many forms, it is important that the notices include reminders of technical and financial report due dates and reminders to work with any subrecipients to begin the closeout process. Some institutions include award balance information to make the PI aware of any current overspending or large balances due to late billing by subcontractors or vendors.

The above are merely some ideas to help ensure compliance with the administrative regulations. An institution is encouraged to review the websites of similar institutions to review their policies and procedures and generate additional ideas for managing sponsored awards.

¶1305.9 Importance of the Cost Principles

The cost principles, previously found in A-21, A-87, and A-122, can now be found in Subpart E of the Uniform Guidance. This section gives instructions and guidance as to what types of costs are allowed to be charged to federal awards.

There are two types of costs that must be understood when talking about charging sponsored awards:

◆ Direct costs are defined as costs that can be assigned to a particular sponsored project relatively easily and with a high degree of accuracy.

◆ Facilities and administrative (F&A) costs are those that are incurred for common or joint objectives, and therefore cannot be readily and specifically identified with a particular sponsored project. (It should be noted that F&A costs are also referred to as indirect or overhead costs).

Determining ‘Allowable’ Costs

Subpart E provides guidance in helping to determine if an expense can be charged to a federal award or used in the calculation to determine the recipient entity’s F&A rate. § 200.403 under the heading of Basic Considerations in this Subpart is the best place to start for general guidance in this area.

Subpart E lists a number of factors that should be taken into consideration in
making a determination of allowability, and ask:
◆ Is the cost reasonable?
◆ Is the cost allocable to the project?
◆ Is the cost consistently treated as either direct or indirect?
◆ Is the cost allowable under the Uniform Guidance, the agreement, and the law?

**Reasonable**

“Reasonable” is defined as being necessary for the operation of the project and paying a price that a prudent person would pay for the same item. The government wants the recipient to take precautions to ensure that the government does not pay for unnecessary items or items that are priced much higher than anyone else would pay. Defining what is reasonable can be difficult at times. The following example may be helpful.

**Example**

A recent award called for the purchasing of recording devices for use in recording the dialects of speakers in South America. The devices were to be used by eight different researchers during a site visit; therefore, eight different machines were required. One of the researchers requested a piece of equipment that cost significantly more than the other seven. Was this reasonable? The answer depends on why the researcher wanted the pricier model. Was it personal preference or did the more expensive machine have some functionality that the researcher required to perform a unique type of recording? If the answer was because the researcher simply preferred the more expensive model, it would be hard to justify the expense as allowable. If, on the other hand, it was needed to perform additional types of recordings, it would certainly be considered reasonable.

The key to ensuring that an additional expense is not disallowed in a future audit is to document the requirements at the time of purchase, so that the additional expense can be easily justified if questioned.

**Allocable**

“Allocable” is defined as making sure that the item or service charged to the project benefits the project and advances the work being performed. The Uniform Guidance also states that if the award only benefits from a portion of the purchase (e.g., a bulk order of chemicals), then only a reasonable portion of the cost may be charged to the award. The allocation methodology should be documented and based upon actual usage, or a reasonable determination made by a knowledgeable source, e.g., the PI or lab manager.

Problems in the area of allocability may arise if careful checks are not performed to ensure that the correct project is charged for its fair share of expenses. Take, for example, a large lab with numerous students and postdoctoral researchers working on a variety of research projects at the same time. It is easy to see how it could become difficult to determine how much time each person was devoting to one partic-
ular project, since there is likely to be movement between projects on a regular basis. In fact, it is not uncommon for students to be totally unaware of which project they are working on when they are working under close supervision of a researcher who is merely assigning them tasks to complete. In such cases, it is incumbent upon the research administrator to meet with the PI or project supervisor on a regular basis to review salary charges to ensure that expenses are being allocated to each award based on the work performed.

**Consistently Treated**

The Uniform Guidance also states that costs must be “consistently treated” in similar circumstances. This means that if the institution tells the federal government that the paper and copiers in each department are part of the F&A rate, a department can’t decide to charge the copy expenses directly to a sponsored project unless it can document that the requirements of the award or other circumstances are different than others normally performed by the institution. When the same types of charges are charged directly by one department but are normally considered as part of the F&A rate, the government ends up paying unfairly for the same expense by two different methods. Office supplies are often used to demonstrate this point, as in the following example.

**Example**

Appendix III, Part B Identification and Assignment of Indirect (F&A) costs 6.b.(2) states that office supplies should normally be treated as F&A expenses. But suppose the project involved printing thousands of pages of survey questions to be distributed to test subjects. Clearly it is not a normal business practice to produce surveys, so the cost of the paper and printing of these surveys is easy to justify as a direct cost of the project. The same logic might be used when purchasing a computer on a federal award. Computing devices and peripherals are considered supplies under the Uniform Guidance and therefore should normally be considered an F&A cost. Suppose, however, the computer was going to be used primarily to record the results of a survey and then used to run highly sophisticated statistical analysis on the data. Clearly this is not a general office use and the computer could be justified as a direct charge to the project.

The principle of consistent treatment also refers to the fact that institutions must treat costs the same regardless of who is paying for them. An institution cannot charge more or less for an item only because it is being paid for by the federal government. Charges must be consistent with institutional policies and procedures.

**Allowable**

To be “allowable,” the expense charged to an award must be allowed by the Uniform Guidance, the agreement, and public laws. While this would seem to be a straightforward requirement, it often confuses people, making the decision process as to whether or not the cost is allowable very difficult. For example, advertising...
expenses are listed as both allowable and unallowable in the Uniform Guidance, depending on what kind of advertising and the type of expense. Subpart E § 200.421 states that the government will pay for advertising to help recruit personnel to work on a project and consider the expense to be a direct cost. On the other hand, while expenses for recruiting personnel to work in the office of sponsored programs are also allowable, they are only allowable as part of the calculation of the F&A rate, not as a direct cost. It will not allow advertising expenses for the purpose of the institution’s public relations to be charged as either a direct cost to an award or included as part of the F&A calculation.

In addition, it is important to keep institutional policy in mind: institutions cannot charge recruitment costs to federal awards if it is not within their institutional policy to do so on other funding. This is related to the principle of consistent treatment.

**Direct versus F&A Costs**

Again there are two types of costs that must be understood when talking about charging sponsored awards: direct costs and facilities and administrative (F&A), also known as indirect or overhead costs. Whether a cost is charged directly to a sponsored project or it is used in the calculation of the F&A rate, it must be allowable under the cost principles.

**Selected Items of Costs**

Within Subpart E of the Uniform Guidance is a list of General Provisions for Selected Items of Cost. This is a list of 55 items, activities, and services whose allowability is commonly questioned in relation to sponsored awards. This section attempts to give the user some idea of when it is fair to ask the federal government to pay all or a portion of the costs of an item.

**Review of Allowability**

While the cost section of the Uniform Guidance can be extremely helpful in determining if a cost is allowable, it is also very limited in the guidance it can provide, as only 55 items of costs are discussed. The PI and administrator must rely on the guidance provided in other sections of the Uniform Guidance, as well as the sponsor’s award administration guide, and the terms and conditions of the award itself to determine the allowability of a cost. In other words, to determine: Is the cost allowable under the rules and regulations? Is it reasonable? Does it benefit the project? And finally, is the cost being consistently treated by the entity and either being treated as a direct cost or F&A as appropriate?

If a cost is not listed specifically in the Uniform Guidance as either allowable or unallowable, judgments will have to be made before the expense is charged to the award. It will be extremely helpful in defending the charge in future audits to document the logic used in determining the allowability of the cost and the benefit it provided to the project(s). While the Uniform Guidance attempts to give guidance, it is not possible to anticipate every single circumstance where an item of cost may come into question. For example, the Uniform Guidance clearly states that alcohol is not allowed to be charged to federal awards (§ 200.423). However, what if the research
experiment being conducted concerns the effects of alcohol on teenage drivers? The award would clearly state the need for purchasing alcohol, making it allowable. However, it would not be reasonable to purchase the most expensive brand. In determining allowability it might be important to ask the following questions:

◆ Would the institution pay this price if it were spending its own money?
◆ How is the purchase or acquisition of this service benefiting the project?
◆ Is this a routine cost that is normally covered by F&A? If so, what makes these circumstances so different from others that this expense should be allowed to be charged directly? ²
◆ Would the cost be easy to explain to a newspaper reporter?

The following real-life example illustrates the need to use judgment when deciding if a cost is allowable:

Example

The central sponsored programs office of a large university received a call from a department asking permission to charge 100 bicycle horns to a federal research project. The office’s immediate reaction was to answer a resounding no! But upon further investigation, it was discovered that the horns were being used in a hearing and speech experiment and were needed because the horns could produce a sound at the perfect pitch needed to test certain types of hearing. There is no place in the Uniform Guidance, or, indeed, in the sponsor’s award administration guide, where bicycle horns are discussed as an allowable cost. Therefore, the research administrator is forced to use the test of reasonable, allocable, and allowable. Obviously the horns in the circumstance were perfectly legitimate expenses on this project.

This example is also a case where the institution might choose to reach out to the federal sponsor and obtain prior written approval for a particular item of cost.

¶1305.10 Ensuring Compliance with the Cost Principles

How can the institution ensure that it is in compliance with the cost principles? In a perfect world each institution would have a staff of well-trained experts in the cost principles, whose sole job would be to review each and every expense to ensure that it complies with the Uniform Guidance before it is charged to an award. However, with shrinking budgets and the government cap on administrative costs at 26 percent, no institution can afford this type of scrutiny. Each institution must put policies and procedures in place to ensure its organization is complying with the rules.

Accomplishing this goal can be achieved in a variety of ways, such as those discussed below.

² See Appendix III Part B Identification and Assignment of Indirect (F&A) costs for more information.
Conducting Staff Training

There is no more important first step in ensuring compliance with cost principles that any organization can take than training its staff. Research administrators and principal investigators must understand the rules to ensure that sponsor funds are used properly. While training can take various forms and include a variety of content, the simple concepts of allowable, allocable, and reasonable must be emphasized when educating others on the cost principles. While it is often difficult to convince busy principal investigators to attend training sessions, it is vital that the administrators on the front lines in departments, labs, and centers are made aware of the regulations so that they can take on the responsibility of keeping the PI informed on issues of compliance with the cost principles.

Reviewing ‘High-Risk’ Transactions

While reviewing every transaction is not possible, organizations should consider establishing methods for reviewing transactions that are likely to raise compliance issues. There are many approaches to this process, including the following:

1. Review all transactions above a certain dollar threshold. This can be accomplished by running reports in the financial system that will reveal costs over some predetermined dollar amount, for example, $5,000, a typical capitalization level. This after-the-fact review will allow for in-depth analysis of these transactions. The reviewer can ask questions or examine documentation to determine the allowability of the cost. Since the capitalization level is the point at which an item is considered to be equipment and not a material or supply under the Uniform Guidance, for many organizations, a limit this high would catch equipment or other capital expenditures that should have been budgeted for in an award proposal and approved by the sponsor during the award process. (It’s not necessarily unallowable to spend money on capital equipment not originally budgeted, but it depends on the sponsor. Some sponsors under a grant make an institution officially request and get approval prior to the purchase of capital equipment. Most contracts require an institution to get permission in advance.)

2. Reviewing the transfer of expenses on sponsored awards is one of the tried-and-true methods of determining compliance with the cost principles. If every expense charged to an award has been affirmed as an allowable cost to that project, to initiate a cost transfer indicates that the initial affirmation was incorrect. Auditors are particularly interested in transfers because it is believed they are an indicator of how well sponsored programs are managed. While it is understood that errors can occur, regularly moving expenses could be an indication of the lack of adequate controls at both the department and institutional levels. In fact, Subpart E § 200.405(c) specifically addresses transferring expenses between awards because of overspending. It states, in part, that “any cost allocable to a particular Federal award ... may not be charged to other Federal awards to overcome fund deficiencies.”

Transfers should be well documented and such documentation should clearly state why and how the error occurred. Auditors have become increasingly impatient
with short-cut explanations such as “to correct the error” or “to place the expense where it belongs.” The National Institutes of Health Office of Extramural Research grants manual states that explanations such as these are not sufficient to support the costs and therefore the expense could be determined to be unallowable.³

The review of transfers, normally done at the central level, allows the institution to review the expense for reasonableness and timeliness and to ensure the documentation is strong enough to support the charge. Those initiating the transfer should be instructed to write explanations that answer the question: “Why is this award being charged for this expense?” Transfers that don’t meet the criteria can be returned for more supporting documentation or rejected immediately, eliminating the threat of audit findings months or years down the road.

1. Review all expenses charged to sponsored projects during the last few months of the award or after the award expired. This review could determine if expenses were “dumped” onto an award merely to use up available funds or spend what is sometimes viewed as “extra money.”

2. With improvements in technology, more automated financial systems with better reporting tools, and savvy auditors, these last minute or after-the-award charges are extremely low-hanging fruit for auditors. Research administrators should provide explanation and justification for these costs at the time of purchase, so when these costs are inevitably audited the institution can show a thoughtful, intentional decision process in last minute or after-the-award charges.

3. A review by object or “subcode” is a proven method of finding potential audit problems. This method allows the central office to search the financial records for expenses charged to awards in categories that the regulations state are either unallowable or should normally be treated as F&A costs. Categories for review might include general office supplies, food and entertainment, clerical salaries, and local telephone charges. If charges are found for these types of expense, budgets and other documentation can be reviewed to determine if the charges can be supported or the expense should be removed, again eliminating potential audit findings in the future.

4. Foreign travel is not prohibited under the cost Uniform Guidance, but the “Fly America Act” prohibits using federal funds to travel on non-U.S. air carriers except under clearly defined circumstances. Furthermore, many federal agencies require specific permissions to travel outside the United States on an award. Therefore, many organizations routinely review all foreign travel prior to the departure of the traveler to make sure the trip and the method of travel are compliant with the myriad regulations.

Internal Audits

Using internal audits allows the institution to police itself by randomly auditing for the full range of compliance issues or to address specific problem areas. (See Chapter 3100 for more information on internal audits and Chapter 3900 for a discussion of using them as forms of assessment.)

¶1305.11 Audit Requirements

The purpose of Subpart F is to set down guidance so that all Federal agencies and, subsequently, auditors hired by the recipients of Federal funds audit consistently for the same things in roughly the same manner. The subpart, in concert with the Compliance Supplement issued as appendix XI is in essence the instruction book for auditors. The subpart does not apply to non-U.S. recipients of federal funds either directly or as a subawardee. (See Chapter 3100 for additional information on audits and interacting with auditors.)

It is important to note that the single audit (formerly known as the A-133 audit) is a risk-based audit, meaning the larger the program dollars spent, the more likely the program is to be audited. Also, if a prior audit found problems, the auditors are likely to spend time testing to see if corrective actions have been put into place. Finally, the auditors will devote resources to test new systems or procedures to ensure they are working properly. For example, if an organization implements a new payroll system, the auditors will devote resources to testing that system in its first year of operation to ensure that the government is being fairly charged for its portion of payroll and employment taxes.

This Subpart is divided into five sections, which allow the user to quickly identify the proper section.

◆ Audits § 200.501-200.507
◆ Auditees § 200.508-512
◆ Federal Agencies § 200.513
◆ Auditors § 200.514-55
◆ Management Decisions § 200.521

General Requirements of Subpart F

The purpose of Subpart F is described in § 200.500. Some of the most important definitions referenced in this section are included below, but can be found earlier in the Uniform Guidance in Subpart A.

Uniform Guidance, Subpart A

§ 200.10 CFDA number means the number assigned to a Federal program in the Catalog of Federal Domestic Assistance (CFDA).

§ 200.26 Corrective action means action taken by the auditee that:

1. Corrects identified deficiencies;
2. Produces recommended improvements; or
3. Demonstrates that audit findings are either invalid or do not warrant auditee action.

§ 200.61 Internal control means a process, implemented by a non-Federal entity designed to provide reasonable assurance regarding the achievement of objectives in the following categories:

1. Effectiveness and efficiency of operations;
2. Reliability of reporting for internal and external use; and
3. Compliance with applicable laws and regulations.

§ 200.74 Pass-through entity means a non-Federal entity that provides a subaward to a subrecipient to carry out part of a Federal program.

§ 200.84 Questioned cost means a cost that is questioned by the auditor because of an audit finding:

1. Which resulted from a violation or possible violation of a statute, regulation, or the terms and conditions of a Federal award, including for funds used to match Federal funds;
2. Where the costs, at the time of the audit, are not supported by adequate documentation; or
3. Where the costs incurred appear unreasonable and do not reflect the actions a prudent person would take in the circumstances.

The important part of the Audit Requirements section of Subpart F is the discussion of the expenditure threshold for those subject to audit. As of December 2014, the limit was set at $750,000 per year of expenditures for Federal awards, based on the non-Federal entity’s fiscal year. Smaller organizations must monitor this threshold carefully to ensure they are compliant with this regulation as their Federal awards and expenditures grow. Recipients must also be aware of this threshold, because if they issue subawards to small nonprofits, they must have an understanding of who is subject to these auditing rules.

**Single Audit Concept**

Congress enacted the Single Audit Act of 1984 to establish uniform audit requirements and an organizationwide audit process for state and local governments. Prior to this act, each federal agency was responsible for auditing its own awards. Audits were not coordinated, causing overlap in auditing some recipients, while other recipients were never audited at all. In 1996 the act was amended to make the statutory audit requirements applicable to nonprofit organizations, therefore placing states, local governments, universities, and nonprofits under the same audit process.

**Auditee Responsibilities**

Sections 200.508-512 are most important to central administrators in the finance or comptroller’s office because they explain exactly what the organization is respon-
sible for in ensuring that an audit occurs and that auditors are given the correct information, such as the financial statements and a listing of all the federal funds expended by the organization.

The auditee has responsibility for the following items:

1. Procure or otherwise arrange for the audit in accordance with § 200.509 and ensure it is properly performed and submitted in accordance with § 200.512 (i.e., either 30 days after receipt of the auditor’s report or nine months after the end date of the audit period, whichever occurs first).

2. Prepare appropriate financial statements, including the schedule of expenditures of Federal awards in accordance with § 200.510.

3. Promptly follow up and take corrective action on audit findings, including preparation of a summary schedule of prior audit findings and a corrective action plan in accordance with § 200.511.

4. Provide the auditor with access to personnel, accounts, books, records, supporting documentation, and other information as needed for the auditor to perform the audit as required by this part.

Federal Agency Responsibilities

Section 200.513 describes what the federal awarding agency is responsible for as well as how the cognizant audit agency is determined. In short, a cognizant federal audit agency is required if the recipient expends more than $50 million per year in federal funds, and the cognizant agency is determined by which agency had the predominant amount of expenditures in the fiscal year by the recipient. This section goes on to identify the federal awarding agency responsibilities (additional information can be found in § 200.210):

1. Ensure that audits are completed and reports are received in a timely manner and in accordance with the requirements of this part.

2. Provide technical advice and counsel to auditees and auditors as requested.

3. Follow-up on audit findings to ensure that the recipient takes appropriate and timely corrective action. As part of audit follow-up, the Federal awarding agency must

   (i) Issue a management decision as prescribed in § 200.521.

   (ii) Monitor the recipient taking appropriate and timely corrective action;

   (iii) Use cooperative audit resolution mechanisms (see § 200.25) to improve Federal program outcomes through better audit resolution, follow-up, and corrective action; and

   (iv) Develop a baseline, metrics, and targets to track, over time, the effectiveness of the Federal agency’s process to follow-up on audit findings and on the effectiveness of Single Audits in improving non-Federal entity accountability and their use by Federal awarding agencies in making award decisions.

This section further goes on to discuss the Federal agency responsibilities for re-
porting to OMB to ensure the compliance supplement provides sufficient guidance to auditors and focuses on the issues most likely to cause fraud, waste, and abuse.

**Auditor Requirements**

Research administrators should be aware of how the audit will be conducted and what auditors will be looking for during the process, as outlined in this section. The auditors will begin the audit by reviewing the institution’s financial statements to determine if they fairly represent the institution’s financial picture according to generally accepted accounting principles. Then they will make sure that federal expenditures are properly represented in the statements. Once that is accomplished, the auditors will review the following:

- Internal controls
- Compliance
- Audit follow-up

**Internal Controls**

The auditors will select transactions in the accounting system to make sure they were properly authorized, reviewed, and posted to the federal award in accordance with the policies of the institution. They will be particularly interested in cash transactions, payroll, and large purchases to make sure that no one person in the process had complete control. Separation of duties helps to ensure that risk of fraud or embezzlement is minimized.

**Compliance**

The auditors will review numerous transactions posted to federal awards to ensure that they comply with the Uniform Guidance, program regulations, and sometimes the OMB circulars. (As mentioned previously, despite the fact that the Uniform Guidance has been in effect for several years, depending on the way the Federal agencies have decided to implement the Uniform Guidance, some awards may still be subject to the OMB circulars. It is important for the recipient institution to be aware of which regulations awards fall under, and to document decisions accordingly.) The methods used for this review will vary by auditor. They may use the documentation supplied by the auditee to justify the expenditure or they may even interview the PI to make the determination. The following is the list of compliance items that are reviewed during the audit.

**A. Activities Allowed or Unallowed.** There are certain types of activities that are expressly unallowable when using federal funds, including such things as fund-raising and lobbying. The auditors will review the financial statements and federal awards to make sure that these costs are properly recorded and not charged directly or indirectly to federal projects.

**B. Allowable Costs/Cost Principles.** The Uniform Guidance Compliance Supplement (located in Appendix XI) defines the criteria for how costs are audited as follows:

1. **Reasonable and necessary:** Costs must be reasonable and necessary for the performance and administration of federal awards.
2. *Allocable:* Costs must be allocable to the federal awards in accordance with relative benefits received.

3. *Consistency:* Costs must be given consistent treatment, meaning a cost may not be assigned to a federal award as a direct cost if any other cost incurred for the same purpose in like circumstances was allocated to the federal award as an indirect cost.

4. *Conformity to laws, regulations, and sponsored agreements:* Costs must conform to any limitations or exclusions set forth in the Uniform Guidance, Federal laws, state or local laws, sponsored agreements, or other governing regulations as to types or amounts of cost items.

5. *Transactions that reduce or offset direct or indirect costs:* Costs must be net of all applicable credits that result from transactions that reduce or offset direct or indirect costs. Examples of such transactions include purchase discounts, rebates, or selling services such as utilities or copy and e-mail services.

6. *Costs documentation:* Costs must be documented in accordance with the Uniform Guidance.

7. *Applicability:* Costs must be applied uniformly to Federal and non-Federal activities.

8. *Rates:* With respect to fringe benefit allocations, charges, or rates, such allocations are to be based on the benefits received by different classes of employees within the educational institution.

**C. Cash.** Since the majority of awards made by the federal government are cost reimbursable, auditors test to make sure that the entity actually spent the money before requesting repayment from the government. If advances were absolutely required, they test to make sure that funds are used as quickly as possible and that interest is paid on any government funds that were received in advance.

**D. Davis-Bacon Act.** The auditor reviews payroll documentation to ensure that if federal funds were used for construction, repairs, and alterations to buildings, construction workers and machinists were paid Department of Labor prevailing wage rates.

**E. Eligibility.** Tests are done to ensure that only people or organizations that were eligible under the laws and regulations received government funds. For example, did students who received federal work-study funds meet the requirements of the program?

**F. Equipment and Real Property Management.** Basically the Property Standards section of Subpart D require that equipment be used in the program for which it was acquired or, when appropriate, other federal programs. Equipment records should be maintained; a physical inventory of equipment must be taken at least once every two years and reconciled to the equipment records; an appropriate control system should be used to safeguard equipment; and equipment should be adequately maintained.

**G. Matching, Level of Effort, Earmarking.** The auditors will test to see if cost sharing commitments were met, the claimed cost sharing was documented, and
all the costs were allowable. Remember that if an item is unallowable as a direct cost, it is unallowable as part of a cost share commitment.

**H. Period of Availability of Federal Funds.** Random tests are done to make sure the expenses are not charged to the federal award after the award has expired. The auditors will look at any transaction that posts after the expiration date and determine if the obligation existed prior to the award ending. For example, it is reasonable to pay a contractor or subrecipient who sends a final invoice after work is completed, but an auditor would question equipment purchases or payroll charges after the expiration date.

**I. Procurement and Suspension and Debarment.** Auditors will make sure that the purchasing policies of the entity comply with federal law and then test to see that those policies are followed. Research administrators must be aware that if they use “purchasing cards” (p-cards) when buying supplies for federal awards, the same procurement policies apply. Auditors will also test to make sure there is due diligence to ensure that no purchases were made or subawards issued to persons or organizations that have been suspended from doing work with the federal government.

**J. Program Income.** Auditors will check to see if program income was properly reported and used in one of the three ways allowed by the regulation: added to the project budget, used to meet matching requirements, or deducted from the total award amount.

**K. Real Property Acquisition and Relocation Assistance.** This section deals with treating people fairly if they have been displaced from their homes or business by a federal program. This section would normally only apply to states that use federal funds to build such things as roads, which may require the state to take property from people or business.

**L. Reporting.** Research administrators responsible for invoicing or drawing funds from federal letters of credit will want to review the Compliance Supplement in detail to gain a complete understanding of how financial reporting will be audited. Basically auditors will check to see if proper procedures were followed when requesting funds from the federal government and all reports were completed accurately and on time.

**M. Subrecipient Monitoring.** When a university, state government, or nonprofit organization makes the decision to subaward a portion of a project to another organization, it takes on a significant amount of risk and responsibilities. The federal government expects the prime recipient to watch over the subrecipient to make sure it is performing the work as promised and it is fiscally responsible with federal funds. Auditors will want to fully understand how this is being accomplished and will ask to review progress and financial reports from subrecipients to ascertain if sufficient oversight is being given. Research administrators should make sure that before any invoice from a subrecipient is paid, the PI reviews it to ensure it fairly represents payment for the work performed.
N. Special Tests and Provisions. Unique federal programs may require special tests to ensure compliance. If a research administrator is doing work on such a project, they should be aware that auditors may want to do very specialized reviews of that program.

Audit Follow-Up
Auditors are required to review audits from the previous year or any other audits performed during the year. This could include property audits, procurement system audits, state audit reports, or a program audit. If there were findings in any of those audits, the auditors will review the corrective action taken to ensure that the new policies or procedures are being followed and have corrected the problem.

¶1305.12 Ensuring Audit Readiness
How can an institution ensure that it is prepared for the audit and ensure that those institutions with which it has subagreements are in compliance with federal regulations? As the discussions above explain, the keys to having a successful audit are having in place strong policies and procedures and regular monitoring of awards to spot potential problems before the audit. In addition, there are steps that can be taken to help an institution ensure that it is audit-ready.

1. Keep files and documentation updated with key information. While this may seem obvious, it has been the downfall of many institutions because the auditees are not able to provide documentation to justify expenses. A prime example of this problem can be seen in p-card procurements. Often receipts and other documentation are maintained in files specifically for p-card purchases and not in the files that support the award expenditures. While there is no right or wrong method for maintaining these records, there must be clear audit trails within these files to ensure that documentation can be easily located.

2. Insist on clear written explanations of transfers or purchases during the life of the award. Requiring clear and concise documentation to support expenses as they occur eliminates the need to try to recreate something months or years down the road. Many universities will reject cost transfers at the central level until the documentation to support the charge is in order.

3. Verify that expenses are properly authorized. While this speaks to strong internal controls, central offices can review transactions continuously to ensure that only authorized persons are approving expenses.

4. Get CFDA numbers at the pre-award phase. The single audit requires that federal assistance awards be identified by CFDA number. Prior to the Uniform Guidance, this number was often omitted from the award document by the awarding agency or the prime recipient when issuing a subaward, however now that this is a required piece of information in the notice of funding opportunity (see § 200.203), all awardees should have this information in advance. Making it a practice of getting the necessary information at the award stage (or even the proposal stage!) eliminates the need for searching for dozens of numbers just prior to the auditors’ arrival.
Subrecipient Monitoring

As a recipient of federal funds, an institution will likely enter into subagreements (grants, cooperative agreements, or contracts) with other entities who participate in doing work for the government. Under the Federal regulations the pass-through entity is required to provide at least minimal oversight to assure the government that the entities it is subawarding to are in compliance with federal regulations.

Monitoring subrecipients can be done on many levels. The first step in determining the level of scrutiny a subrecipient should receive is to determine the level of risk the entity represents. While the assessment can be based on many criteria, some factors are:

1. Consider the size of the subaward. Often the higher the dollar volume, the higher the risk.
2. Consider the size of the entity and its length of time in business. Small start-up companies should be considered very high risk as the failure rate for start-up businesses is high.
3. Past performance of the entity should be reviewed. If there were complications with past agreements, such as failure to meet deadlines, late reports, or lack of cooperation in the research — or other indicators of noncompliance — this is clearly a high-risk entity.

The higher the risk, the tighter the controls in place should be to ensure that the subrecipient is complying with all federal regulations. Higher-risk entities might be required to provide extensive documentation to support invoices or need close monitoring of performance by the principal investigator.

Subrecipient Single Audit Reports. An absolute requirement of Subpart F is verifying that all subrecipients who meet the financial threshold outlined in § 200.501 have completed their single audit within nine months of the closing of their fiscal years. There are a number of methods that can be used to verify this information. Five practical ideas are listed below:

1. Create a database of the entities the institution subawards with so that it can record the latest audit information and eliminate duplication should the institution enter into another agreement with the same entity later in the same year.
2. Use the information in the database to send annual certification letters to all subrecipients asking them to attest to the fact that their audit was completed and indicate any audit findings.
3. Create a certification as part of all subaward renewals that states the subrecipient has completed its single audit and that any reportable conditions will be disclosed. Record these certifications in a database.
4. Check the Federal Audit Clearinghouse (FAC) online at http://harvester.census.gov/sac/ to verify the entity completed its single audit report in a timely manner and there were no audit findings, and document the search results.
5. Request a copy of the subrecipient’s audit report. It should be noted that many institutions now provide audit report information on their websites so that it can be accessed at any time.
Audit Findings. If the subrecipient indicates that there were audit findings, the next step is to determine the severity of the finding so that the institution can assess how the finding may affect the institution’s ability to continue to manage its sub-agreements. In order to do this, an institution should be familiar with the following audit terms that are used to describe audit findings:

◆ Reportable condition: internal control deficiency

◆ Material finding (weakness): noncompliance with applicable laws, regulations, or agreement terms and conditions of a substantive nature

◆ Immaterial finding (weakness): noncompliance with applicable laws, regulations, or agreement terms and conditions of an inconsequential nature

◆ Questioned cost: level of uncertainty or doubt as to allowability or appropriateness

To ensure that the institution has all the facts surrounding the audit finding, it may be best to obtain a full copy of the single audit so that it can have all available information in making an assessment. Material issues of noncompliance or reportable conditions related to internal controls are serious concerns. As the pass-through entity, it is important for the institution to obtain a corrective action plan from the subrecipient. After reviewing the plan, the situation should be discussed with the PI and a plan of action must be determined to ensure that the subrecipient is monitored closely throughout the project period. If, after a subaward is issued, the subrecipient is unwilling or unable to comply with the regulations, sanctions such as withholding payment or termination of the award may become necessary.

¶1305.13 Facilities and Administrative (F&A) Rate Calculation

The science of calculating administrative cost rates can take years to fully understand, but in its simplest form, the calculation is an attempt to fairly distribute the cost of running a state, university, hospital, or nonprofit recipient institution to each of the major functions that the entity performs. Appendices III, IV, and V of the Uniform Guidance give instructions on how to calculate these rates so the government pays its fair share of the expenses.

The expenses that are covered under the F&A rate include facilities costs, such as utilities and ground maintenance, and the cost of running the library, and administrative costs, such as central payroll offices, purchasing and procurement offices, the personnel department, accounting, departmental administrators, and the sponsored programs office. These expenses can be compared to what most organizations would characterize as the cost of doing business. They are real expenses of the institution and the reimbursement of these costs is key to maintaining a strong research infrastructure. (See Chapter 1700 for a full discussion of F&A rates.)

¶1305.14 Conclusion

Understanding what really matters in the Uniform Guidance can be a daunting task, but it is critical. In order to be good stewards of federal funds, research administrators must study the regulations and overarching principles of reasonableness, allow-
ability, and allocability when making judgments on the validity of expenses charged to federal awards. Coupled with this knowledge must be sound business practices that ensure accountability and strong controls over federal funds. Finally, a research administrator must prepare for audits during the entire award cycle, from preparing the budget to closeout.
1320 Supplementary Material

This section includes expanded coverage of topics relating to the regulatory environment surrounding sponsored research administration. These materials are culled from a variety of authoritative sources.

1320.1 Overview of the Compliance Supplement

Appendix XI of the Office of Management and Budget (OMB) Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards (“Uniform Guidance”) contains its Compliance Supplement. The Compliance Supplement is an instruction book for auditors to assist them in performing the required audits under Subpart F of the Uniform Guidance. In the absence of the supplement, individual auditors would have to research and determine which laws and regulations could have a direct and material effect on a program. In creating the Compliance Supplement, OMB and the many federal agencies providing information to OMB present a source of information for auditors to understand the federal program’s objectives, procedures, and compliance requirements relevant to the audit, as well as audit objectives and suggested audit procedures to be used in determining compliance with the requirements. Likewise, for colleges and universities that must conduct a Single audit, the Compliance Supplement provides guidance on what compliance requirements their auditors will be reviewing.

(For a discussion of the auditing requirements of the Uniform Guidance, see ¶1305.11-14. For a discussion of interacting with auditors, see Chapter 3100.)

Part 2 of the supplement contains a “Matrix of Compliance Requirements” that identifies the federal programs and compliance requirements addressed in the supplement and correlates the program, by Code of Federal Domestic Assistance (CFDA) number, with applicable compliance requirements. The matrix addresses audit requirements in 14 different federal grant-related requirements that generally apply to all, or most, federal grants (see ¶1305.11).

The Compliance Supplement is revised annually, usually each spring. With each annual version, the size of the supplement increases as more program-specific compliance requirements are included. Research administrators are advised to ensure that auditors are using the correct version of the Compliance Supplement when conducting an audit for an institution. To view the full text of the revised supplement (and any recent changes), visit www.whitehouse.gov/omb/circulars/.

Clusters of Programs. OMB and the federal Inspectors General introduced the concept of “cluster of programs” into the Compliance Supplement, as it is generally thought that while there may be differences between the programmatic objectives of individual federal programs, there is much similarity in the underlying compliance objectives. Accordingly, OMB determined that such similar programs could be treated as a single program for major program determinations and for sampling purposes. One such cluster, for Research and Development, was introduced in 1997 and has remained in each annual supplement since then.
§1320.2 Using the Federal Audit Clearinghouse

Since the initial implementation of the Single Audit Act of 1984, the Office of Management and Budget (OMB) has relied on the U.S. Census Bureau for certain data collection activities. The bureau established the Federal Audit Clearinghouse (FAC) to carry out such responsibilities. The FAC serves as the repository for the Form SF-SAC, “Data Collection Form for Reporting on Audits of States, Local Governments, and Non-Profit Organizations” and the single audit reporting package. (For a full discussion of the auditing requirements see ¶1305.11.)

The FAC compiles the data contained in the single audit package and provides that information, along with other appropriate information about the auditee, its audit report, and federal programs to awarding agencies.

The FAC “operates on behalf of” OMB to

◆ disseminate audit information to federal agencies and the public;
◆ support OMB oversight and assessment of federal award audit requirements;
◆ assist federal cognizant and oversight agencies in obtaining Circular A-133 data and reporting packages; and
◆ help auditors and auditees minimize the reporting burden of complying with Circular A-133 audit requirements.

Single Audit Database

The FAC maintains a searchable database of information derived from the SF-SACs. An institution should be sure to use the correct SF-SAC version that corresponds to the reporting year.

In general, Form SF-SAC and the database provide five kinds of information:

◆ General Information
◆ Auditee Information
◆ Auditor Information
◆ Financial Statement of Audit Information
◆ Financial Program Information

Reminder
Clearinghouse is https://harvester.census.gov/facweb. To access the single audit database from this site, click the icon at the bottom of the page that says “Find Audit Information.”
Late Filing

According to Uniform Guidance Subpart F, the audit shall be completed and the
data collection form and reporting package shall be submitted by the earlier date of
either 30 days after receipt of the auditor’s report(s), or nine months after the end of
the fiscal year end date, unless a longer period is agreed to in advance by the cognizant or oversight agency for audit.

The FAC is not authorized to grant extensions of the deadline for filing single audit submissions. The auditee institution should contact their cognizant/oversight agency to request an extension. Federal agency contact information can be obtained from http://harvester.census.gov/fac/APPX3.htm.

An OMB task force has been considering the topic of late submission of audit reports to the FAC, and the preliminary recommendation of the task force is to deny low risk auditee status to any entity that submits the report to the clearinghouse late. The concern is that late submission may be due to underlying problems with management and internal controls that are not addressed in the report.

Figure 1320.2-1: Flow Chart of Funding/Audit Reporting
Figure 1320.2-2: Selected Items from the FAC FAQs
Certifying:
Q: Who should sign/certify the form?
A: According to the OMB Circular A-133, §...320 (b), and Uniform Guidance, 2 CFR 200.512 (b), a senior level representative of the auditee and the auditor must sign the form. Electronic signatures are accepted for submissions as of 2008.

Submission Requirements:
Q: Is my organization required to conduct a Single Audit?
A: According to the OMB Circular A–133, Subpart B–Audits §...200(a), and Uniform Guidance, 2 CFR 200.501(a), non-Federal entities that expend $500,000 ($750,000 for fiscal years beginning on or after December 26, 2014) or more in a year in Federal awards shall have a single or program-specific audit conducted for that year in accordance with the provisions of these parts. Guidance on determining Federal awards expended is provided in §...205 and 2 CFR 200.502. Please see §...205 and 2 CFR 200.502 for information regarding loans as expenditures.

Deadlines
Q: When are the Form SF-SAC and the Single Audit reporting package due?
A: The audit package and the data collection form shall be submitted 30 days after receipt of the auditor’s report(s), or 9 months after the end of the fiscal year — whichever comes first. See OMB Circular A-133 §...320 (a) and Uniform Guidance 2 CFR 200.512(a) for additional information and exceptions.

Q: How do I request an extension on the due date?
A: Federal agencies no longer grant extensions for Single Audit submissions. If the auditee or auditor wishes to inform the Federal agency they will be late, he or she may do so by contacting the Federal Oversight or Cognizant Agency for the audit. (Link: https://harvester.census.gov/facides/files/agencycontact.pdf)

Please refer to Item 7, pages 5 & 6 of the OMB Memorandum M-10-14 for additional guidance regarding extensions. (Link: https://www.whitehouse.gov/sites/default/files/omb/assets/memoranda_2010/m10-14.pdf)
**Subrecipient Monitoring**

To assist in making subrecipient monitoring easier, the audit supplement to the Uniform Guidance has incorporated use of the Federal Audit Clearinghouse to determine the Single Audit status of subrecipients. As such, sponsored research administrators should make sure pertinent staff members are trained in using and understanding information in the clearinghouse.

To document that there are no negative audit findings impacting the subrecipient’s management of grants that might affect the subaward, one could make a copy of the FAC information and insert it either electronically or on paper into the subaward file and mark any subaward database accordingly. If there is a finding, an institution should be sure to follow up with the subrecipient institution to ensure corrective action is being put into place and document the action. (For more on subrecipient monitoring, see Chapter 3700.)

**Public Availability of A-133 Audits**

Buried in Sec. 5.8 of the OMB April 3, 2009, guidance on funding under the American Recovery and Reinvestment Act (ARRA) is a statement that, “For fiscal years ending September 30, 2009 and later, all Single Audit reports filed with the Federal Audit Clearinghouse (FAC) will be made publicly available on the internet” (see www.whitehouse.gov/omb/assets/memoranda_fy2009/m09-15.pdf).

Single audits are currently available to the public under the Freedom of Information Act, but FAC’s policy has been to refer such FOIA requests to the cognizant agency responsible for the report, so that the agency can remove any personally identifiable information (PII) in the report before release. A footnote in the OMB guidance justifies this public release requirement and suggests ways for the FAC to avoid disclosure of any PII.
1320.3 Reviewing NIH Award Oversight and Audits of Funding

In *National Institutes of Health Extramural Research Grants: Oversight of Cost Reimbursements to Universities*, the Government Accountability Office (GAO) examined how the National Institutes of Health (NIH) oversees its extramural research grants at approximately 530 colleges and universities that are the recipients of these funds (GAO-07-294R; link: http://www.gao.gov/new.items/d07294r.pdf). A look at the GAO’s findings can provide an instructive review for research administrators of agency use of controls for oversight of grant awards.

Because a major part of NIH oversight activities involves either single audits, as required by the Uniform Guidance Subpart F (formerly OMB Circular A-133), or audits of NIH funds conducted by the Department of Health and Human Services (HHS) Office of Inspector General (OIG), GAO reviewed 109 single audits from FY 2003 and 2004 and nine OIG audits from FY 2003 through 2006, all of which had findings requiring NIH resolution.

Single audits, which are required for institutions expending $750,000 (up from $500,000 under A-133) or more in federal funds in a given year, examine financial statements, internal controls, and compliance with laws and regulations pertaining to federal programs on an organization-wide basis. The OIG audits, on the other hand, scrutinize an institution’s use of NIH funds more narrowly, often in relation to a particular grant or a particular risk area.

The GAO report does not draw any conclusions with regard to the adequacy of the NIH oversight to protect federal funds; instead, it simply describes NIH’s process in great detail and provides examples.

Findings Must Be Addressed

Although the scope of each type of audit differs, the audits may report similar findings. Findings common to both A-133 audits (now Single Audits) and OIG audits were

- unallowable costs;
- incorrect accounting for indirect costs;
- allocation of costs to the wrong grants; and
- insufficient monitoring of subrecipients.

According to the report, NIH requires universities to address all findings and to reimburse questioned costs unless sufficiently justified. Because many single audit findings are nonmonetary, such as inadequate documentation of costs or insufficient subrecipient monitoring, Uniform Guidance Subpart F requires universities to submit a corrective action plan to the agency, and NIH policy requires corrective action plans for any OIG findings. GAO confirmed that NIH had obtained the requisite documentation from the universities to corroborate that the problems had been addressed.
Recovery of Questioned Costs

GAO found that NIH’s recovery of questioned costs varied, depending on whether the costs were questioned in single audits or in OIG audits. For single audits with monetary findings, NIH said that the agency usually obtains the full amount of the questioned costs. GAO reviewed three single audits reporting monetary findings; two of these had questioned costs totaling less than $5,000, and both were repaid.

The third report questioned over $150,000 included in the calculation of the university’s indirect cost rate; at the direction of NIH, the rate was renegotiated and reduced by 3 percent for the following year. Resolution of monetary findings in OIG audits, on the other hand, was much more likely to result in recovery of smaller amounts than those questioned. The OIG reports questioned about $1.5 million (12 percent of the funds under audit), and NIH recovered just over $850,000, or about 56 percent of the questioned costs. NIH explained that the large discrepancy between questioned and recovered costs in OIG audits occurs because of the process it follows to make its final determination.

Audit Determination Letter

If a grantee disagrees with the agency’s resolution of an audit, NIH issues an audit determination letter specifying the amounts, including accrued interest, to be returned by the grantee and any corrective actions the grantee must take. Grantees can appeal this audit determination, but NIH noted that very few audit determination letters are ever issued because the universities and NIH nearly always come to agreement on resolution of the audit.

Compliance Controls

Congress also had asked GAO to examine NIH’s controls for ensuring that grantees comply with federal requirements in claiming costs under NIH grants. GAO determined that these key controls included the review of information submitted by universities when they are negotiating indirect cost rates, when they apply for grants, and when they submit annual grant progress reports.

Oversight of direct cost reimbursement is conducted by the staff of the NIH institute or center (IC) that granted the funds. The ICs examine grant applications to assess the reasonableness of the proposed budget relative to the scientific research the university plans to undertake. They examine the application budget to make sure that costs are necessary, reasonable, and allowable; they also look for budgetary overlap, where costs may be charged to more than one source of funding. The ICs also review the annual status reports to determine whether the university is expending funds as planned and whether the university is managing its grants consistent with the scientific progress that has been made. These reviews determine whether or not the grantee should continue to receive funding under the grant.

Indirect (F&A) cost rates are negotiated and established by the HHS Division of Cost Allocation (DCA). Based on risk assessments, DCA conducts more extensive reviews of certain grantees, including on-site reviews, and examines cost accounting practice disclosure statements of the largest grantees.
GAO also reported the trends in indirect costs claimed for NIH research grants during FY 2003 through 2005, which it concluded remained stable throughout the period at about 28.5 percent.

In its response to a draft of GAO’s report, HHS indicated that, in addition to the key controls discussed in the GAO report, it also uses several others to oversee costs claimed by universities. Specifically, HHS mentioned ICs’ use of the terms and conditions of the grant and prior approval requirements, the NIH Office of Financial Management’s review and approval of financial status reports, and the HHS Division of Payment Management’s reconciliation of federal cash transaction reports.
1320.4 Importance of Standard Research Terms and Conditions

A grant or cooperative agreement generally will adopt, often by reference, standard provisions associated with programmatic and administrative regulations that apply to the award as well as other sources of legal authority that a recipient must follow as a condition of receipt of federal funds. These standard provisions mirror the assurances that were provided by an applicant during the pre-award stage and often restate those responsibilities. It is also important to be cognizant of the agency regulations that implement the requirements of the OMB circulars, as the regulations become the primary policy documents of the funding agency.

Research Terms and Conditions

Developed under the auspices of the Office of Science and Technology Policy (www.ostp.gov), this standard set of core terms and conditions for research awards are meant to promote greater consistency across federal agencies in the administration of research awards, including grants and cooperative agreements. Such a consistency would be a welcome implementation for university research administrators, who often have to deal with applications from multiple agencies.

The core terms and conditions are a precursor to the issuance of government-wide terms and conditions that will apply to all federal grants and cooperative agreements, not just research and research-related ones. Research agencies and awarding offices participating in the Federal Demonstration Partnership (FDP) (www.thefdp.org) must use the core set of administrative requirements, to the maximum practicable extent, in research and research-related grant awards to organizations that are subject to the Uniform Guidance. The core set may be supplemented with agency-, program-, or award-specific administrative requirements, but supplemental requirements should be limited. Other agencies that do not participate in FDP are encouraged to use the core set of standard requirements.

At this writing, the Research Terms and Conditions under the Uniform Guidance are still in the review process and have not yet been finalized. When they are finalized, the Research Terms and Conditions can be found along with previous versions of this document on NSF’s website (https://www.nsf.gov/awards/managing/rtc.jsp).
¶1320.5 NIH Grants Policy Statement, and revisions
National Institutes of Health

The NIH Grants Policy Statement (NIHGPS) is the single document containing all policy requirements which act as terms and conditions on NIH awards. It is updated nearly annually. Most updates do not introduce new material for the first time, but instead incorporate new and modified requirements, clarifies policies, and implements changes which have been made to statutes and other federal regulations. Each policy statement update supersedes the prior version. Current and prior policy statements can be found on the NIH’s Office of Extramural Research website (https://grants.nih.gov/policy/nihgps/index.htm).

¶1320.6 NSF Proposal & Award Policies & Procedures Guide (PAPPG)
National Science Foundation

Like NIH, the National Science Foundation maintains a Proposal and Award Policies and Procedures Guide. This document is the overarching set of terms and conditions for proposal submission and award administration for the Foundation, and serves as the Foundation’s implementation of the Uniform Guidance. Part I of the PAPPG contains instructions for proposal preparation and submission, and Part II contains the instructions for administering awards. While the PAPPG is the main guidance document for NSF, it is important to remember the order of precedence of awards as many NSF solicitations and awards contain modifications to the Guide.

The current NSF PAPPG as well as past version can be found on the NSF Policy Office’s website (https://www.nsf.gov/bfa/dias/policy/).

¶1320.7 Frequently Asked Questions for the Uniform Guidance at 2 CFR 200
Council on Financial Assistance Reform (COFAR)

Since the issuance of the Uniform Guidance in December 2013, the Council on Financial Assistance Reform (COFAR) has issued a series of Frequently Asked Questions documents to address questions from federal sponsors, recipients of federal funds, and the audit community. The FAQ documents have been incorporated by reference to the Uniform Guidance via the Compliance Supplement. As of this writing, the most recent update to the FAQs was issued in September of 2015. A 2017 update is highly anticipated. The COFAR has an interactive website with additional information on the Uniform Guidance, and also contains a link to the most up to date version of the FAQs (https://cfo.gov/cofar/uniform-guidance/).
OMB New Metrics on Uniform Guidance
Office of Management and Budget

M-14-17, September 30, 2014
Subject: Metrics for Uniform Guidance (2 C.F.R. 200)

On December 26, 2013, OMB published final guidance in 2 C.F.R 200 titled Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards to improve the effectiveness and efficiency of Federal financial assistance. This guidance delivers on President Obama’s second term management agenda and his first term directives under Executive Order 13520, February 28, 2011 Presidential Memorandum, and the objectives laid out in OMB Memorandum M-13-17 to better target financial risks and better direct resources to achieve evidence-based outcomes.

Federal agencies are required to issue implementing regulations effective December 2014. In order to assure effective implementation, the Council on Financial Assistance Reform (COFAR) has established metrics to gauge how the guidance addresses its intended enhancements and to measure the performance of the Federal government’s work in the management of assistance in the form of Federal financial assistance. This memorandum applies to all CFO Act agencies that manage assistance programs, and sets forth requirements for the initial collection and use of administrative and audit metrics for the Uniform Guidance. By January 2017, OMB with the COFAR will evaluate the initial impact of the guidance based on these metrics and determine what additional steps may be necessary to further deliver administrative efficiency.

Summary of Required Agency Actions:

1. By January 15, 2015: All CFO Act agencies must report required baseline data for administrative metrics to OMB. OMB will provide a framework for metric collection via MAX. The Federal Audit Clearinghouse will provide baseline data for the audit metrics.

2. By January 15th (or following business day) of each subsequent year: Federal agencies and Federal Audit Clearinghouse must provide implementation metrics to OMB where required by this memo, which will be evaluated by the OMB and the COFAR.

3. By January 15, 2017, OMB and the COFAR will evaluate the utility of these metrics for evaluation of the guidance and as sentinels to identify issues with the guidance and opportunities to enhance effective implementation. As part of this evaluation, the COFAR will consider whether it is appropriate to set goals or target outcomes for these metrics.

Background:
The mandate for Federal grants management reform was established by Executive
Order 13520 in November 2009 and a Presidential Memorandum in February 2011.1 These directives instructed OMB to review government-wide policies governing grants to reduce administrative burden associated with management and oversight and focus our resources to better target risks of waste, fraud and abuse.

The COFAR, established October 2011, is an interagency group of Executive Branch officials for the coordination of Federal financial assistance. The Council, working with OMB, developed the Uniform Guidance over a two-year period, which included consideration of two rounds of extensive public comment. Final guidance was issued on December 26, 2013 and will be implemented by agency regulations to be effective December 26, 2014. Major elements of the reform include:

1. Integrating and streamlining eight overlapping OMB circulars into one set of guidance in Title 2 of the CFR;
2. Providing a set of uniform definitions for federal assistance;
3. Requiring pre-award consideration of merit and risk;
4. Strengthening internal controls while providing administrative flexibility;
5. Provisions for exceptions to support new innovative programs that improve cost effectiveness while achieving outcomes;
6. Streamlining and clarifying guidance on sub-recipient monitoring;
7. Providing consistency on negotiated indirect cost rates by creating a minimum rate for recipients and requiring agency-head approval for deviations from negotiated rates;
8. Simplifying reporting requirements for time and effort while strengthening the requirement for effective internal controls;
9. Targeting audit resources based on risk by raising the single audit threshold from $500K to $750K and focusing audits on material weaknesses; and
10. Strengthening audit follow-up by requiring greater accountability and monitoring results more closely.

In order to gauge success of guidance and identify opportunities to enhance its goals, OMB and the COFAR developed the metrics below. For all of these metrics, the baseline information will be taken from the last year prior to the new guidance taking effect.

In the first year, the COFAR anticipates that there will be some additional administrative burden resulting from the transition to the new guidance, which will decrease once the new policies are fully implemented. In order to minimize this burden, OMB intentionally developed metrics that may be predominantly mea-

sured based on information we already collect. This information is already available through the Office of Information and Regulatory Affairs (OIRA) and the Federal Audit Clearinghouse (FAC). For other information, OMB will work to collect it from the most centrally held place possible, and will work to develop a simplified collection through OMB MAX. Information to be collected from non-Federal stakeholders will be entirely optional. At this initial stage, metric collection is only to inform the COFAR about the current impact of implementation. Once the COFAR has reviewed the metrics for the first year, it will consider whether it is appropriate to establish goals or target outcomes for any given metric.

**Administrative Metrics:**

1. Inventory of OMB-approved Information Collections for Grants and Cooperative Agreements;
2. Number of OMB-approved Exceptions Focused on Program Performance Over Compliance;
3. Number of Fixed Amount Awards Issued;
4. Number/Impact of Agency Exceptions to the Provision of Federally Negotiated Rates; and
5. Number of Indirect Cost Rate Extensions Approved by Cognizant Agencies.

**Frequency:** Annual

**Baseline:** Guidance under previous circulars

**Data elements and sources of data:** HHS-led data standards repository, OMB records of exceptions, Federal agency records of fixed-amount awards collected via MAX, and indirect cost rate negotiation agencies.

**Burden of obtaining data:** Moderate — this will require some data to be collected from Federal agencies.

**Single Audit Metrics:**

1. Number of Modified Opinions for Higher Risk Major Programs;
2. Number of Audit Findings of Material Weaknesses in Internal Controls for Higher Risk Major Programs;
3. Number of Repeat Findings for Higher Risk Major Programs (Starting FY 2015);
4. Number of Major Programs selected for audit; and
5. Number of Audit Objectives in the Compliance Supplement.  

**Frequency:** Annual

**Baseline:** Audit Metrics FY 2014

**Data elements and sources of data:** FAC data, Single Audit reports, and the Compliance Supplement.

---

2 This will be complemented by qualitative feedback from auditors on the extent to which the entire scope of work has been decreased.
**Burden of obtaining data:** Low to moderate as data routinely collected in the regular FAC or Compliance Supplement processes.

**Overall Impact on Burden and Waste, Fraud, and Abuse:**
1. Policy change that most reduced administrative burden, and dollar value of impact.
2. Policy change that most increased administrative burden, and dollar value of impact.
3. Policy change that most reduced risk of waste, fraud, and abuse, and dollar value of impact.
4. Policy change that most increased risk of waste, fraud, and abuse, and dollar value of impact.
5. Stakeholder satisfaction with the opportunity to engage with the COFAR or Federal agencies during the policy development process.
6. Stakeholder perception of whether the policy outcome appears responsive to (if not 100% aligned with) their input.
7. Opportunities for greater stakeholder engagement.

**Frequency:** Annual

**Baseline:** Guidance under previous circulars

**Data elements and sources of data:** Key stakeholder groups that voluntarily submit aggregated information on behalf of their constituencies.

**Burden of obtaining data:** Low to moderate as data collected voluntarily.

**Next Steps from Data Collection: Data Analysis, Recommendations & Future Policies**

Based on the evaluation of these metrics after the implementation of the uniform guidance, OMB and the COFAR will work with Federal agencies to gauge the success of the guidance and the performance of the Federal government’s work in the management of Federal financial assistance. If you have any questions regarding this memorandum, please contact Victoria Collin (vcollin@omb.eop.gov) (202-395-7791) or Gilbert Tran (htran@omb.eop.gov) (202-395-3052).
1320.9 Uniform Guidance Implementation and Readiness Guide

Council on Governmental Relations (COGR)

The Implementation and Readiness Guide for the OMB Uniform Guidance (Readiness Guide), developed by COGR, is a resource to help your institution prepare for and implement the OMB Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards; Final Rule – 2 CFR Chapter I, Chapter II, Part 200, et al. (i.e., the Uniform Guidance, or the UG). The Readiness Guide incorporates guidance and clarifications based on November 25th, August 29th, and February 12th FAQs released by the Council on Financial Assistance Reform (COFAR) and available on their website.

As of the writing of this document, we are uncertain on the status of possible technical corrections and other updates to the Final Version of the Uniform Guidance, including uncertainty as to how each federal agency will implement the Uniform Guidance. Consequently, we have developed this as a “Living Document” and have notated this document as the DECEMBER 12, 2014 VERSION of the Readiness Guide. We will update, accordingly, after the Uniform Guidance is released.

The Uniform Guidance is applicable to Institutions of Higher Education (IHEs) and Nonprofit Research Institutions, as well as other non-federal entities including States, Local and Tribal governments and nonprofit organizations. As specified in the preamble to the Uniform Guidance, the cost principles for Hospitals are not changed but may be addressed in the future. The Readiness Guide is targeted to IHEs and Nonprofit Research Institutions that comprise the COGR Membership.

The Readiness Guide is organized into the sections described below. Each section includes: Item (with reference to the applicable section of the Uniform Guidance in parentheses) and Summary and Points to Consider (quick summary and suggested institutional considerations specific to the applicable section of the Uniform Guidance).

A. GENERAL
B. FUNDING AGENCY AND AWARD REQUIREMENTS
C. AWARD ADMINISTRATION
D. SUBAWARDS AND SUBRECIPIENT MONITORING
E. PROPOSING AND CHARGING COST ITEMS (includes initial comments on “effort reporting”)
F. F&A RATE PROPOSALS

Contact COGR staff if you have questions and we will keep the COGR membership updated on all important developments.

---

### A. General

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Effective Dates (200.110)</td>
<td>200.110(a) and (b) specify that Federal agencies must implement the policies and procedures applicable to Federal awards by promulgating regulations to be effective by December 26, 2014. Subpart F-Audit Requirements will apply to audits of fiscal year beginning on or after December 26, 2014. COFAR FAQs .110-7 and .110-12 specify that funding increments on existing awards, issued post 12/26/14, may be subject to the UG at the agency’s discretion and if the incremental funding is subject to the UG, it will be issued with modified terms and conditions. COFAR FAQ .110-2 states that F&amp;A rate proposals based on FY14 can be developed using provisions in the UG. COFAR FAQs .110-3 and .110-5 provide guidance to IHE’s for submitting revised DS-2s. COFAR FAQ .110-6 creates a grace period for the implementation of the Procurement Standards. For FY16, institutions have the option to use Circular A-110 or the UG. Beginning with FY17, institutions must comply with the UG. <strong>POINTS TO CONSIDER:</strong> 1. Track, if necessary, awards issued under the Circulars and awards issued under the UG. 2. Update institutional policy to specify which federal procurement policies will be followed. 3. Work closely with your A-133/Single Audit team to understand the approach to the FY2015 single audit. Technically, Subpart F will be effective for the institution’s first FY beginning on or after 12/26/14 (e.g., fiscal year beginning on July 1, 2015, or FY2016). However, the 2015 Compliance Supplement (normally released in March) will include guidance to auditors on how to review and audit new awards to which the UG is applicable. 4. Pay close attention to new developments related to updating the DS-2, as well as cognizant agency positions on F&amp;A rate proposal submissions. Some of these issues are unsettled and more clarification should be provided, shortly.</td>
</tr>
<tr>
<td>2.</td>
<td>Conflict of interest (200.112)</td>
<td>COFAR FAQ .112-1 specifies this section of the UG does not refer to scientific conflicts of interest related to research. Instead, it refers to conflicts related to how decisions are made for selecting subrecipients or procurements as described in 200.318. <strong>POINTS TO CONSIDER:</strong> 1. Review processes for identifying and managing conflicts of interest in the procurement process. 2. The standard convention is that that subrecipient selection is part of the proposal evaluation process and not part of a procurement action. The FAQ confuses this matter. Institutions should clearly articulate their policies and distinguish between procurement actions and subrecipient selection.</td>
</tr>
<tr>
<td>3.</td>
<td>Mandatory disclosures (200.113)</td>
<td>This section is new to the Uniform Guidance. <strong>POINTS TO CONSIDER:</strong> 1. COGCR’s view is that this section does not change the current obligation and responsibility to disclose and report violations of Federal criminal law involving fraud, bribery, or gratuity violations potentially affecting the Federal award. The FAR has provisions (Subpart 3.10 Contractor Code of Business Ethics and Conduct; see also DFARS Subpart 209.5; EDAR 3409.5; etc.) and institutions that receive Federal contracts already should have a mechanism for meeting this FAR requirement. 2. Review current policies and practices (e.g., posting of hotline numbers, reportable violations, materiality levels, timeliness for reporting, etc.) to ensure that they provide for compliance with current obligations to report.</td>
</tr>
</tbody>
</table>
### Item Summary and Points to Consider

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.</td>
<td>Internal controls (200.303)</td>
<td>There are five “musts” and one “should” for non-Federal entities articulated in this section:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>must establish and maintain effective internal control over Federal awards that provide</td>
</tr>
<tr>
<td></td>
<td></td>
<td>reasonable assurance of managing in compliance with Federal rules and regulations; should be</td>
</tr>
</tbody>
</table>
|    |                                                           | in compliance with guidance in “Standards for Internal Control in the Federal Government” (i.e., the Green Book) issued by the Comptroller General of U.S. and the “Internal Control Integrated Framework”, issued by the COSO; must comply with Federal statutes, regulations and terms and conditions of award; must evaluate and monitor compliance; must take action on any instances of non-compliance; and, must take reasonable measures to safeguard personally identifiable information any other designated sensitive information. FAQ .303-2 clarifies the use of “must” and “should” in the UG. FAQ .303-3 specifies that it is not a requirement to strictly follow the Green Book and COSO. **POINTS TO CONSIDER:**  
  1. COGR’s view is that this section does not change the current obligation and responsibility for an institution to have a robust system of internal controls.  
  2. The Green Book and COSO can be utilized, but are not required, to assess compliance. COFAR FAQs .303-2 and .303-3 support this.  
  3. Review your current internal control infrastructure, with a special focus on areas that changed due to the Uniform Guidance. Ensure controls are documented adequately.  |
| 5. | Research Terms and Conditions (200.210)                   | 200.210(b) states that Federal awarding agencies must incorporate general terms and conditions either in the Federal award or by reference. However, long-practiced Research Terms and Conditions are not addressed in this section. **POINTS TO CONSIDER:**  
  1. Research Terms and Conditions, previously applicable by reference to OMB Circular A-110 (2CFR Part 215), will not be applicable to research awards issued after 12/26/14.  
  2. Until new Research Terms and conditions are available, Federal awarding agencies may incorporate general terms and conditions either in the Federal award or by reference. These awards issued may include varying prior approval requirements, either in the award agreement or in the agency’s implementation of the UG.  
  3. Work closely with Federal officials to confirm the applicable terms and conditions for new awards.  
  4. Updated Research Terms and Conditions applicable to awards subject to the UG are in development and may be available soon.  
  5. **CURRENTLY UNDER REVIEW:** Upon release of updated Research Terms and Conditions, OMB and Federal agencies are considering a policy that would allow the updated Research Terms and Conditions to be applied retroactively to research awards issued after 12/26/14, if updated Research Terms and Conditions were not yet available. Pay close attention to new developments related to the release of updated Research Terms and Conditions. |
## B. Funding Agency and Award Requirements

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Funding opportunities available for at least 60 calendar days</td>
<td>200.203(b) states that Federal awarding agency must generally make all funding opportunities available for at least 60 calendar days. The awarding agency may make a determination to have a less than 60 calendar day availability period but no funding opportunity should be available for less than 30 calendar days unless exigent circumstances. <strong>POINTS TO CONSIDER:</strong> 1. 60 calendar days sets a clear standard. However, agencies still can make determinations that less than 30 days is appropriate. 2. Contact Federal officials when there are deviations and ask for documentation and justification. 3. Notify COGR staff to document deviations.</td>
</tr>
<tr>
<td>2.</td>
<td>Voluntary cost sharing cannot be required</td>
<td>200.204 states that the Federal awarding agency must design and execute a merit review process for applications, which must be described or incorporated by reference in the applicable funding opportunity and Appendix I, C.2., states that announcements must state whether there is required cost sharing, matching, or cost participation. If cost sharing will not be considered, the announcement should say so. 200.306 states that Under Federal research proposals, voluntary committed cost sharing is not expected. It cannot be used as a factor during the merit review of applications or proposals, but may be considered if it is both in accordance with Federal awarding agency regulations and specified in a notice of funding opportunity. COFAR FAQ 458-2 confirms applicability of the OMB clarification of uncommitted cost sharing in OMB M-01-06 dated January 5, 2001. <strong>POINTS TO CONSIDER:</strong> 1. Contact Federal officials when there are deviations and ask for documentation and justification. 2. Notify COGR staff to document deviations.</td>
</tr>
<tr>
<td>3.</td>
<td>Agency financial risk assessment of applicants</td>
<td>200.205(b) states that the Federal awarding agency must have in place a framework for evaluating the risks posed by applicants before they receive Federal awards. COFAR FAQ .205-1 specifies that this section of the UG applies to Federal awarding agency assessment of risk, not auditor assessment. <strong>POINTS TO CONSIDER:</strong> 1. Be aware that agencies likely will review audit results and could be looking for other ways to evaluate risk. 2. Notify COGR staff if it appears agencies are making determinations based on other criteria, particularly if the agency determines anything other than low-risk AND what the agency does to mitigate the perceived risk (e.g. more restrictive terms and conditions).</td>
</tr>
<tr>
<td>4.</td>
<td>Agencies can use only OMB approved information collections</td>
<td>200.206(a) states that the Federal awarding agency may only use application information collections approved by OMB under the Paperwork Reduction Act of 1995 and OMB’s implementing regulations in 5 CFR Part 1320, Controlling Paperwork Burdens on the Public. <strong>POINTS TO CONSIDER:</strong> 1. Contact Federal officials when there are deviations and ask for documentation and justification. 2. Notify COGR staff to document deviations.</td>
</tr>
<tr>

C. Award Administration

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Program Income (200.307)</td>
<td>200.307(e) states that the “Addition” method is the default for IHEs and nonprofit research institutions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>COFAR FAQ .307-1 specifies that program income from license fees and royalties should be excluded from the definition of program income and that U.S. law and statute take precedent.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>POINTS TO CONSIDER:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. a) The FAQ clarifies the treatment of program income from license fees and royalties to make it consistent with past requirements in A-110 so no action is necessary.</td>
</tr>
<tr>
<td>2.</td>
<td>Faculty Disengagement (200.308)</td>
<td>200.308(c) states that prior approval is required when there is “disengagement” (previously, “absence” per Circular A-110) from the project for more than three months, or a 25 percent reduction in time devoted to the project, by the approved project director or principal investigator.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>POINTS TO CONSIDER:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Be aware of the new terminology (“disengagement”) and update policies and practices, accordingly.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Consider using more positive language such as “Principal Investigators can be away from campus and still be engaged in the sponsored project.”</td>
</tr>
<tr>
<td>3.</td>
<td>Equipment and property systems (200.313)</td>
<td>COFAR FAQ .313-1 clarifies that “conditional title” is not a new term and always has been in effect. Therefore, title continues to vest upon acquisition and is only contingent on meeting the requirements for use. COFAR FAQ .313-2 confirms that non-Federal entities are not expected to change their inventory systems or data elements in those systems if the systems are in compliance with the current requirements in Circular A-110.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>POINTS TO CONSIDER:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Review existing equipment and property systems and confirm current compliance with A-110.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Update systems or data elements, if necessary, to ensure compliance.</td>
</tr>
<tr>
<td>#</td>
<td>Item</td>
<td>Summary and Points to Consider</td>
</tr>
<tr>
<td>----</td>
<td>----------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>4.</td>
<td>Accounting for residual inventory &gt; $5,000 (200.314)</td>
<td>200.314(a) states that if there is a residual inventory of unused supplies exceeding $5,000 in total aggregate value upon completion of an award and the supplies are not needed for any other Federal award, the non-Federal entity must retain the supplies for use on other activities or sell them, but must, in either case, compensate the Federal government for its share. This is not a new requirement and existed under Circular A-110, C.35(a). <strong>POINTS TO CONSIDER:</strong> 1. Review current policies and practices, especially regarding purchases made during the last 60 – 90 days of the award. 2. Pay special attention to Computing Devices (also see section 200.453). One interpretation may be that once a computing device is used on a project, it does not meet the definition of “residual inventory” and therefore is not subject to the post-award accounting requirement. However, proper cost allocation principles still apply, and allocation may be questioned for computing devices purchased towards the end of project.</td>
</tr>
<tr>
<td>5.</td>
<td>Procurement standards (200.317 thru 200.326)</td>
<td>COFAR FAQ.110-6 creates a grace period for the implementation of the Procurement Standards. For an institution’s FY16, it will have the option to use Circular A-110 or the UG. An institution must document whether it is in compliance with A-110 or the UG, and must meet the documented standard. Beginning with an institution’s FY17, it must comply with the Procurement Standards in the UG. <strong>POINTS TO CONSIDER:</strong> 1. Review new standards and begin consideration of revisions to policies and practices. 2. Update institutional policy to specify which federal procurement policies will be followed during the grace period, and be prepared to share the institutional policy with auditors. 3. Pay close attention to new developments and work being conducted by COGR and the FDP. COGR expects to provide additional guidance in 2015.</td>
</tr>
<tr>
<td>6.</td>
<td>Project Closeout and the 90-day requirement (200.343)</td>
<td>The UG requires all financial, performance and other reports be submitted using the longstanding 90-day after the end date of the project, unless an extension is approved by the awarding agency. <strong>POINTS TO CONSIDER:</strong> 1. Some federal agencies have recently implemented technology to tightly monitor the 90 closeout rule. IHEs should review procedures for the timing of final billing and submission of final reports. 2. If necessary, consider different guidance for Federal versus non-Federal awards. 3. Consider cutoff dates for subrecipients and language in subrecipient agreement (FDP templates will be updated with appropriate language). 4. Review the need to update or change procedures for the posting of charges after the closeout period. 5. COGR is cautiously optimistic that the updated Research Terms and Conditions (as indicated previously, release date uncertain) will extend the deadline for certain types of reports (e.g., financial) to 120 days. The treatment of other types of reports is uncertain. 6. If/when the 120 days is implemented, it is possible there will be differences across Federal agencies (e.g., some may maintain 90 days). Close attention should be paid to these variances. 7. Attention also should be paid to any agency guidance related to old versus new awards to confirm that both should be treated the same way.</td>
</tr>
</tbody>
</table>
### Required certifications (200.415)

200.415(a) states that to assure that expenditures are proper and in accordance with the terms and conditions of the award, the annual and final fiscal reports or vouchers requesting payment under the agreements must include a certification, signed by an official who is authorized to legally bind the non-Federal entity. The certification language must include language as specified in this section (see 200.415(a) for exact language and context of the requirement).

**POINTS TO CONSIDER:**
1. Review and adjust your delegation policies to ensure those responsible for signing financial reports are compliant with the new certification requirements.
2. Consider simpler certifications, if any, on non-Federal awards.

### D. Subawards and Subrecipient Monitoring

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Payments to subrecipients (200.305)</td>
<td>200.305(b)(3) states that when the cost reimbursement method of payment is used, payments to subrecipients must be made within 30 calendar days after the receipt of the billing, unless the request is improper.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>POINTS TO CONSIDER:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Consider review of current procedures for payments, including documenting receipt of invoices and whether payment is occurring timely.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Consider whether updated procedures are necessary for proper handling of improper invoices (see 200.305(b)(6)).</td>
</tr>
<tr>
<td>2</td>
<td>Requirements for paying subrecipient F&amp;A</td>
<td>Except if the awarding federal program is subject to a reduced F&amp;A rate (conforming to 200.414), pass-through entities must pay the subrecipient’s federally negotiated rate or, if they have never had a rate, either pay a de minimus F&amp;A rate of 10% MTDC or negotiate a rate with the subrecipient. Subrecipients may decline F&amp;A reimbursement, but pass-through entities may not coerce them to accept a rate lower than that to which they are entitled.</td>
</tr>
<tr>
<td></td>
<td>(200.331, 200.414)</td>
<td><strong>POINTS TO CONSIDER:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Consider developing a policy to document the rate agreed at the time of a proposal and the basis for the rate (federally-negotiated, de minimus, negotiated with pass-through entity, other). If the rate used is lower than the rate to which the subrecipient was entitled, consider documenting that such a rate was agreed to voluntarily by the subrecipient.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Consider an institutional approach for managing F&amp;A shortfalls for awards proposed/costed under the old rules, but subsequently awarded under the UG.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Consider identifying and publishing the circumstances under which your institution may be willing to negotiate an F&amp;A rate with a proposed subrecipient who does not have a federally negotiated rate.</td>
</tr>
<tr>
<td>3</td>
<td>Mandatory new data elements (200.331)</td>
<td>200.331(a) includes a list of the mandatory new data elements.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>POINTS TO CONSIDER:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. a) Revise local subaward templates (or use FDP templates) to ensure that the several new data elements required under this section are included in each subaward.</td>
</tr>
<tr>
<td>4</td>
<td>Subaward Financial and Progress Reports</td>
<td>200.331(d)(1) states that pass-through entities must specify any required financial and programmatic reports in their subawards, and are responsible for reviewing such reports.</td>
</tr>
<tr>
<td></td>
<td>(200.331, 200.328)</td>
<td><strong>POINTS TO CONSIDER:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Review subaward issuance procedures to ensure desired reports are included.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Review subrecipient monitoring procedures to ensure receipt and review of subrecipient programmatic reports and financial reports/invoices. Ensure mechanism for documenting reviews for audit purposes.</td>
</tr>
</tbody>
</table>
### Item Summary and Points to Consider

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
</table>
| 5. | Risk Assessment (200.331) | **200.331(e)** states that pass-through entities are obligated to evaluate a subrecipient’s risk and use that assessment to determine appropriate subrecipient monitoring activities. The UG suggests but does not require that certain factors be included in the risk assessment.  
 **POINTS TO CONSIDER:**  
 1. Decide if your risk assessment process is adequate and if the outcomes are used to drive your subrecipient monitoring.  
 2. Determine if you will adopt the recommended risk assessment factors. |
| 6. | Subrecipient Monitoring (200.331) | **200.331(d)** specifies both mandatory and as-needed subrecipient monitoring obligations. Audit reports are now expected to be obtained through the Federal Audit Clearinghouse (rather than from each subrecipient, though audit reports are not expected to be available until later in 2015.).  
 **POINTS TO CONSIDER:**  
 1. Determine whether your subrecipient monitoring process includes all of the specified mandatory monitoring obligations and whether you wish to include the optional monitoring recommendations.  
 2. Consider the impact of subrecipients previously subject to A-133 audits but now exempt because of the increase in the audit threshold from $500K to $750K on your risk assessment and monitoring.  
 3. Ensure that audit reports are sought through the Federal Audit Clearinghouse (FAC) rather than contacting individual subrecipients (once these become available in the FAC).  
 4. Review monitoring process to ensure that your management decisions are documented |
### Item Summary and Points to Consider

</thead>
<tbody>
<tr>
<td>7.</td>
<td>Issuing fixed amount subawards (200.45, 200.201, 200.332)</td>
<td>200.332 requires a pass-through entity to obtain Federal agency prior approval to enter into fixed price subawards; fixed price subays may not be used if cost-sharing is involved; the total dollar amount of each fixed price subaward may not exceed $150K (the simplified acquisition threshold); and requires a new certification by the sub-awardee at the end of the project that the activity or level of effort was completed or else the cost must be adjusted. COFAR FAQ .332-1 states it is acceptable to have more than one fixed price subaward to the same subrecipient if its total cost under the project exceeds $150K, or the agency can be consulted for guidance.</td>
</tr>
</tbody>
</table>

**POINTS TO CONSIDER:**

1. Determine the volume and size of your fixed price subaward portfolio to ascertain the impact of these new requirements. Consider whether you need to identify fixed price subawards in your tracking system.
2. Review procedures to ensure prior approval is obtained from the agency before executing a fixed price subaward.
3. For fixed price subawards exceeding $150K, develop a process to create separate statements of work and deliverables that stay within the $150K threshold, or decide when you will consult the agency for guidance.
4. Review your closeout process to ensure you obtain mandatory completion certification. Determine procedure for deciding when cost adjustments are needed and the basis that will be used for adjusting cost (see FAQs .201-3 and 200.308).

### E. Proposing and Charging Cost Items

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
</table>
| 1. | Direct charging of administrative and clerical salaries (200.413) | 200.413(c) states that salaries of administrative and clerical staff should normally be treated as indirect (F&A) costs. Direct charging of these costs may be appropriate only if all of the following conditions are met:

1. Administrative or clerical services are integral to a project or activity;
2. Individuals involved can be specifically identified with the project or activity;
3. Such costs are explicitly included in the budget or have the prior written approval of the federal awarding agency; and
4. The costs are not also recovered as indirect costs. |

**POINTS TO CONSIDER:**

1. Update and/or develop a policy for charging administrative and clerical salaries that addresses the UG criteria.
2. Such a policy might define integral, provide examples and FAQs, and specify when a budget justification is required.
3. For non-federal projects consider requiring only that the cost be allocable to the project.
4. Pay special attention to Modular budgets and any forthcoming guidance specific to the UG.
5. Pay special attention to prior approvals expectation as specific guidance has yet to be confirmed.
6. Consider a review of systems and processes to ensure these costs are not included in F&A rate cost pools.
7. Pay close attention to new developments related to updating the DS-2. This issue is unsettled and more clarification should be provided shortly.
<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
</table>
| 2. | Compensation and documentation (formerly effort reporting) (200.430) | Review this section carefully and determine the system of records necessary to address the requirements, if not already doing so.  
200.430(i), Standards for Documentation, changes the emphasis of documenting salary charges to federal awards from the three examples in A-21 (which have been eliminated in the Uniform Guidance) to a system that is premised on strong internal controls. There is no reference to "certification", which suggests that a traditional effort reporting system may not be required and that the institution’s official payroll system may be the basis for confirming payroll charges to federal awards. Issues, such as the characteristics of an auditable “system of internal control which provides reasonable assurance”, require further analysis. COGR will work towards developing additional analysis to address effective institutional practices and methodologies that will be in compliance with the new requirements for documenting salary charges to federal awards. Some analysis may utilize, if appropriate, results of audits based on the FDP demonstration projects on payroll confirmation.  
200.430(h) is directed to IHE’s. 200.430(h)(2) defines Institutional Base Salary, IBS, as “the annual compensation paid by an IHE for an individual’s appointment, whether that individual’s time is spent on research, instruction, administration or other activities.” COGR understands this language to include the total of the individual’s multiple appointment(s) that comprise IBS within the institution. Again, COGR will work towards developing additional analysis on this section.  
FAQ .430-1 addresses the role of the DS-2 in the case of changes to time and effort systems. However, additional clarification may be necessary and we recommend paying close attention to new developments related to updating the DS-2.  
**POINTS TO CONSIDER:**  
1. Review new standards and begin consideration of revisions to policies and practices.  
2. If changes are being considered (e.g., frequency, certification language, etc.), pay close attention to new developments related to updating the DS-2. This issue is unsettled and more clarification should be provided shortly.  
3. Pay close attention to new developments and work being conducted by COGR, the FDP, and other higher education leaders. COGR expects to provide additional guidance in 2015. |
| 3. | Executive Compensation limitation (200.430)                         | 200.430(d)(2) states that the allowable compensation for certain employees is subject to a ceiling in accordance with statute. For the amount of the ceiling for cost-reimbursement contracts, the covered compensation subject to the ceiling, the covered employees, and other relevant provisions, see 10 U.S.C. 2324(e)(1)(P), and 41 U.S.C. 1127 and 4304(a)(16). According to Public Law 113- 67 (effective 12/26/13), the compensation limit (i.e., salary and all benefits) is set at ~$487,000 for covered contracts awarded on or after 6/24/14. FAR 31.2 (cost principles for contracts with commercial organizations) incorporates the applicable USC sections by reference and limits allowable compensation on covered contracts.  
**POINTS TO CONSIDER:**  
1. The FAR currently defers to Circulars A-21 and A-122 for covered contracts with IHEs and nonprofit research institutions.  
2. Going forward, the FAR will defer to the Uniform Guidance and, consequently, IHEs and nonprofit research institutions may be required to comply with the limit. |
| 4. | Terminal Leave and other benefits (200.431)                          | COFAR FAQ 200.431-1 states that OMB will issue a technical correction to delete the requirement that indirect costs be used to charge payments of unused leave, workers compensation, unemployment compensation, severance pay and similar employee benefits. Consequently, direct charging using the cash basis of accounting remains an allowable methodology.  
**POINTS TO CONSIDER:**  
1. If continuing to direct charge terminal leave costs under the cash basis, review your process for allocating these costs, and the internal control environment to assure proper allocation of the costs. |
### Item Summary and Points to Consider

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Computing devices</td>
<td>200.453 states that materials and supplies used for the performance of a Federal award may be charged as direct costs. In the specific case of computing devices, charging as direct costs is allowable for devices that are essential and allocable, but not solely dedicated, to the performance of a Federal award.</td>
</tr>
<tr>
<td></td>
<td>(200.453)</td>
<td><strong>POINTS TO CONSIDER:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Consider reviewing current institutional policy to ensure that computing devices that are charged as direct costs are essential and allowable, even if not solely dedicated to the award.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Charging 100% to a Federal award appears to be allowable, though this is a topic still under discussion as to the best/effective practices for implementing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. When computing devices are used for the conduct of research and exceed the institution’s capitalization threshold, such devices should be proposed and charged as scientific equipment and not as general purpose equipment.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4. Refer to agency implementation guidelines for specifics regarding proposing and charging computing devices, and scientific and general purpose equipment.</td>
</tr>
<tr>
<td>6</td>
<td>Participant Support Costs and MTDC (200.456)</td>
<td>200.456 states that participant support costs, as defined in Subpart A. Definitions, 200.75, are allowable with the prior approval of the Federal awarding agency but are excluded from the MTDC base (see Subpart A. Definitions 200.68).</td>
</tr>
<tr>
<td>7</td>
<td>Publication costs</td>
<td>200.461 states that page charges for professional journals are allowable when they report work on an award and the journal levies charges impartially on all items published by the journal (whether or not under a federal award). The costs of publication or sharing of research results may be charged even if incurred after the end date of the award but before award closeout.</td>
</tr>
<tr>
<td></td>
<td>(200.461)</td>
<td><strong>POINTS TO CONSIDER:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Review current processes to determine how you will ensure that the journal applies its charges independent of fund source</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Review internal procedures to determine if you will allow posting of publication charges after the end date of the award, but before closeout; and if so, during what period of time this will be permitted (e.g., without delaying closeout).</td>
</tr>
<tr>
<td>#</td>
<td>Item</td>
<td>Summary and Points to Consider</td>
</tr>
<tr>
<td>----</td>
<td>----------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| 8. | Dependent travel and commercial airfare (200.474)                    | 200.474(c) states that temporary dependent care costs (as dependent is defined in 26 U.S.C. 152), above and beyond regular dependent care, that directly results from travel to conferences is allowable provided that:  
1. The costs are a direct result of the individual’s travel for the Federal award;  
2. The costs are consistent with the non-Federal entity’s documented travel policy for all entity travel;  
3. Are only temporary during the travel period.  
Travel costs for dependents are unallowable, except for travel of duration of six months or more with prior approval of the Federal awarding agency.  
200.474(d)(1) refers to Commercial air travel and uses the following language: the “least expensive unrestricted accommodations class” offer by commercial airlines.  
A-21 J.53 c(1) used the language “customary standard commercial airfare (coach or equivalent), ... or the lowest commercial discount airfare”.

**POINTS TO CONSIDER:**  
1. Consider performing a cost analysis for item (ii) above to estimate the cost to the institution of providing temporary dependent care costs institution-wide.  
2. IHEs may consider adding an extraordinary dependent care program as a component of their Fringe Benefit rate, recognizing that it would take time to define and estimate the costs of the program, and to propose and negotiate the costs added to the Fringe Benefit rate.  
3. Consider whether an IHE should change policies from the lowest available fare (LAF) to “least expensive unrestricted class”. While this may represent a more expensive airfare, the Uniform Guidance allows this methodology.

---

F. F&A Rate Proposals

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
</table>
| 1. | Treatment of cost sharing and losses in the research base (200.306 & 200.451) | 200.306(a) states that only mandatory cost sharing or cost sharing specifically committed in the project budget must be included in the organized research base. FAQ .458-2 confirms the continued applicability of the 2001 OMB memorandum that addressed voluntary uncommitted cost share, M-01-06. FAQ .201-2 (addressing Fixed Amount Awards) also provides a clarification that salary costs above a Federal awarding agency’s cap are not mandatory cost-share or match but, instead, are the result of limitations on the amount of salary costs that may be charged.

200.451 specifies that losses on awards are not allowable indirect (F&A) costs and are required to be included in the appropriate indirect cost rate base to receive an allocation of indirect costs.  

**POINTS TO CONSIDER:**  
1. Develop institutional procedures for treatment of salary costs above a Federal awarding agency’s cap within the F&A proposal. Since there is currently no specific requirement within the UG to include these costs in the organized research base, look for potential opportunities for fair treatment of salary costs above the cap.  
2. Consider whether your institution will allow, not allow, or discourage voluntary committed cost sharing since agencies are not to consider it in merit reviews of applications or proposals, unless it is both in accordance with Federal awarding agency regulations and specified in a notice of funding opportunity.  
3. As OMB M-01-06 remains applicable, a minimum level of committed effort still needs to be captured for faculty (or senior researchers) on most Federally-funded research programs, either paid or unpaid by the Federal Government.
# Item Summary and Points to Consider

<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.</td>
<td>Request for a 4-year rate extension (200.414)</td>
</tr>
</tbody>
</table>

200.414(g) allows for a one-time extension of the current negotiated indirect cost rate for a period of up to four years. This refers to an extension that changes your base year, not an extension of the due date to submit your proposal for the same base year. FAQs .414-2 and .414-3 confirm that multiple four-year rate extensions can be requested if a negotiation is completed between each rate extension request. FAQ .414-2 also specifies that documentation requests to support a four-year extension should be kept to a minimum.

**POINTS TO CONSIDER:**

1. Contact your cognizant agency as soon as possible if you are considering requesting such an extension.

2. CAS and ONR, in an October 22nd meeting with COGR, were consistent in stating that documentation requirements for requesting an extension will be kept to a minimum. Also, once the extension period is complete (even if only for one year), a new proposal will be required. COGR's understanding of each agency's current position on data requirements is:

   CAS: Additional data requirements will include the last audited financial statement, last A-133 audit, summary schedules of Research base activity and space activity since your last proposal, along with a forecast for both the number of years for which the extension is being requested;

   ONR: Documentation requirements will depend on the number of years requested. If requesting 1-2 years, start with a phone call to ONR. They will review the previous proposal and other information and determine the documentation that will be necessary. If requesting 3-4 years, the documentation required would be more comprehensive, including the last audited financial statement, last A-133 audit, space and base activity since your last proposal, and space and base forecasts for the number of years for which the extension is being requested.

3. Submitting a revised DS-2 (200.419) |

200.419(b) maintains the requirement that an IHE that receives aggregate Federal awards totaling $50 million during its most recently completed fiscal year must disclose their cost accounting practices by filing a Disclosure Statement (DS-2). FAQs .110-3 and .110-5, released in November 2014, attempt to clarify the process for completing and submitting a DS-2. However, additional clarification is necessary and should be forthcoming.

**POINTS TO CONSIDER:**

1. Per FAQ .110-3, IHE's with CAS covered-contracts meeting the dollar threshold should submit their revised DS-2 as soon as possible after 12/26/2014, but in any event no later than prior to the award of a CAS-covered contract or subcontract.

2. Per FAQ .110-3, IHEs that do not meet the CAS covered contract threshold should submit their DS-2 with the next submission of the IHE's indirect cost rate proposal, unless requested earlier by the cognizant agency.

3. Per FAQ .110-3, IHE's making voluntary changes in cost accounting practices other than those required in the Uniform Guidance or submitting indirect cost rate proposals that are currently due should submit their DS-2 (or revised pages of the DS-2 for changes that are not extensive) 6 months before the effective date of proposed changes.

4. Per FAQ .110-5, Non-Federal entities will not be penalized for discrepancies between their approved DS-2 and actual charging practices in accordance with the new uniform guidance, provided that an updated DS-2 (consistent with actual charging practices) has been revised and submitted in accordance with FAQ .110-3.

5. Pay close attention to new developments related to revising and submitting the DS-2. Simplification and clarification of the process will be provided by OMB shortly.
<table>
<thead>
<tr>
<th>#</th>
<th>Item</th>
<th>Summary and Points to Consider</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.</td>
<td>Allowable depreciation (200.436)</td>
<td>200.436(a) includes software as an asset that can be capitalized, in accordance with GAAP. FAQ .436-1 clarifies that the depreciation associated with the institutional contribution toward the cost of buildings and equipment is allowable, unless law or agreement prohibits recovery. This resolves the confusion created by 200.436(c)(3), which states that if an institution receives federal assistance for a portion of the costs to construct buildings or equipment, even if the institutional share is not by law or agreement required as cost sharing, the institution’s share is excluded from cost prior to calculating depreciation. 200.436(c)(4) states that the acquisition cost will exclude only assets acquired solely for the performance of a non-federal award. <strong>POINTS TO CONSIDER:</strong> 1. Review/update institutional equipment policy and disclosure statement regarding software. 2. Include equipment depreciation on non-federal awards that are not acquired solely for the performance of the non-federal award in your next F&amp;A proposal. This is a change from the previous cognizant agency position where remaining depreciation from any non-federal award could be recovered only after the non-federal award ended. 3. Notify COGR if depreciation on the institutional contribution associated with buildings and equipment is disallowed.</td>
</tr>
<tr>
<td>5.</td>
<td>1.3% Utility Cost Adjustment (Appendix III)</td>
<td>Appendix III, B.4.c, states that a utility cost adjustment of up to 1.3 percentage points may be included in the negotiated indirect cost rate for organized research. FAQ .110-2 states that F&amp;A rate proposals based on FY14 and after can be developed using provisions in the UG. FAQ Appendix III-1 specifies that IHEs and cognizant agencies should address issues related to the 1.3% UCA in a collaborative manner. <strong>POINTS TO CONSIDER:</strong> 1. COGR’s understanding of CAS’s current position is that CAS may (or may not) not accept the UCA factor for IHEs that have never had the UCA, until base year FY2016. For institutions with FY2014 or FY2015 base years: • - IHEs already receiving the 1.3% should add the 1.3% as they have in the past without additional justification. • - IHEs that have never received the 1.3% should add in a factor with a justification, but at this point there is no indication that CAS will/will not accept the adjustment. • - Proposals based on FY2016 and beyond should include the UCA factor with the appropriate justification. 2. COGR’s understanding of ONR’s current position is that institutions will be allowed to include the UCA, but may need to calculate and justify it beginning with FY2014, regardless of whether or not the institution previously received the UCA. 3. Pay close attention to new developments related to application of the 1.3% UCA. This issue is unsettled and more clarification should be provided shortly.</td>
</tr>
<tr>
<td>6.</td>
<td>Treatment of DA expenses and the DCE (Appendix III)</td>
<td>Appendix III, B.6.a eliminates the language from A-21 F.6.b(2) which stated that administrative and clerical salaries should normally be treated as F&amp;A costs unless they could be specifically identified to a “major project”. <strong>POINTS TO CONSIDER:</strong> 1. For those institutions using a Direct Charge Equivalent (DCE) to build their DA cost pool, this change in costing could affect the DCE ratio. It is assumed that the change in language regarding administrative and clerical salaries will allow for more direct charging of these costs, which could raise DCE ratios and lower DA costs. 2. The DCE is predicated on the treatment of job titles/ codes/ descriptions, and consequently, may require closer review when developing the DA cost pools. 3. Institutions not significantly over the administrative cap should analyze the effect this has on their DA calculation.</td>
</tr>
<tr>
<td>#</td>
<td>Item</td>
<td>Summary and Points to Consider</td>
</tr>
<tr>
<td>----</td>
<td>----------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| 7. | Library expenses and other users (Appendix III)                      | Appendix III, B.8.b states that in the first step of the library allocation, which is based on primary categories of users, the other user category must consist of a reasonable factor as determined by institutional records to account for all other users of library facilities.  
**POINTS TO CONSIDER:**  
1. a) Research what institutional records exist or could be generated (e.g., on-line login logs, card access, sign-in statistics, use agreements, etc.) to support the other users category. |
| 8. | The distribution basis and MTDC exclusions (Appendix III)             | Appendix III, C.2 cross-references to the definition of MTDC (Subpart A, 200.68). The definition now covers participant support costs as an MTDC exclusion (also see 200.75 and 200.456). The definition remains unchanged in regard to the portion of each subaward and subcontract in excess of $25,000 as an MTDC exclusion.  
**POINTS TO CONSIDER:**  
1. Review UG and agency definitions of participant support costs and compare to institutional definitions and policy.  
2. Consider system/accounting changes to identify and account for participant support costs that will allow for correct treatment in defining MTDC for F&A rate development purposes.  
3. Train appropriate staff (e.g., those preparing budgets for sponsored project proposals) so that F&A is not applied to participant support costs.  
4. Some agencies maintain that a vendor contract greater than $25,000 is a subcontract subject to the MTDC exclusion. Pay close attention to technical correction in the UG that may eliminate the term “subcontract” from the definition, which would clarify that the MTDC exclusion is applicable to subawards > $25,000 only. |
§1320.10 Measuring the Impact of the Uniform Guidance: Single Audit Metrics
Council on Financial Assistance Reform (COFAR)

On December 26, 2013 Office of Management and Budget (OMB) published final guidance in 2 C.F.R 200 titled Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards in order to improve the effectiveness and efficiency of Federal financial assistance. The guidance served as an instrument to better target financial risk and better direct resources in order to achieve evidence-based outcomes.

In an effort to assure effective implementation, the Council on Financial Assistance Reform (COFAR) established metrics to gauge how the guidance addressed its intended enhancements and to measure the performance of the Federal government’s work in the management of assistance in the form of Federal financial assistance. On September 30, 2014 OMB issued Memorandum M-14-17 to all executive Departments and Agency Chief Financial Officers (CFO) that manage assistance programs, and set forth requirements for the initial collection and use of administrative and audit metrics for the Uniform Guidance.

These findings for the Administrative Metrics are aggregated from twenty-one CFO Act agencies and will help establish a baseline. At this initial stage, metric collection is to inform the COFAR about the state prior to implementation of the Uniform Guidance. As outlined in Memorandum M-14-17, by January 15, 2017, OMB and the COFAR will evaluate the utility of these metrics and will consider whether it is appropriate to establish goals or target outcomes for any given metric.

### 2014 Administrative Metrics results

<tr>
<td>Number of Indirect Cost Rate Extensions Approved by Cognizant Agencies</td>
<td>83</td>
</tr>
</tbody>
</table>

* Data not requested for this baseline metric.

** Baseline data is based on Federal awarding agencies best approximation of what they considered fixed amount awards for 2014. Prior to the implementation of the Uniform Guidance, there was no unified definition on what was considered a fixed amount award.

These Administrative Metrics will be collected annually from OMB records of exceptions and Federal awarding agency records of: information collection requests, fixed-amount awards, number of indirect cost extensions, and agency exceptions to the provision of federally negotiated rates. Federal awarding agencies are responsible for the accuracy of the data submitted to OMB and are expected to accurately report the annual metrics as required by Memorandum M-14-17.

Based on the evaluation of these indicators after the implementation of the Uni-
form Guidance, OMB and the COFAR will work with Federal agencies to gauge the success of the guidance and the performance of the Federal government’s work in the management of Federal financial assistance.

### 2014 Single Audit Metrics Results

<table>

<tr>
<td>Number of Modified Opinions for Major Programs selected for audits</td>
<td>3,886</td>
</tr>
<tr>
<td>Number of Audit Findings of Material Weaknesses in Internal Controls for Major Programs selected for audits</td>
<td>4,838</td>
</tr>
<tr>
<td>Number of Repeat Findings for Higher Risk Major Programs</td>
<td>*</td>
</tr>
<tr>
<td>Number of Audit Objectives in the Compliance Supplement</td>
<td>**73</td>
</tr>
</tbody>
</table>

* Data to be collected starting FY 2015
** Audit objectives in Part 3 – Compliance Requirements of the 2014 Compliance Supplement

These Single Audit metrics results are aggregated from all the audit submissions by the auditees for FY 2014 (i.e., for fiscal year that ended between 01/01/2014 through 12/31/2014) to the Federal Audit Clearinghouse. As of 12/18/2015 we have received 38,025 audits. The metrics results will be updated in spring 2016 to provide a more complete picture as we expect that the rest of FY 2014 audits will be submitted by that date. These metrics will help establish a baseline for audits that were conducted before the effective of the Uniform Guidance and will serve to measure over time the effective implementation of the Uniform Guidance, including reductions of unnecessary administrative burden, and reductions in risks of waste, fraud and abuse. The analysis of these audit metrics will provide demonstrations of success and opportunities and needs for future revisions to the Uniform Guidance.

The next collection of the Single Audit metrics will be collected for FY 2015 (i.e., for fiscal year that ended between 01/01/2015 and 12/31/2015) in winter 2016-2017.

Based on the evaluation of these metrics after the implementation of the Uniform Guidance, OMB and the COFAR will work with Federal agencies to gauge the success of the Uniform guidance and the performance of the Federal government’s work in the audit and oversight of Federal financial assistance.

### 1330 Practical Tools

This section contains practical resources related to the ever-changing regulatory environment. The materials are culled from a variety of sources.

### 1330.1 Summary of Significant Changes to the NIH GPS for October 2017 Version

National Institutes of Health

The revised NIH Grants Policy Statement (NIHGPS, rev. 10/01/2017) represents an update to the November 2016 version and is applicable to all NIH grants and cooperative agreements beginning on or after October 1, 2017. While the update does not introduce any new material for the first time, it incorporates new and modified requirements, clarifies certain policies, and implements changes in statutes, regulations, and policies that have been implemented through appropriate legal and/or policy processes since the previous version of the NIHGPS dated November 2016. The 10/01/2017 revision supersedes, in its entirety, the NIH Grants Policy Statement (November 2016) as a standard term and condition of the award.

**Notable Policy Changes**: Implements new policies and clarification of existing policies announced in the NIH Guide since October 2016, and listed at Grants Policy & Guidance.

<td><strong>Chapter 4 – Public Policy Requirements, Objectives and Other Appropriation Mandates</strong></td>
<td>Sec. 4.1.3 ClinicalTrials.gov and Dissemination of NIH-Funded Clinical Trial Information Requirements: This policy applies to applications submitted on or after January 18, 2017, requesting support for the conduct of a clinical trial to be initiated on or after January 18, 2017. NIH expects all NIH-funded awardees and investigators conducting clinical trials, funded in whole or in part by the NIH, ensure that their NIH-funded clinical trials are registered at, and that summary results information is submitted to, ClinicalTrials.gov for public posting. As part of their applications, applicants seeking NIH funding will be required to submit a plan for the dissemination of NIH-funded clinical trial information that will address how the expectations of this policy will be met. NIH-funded awardees and investigators conducting clinical trials funded in whole or in part by the NIH will be required to comply with all terms and conditions of award, including following their plan for the dissemination of NIH-funded clinical trial information.</td>
<td>Implements provisions announced in NOT-OD-16-149.</td>
</tr>
<tr>
<td></td>
<td>Sec. 4.1.4.1 Certificates of Confidentiality: Section 301(d) of the PHS Act, as amended by Section 2012 of the 21st Century Cures Act, P.L. 114-255, states that the Secretary shall issue Certificates of Confidentiality (Certificates) to investigators or institutions engaged in biomedical, behavioral, clinical, or other research activities in which identifiable, sensitive information is collected. All recipients covered by this policy are deemed to be issued a Certificate, and are therefore required to protect the privacy of individuals who are subjects of such research. NIH will no longer accept applications or issue paper certificates for NIH-funded research collecting “covered information,” as defined in the policy.</td>
<td>Implements provisions announced in NOT-OD-17-109.</td>
</tr>
<tr>
<td></td>
<td>Sec. 4.1.15.10 NIH Policy on Good Clinical Practice Training for NIH Awardees Involved in NIH-funded Clinical Trials: Establishes the expectation that all NIH-funded investigators and staff who are involved in the conduct, oversight, or management of clinical trials should be trained in Good Clinical Practice (GCP), consistent with principles of the International Conference on Harmonisation (ICH) E6 (R2).</td>
<td>Implements provisions announced in NOT-OD-16-148.</td>
</tr>
<tr>
<td></td>
<td>Sec. 4.2.2 Certification of Filing and Payment of Taxes has been removed. This statutory requirement is no longer in place.</td>
<td>Clarifies legislative mandates in effect as outlined in NOT-OD-17-075</td>
</tr>
<tr>
<td><strong>Chapter 8 – Administrative Requirements</strong></td>
<td>Sec. 8.1.2.5 Change in Scope: The prior approval requirement for changes from “No Clinical Trial” to “Includes Clinical Trial” has changed. This project change now requires submission of a competitive revision application, to a FOA which accepts clinical trials.</td>
<td>Implements provisions announced in NOT-OD-16-147 and NOT-OD-17-043</td>
</tr>

</table>
1330.2 Significant Changes and Clarifications to the NSF PAPPG, NSF 18-1
National Science Foundation

Overall Document
◆ Editorial changes have been made to either clarify or enhance the intended meaning of a sentence or section. The document has been updated to ensure consistency with data contained in NSF systems or guidance located in other NSF or Federal policy documents. Throughout the PAPPG, website, address and document references and organizational names have been updated to reflect current information.

Significant Changes
◆ Chapter I.E, Who May Submit Proposals, incorporates new coverage on the eligibility of international branch campuses of US institutions of higher education. The definition of colleges and universities in Chapter I.E.1 has been updated to now refer to institutions of higher education, for consistency with 2 CFR § 200. In addition, changes have been made to the eligibility requirements for foreign organizations.

◆ Chapter II.C.1.e, Collaborators & Other Affiliations Information, has been significantly revised to request information regarding collaborators and other affiliations (COA) be provided through use of a standard NSF COA template. Footnotes also have been added to address frequently asked questions relating to the new COA template.

◆ Chapter II.C.2.d, Project Description, has been modified to reflect that the Project Description must now contain a separate section specifically identified as “Intellectual Merit”.

◆ Chapter II.C.2.g, Budget and Budget Justification, has been revised to increase the number of pages allowed for the budget justification to no more than five pages per proposal. This change applies to budget justifications for both proposers and subawardees.

◆ Chapter VII.A.2, Grantee Notifications to NSF, has been restructured to remove information on requests for NSF approval. In addition, Exhibit VII-1 has been deleted, as coverage on grantee requests for approval from NSF is contained in the Research Terms and Conditions Appendix A and Chapter X.A.3.

◆ Chapter X.A.3, Prior Written Approvals, has been updated to reference the Research Terms and Conditions Appendix A, which is the authoritative source of NSF prior approval requirements.

Clarifications and Other Changes
◆ Section B, Foreword, has been modified to refer to the applicable standard grant conditions, instead of solely the NSF Grant General Conditions, now that the Research Terms and Conditions have been implemented.
◆ Section D, Definitions & NSF-Grantee Relationships, provides additional guidance on the types of cooperative agreements awarded by NSF.

◆ Section E, NSF Organizations, has been revised to reflect the current responsibilities of the organizations that are normally of most direct interest to the NSF proposer and grantee community.

◆ Chapter II.C.1.f, Submission of Proposals by Former NSF Staff, incorporates new coverage to address submission of proposals from former NSF staff and the procedures that must be followed in such circumstances.

◆ Chapter II.C.2.d(iii), Results from Prior NSF Support, clarifies the timeframe during which any PI or co-PI that has received NSF support must report on such funding. Chapter II.E.7 on conference proposals, II.E.8 on equipment proposals, II.E.9 on travel proposals and Exhibit II-1, the Proposal Preparation Checklist, also have been updated with this guidance.

◆ Chapter II.C.2.g(i)(a), Senior Personnel Salaries & Wages Policy, has been supplemented with guidance that reflects it is the proposing organization’s responsibility to define and apply the term “year” and include the definition in the budget justification.

◆ Chapter II.C.2.g(viii), Indirect Costs, has been updated to state that amounts for indirect costs should be specified in the budget justification.

◆ Chapter II.C.2.j, Special Information and Supplementary Documentation, includes additional guidance on the content for data management plans that involve collaborative activities.

◆ Chapter II.D.4, Proposals Involving Vertebrate Animals, has been revised to enhance the clarity of guidance on the use of vertebrate animals for research or education on NSF supported projects. For projects at an international organization that involve the use of vertebrate animals, a statement from the international organization will need to be provided.

◆ Chapter II.D.5, Proposals Involving Human Subjects, has been supplemented with additional language regarding international projects.

◆ Chapters II.D.6 and XI.B.5, Life Sciences Dual Use Research of Concern (DURC), include new coverage regarding NSF’s funding of research that would be considered to lead to a gain of function of agents. The title of these sections also has been changed for consistency with the US Government Policy for Institutional Oversight of Life Sciences Dual Use Research of Concern.

◆ Chapter II.E.11, Research Infrastructure Proposal, has been revised to reflect current practices and provide greater clarity in the description of these types of proposals.

◆ Exhibit II-1, Proposal Preparation Checklist, has been updated to reflect relevant changes made to Chapter II of the PAPPG. Additional checklist components also have been added to assist proposers in the pre-submission administrative review of proposals to NSF.
◆ Chapter V, Renewal Proposals, has been modified to update reference information regarding recompetition of expiring awards. Section B on Accomplishment-Based Renewals has been updated to provide greater clarity regarding the submission of reprints.

◆ Chapter VII.B.2.e, Substitute (Change) PI/PD or co-PI/co-PD, has been supplemented with guidance on the reappointment of prior NSF staff as PI.

◆ Chapter VII.B.3, Subawarding or Transferring Part of an NSF Award (Subaward), has been modified for consistency with terminology in 2 CFR § 200.

◆ Chapter VII.D.2, Final Project Report, has been updated to reflect that when PIs submit the report, they are indicating that the scope of work is complete and no further administrative actions are anticipated on the grant.

◆ Chapter VIII.E.6, Award Financial Reporting Requirements and Final Disbursements, has been supplemented to clarify the intent of NSF notifications regarding canceling appropriations.

◆ Chapter X.B, Direct Costs and X.C, Other Direct Costs, have been modified to remove coverage that is redundant with 2 CFR § 200 and other sections of the PAPPG. Terminology on rearrangement and reconversion costs has been updated for consistency with 2 CFR § 200.462.

◆ Chapter XI.A, Non-Discrimination Statutes and Regulations, has been revised to provide current information on NSF grantee obligations to comply with civil rights laws and regulations. These changes provide NSF grantees and applicants for NSF grants with an overview of relevant civil rights regulatory obligations and compliance mechanisms. Information also has been included on how grantee program participants can file complaints with NSF alleging discrimination in an NSF grantee’s programs.

◆ Chapter XI.B.1, Human Subjects and XI.B.3, Vertebrate Animals, include the relevant new award-specific condition on organizational responsibilities. In addition, language has been added on post-award responsibilities.

◆ Chapter XI.D.1.d, Intellectual Property, has been updated to specify that grantees are required to use iEdison to disclose NSF subject inventions. In addition, NSF now reserves the option to request an Annual Utilization Report or a Final Invention Statement and Certification.

◆ Chapter XI.M.4, Executive Order 13788, Buy American and Hire American, is a new section which serves as NSF’s implementation of Executive Order 13788.

1330.3 NSF FAQs on Proposal Preparation and Award Administration
National Science Foundation

A

Frequently Asked Questions (FAQs)

What should I do if I notice an error in a proposal I just submitted via FastLane?
It is the responsibility of the proposing organization to thoroughly review each proposal prior to submission. On occasion, however, a problem is identified with a portion of the proposal after the proposal has been submitted electronically to NSF. The FastLane Proposal File Update Module allows the organization to request the replacement of files or revision of other Proposal Attributes, associated with a previously submitted proposal. A request for a proposal file update must be submitted by an Authorized Organizational Representative (AOR). The Proposal File Update module, however, may not be used for submission of revised budgets. All budgetary revisions must be submitted through use of the FastLane Revised Proposal Budget Module. More information on and submission procedures for proposal file updates can be found in the Proposal & Award Policies & Procedures Guide (PAPPG) Chapter III.C.

Audit Reports

Where should copies of audits required by 2 CFR § 200, Subpart F be sent?
In accordance with 2 CFR Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards (Uniform Guidance), grantees that are states, local governments or non-profit organizations must submit copies of their audit reports to the Federal Audit Clearinghouse (FAC). See 2 CFR § 200.512(b) for additional information.

Award Administration

Where can I find information regarding post-award issues?
Information regarding pre-award costs, required notifications and prior approvals, extensions, transfer of the award, reporting requirements and other award administration requirements can be found by accessing the applicable award conditions on the NSF website. Additional information regarding the award and administration of NSF grants and cooperative agreements may be found in Part II of the Proposal & Award Policies & Procedures Guide (PAPPG).

B

Biographical Sketches

Instructions for the Biographical Sketch(es), Products section indicate that “acceptable
products must be citable and accessible.” Accessibility may be difficult to accomplish in the case of manuscripts submitted or accepted for publication and other documents and materials. Access may need to be provided through organizational or personal websites. Will that be sufficient to meet the proposal submission requirements?

The language was changed from “publications” to “products” in order to allow proposers to receive appropriate credit for research products that may not be traditional publications. The requirement that all products be “citable and accessible” is not a submission requirement, in the sense of blocking a proposal from consideration, but a definition of the standard to which proposers should adhere. It was introduced because of experience with citations that are not readily available, including web references that are inaccessible or out of date, and is intended to indicate that such mistakes have demonstrably downgraded a proposal in the judgment of reviewers. References to websites, even private ones, are appropriate, provided that the site is available for a reasonable percentage of the time. Such material is often the best way to demonstrate the applicant’s ability to carry out the project.

For Biographical Sketch(es), now that “Publications” has become “Products,” are proposers still limited to the same number of Products as they were Publications?

Yes. The proposer may include up to five products most closely related to the proposed project and up to five other significant products, whether or not related to the proposed project.

C

Categories of Funding Opportunities

What types of mechanisms does NSF use to generate proposals? In what scenario is each mechanism used?

NSF utilizes a variety of mechanisms to generate proposals. There are four categories of funding opportunities: Dear Colleague Letters, Program Descriptions, Program Announcements and Program Solicitations. For a description of each category and further information, see PAPPG Chapter I.C.

CFDA Numbers

What is the CFDA number and where can a proposer find it?

The Catalog of Federal Domestic Assistance (CFDA) profiles all Federal grant programs and is jointly issued by the Office of Management and Budget (OMB) and the General Services Administration (GSA). The Catalog is available for reference in the Government documents section of most major libraries and in the offices of state and local governments. The CFDA number is important for tracking and audit purposes. The applicable CFDA number is identified in the Summary section of NSF program announcements and solicitations. A complete listing of NSF CFDA numbers, by Division, is included on the DIAS/Policy Office website.
Collaborative Proposals

What is a collaborative proposal?
A collaborative proposal is one in which investigators from two or more organizations wish to collaborate on a unified research project. Collaborative proposals may be submitted to NSF in one of two methods: as a single proposal, in which a single award is being requested (with subawards administered by the lead organization); or by simultaneous submission of proposals from different organizations, with each organization requesting a separate award. All components of the collaborative proposal must meet any established deadline, and, failure to do so may result in the entire collaborative proposal being returned without review. PAPPG Chapter II.D.3 contains additional information and instructions regarding collaborative proposals.

Concurrent Proposals

Can a proposer submit the same proposal to different organizations within NSF for simultaneous review?
Only one submission should be provided to NSF even if review by multiple programs is envisioned. Proposers may indicate on the Cover Sheet which NSF organizational unit(s) they believe would be most appropriate for proposal review. However, NSF will determine which program will evaluate each proposal. The submission of duplicate or substantially similar proposals concurrently for review by more than one program without prior NSF approval may result in the return of the redundant proposal(s). (Reference PAPPG Chapter IV.B).

Can the same proposal submitted to NSF be submitted to other agencies for simultaneous review?
Generally, proposals may be submitted to other agencies for simultaneous review. Research proposals (not proposals for conferences or workshops) to the Biological Sciences Directorate, however, cannot be duplicates of proposals to any other Federal agency for simultaneous consideration. The only exceptions to the rule for research proposals submitted to the Biological Sciences Directorate are: (1) when the proposers and program managers at relevant Federal agencies have previously agreed to joint review and possible joint funding of the proposal; or (2) proposals for PIs who are beginning investigators (individuals who have not been a principal investigator (PI) or co-principal investigator (co-PI) on a Federally funded award with the exception of doctoral dissertation, postdoctoral fellowship, or research planning grants). For proposers who qualify under this latter exception, the box for “Beginning Investigator” must be checked on the proposal Cover Sheet. (Reference PAPPG Chapter II.D.2).

Conference, Symposia and Workshop Proposals

Can I submit a proposal for NSF funding to conduct a conference, symposia or workshop?
NSF supports conferences, symposia and workshops in special areas of science
and engineering that bring experts together to discuss recent research or education findings or to expose other researchers or students to new research and education techniques. Requests generally should be made at least a year in advance of the scheduled date. See PAPPG Chapter II.E.7 for additional information. Conferences or meetings, including the facilities in which they are held, funded in whole or in part with NSF funds, must be accessible to participants with disabilities.

Should I include conference speaker fees in the participant support costs section of the budget?
The participant support category of the budget is for the support of participants or trainees only. Speakers and trainers are not considered participants in the conference/training event, therefore, the cost of speakers or trainers should not be included in the participant support cost section of the budget.

Confidential Budgetary Information

How do I indicate in my proposal if I do not want salary information to be released to people outside the Government?
The proposing organization may request that salary data on senior personnel not be released to persons outside the Government during the review process. In such cases, the item for senior personnel salaries in the proposal budget may appear as a single figure and the person-months represented by that amount omitted. If this option is exercised, senior personnel salaries and person-months must be itemized in a separate statement, and forwarded to NSF in accordance with the instructions specified in the PAPPG Chapter II.D.1, Proprietary or Privileged Information.

Consultant Rate

Is there a limitation on payments to consultants under NSF awards?
No, there is no limitation on payments to consultants under NSF awards. Payment for consultant services should be comparable to the normal or customary fees charged and received by the consultant for comparable services, especially on non-Government contracts and grants. See PAPPG Chapter II.C.2.g(vi)(c) and 2 CFR § 200.459, Professional Services, for additional information.

Cost Sharing

Where can I find more information on NSF’s cost sharing policy?
The National Science Board issued a report entitled “Investing in the Future: NSF Cost Sharing Policies for a Robust Federal Research Enterprise” (NSB 09-20, August 3, 2009), which contained eight recommendations for NSF regarding cost sharing. In implementation of the Board’s recommendations, NSF’s revised guidance (see PAPPG Chapter II.C.2.g(xii)) is as follows:

- Except where required by a program solicitation, inclusion of voluntary committed cost sharing is prohibited.
◆ When cost sharing is required by the Foundation, included on Line M of the proposal budget and accepted by NSF, the commitment of funds becomes legally binding and is subject to audit. Failure to provide the level of cost sharing required by the NSF solicitation and reflected in the approved award budget may result in termination of the NSF award, disallowance of award costs and/or refund of award funds to NSF by the grantee.

More information can be found in PAPPG Chapter II.C.2.g(xii) and Chapter VII.C.

_The Proposal & Award Policies & Procedures Guide (PAPPG) Chapter II.C.2.g.(viii) states that, “Except where specifically identified in an NSF program solicitation, the applicable US Federally negotiated indirect cost rate(s) must be used in computing indirect costs (F&A) for a proposal.” Does this mean that organizations cannot request a reduced or waived rate because this would constitute voluntary committed cost sharing?_

Yes. Unless required by an NSF program solicitation, the organization’s current negotiated indirect cost rate agreement must be used in computing indirect costs for a proposal. Otherwise, foregoing full indirect cost rate recovery would be considered voluntary committed cost sharing and is therefore prohibited by NSF.

**What is the distinction between voluntary committed cost sharing and voluntary uncommitted cost sharing?**

As stipulated in 2 CFR § 200.99, “Voluntary committed cost sharing means cost sharing specifically pledged on a voluntary basis in the proposal’s budget or the Federal award on the part of the non-Federal entity and that becomes a binding requirement of Federal award.” As such, to be considered voluntary committed cost sharing, the amount must appear on the NSF proposal budget and be specifically identified in the approved NSF budget (inclusion in the budget justification also meets this definition). Unless cost sharing is required by a specific NSF program, inclusion of voluntary committed cost sharing is prohibited and Line M on the proposal budget will not be available for use by the proposer. NSF Program Officers are not authorized to impose or encourage cost sharing unless such requirements are explicitly included in the program solicitation. A complete listing of NSF programs that require cost sharing is available on the NSF website at: http://www.nsf.gov/bfa/dias/policy/.

In order for NSF, and its reviewers, to assess the scope of a proposed project, all organizational resources necessary for, and available to, a project must be described in the Facilities, Equipment and Other Resources section of the proposal (see PAPPG Chapter II.C.2.i for further information). While not required by NSF, the grantee may, at their own discretion, continue to contribute voluntary uncommitted cost sharing to NSF-sponsored projects. As noted above, however, these resources are not auditable by NSF and should not be included in the proposal budget or budget justification.

_Where can the PI describe the time they’ll spend if they don’t request salary?_

The Facilities, Equipment and Other Resources section should contain an aggregated description of the resources that the organization will provide to the project (both
physical and personnel), should it be funded. The description should be narrative in nature and must not include any quantifiable financial information.

D

Data Management Plan

Where can I find more information about the requirement for a data management plan? PAPPG Chapter II.C.2.j reflects NSF’s long standing data policy. All proposals must describe plans for data management and sharing of the products of research, or assert the absence of the need for such plans. FastLane will not permit submission of a proposal that is missing a Data Management Plan. The Data Management Plan will be reviewed as part of the intellectual merit or broader impacts of the proposal, or both, as appropriate.

For a separately submitted collaborative proposal, do non-lead organizations need to submit a data management plan?

No. The lead organization should submit one data management plan for all the collaborating organizations. A non-lead organization does not need to submit a data management plan for a separately submitted collaborative proposal. More information can be found in PAPPG Chapter II.D.3.

Deviation Authorization

What is the process for requesting authorization of a deviation from the PAPPG proposal preparation instructions?

Deviations from NSF proposal preparation and processing instructions may be authorized in one of two ways:

1. through specification of different requirements in an NSF solicitation; or

2. by the written approval of the cognizant NSF Assistant Director/Office Head or designee. These approvals to deviate from NSF proposal preparation instructions may cover a particular program or programs or, in rare instances, an “individual” deviation for a particular proposal.

Proposers may deviate from these instructions only to the extent authorized. Proposals must include an authorization to deviate from standard NSF proposal preparation instructions in one of the following ways as appropriate: (a) by identifying the solicitation number that authorized the deviation in the appropriate block on the Cover Sheet; or (b) for individual deviations, by identifying the name, date and title of the NSF official authorizing the deviation. (Reference PAPPG Chapter II.A).

Drug-Free Workplace Certification

Where can I find the complete text of the Drug-Free Workplace Certification?

The full text of the Drug-Free Workplace Certification can be found in PAPPG Exhibit II-3.
**E**

**EARly-concept Grants for Exploratory Research (EAGER)**

What is an EAGER proposal, and where can I find information about submitting this type of proposal?

The EAGER type of proposal may be used to support exploratory work in its early stages on untested, but potentially transformative, research ideas or approaches. This work may be considered especially “high risk-high payoff” in the sense that it, for example, involves radically different approaches, applies new expertise, or engages novel disciplinary or interdisciplinary perspectives. These exploratory proposals may also be submitted directly to an NSF program, but the EAGER type of proposal should not be used for projects that are appropriate for submission as “regular” (i.e., non-EAGER) NSF proposals. PI(s) must contact the NSF Program Officer(s) whose expertise is most germane to the proposal topic prior to submission of an EAGER proposal. This will aid in determining the appropriateness of the work for consideration under the EAGER program; this suitability must be assessed early in the process.

More information about the EAGER program can be found in PAPPG Chapter II.E.2.

**Electronic Submission**

Am I required to use FastLane to prepare and submit my proposal to NSF?

Unless otherwise specified in the program solicitation, proposers may opt to submit a proposal electronically either via Grants.gov or via the NSF FastLane system. Grants.gov provides a single Government-wide portal for finding and applying for Federal grants online. In determining which method to utilize in the electronic preparation and submission of a proposal, proposers should be aware that all collaborative proposals submitted as separate submissions from multiple organizations must be submitted via the NSF FastLane system. PAPPG Chapter II.D.3 provides additional information on collaborative proposals.

For proposers who cannot submit electronically, a deviation must be approved in advance of submission of the paper proposal in accordance with PAPPG Chapter II.A.

Must the awardee organization code and the Data Universal Numbering System (DUNS) number be entered on the proposal Cover Sheet?

The awardee organization name, address, DUNS number and Employer Identification Number/Taxpayer Identification Number are derived from the login information and therefore do not need to manually be entered when preparing the Cover Sheet.

What is the box for “International Cooperative Activities: Country/Countries” used for on the Cover Sheet?
The box for “International Cooperative Activities: Country/Countries” on the Cover Sheet is used to assist NSF program staff in identifying the appropriate Office of International Science and Engineering (OISE) country-specific point of contact. OISE staff serve as a resource for NSF directorates with projects that involve international cooperative activities. An international activity is defined as research, training and/or education carried out in cooperation with foreign counterparts either overseas or in the US using virtual technologies. Proposers also should enter the country/countries with which project participants will engage and/or travel to attend international conferences. (Reference PAPPG Chapter II.C.2.a)

When should a SF LLL, Disclosure of Lobbying Activities, be submitted?

The Disclosure of Lobbying Activities form, SF LLL, is required when the proposal exceeds $100,000 and the conditions in paragraph (2) of the certification are met. Specifically, if any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence a Government employee, Member or employee of Congress in connection with a specific Federal grant or cooperative agreement. (Reference PAPPG Chapter II.C.1.d and Exhibit II-5).

**Eligibility**

*Can an award be made to an individual?*

Unaffiliated individuals in the US and US citizens rarely receive direct funding support from NSF. Recipients of Federal funds must be able to demonstrate their ability to fully comply with the requirements specified in 2 CFR § 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards. As such, unaffiliated individuals are strongly encouraged to affiliate with an organization that is able to meet the requirements specified in 2 CFR § 200.

Unaffiliated individuals must contact the cognizant Program Officer prior to preparing and submitting a proposal to NSF. (Reference PAPPG Chapter I.E.5).

*Can an individual who is not a U.S. citizen serve as a Principal Investigator on a proposal?*

Except for NSF fellowships, which by statute can be made only to citizens, nationals, or lawfully admitted permanent resident aliens of the United States, there is no general policy restricting involvement on NSF grants based on nationality. A proposing organization in the U.S. may designate as Principal Investigator anyone it believes to be capable of fulfilling the role.

*Can an award be made directly to a foreign organization?*

NSF rarely provides support directly to foreign organizations. NSF, however, will consider proposals for cooperative projects involving U.S. and foreign organizations, provided direct support is requested only for the U.S. portion of the collaborative effort. Foreign organizations can participate as subawards on an NSF award made to a domestic organization. (Reference PAPPG Chapter I.E.6).
Can a person from a non-U.S. organization be a co-PI on a project?
There is no general prohibition against someone from a non-U.S. organization serving as a co-PI on an NSF project. NSF does allow subawards to non-U.S. organizations and per PAPPG Chapter II.D.3.a, collaborators from the subaward organization may be named as co-PIs under the prime’s proposal (although that is at the discretion of the prime). Proposers should check their organizational policies regarding PI/co-PI eligibility to determine whether the organization permits non-employees to serve in this capacity. In addition, proposers should review the relevant program solicitation, if applicable, to ensure that there are no additional eligibility requirements that restrict co-PI eligibility.

Can a Federal agency apply directly for an NSF award?
NSF does not normally support research or education activities by scientists, engineers or educators employed by Federal agencies or Federally Funded Research and Development Centers (FFRDCs). A scientist, engineer or educator, however, who has a joint appointment with a university and a Federal agency (such as a Veterans Administration Hospital, or with a university and an FFRDC) may submit proposals through the university and may receive support if he/she is a bona fide faculty member of the university, although part of his/her salary may be provided by the Federal agency. Under unusual circumstances, other Federal agencies and FFRDCs may submit proposals directly to NSF. Preliminary inquiry should be made to the appropriate program before preparing a proposal for submission. (Reference PAPPG Chapter I.E.7).

Can different campuses of the same university system submit separate proposals in response to a program solicitation that limits the number of proposals to one per organization?
NSF’s long-standing stance on the definition of “organization” is that, in addition to having its own DUNS number and being registered in FastLane, organizations must have separate Sponsored Projects Offices that have the ability to submit proposals directly to NSF. The campus would need to be listed as the awardee organization on the NSF Cover Sheet and if all of the above criteria are met, that organization would be considered independent for purposes of solicitations that have limited submissions.

Equipment Proposals

Does NSF fund proposals for the specific purpose of purchasing equipment or instrumentation?
Proposals for specialized equipment may be submitted by an organization. More information regarding how to apply for equipment proposals can be found in PAPPG Chapter II.E.8.
Facilitation Awards for Scientists and Engineers with Disabilities (FASED)

What are the Facilitation Awards for Scientists and Engineers with Disabilities (FASED) and how can a proposer/grantee apply for one?

As part of its effort to promote full utilization of highly qualified scientists, mathematicians and engineers, and to develop scientific and technical talent, the Foundation has the following goals:

◆ to reduce or remove barriers to participation in research and training by persons with physical disabilities by providing special equipment and assistance under awards made by NSF; and

◆ to encourage persons with disabilities to pursue careers in science and engineering by stimulating the development and demonstration of special equipment that facilitates their work performance.

Requests can be made in conjunction with regular competitive proposals, or as a supplemental funding request to an existing NSF award. Specific instructions for each type of request can be found in PAPPG Chapter II.E.6.

Facilities and Administrative (F&A) Costs (see Indirect Costs)
Facilities, Equipment and Other Resources

What should be included in the Facilities, Equipment and Other Resources section of the proposal?

This section of the proposal is used to assess the adequacy of the resources available to perform the effort proposed to satisfy both Intellectual Merit and Broader Impacts review criteria. Proposers should describe only those resources that are directly applicable. Proposers should include an aggregated description of the internal and external resources (both physical and personnel) that the organization and its collaborators will provide to the project, should it be funded. Such information must be provided in this section, in lieu of other parts of the proposal (e.g., budget justification, project description). The description should be narrative in nature and must not include any quantifiable financial information. Reviewers will evaluate the information during the merit review process and the cognizant NSF Program Officer will review it for programmatic and technical sufficiency.

Although these resources are not considered cost sharing as defined in 2 CFR § 200.99, the Foundation does expect that the resources identified in the Facilities, Equipment and Other Resources section will be provided, or made available, should the proposal be funded.

If there are no Facilities, Equipment and Other Resources to describe, a statement to that effect should be included in this section of the proposal and uploaded into FastLane.

Is an organization obligated to provide the resources described in the Facilities, Equipment and Other Resources section, should an award be made? What should a grantee do if they
cannot provide some of those resources?
The resources described in the Facilities, Equipment and Other Resources section are evaluated during the merit review process and, as such, NSF does have an expectation that they will be made available, should the proposal be funded. Therefore, organizations do need to ensure that they are provided if an award is made.

Should a grantee not be able to provide some of those resources, they should discuss the situation with the cognizant NSF Program Officer. Prior NSF approval is required for any change to the Facilities, Equipment and Other Resources section of an approved proposal that would constitute a change in objectives, scope or methodology (Reference PAPPG Chapter VII.B.1 for further information).

**FastLane System**

What is FastLane? Where can a proposer find more information?
The NSF FastLane system uses Internet/Web technology to facilitate the way NSF does business with the research, education and related communities. The NSF FastLane system is available for proposal preparation; submission and status checking; and some post-award administrative activities. All project reporting and many post-award administrative activities have been moved from FastLane to Research.gov. All FastLane functions are available at: http://www.fastlane.nsf.gov. All Research.gov functions are available at: https://www.research.gov/.

Am I required to use FastLane to prepare and submit my proposal to NSF?
Unless otherwise specified in a program solicitation, proposers may opt to submit proposals electronically either via Grants.gov or via the NSF FastLane system. Grants.gov provides a single Government-wide portal for finding and applying for Federal grants online. In determining which method to utilize in the electronic preparation and submission of a proposal, proposers should be aware that all collaborative proposals submitted as separate submissions from multiple organizations must be submitted via the NSF FastLane system. PAPPG Chapter II.D.3 provides additional information on collaborative proposals.

Where should questions be directed on use of the NSF FastLane system?
Questions related to use of the NSF FastLane system may be directed to the FastLane Help Desk at (800) 673-6188 or (703) 292-8142 or by sending an e-mail message to fastlane@nsf.gov.

In addition, for information on the availability of the NSF FastLane system, phone (800) 437-7408 for a recorded message.

**Final Project Report**

Why does Research.gov say that my final report is due 90 days after the award end date? I thought I had 120 days.
The final project report and project outcomes report should be submitted no later than 120 days following the end date of the award for all new NSF awards and
funding amendments to existing NSF awards made on or after January 25, 2016. If the award has not received a funding amendment since January 25, 2016, the final project report and project outcomes report is due no later than 90 days following the end date of the award. The reporting conditions relevant to the award are referenced in the award notice; the Research.gov system reflects the requirement applicable to the award.

**Fringe Benefits**

*Can proposers use projected fringe benefit rates when submitting budgets to NSF?*

Generally, proposers should be using their currently approved fringe benefit rate for budgeting purposes.

NSF policy does allow awardees to re-budget funds, within the award, to cover fringe benefit costs that are finalized higher than budgeted. Therefore, if funds under the award are available, the actual fringe rates may be charged.

**G**

**Grant Opportunities for Academic Liaison with Industry (GOALI)**

*What is a GOALI proposal and where can I find information about submitting this type of proposal?*

A GOALI type of proposal may be used to support projects that seek to stimulate collaboration between academic research institutions and industry. Under this proposal type, academic scientists and engineers request funding either in conjunction with a regular proposal submitted to a standing NSF program or as a supplemental funding request to an existing NSF-funded award. GOALI is not a separate program; GOALI proposals must be submitted to an active NSF funding opportunity and must be submitted in accordance with the deadlines specified therein. A proposer interested in submitting a GOALI proposal or a GOALI supplemental funding request to an existing NSF-funded award must contact the cognizant NSF Program Officer listed in the relevant funding opportunity prior to submission.

More information about the GOALI type of proposal can be found in PAPPG Chapter II.E.4.

**Grants.gov**

*What is Grants.gov and where can I learn more about it?*

**Group Proposals**

*May group proposals exceed the 15 page Project Description limitation?*
NSF encourages submission of proposals by groups of investigators; often these are submitted to carry out interdisciplinary projects. Unless stipulated in a specific program solicitation, group proposals are subject to the 15 page Project Description limitation established in PAPPG Chapter II.C.2.d. PIs who wish to exceed the established page limitations for the Project Description must request and receive a deviation in advance of proposal submission. (Reference PAPPG Chapter II.A).

H

Human Subjects

What is NSF’s policy on the use of human subjects in research?

Projects involving research with human subjects must ensure that subjects are protected from research risks in conformance with the relevant Federal policy known as the Common Rule (Federal Policy for the Protection of Human Subjects, 45 CFR 690). All projects involving human subjects must either (1) have approval from the organization’s Institutional Review Board (IRB) before issuance of an NSF award or, (2) must affirm that the IRB has declared the research exempt from IRB review, in accordance with the applicable subsection, as established in section 101(b) of the Common Rule.

For projects lacking definite plans for the use of human subjects, their data or their specimens, pursuant to 45 CFR 690.118, NSF can accept a determination notice that establishes a limited time period under which the PI may conduct preliminary or conceptual work that does not involve human subjects. An NSF-approved format for submission of these determination notices is available on the NSF website. (Reference PAPPG Chapter II.D.5).

Additional information, including Frequently Asked Questions and Vignettes, for use in interpreting the Common Rule for Behavioral and Social Science Research, is available on the NSF Website.

I

Grants for Ideas Lab

What is an Ideas Lab proposal and where can I find information about submitting this type of proposal?

“Ideas Lab” is a type of proposal to support the development and implementation of creative and innovative project ideas that have the potential to transform research paradigms and/or solve intractable problems. An Ideas Lab may be run independently, or in parallel, with the issuance of an NSF funding opportunity on the same topic. These project ideas typically will be high-risk/high-impact, as they represent new and unproven ideas, approaches and/or technologies.

More information about the Ideas Lab type of proposal can be found in PAPPG Chapter II.E.5.
Indirect Costs (Facilities and Administrative (F&A) Costs)

If the fixed predetermined indirect cost rate changes during the life of the award, may a grantee charge indirect costs to NSF awards based on newly negotiated rates in effect at the time the charges were incurred?

Colleges, universities and other institutions of higher education are subject to 2 CFR § 200, Appendix III, paragraph C.7, which specifies that Federal agencies are required to use the negotiated F&A rate that is in effect at the time of the initial award throughout the life of the award.

Other proposing organizations, however, are not bound by this restriction on the use of a fixed rate in effect at the time of the initial award. These organizations may charge indirect costs based on newly negotiated rates in effect at the time the costs are incurred, provided this will not affect the scope, increase award costs, decrease the period of support, or otherwise be inconsistent with the indirect cost rate provisions of the award.

Given the complex nature of the above question, can an example be provided to better illustrate the correct application of the indirect cost rate for a college or university?

A college or university submits a proposal to NSF for consideration in April and at that time, their approved predetermined indirect cost rate is 45%. In June of that year, they negotiate a new rate with their cognizant agency. The new agreement contains the following rates:

- Predetermined: July 1, 2017 through June 30, 2018 47%
- Predetermined: July 1, 2018 through June 30, 2019 50%

If the proposal is funded in September, they can use the 47% rate. In fact, for any award made after July 1, 2017, they can re-budget and claim indirect costs at the 47% rate.

If, however, the rate agreement will be negotiated again in 2017 and the resulting rate agreement is more than what was previously approved, the higher rate cannot be applied to an award that was made before the effective date of the new F&A rate agreement. In accordance with 2 CFR § 200, Appendix III, paragraph C.7, a college or university cannot re-budget for indirect cost rate changes negotiated after the award was made.

PAPPG Chapter II.C.2.g(viii) states, “Except where specifically identified in an NSF program solicitation, the applicable US Federally negotiated indirect cost rate(s) must be used in computing indirect costs (F&A) for a proposal.” Does this mean that a college or university is required to claim the entirety of its negotiated indirect cost rate?

Yes. Unless specified in an NSF program solicitation, an organization must use its current negotiated indirect cost rate agreement in computing indirect costs for a proposal.

Information Sources

Where can a proposer find general information about NSF programs and funding opportunities?
Information on a variety of funding opportunities is located on the NSF home page under “Funding.”

Individual program descriptions, announcements and solicitations address specific areas that NSF is interested in funding. These funding opportunities may be accessed electronically on the NSF Website.

What is the NSF Update service and what is the process for signing up?
The NSF Update service is an information-delivery system designed to keep potential proposers and other interested parties apprised of the issuance of new program announcements and solicitations (as well as other NSF publications and policies). Subscribers receive notifications about publications that match their identified interests. To subscribe to NSF Update, go to the NSF Website, scroll halfway down the page, and click on the yellow circle icon with a white envelope inside of it on the right-hand side of the page.

Where can a proposer find guidance on proposal preparation?
NSF’s proposal preparation and submission guidelines – Part I of the Proposal & Award Policies & Procedures Guide (PAPPG) and the NSF Grants.gov Application Guide -- provide guidance for the preparation and submission of proposals to NSF, whether by the NSF FastLane System or Grants.gov. Some NSF programs have program solicitations that modify the general provisions of these Guides, and, in such cases, the guidelines provided in the solicitation must be followed. For those connected with institutions of higher education, the college or university’s Office of Sponsored Programs is a good place to start gathering information.

Where can a proposer find guidance on administration of an NSF award?
Part II of the Proposal & Award Policies & Procedures Guide (PAPPG) provides information regarding the NSF award cycle from issuance and administration of an award through closeout. See the Research Terms and Conditions included in the Award Notice for additional information. For those connected with institutions of higher education, the college or university’s Office of Sponsored Programs is a good place to start gathering information.

Are there presentations and other materials available to help me with proposal preparation and award administration?
The Policy Office in the Division of Institution & Award Support (DIAS) frequently posts presentations from recent events such as the NSF Grants Conference. Presentations are available at: http://nsf.gov/bfa/dias/policy/outreach.jsp#present.

Where can a proposer obtain copies of the NSF Grants.gov Application Guide?
M

Margin and Spacing Requirements

What are the proposal margin and spacing requirements that need to be followed when developing an NSF proposal?

The proposal must be clear, readily legible and conform to the requirements contained in PAPPG Chapter II.B.2.

The typefaces that may be used are identified below:

◆ Arial, Courier New, or Palatino Linotype at a font size of 10 points or larger
◆ Times New Roman at a font size of 11 points or larger
◆ Computer Modern family of fonts at a font size of 11 points or larger

In addition to the typefaces listed above, Macintosh users also may use Helvetica and Palatino typefaces.

A font size of less than 10 points may be used for mathematical formulas or equations, figure, table or diagram captions and when using a Symbol font to insert Greek letters or special characters.

The PAPPG guidelines establish the minimum type size requirements; however, PIs are advised that readability is of paramount importance and should take precedence in selection of an appropriate font for use in the proposal. Small type size makes it difficult for reviewers to read the proposal; consequently, the use of small type not in compliance with the above guidelines may be grounds for NSF to return the proposal without review.

If a proposer uses a prescribed typeface and font size, will their proposal comply with formatting requirements?

It is the responsibility of the proposing organization to thoroughly review each proposal prior to submission. Use of a particular typeface and font size are simply two of the required formatting elements. A proposer should also ensure that there are no more than six lines of text within a vertical space of one inch and that margins, in all directions, are at least an inch. Formatting requirements are described in PAPPG Chapter II.B.

Mentoring (see Postdoctoral Researcher Mentoring Plan)

Merit Review Criteria

Where can a proposer find information related to NSF’s merit review criteria?

All NSF proposals are evaluated through use of two National Science Board approved merit review criteria. Some program solicitations, however, employ additional criteria as required to highlight the specific objectives of certain programs and activities.

The two NSB-approved merit review criteria are listed in PAPPG Chapter III.A. Further information about the review process can be found on the NSF Merit Review Website.
New Awardees

An organization is preparing a grant proposal for submission to NSF but does not have a negotiated indirect cost rate. Can the organization submit a grant proposal without a negotiated indirect cost rate, and if so, what indirect cost rate should be used in the grant proposal budget?

In accordance with 2 CFR § 200.414(f), a proposer that has never received a negotiated indirect cost rate, may elect to charge a de minimis rate of 10% of modified total direct costs (MTDC). No supporting documentation is required for proposed rates of 10% MTDC or less.

Domestic proposing organizations that do not have a current negotiated indirect cost rate agreement with a cognizant Federal agency, and who are requesting more than a de minimis 10% recovery of modified total direct costs should prepare an indirect cost proposal based on expenditures for its most recently ended fiscal year. Based on information provided in the indirect cost proposal, NSF may negotiate an award-specific rate to be used only on the award currently being considered for funding. The contents and financial data included in indirect cost proposals vary according to the make-up of the proposing organization. Instructions for preparing an indirect cost rate proposal can be found on the NSF website.

Additional Information on indirect costs is provided in 2 CFR 200 by type of awardee organization:
◆ Institutions of Higher Education
◆ Non-profit Organizations
◆ State and Local Governments

For Profit Organizations should consult the Federal Acquisition Regulation (FAR).

There are a number of other references from both NSF and other Federal Agencies that potential awardee organizations can use to assist in the preparation of an indirect cost rate proposal:

https://www.nsf.gov/bfa/dias/caar/indirect.jsp
https://rates.psc.gov/
http://www2.ed.gov/about/offices/list/ocfo/intro.html

While there are some differences between agencies these can provide an explanation of what indirect costs are and sample calculations.

Foreign organizations that do not have a current US Federally negotiated indirect cost rate(s) are limited to a de minimis indirect cost rate recovery of 10% of modified total direct costs. (Reference PAPPG Chapter II.C.2.g(viii)).

What if an organization has never received NSF funding?

An in-depth review of the organization’s accounting, management and financial practices must be undertaken and certification completed prior to finalizing a
pending award. The Division of Grants and Agreements (DGA) or the Division of Acquisition and Cooperative Support (DACS) will send the requisite forms and the listing of information which needs to be completed and returned, upon notification from programs that an award is imminent for a new performer organization. By examining the documents, DGA and DACS, along with the Division of Institution and Award Support (DIAS), will be able to determine if the grantee organization is capable of directly receiving NSF funds and thereby is eligible to be a recipient of an NSF award.

Potential awardee organizations should be prepared to demonstrate and document that they have an acceptable accounting system (project cost accounting system) adequate to manage cost reimbursable awards. This should include adequate internal controls and segregation of duties. The organization also should be prepared to document that they are financially viable so there is a low risk that NSF funds would be used to meet other organizational expenses not related to the NSF award, and that the organization will remain in business over the term of the NSF award. Lastly, there are requirements in the Uniform Guidance for documented or written policies and procedures that awardee organizations must have in place prior to award.

These include, but are not limited to, the following sections of the Uniform Guidance:

- §200.202 Financial Management
- §200.305 Payment
- §200.318 General Procurement Standards
- §200.333 Retention Requirements for Records
- §200.430 Compensation for Personal Services

Potential awardee organizations should be aware that NSF funding is discretionary and that proposals which have passed peer or other review and have been recommended for funding (scientifically and technically meritorious) can be declined for administrative and financial considerations.

Where can a new proposer find information on the types of documents required to be completed and submitted to NSF in order for NSF to conduct the necessary administrative and financial reviews of the organization?

The “Prospective New Awardee Guide” includes information on: Administration and Management Information; Accounting System Requirements and Auditing Information; and Payments to Organizations with Awards. This information will assist an organization in preparing documents which the NSF requires to conduct administrative and financial reviews of an organization. The guide also serves as a means of highlighting the accountability requirements associated with Federal awards.

See also 2 CFR Part 200, Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards.

**Nondiscrimination Certification**

Where can I find the complete text of the Nondiscrimination Certification?
See PAPPG Exhibit II-6 for the full text of the Nondiscrimination Certification. These obligations also apply to subrecipients and contractors under the award.

**Notification of Proposal Receipt**

*How will a proposer know whether NSF has received his/her proposal?*

Once the proposal is submitted, PIs can access the number assigned to the proposal via the “Submitted Proposals” list in the FastLane Proposal Preparation module. If a proposal number is not reflected in the FastLane System, contact the FastLane Help Desk at (800) 673-6188, or (703) 292-8142 or by e-mail to fastlane@nsf.gov.

When the proposal is assigned to an NSF program, the cognizant program information is available through the FastLane “Proposal Status Inquiry” function for PIs and through the “Recent Proposals” report for Sponsored Projects Offices. This information is also available through the Research.gov “Grants Application Status” for both PIs and SPOs. Communications about the proposal should be addressed to the cognizant NSF Program Officer with reference to the proposal number. Proposers are strongly encouraged to use FastLane or Research.gov to verify the status of their submission to NSF. (Reference PAPPG Chapter I.G.5).

**Outreach**

*Where can a proposer find information about NSF outreach opportunities?*

In addition to visits by NSF Program Officials and Grants Officers, NSF conducts two grants conferences per calendar year. These grants conferences are held in the spring and fall each year and are announced on the NSF Events Calendar, and on the DIAS/Policy Office website.

These conferences cover topics such as: proposal preparation; merit review; award administration; electronic initiatives; new programs and cross-disciplinary initiatives; and future directions and strategies for the Foundation. NSF representatives also participate in educational and professional development seminars, webcasts, meetings and workshops, which focus on current issues and developments, frequently with such organizations as the National Council of University Research Administrators (NCURA) and the Society of Research Administrators International (SRA). See the DIAS/Policy Office website for additional information.

NSF also focuses outreach for different organization types and has coordinated or is planning workshops for Tribal Colleges and Universities, Historically Black Colleges and Universities (HBCUs), Hispanic Serving Institutions (HSIs) and Minority Serving Institutions (MSIs). For further information about these and other opportunities, contact the DIAS/Policy Office at: policy@nsf.gov.

*Will the NSF Update or Updates to the Proposal & Award Policies & Procedures Guide (PAPPG) presentations be made available?*

Yes. Please see the Recent Presentations section of the DIAS/Policy Office website.
P

Person-Months (for “2 month rule” information, see Senior Personnel)

What is the definition of “person-months”?
The term “person-months” refers to the effort (amount of time) that PI(s), faculty and other senior personnel will devote to a specific project. The effort is based on the organization’s regular academic-year, summer or calendar-year. For example, if the regular schedule is 10 months and 20% effort will be devoted to the project, a total of 2 months should be listed in the academic or calendar-year block (10 months x 20% = 2 months). (Reference PAPPG Chapter II.C.2.g(i)).

How do I calculate the person-months per year committed to the project for completion of the current and pending support section of the proposal?
An individual serving as PI, co-PI, or other senior personnel should multiply the percentage of effort associated with the project by the number of months of his/her appointment (i.e. 10% of a 9 month AY appointment equals .9 person months; 10% of a 12 month calendar appointment equals 1.2 months). Organizations may have internal policies and procedures that relate specifically to the type of appointment under which an individual is employed. PIs, co-PIs, or other senior personnel should, therefore, confirm with their Sponsored Projects Office that this simplified methodology is consistent with organizational policy.

Points of Contact

Who should a proposer contact when seeking guidance on proposal preparation?
Proposers should contact the office with responsibility for submitting the proposal on behalf of the organization. The Sponsored Projects Office, or equivalent, should be the first point of contact. For general policy-related questions regarding proposal preparation, the DIAS/Policy Office may be contacted on (703) 292 8243 or by e-mail to policy@nsf.gov. When responding to a specific program announcement/solicitation, contact the applicable Program Office. The Division of Grants and Agreements or the Division of Acquisition and Cooperative Support should be contacted regarding questions related to award or administration of an award (e.g., terms and conditions of an award or special award conditions).

Post Award Considerations

Where can a grantee find information related to post award administration?
Part II of the Proposal & Award Policies & Procedures Guide (PAPPG) provides information that follows the NSF award cycle from issuance and administration of an award through closeout. The guide is available electronically via the NSF website. Information on post award administration also can be found by accessing the applicable award conditions on the NSF website.
Postdoctoral Researcher Mentoring Plan

Where can I find more information about NSF’s requirement for a postdoctoral researcher mentoring plan?

Each proposal that requests funding to support postdoctoral researchers must include, as a supplementary document, a description of the mentoring activities that will be provided for such individuals. Please be advised that if required, FastLane will not permit submission of a proposal that is missing a Postdoctoral Researcher Mentoring Plan. In situations where a postdoctoral researcher is listed in Section A of the NSF Budget, and is functioning in a Senior Project personnel capacity (i.e., responsible for the scientific or technical direction of the project), a mentoring plan is not required.

More information about this requirement can be found in PAPPG Chapter II.C.2.j.

After my proposal was submitted, I discovered that my postdoctoral mentoring plan needs to be corrected. FastLane is not allowing me to do a Proposal File Update to make the correction. What should I do?

If a proposer discovers that a postdoctoral mentoring plan needs to be corrected, the proposal must be withdrawn and resubmitted prior to the deadline. The postdoctoral mentoring plan cannot be corrected through the Proposal File Update module.

I would like to add a postdoctoral researcher after the award has been made. Do I need to notify NSF or request approval?

If your original proposal did not include a mentoring plan, then you must send the cognizant NSF Program Officer the requisite mentoring plan, as described in PAPPG Chapter II.C.2.j. If you are requesting supplemental funding to support the postdoctoral researcher, the guidance in PAPPG Chapter VI.E.4.f should be followed. In either case, the PI must report on the mentoring activities provided to the individual in the annual and final project reports.

Primary Place of Performance Zip Code Field

What is the Primary Place of Performance?

The Primary Place of Performance is the location at which the research is actually being conducted. Many projects are performed at a location other than the Awardee Organization. As a result, NSF requires applicants to list a Primary Place of Performance for each proposal (PAPPG Chapter II.C.2.a).

Do I have to enter an address for the Primary Place of Performance if it’s the same as the address for the Awardee Organization?

Yes. Proposers may select to make the Primary Place of Performance name the same as the Awardee Organization name; however, they must re-enter the full address in the Primary Place of Performance address fields.
Why is it necessary to enter a 9-digit zip code for the Primary Place of Performance?
A 9-digit zip code is required for consistency with the requirements of the Federal Funding Accountability and Transparency Act (FFATA). The 9-digit zip code is validated against the U.S. Postal Service’s (USPS) database, which ensures that the location can be accurately identified and aligns with the correct Congressional district.

Do I need to enter a dash (“-“) in my 9-digit zip code?
No, do not enter a dash. Enter only the digits of the zip code.

How do I enter a foreign address for the Primary Place of Performance?
Enter the street address in the Street Address field, and then select the appropriate country. Zip code and state are not applicable for non-US addresses, therefore, those fields should be left blank.

I received an error message “a valid zip code is required” when entering a zip code for the Primary Place of Performance. How do I correct it?
If this error message appears, a proposer must enter the correct 9-digit zip code for the Primary Place of Performance in order to submit the proposal. The 9-digit zip code for the Primary Place of Performance can be found through the USPS website (http://usps.com) by selecting “Look Up a Zip Code” under the “Quick Tools” menu on the homepage and entering the street address for the performance location.

Why won’t FastLane recognize my organization’s 9-digit zip code?
Some organizations assign unique 9-digit zip code combinations within the organization, which are not registered with the USPS. To verify that the correct USPS-recognized 9-digit zip code for an organization is being used, visit the USPS website at http://usps.com, select “Look Up a Zip Code” under the “Quick Tools” menu on the homepage, and enter the street address for the performance location.

Why is FastLane only allowing me to enter 8 of the 9 digits of my zip code?
Verify that only digits are being entered for the zip code. Do not enter a dash. If only digits are being entered and issues continue to occur, contact the FastLane Helpdesk (fastlane@nsf.gov or 1-800-673-6188, 7AM-9PM EST Monday – Friday except Federal holidays).

Prior Approval Requirements

What types of post-award actions require prior approval from NSF and which can be submitted via FastLane?
All NSF prior approval requirements can be found in PAPPG Chapter VII and Exhibit VII-1. While most notifications and requests should be submitted in Research.gov, a few functions still remain in FastLane. A complete listing of notifications and requests, including where they should be submitted, is located on the Research.gov website.
**Program Announcements and Solicitations**

*Where can a proposer obtain copies of program announcements and solicitations?*

Program announcements and solicitations are available electronically on the NSF website and on individual Directorates’ webpages.

*If there is a conflict between the PAPPG and a program solicitation, which document should be followed?*

Instructions in an NSF program solicitation can modify general guidance in the PAPPG. Proposal preparation guidance contained in program solicitations takes precedence over instructions in the PAPPG and should, therefore, be followed closely. The cognizant program office should be consulted with questions regarding compliance with specific programmatic requirements contained in a program solicitation. (Reference PAPPG Chapter I.C.4).

**Project Outcomes Report for the General Public**

*How does the Project Outcomes report differ from the Annual and Final project reports?*

Annual and final project reports provide NSF Program Officers and administrative offices with information on the progress of supported projects and the way these funds are used. Annual, final and interim project reports must be submitted via Research.gov.

The Project Outcomes report is a brief summary (200-800 words), prepared specifically for the public, of the nature and outcomes of the project, and is not reviewed or approved by NSF Program Officers. The Project Outcomes report is submitted in Research.gov. Additional information is available on the Project Reports page of Research.gov.

*What should be included in a Project Outcomes report?*

PAPPG Chapter VII.D.3 describes the required contents of a Project Outcomes report.

*For a collaborative project, who should submit a Project Outcomes Report?*

For a collaborative project where a single award is made to one lead organization (which administers subawards to other organizations), the PI for the lead organization is responsible for submitting the Project Outcomes Report. For a collaborative project where a separate award is made to each organization in the collaborative, the PI for each separate award is responsible for submitting a Project Outcomes Report.

**Proposal File Updates**

*Can files associated with a previously submitted proposal be replaced and if so, what procedure should be followed?*

It is the responsibility of the proposing organization to thoroughly review each proposal prior to submission. On occasion, however, a problem is identified with a
portion of the proposal after the proposal has been submitted electronically to NSF.

The FastLane Proposal File Update Module allows the organization to request the replacement of files or revision of other Proposal Attributes, associated with a previously submitted proposal. PAPPG Chapter III.C contains the procedures to be followed for proposal file updates.

The Proposal File Update module, however, may not be used for submission of revised budgets. All budgetary revisions must be submitted through use of the FastLane Revised Proposal Budget Module. The postdoctoral mentoring plan also cannot be corrected through the Proposal File Update module. If a proposer discovers that a postdoctoral mentoring plan needs to be corrected, the proposal must be withdrawn and resubmitted prior to the deadline.

**Proposal Not Accepted**

*What does “proposal not accepted” mean?*

Proposal not accepted is defined as FastLane will not permit submission of the proposal because a required component of the proposal is missing, not in compliance with NSF proposal preparation instructions, or the deadline has passed. FastLane will not permit submission of any proposal that fails an automated compliance check resulting in an error. A complete listing of automated proposal compliance checks performed by the system is available on the NSF website. More information is available in PAPPG Chapter IV.B.

**Proposal Preparation**

*Is there a salary cap for proposals submitted to NSF?*

There is no salary cap for proposals submitted to NSF. Salaries, however, are to be based on the individual faculty member’s regular compensation for the continuous period which, under the policy of the organization concerned, constitutes the basis of his/her salary. Except as provided in PAPPG Chapter X.B.3 “Intra-University (IHE) Consulting,” charges to Federal grants, irrespective of the basis of computation, will not exceed the proportionate share of the base salary for that period.

*Are there specific line spacing requirements that must be used for preparation of a proposal?*

While line spacing (single-spaced, double-spaced, etc.) is at the discretion of the proposer, established page limits must be followed and there also must be no more than 6 lines of type within a vertical space of one inch. (Reference PAPPG Chapter II.B.2).

*Are there any specific page numbering requirements which should be used in preparation of a proposal?*

Proposers are advised that FastLane does not automatically paginate a proposal. Each section of the proposal that is uploaded as a file must be individually paginated before upload to FastLane. (Reference PAPPG Chapter II.B.1).

*May Uniform Resource Locators (URLs) be included within the Project Description?* What
about in other sections of the proposal?
PIs are advised that the project description must be self-contained and are cautioned that URLs (Internet addresses) that provide information related to the proposal must not be used because 1) the information could circumvent page limitations, 2) the reviewers are under no obligation to view the sites and 3) the sites could be altered or abolished between the time of submission and the time of review. Inclusion of URLs in other sections of the proposal is not prohibited by the PAPPG, however, PIs should be advised that reviewers are under no obligation to view the site(s).

What are the guidelines concerning collaborative proposals?
The guidelines relevant to collaborative proposals can be found in PAPPG Chapter II.D.3. A collaborative proposal is one in which investigators from two or more organizations wish to collaborate on a unified research project. Collaborative proposals may be submitted to NSF in one of two methods: as a single proposal, in which a single award is being requested (with subawards administered by the lead organization); or by simultaneous submission of proposals from different organizations, with each organization requesting a separate award. All components of the collaborative proposal must meet any established deadline, and, failure to do so may result in the entire collaborative proposal being returned without review.

What information should be included in the “References Cited” section of the proposal?
Each reference must include the names of all authors (in the same sequence in which they appear in the publication), the article and journal title, book title, volume number, page numbers and year of publication. If the document is available electronically, the website address also should be identified. Proposers must be especially careful to follow accepted scholarly practices in providing citations for source materials relied upon when preparing any section of the proposal. If there are no references cited, a statement to that effect should be included in this section of the proposal and uploaded into FastLane. (Reference PAPPG Chapter II.C.2.e).

What is the NSF policy on submission of appendices?
All information necessary for the review of a proposal should be contained in Sections a through j of the proposal. Appendices may not be included unless a deviation has been authorized. PAPPG Chapter II.A contains information on deviations.

If the project will be performed at a location other than the awardee organization, how should that be reflected in the proposal?

If the project will be performed at the awardee organization, the designated box on the Cover Sheet should be checked. If the project, however, will be performed at a location other than the awardee, the following information (where applicable) should be provided:
◆ Organization Name (identify the organization name of the primary site where the work will be performed, if different than the awardee);
◆ Street;
City;
State;
Country; and
9-digit Zip Code.

For further information, see the PAPPG Chapter II.C.2.a(1).

Proposal Submission

What forms do I need to complete for an NSF proposal?
All proposal forms and data requirements for submission of a proposal to NSF are available in Grants.gov or the NSF FastLane system. All sections of the proposal listed in PAPPG Chapter II.C.2 are required parts of the proposal, and must be included with the proposal. Failure to submit the required sections may result in the proposal not being accepted or being returned without review. Detailed information about proposal preparation and submission is available from the Grants.gov and FastLane websites.

Grants for Rapid Response Research (RAPID)

What is a RAPID proposal and where can I find information about submitting this type of proposal?
A RAPID type of proposal is used for proposals having a severe urgency with regard to availability of, or access to data, facilities or specialized equipment, including quick-response research on natural or anthropogenic disasters and similar unanticipated events. PI(s) must contact the NSF Program Officer(s) whose expertise is most germane to the proposal topic before submitting a RAPID proposal. This will facilitate determining whether the proposed work is appropriate for RAPID funding.

More information about the RAPID type of proposal can be found in PAPPG Chapter II.E.1.

Receipt Dates

What happens if a deadline date falls on a weekend or Federal holiday?
If the deadline date falls on a weekend, it will be extended to the following Monday; if the date falls on a Federal holiday, it will be extended to the following business day. (Reference PAPPG Chapter I.F).

What is the difference between target dates, deadline dates and submission windows?
The following types of due dates are utilized by NSF:
◆ Target dates: dates after which proposals will still be accepted, although they may miss a particular panel or committee meeting.
Deadline dates: dates after which proposals will not be accepted for review by NSF. The deadline date will be waived only in extenuating circumstances. Such a deviation only may be authorized in accordance with PAPPG Chapter II.A or in the circumstances outlined in Chapter I.F.

Submission windows: designated periods of time during which proposals will be accepted for review by NSF. For purposes of NSF, the end date of a submission window converts to, and follows the same policies as, a deadline date.

These target dates, deadlines and submission windows are published in specific program descriptions, program announcements and solicitations that can be obtained through the NSF website. Proposals must be received by 5 p.m. submitter’s local time on the established deadline date. (Reference PAPPG Chapter I.F).

If a proposer needs to request extension of a deadline due to a disaster (hurricane, flood, etc.), what process should be followed?

In the event of a natural or anthropogenic disaster that interferes with an organization’s ability to meet a proposal submission deadline, proposers should contact the cognizant NSF Program Officer in the Division/Office to which they intend to submit their proposal and request authorization to submit a “late proposal.” Such contact should be via e-mail (or telephone, if e-mail is unavailable). Where possible, such requests should be submitted in advance of the proposal deadline. Proposers should then follow the written or verbal guidance provided by the cognizant NSF Program Officer. Further information can be found in PAPPG Chapter I.F.

How do I submit a proposal after the deadline date if an extension has been granted due to a natural or anthropogenic disaster?

When an exception to the deadline date has been granted, proposers must check the “Special Exception to the Deadline Date Policy” box on the NSF Cover Sheet in FastLane. This will indicate to the system that NSF approval has been obtained. A statement identifying the nature of the event that impacted the ability to submit the proposal on time should be uploaded under “Nature of Natural of Anthropogenic event” in the Single Copy Document section in FastLane. If available, written approval from the cognizant NSF Program Officer also should be uploaded under “Additional Single Copy Documents” in the Single Copy Document section in FastLane. (Reference PAPPG Chapter I.F).

Reconsideration

What is the process for requesting reconsideration of an NSF funding decision?

A PI whose proposal for NSF support has been declined generally will receive information and an explanation of the reason(s) for declination along with copies of the reviews considered in making the decision.

If the explanation provided does not satisfy the PI, he/she may request that the cognizant NSF Assistant Director or Office Head reconsider the action to determine whether the proposal received a fair and reasonable review, both substantively and
procedurally. Consult PAPPG Chapter IV.D for additional information on the NSF reconsideration process, including the categories of actions that are subject to the NSF reconsideration policy.

References Cited

Will a proposal be returned if a website address is not included in a reference citation?
The NSF guidelines on References Cited are available in PAPPG Chapter II.C.2.e.

If the proposer has a website address readily available, that information should be included in the citation. It is not NSF’s intent, however, to place an undue burden on proposers to search for the URL of every referenced publication. Therefore, inclusion of a website address is optional.

Renewal Awards

Can funds be transferred from the old grant to the new grant in the case of renewal awards?
No, in the case of a renewal award, funds cannot be transferred from the old grant to the new grant. It may, however, be necessary to transfer allowable costs from the old grant to the new grant where appropriate justification exists, e.g., a cost was erroneously charged to the old grant, rather than the new grant. Grantees are reminded that any costs transferred to the new grant must be allocable, allowable and reasonable, in accordance with 2 CFR § 200, Subpart E – Cost Principles, and must be documented in accordance with institutional policies and procedures.

Renewal Proposals

What guidelines are important to know when submitting a renewal proposal?
A traditional renewal application competes with all other applications and must be developed as fully as though the applicant is applying for the first time. In preparing a renewal proposal, proposers should assume that reviewers will not have access to previously submitted versions of the proposal. In addition, the National Science Board strongly endorses the principle that all expiring awards are subject to recompetition. See PAPPG Chapter V for more information on renewal proposals and a link to the NSB resolution.

Grants for Research Advanced by Interdisciplinary Science and Engineering (RAISE)

What is a RAISE proposal and where can I find information about submitting this type of proposal?
A RAISE type of proposal may be used to support bold, interdisciplinary projects whose:

◆ Scientific advances lie in great part outside the scope of a single program or discipline, such that substantial funding support from more than one program or discipline is necessary.
◆ Lines of research promise transformational advances.
◆ Prospective discoveries reside at the interfaces of disciplinary boundaries that may not be recognized through traditional review or co-review.

To receive funding as a RAISE-appropriate project, all three criteria must be met. RAISE is not intended to be used for projects that can be accommodated within other types of proposals or that continue well established practices. Prospective PI(s) must receive approval to submit a proposal from at least two NSF Program Officers, in intellectually distinct programs, whose expertise is most germane to the proposal topics.

More information about the RAISE type of proposal can be found in PAPPG Chapter II.E.3.

**Research Performance Progress Report (RPPR)**

*What is the Research Performance Progress Report?*

The Research Performance Progress Report is the result of a Government-wide effort to create greater consistency in the administration of Federal research awards by streamlining and standardizing reporting formats. The RPPR is used by agencies that support research and research-related activities for use in submission of progress reports.

NSF has developed the RPPR as a service within Research.gov. PIs and co-PIs use Research.gov to meet all NSF project reporting requirements, including submission of annual, final, interim and Project Outcomes Reports.

*Where can I find more information about the RPPR?*

More information may be found on the Project Reports page of Research.gov.

**Responsible Conduct of Research (RCR)**

*Where can a proposer find more information about NSF’s RCR policy?*

Information about NSF’s RCR policy, including links to important documents, is available on the DIAS/Policy Office webpage.

**Resubmissions**

*Can a proposer resubmit a previously declined proposal?*

A declined proposal may be resubmitted, but only after it has undergone substantial revision. Resubmissions that have not clearly taken into account the major comments or concerns resulting from the prior NSF review may be returned without review. NSF will treat the revised proposal as a new proposal, subject to the standard review procedures. (Reference PAPPG Chapter IV.E).

**Returns**

*For what reasons does NSF return a proposal without review?*
The various reasons why NSF may return a proposal without review are listed in PAPPG Chapter IV.B.

**Reviewer**

*How can I volunteer to be a reviewer for NSF?*

In order to become an NSF reviewer, the individual should identify the program(s) that most closely fit their expertise and send an email to the responsible NSF Program Officer(s). Additional information on how to become a reviewer can be found on the NSF website.

**Senior Personnel**

*How is the term “senior personnel” defined?*

The term “senior personnel” includes:

1. (co) Principal Investigator/Project Director (PI/PD) -- the individual(s) designated by the proposer, and approved by NSF, who will be responsible for the scientific or technical direction of the project. NSF does not infer any distinction in scientific stature among multiple PIs, whether referred to as PI or co-PI. If more than one, the first one listed will serve as the contact PI, with whom all communications between NSF program officials and the project relating to the scientific, technical and budgetary aspects of the project should take place. The PI and any identified co-PIs, however, will be jointly responsible for submission of the requisite project reports.

2. Faculty Associate (faculty member) (or equivalent) -- an individual other than the Principal Investigator(s) considered by the performing institution to be a member of its faculty (or equivalent) or who holds an appointment as a faculty member at another institution, and who will participate in the project being supported. (Reference PAPPG Exhibit II-7).

*Does the “2 month” salary rule apply to all senior personnel or only to faculty on academic appointments?*

Yes, the salary policy contained in PAPPG Chapter II.C.2.g.(i) does apply to all senior personnel listed on the NSF budget, not just faculty on academic appointments. The policy does, however, allow for flexibility to request more than two months of salary per year, when applicable. If proposers request more than two months, the needed salary support should be put on the proposal budget and will need to be very well justified in the budget justification. If more than 2 months is approved by NSF, it will be included on the award budget.

*Must grantees request prior NSF approval if making a change post-award to the amount originally budgeted for senior personnel salary?*

NSF has not changed the terms and conditions or any of our post-award prior
approval requirements (See PAPPG Exhibit VII-1). Therefore, under normal rebudgeting authority, a grantee can internally approve an increase in person months devoted to the project after an award is made, even if doing so results in salary support for senior personnel exceeding the 2 month salary rule. No prior approval from NSF is necessary. The caveat is if the change would cause the objectives or scope of the project to change, then the grantee would have to submit an approval request via Research.gov. Since salary can amount to a large part of the budget, there may very well be a scope change with addition of salary, especially if, for example, the PI decided not to hire a graduate student in order to have enough money to cover the salary increase.

Is it possible to remove the PI or other senior personnel from the proposal budget in FastLane?

For consistency with the NSF cost sharing policy, if person months will be requested for senior personnel, a corresponding salary amount must be entered on the budget. If no person months and no salary are being requested for senior personnel, they should be removed from section A of the budget. Their name(s) will remain on the Cover Sheet and the individual(s) role on the project should be described in the Facilities, Equipment and other Resources section of the proposal. See PAPPG Chapter II.C.2.i for additional information.

If PIs can be taken off the budget in FastLane, does this mean that there is no minimum effort requirement for PIs on NSF-sponsored projects?

The PAPPG coverage reminds recipients that they remain subject to the provisions of OMB M-01-06, “Clarification of OMB A-21 Treatment of Voluntary Uncommitted Cost Sharing and Tuition Remission Costs,” regarding requirements for committing and tracking “some level” of faculty (or senior researcher) effort as part of the organized research base.

Special Considerations

Where can a proposer find information on conflicts of interest (the investigator financial disclosure policy)? Does NSF provide a written sample of an organizational conflicts of interest policy? Who should a proposer contact if there are questions?

The PAPPG Chapter IX.A provides information on NSF’s conflicts of interest policy. NSF does not provide written samples of such policies. Questions regarding the NSF conflicts of interest policy should be directed to the Office of the General Counsel on (703) 292 8060.

Are there any special requirements for proposals which involve the use of human subjects?

Projects involving research with human subjects must ensure that subjects are protected from research risks in conformance with the relevant Federal policy known as the Common Rule (Federal Policy for the Protection of Human Subjects, 45 CFR 690). All projects involving human subjects must either (1) have approval from the organization’s Institutional Review Board (IRB) before issuance of an NSF award.
or, (2) must affirm that the IRB has declared the research exempt from IRB review, in accordance with the applicable subsection, as established in section 101(b) of the Common Rule.

For projects lacking definite plans for the use of human subjects, their data or their specimens, pursuant to 45 CFR 690.118, NSF can accept a determination notice that establishes a limited time period under which the PI may conduct preliminary or conceptual work that does not involve human subjects. (Reference PAPPG Chapter II D.5).

**Special Programs**

*Does NSF fund projects for targeted or special programs?*

NSF sponsors many funding programs for special purposes. Examples include Doctoral Dissertation Research Improvement Grants and Research Experiences for Undergraduates. Information about these and other programs can be found on the NSF website.

**Subawards**

*What documentation is needed for subawards?*

The basic items are a clear description of the work to be performed, the basis for selection of the subawardee (except for collaborative/joint arrangements) and a separate budget and budget justification for each subaward. (Reference PAPPG Chapter II.C.2.g(vi)(e)).

**Submission Windows**

*I’m familiar with deadlines and target dates, but what is the definition of a submission window?*

Submission windows are designated periods of time during which proposals will be accepted for review by NSF. It is NSF’s policy that the end date of a submission window converts to, and is subject to, the same policies as a deadline date. (Reference PAPPG Chapter I.F).

Target dates, deadlines and submission windows are published in specific program descriptions, program announcements and solicitations that can be obtained from NSF at pubs@nsf.gov or electronically through the NSF website.

**Supplements**

*How do I apply for supplemental funding?*

In unusual circumstances, small amounts of supplemental funding and up to six months of additional support may be requested to assure adequate completion of the original scope of work. The grantee must submit a request for supplemental funding at least two months before funds are needed.

Requests for supplemental funding must be initiated in the FastLane system
by using the “Supplemental Funding Request” function. Grantees should contact the cognizant NSF Program Officer prior to submitting a request for supplemental funding. (Reference PAPPG Chapter VI.E.4).

**System for Award Management (SAM)**

*Does a proposer have to be registered in SAM?*

Each proposer must be registered in the SAM database prior to submission of the proposal. Subawardees named in the proposal, however, do not need to be registered in SAM. SAM is the primary registrant database for the US Government. SAM collects, validates, stores and disseminates data in support of agency assistance and acquisition missions, including Federal agency grant and contract awards. This SAM registration must be maintained with current information at all times during which the organization has an active award or a proposal under consideration by NSF. Failure to comply with the SAM registration requirement prior to proposal submission may impact the processing of the proposal. To register in SAM, go to https://www.sam.gov. Proposers are advised that it takes approximately three-to-five business days to complete the registration process.

**Technology Expenses**

*Can technology devices such as Smartphones, iPhones, iPads, etc. be charged directly to an NSF award?*

A computing device is considered a supply if the acquisition cost is less than the lesser of the capitalization level established by the proposer or $5,000, regardless of the length of its useful life. As such, the cost of computing devices are allowable, so long as the devices are essential and allocable, but not solely dedicated to the performance of the NSF project. (Reference PAPPG Chapter II.C.2.g(vi)(a) and 2 CFR § 200.453).

**Transfer of the Award**

*What procedure should be followed if a PI plans to leave an organization during the course of an active award?*

If a PI plans to leave an organization during the course of an award, the organization has the prerogative to nominate a replacement PI, request that the award be terminated, or transfer the award (via NSF) to the PI’s new organization. Replacement PIs are subject to NSF approval. In those cases where a particular PI’s participation is integral to a given project and the PI’s original and new organizations agree, an award transfer request shall be submitted via the Notification and Request module in the FastLane system.

See PAPPG Chapter VII.B.2.f for additional information on award transfers.
Travel

I will be flying to a location that does not have a City Pair fare with my starting destination, but I will change planes in a city that does have a City Pair fare with my final destination. Am I required to fly an American carrier for the part of the trip that has a City Pair fare?

No. The requirement is only that the grantee determines if there is a City Pair fare between the starting airport and the final destination airport. If there is no city pair between the starting airport and the final destination, the traveler could fly the entire way on a foreign flag air carrier or part of the way on a U.S. flag air carrier and part of the way on a foreign flag air carrier.

Can I charge temporary dependent care costs to my NSF grant?

Temporary dependent care costs are only allowable on a Federal award if the charging of these costs is consistent with the organization’s documented travel policy for all organizational travel. The other conditions in 2 CFR § 200.474(c)(1) must also be met.

Are visa fees allowable as a direct cost on NSF grants?

NSF’s position on the allowability of direct charging visa costs is consistent with 2 CFR § 200.463(d). This section specifically makes the distinction between short-term, travel visa costs, which may be directly charged to a grant if they meet the criteria outlined in section 200.463(d), and longer-term immigration visas, which may not.

Tuition Remission

What is NSF’s policy on treatment of tuition remission?

Tuition remission is generally treated as part of an organization’s fringe benefit rate or as a direct cost. NSF’s policy is that colleges and universities should budget tuition remission consistent with its negotiated indirect cost rate agreement. If tuition remission is budgeted as a direct cost, it should be listed in the “Other” category of the NSF budget under “Other Direct Costs.”

Types of Submissions

What types of submissions may be required under NSF program solicitations?

NSF utilizes three types of submissions – Letters of Intent, Preliminary proposals and Full proposals. A program solicitation can require any of these types of submissions.

More information on these types of submissions and the circumstances under which they are used can be found in the PAPPG Chapter I.D.

V

Vertebrate Animals

What is NSF’s policy on the use of vertebrate animals in research?
For proposals involving the use of vertebrate animals, sufficient information must be provided within the 15-page project description to enable reviewers to evaluate the choice of species, number of animals to be used and any necessary exposure of animals to discomfort, pain, or injury.

Consistent with the requirements of the Animal Welfare Act [7 USC 2131 et seq] and the regulations promulgated thereunder by the Secretary of Agriculture [9 CFR, 1.1-4.11], NSF requires that proposed projects involving use of any vertebrate animal for research or education be approved by the submitting organization’s Institutional Animal Care and Use Committee (IACUC) before an award can be made. For this approval to be accepted by NSF, the organization must have a current Public Health Service (PHS) Approved Assurance. (Reference PAPPG Chapter II.D.4 and Chapter XI.B.3).

W

Withdrawal of a Proposal

What is the procedure for the withdrawal of a proposal?

A proposal may be withdrawn at any time before a funding recommendation is made by the cognizant NSF Program Officer. Proposals must be electronically withdrawn via the FastLane Electronic Proposal Withdrawal System. This module in FastLane automates the proposal withdrawal process and provides a mechanism that will help organizations to more effectively manage their proposal portfolio, as well as to help eliminate the submission of duplicate proposals to NSF. Further information regarding proposal withdrawal procedures can be found in PAPPG Chapter IV.A.
1330.4 Implementation of Final Research Performance Progress Reports (Final RPPR)
National Institutes of Health

Notice Number: NOT-OD-17-022
National Institutes of Health

Key Dates
Release Date: November 23, 2016

Related Announcements
NOT-OD-17-037

NOT-OD-14-026
NOT-OD-13-113
NOT-OD-13-035
NOT-OD-13-061
NOT-OD-12-083

Purpose
The National Institutes of Health intends to replace the Final Progress Report (FPR) with the Final Research Performance Progress Report (Final RPPR) through a new eRA Commons module effective January 2017.

Background
NIH implemented the interim RPPR in 2012, based on a policy memorandum from the Office of Management and Budget and Office of Science and Technology Policy (OSTP) to the heads of executive departments and agencies establishing the uniform RPPR for use by agencies supporting research and research-related activities. The RPPR replaced previous interim performance reporting formats used by NIH and other agencies.

In order to keep its promise, the Research Business Models (RBM), an Interagency Working Group of the Social, Behavioral & Economic Research Subcommittee of the Committee on Science (CoS), charged NSF and NIH to serve as the co-chairs of an interagency workgroup tasked with developing a standard format for use in reporting final progress on Federally-funded research projects and research-related activities, taking into consideration the lessons learned from implementation of the interim RPPR. This interagency workgroup completed its task and on November 16, 2016, published a Federal Register notice announcing the updated standardized
RPPR to be used for final performance progress reporting.

**NIH Implementation**

For NIH, the Final Research Performance Progress Report (F-RPPR) will replace the Final Progress Report (FPR) for closeout effective January 1, 2017. On or after that date, NIH will no longer accept FPRs. Generally, the format will be the same as the current interim/annual RPPR, making it easier for recipients to navigate through the F-RPPR based on familiarity with the existing format of the annual RPPR.

However, a significant change with implementation of the F-RPPR, is that in order to maximize public transparency, NIH will not maintain the current Type 2 policy which in accordance with NIHGPS Chapter 8.6.2 states that “whether funded or not” the progress report contained in the Type 2 application may serve in lieu of a separate final progress report. It is important to note that the discontinuance of this longstanding policy aligns NIH’s final performance reporting requirement with the requirements imposed by other Federal research awarding agencies thus reducing the administrative burden associated with a unique NIH reporting requirement.

Therefore, as a standard policy, NIH will request that organizations submit an “Interim-RPPR” while their renewal application (Type 2) is under consideration. In the event that the Type 2 is funded, NIH will treat the Interim-RPPR as the annual performance report for the final year of the previous competitive segment. If the Type 2 is not funded, the Interim-RPPR will be treated by NIH staff as the institution’s Final-RPPR.

Also, in accordance with NIH’s implementation of the F-RPPR, recipients will be required to adhere to the new requirement to report on Project Outcomes. This section will be made publicly available, thus allowing recipients the opportunity to provide the general public with a concise summary of the cumulative outcome or findings of the project (analogous to the Project Summary/Abstract section of the competing application).

As mentioned, NIH is aligning its reporting requirement with other Federal research agencies and therefore will not be making any changes to the deadline for submitting the final report- i.e., the Final RPPR or Interim-RPPR must be submitted via eRA Commons no later than 120 calendar days from the period of performance end date. If a recipient fails to comply with this reporting requirement, NIH may take one or more enforcement actions, such as a decision not to make a non-competing continuation award, consistent with NIHGPS Chapter 8.5.2. NIH also plans to maintain the business rule in the RPPR module enabling institutional signing officials (SOs), at their discretion, to delegate submission of the Final RPPR or Interim-RPPR to the Program Director/Principal Investigator (PD/PI).

Note: Implementation of the Final RPPR for Small Business Innovation and Research (SBIR) and Small Business Technology Transfer (STTR) grants will occur approximately 2 months after implementation for all other NIH grants due to unique final reporting requirements under the Small Business Administration’s SBIR/STTR Policy Directive.

FAQs and additional information pertaining to NIH’s implementation of the F-
RPPR will be available on the NIH RPPR website.

**Inquiries**

Recent FAQs on the NIH Research Performance Progress Reports
National Institutes of Health

I. Final RPPR

Why is NIH implementing the Final Research Performance Progress Report (RPPR)? (01/06/2017)
The Research Business Models (RBM), an Interagency Working Group of the Social, Behavioral & Economic Research Subcommittee of the Committee on Science (CoS), charged NSF and NIH to serve as the co-chairs of an interagency workgroup tasked with developing a standard format for use in reporting final progress on Federally-funded research projects and research-related activities.

Are NIH grantees required to use the Final RPPR? (01/06/2017)
Yes. If a recipient fails to comply with this reporting requirement, NIH may take one or more enforcement actions, such as a decision not to make a non-competing continuation award, consistent with NIHGPS Chapter 8.5.2. Note: Implementation of the Final RPPR for Small Business Innovation and Research (SBIR) and Small Business Technology Transfer (STTR) grants will occur approximately 2 months after implementation for all other NIH grants due to unique final reporting requirements under the Small Business Administration’s SBIR/STTR Policy Directive.

When is the Final RPPR due? (01/06/2017)
The Final RPPR must be submitted via eRA Commons no later than 120 calendar days from the period of performance end date.

Can I still submit the Final Progress Report (FPR) using the old format? (01/06/2017)
If you have a final progress report due, and you wish to use the old FPR format of an uploaded document, you must submit the FPR before January 1, 2017. NIH will no longer accept any of the old format FPRs on or after January 1, 2017.

Are there any differences in the format of the Final RPPR? (01/06/2017)
The format of the Final RPPR is very similar to that of the annual RPPR. The notable differences being the Final RPPR does not have sections F (Changes), and H (Budget). Likewise, the following items do not require responses: B.1.a, B.6, D.2, G.10, G.11, and G.12.

The Final RPPR does have a new section: Section I (Outcomes) https://grants.nih.gov/images/Final-RPPR-Project_Outcomes.png

Will the information reported under Project Outcomes be made public? (01/06/2017)
Yes. The information submitted in this section will be accessible to the general public via NIH’s Research Portfolio On-line Reporting Tools (RePORT). Thus, PD/PI’s are encouraged to ensure the narrative is understandable to a lay person audience.
The report form itself includes the following instruction:
Provide a concise summary of the outcomes or findings of the award (no more than 8,000 characters) that:

◆ is written for the general public in in clear, concise, and comprehensible language;
◆ is suitable for dissemination to the general public, as the information may be available electronically;
◆ does not include proprietary, confidential information or trade secrets; and
includes up to six images (images are optional)

J. Interim RPPR

Our group is submitting a renewal application (R01) in March 2017. Due to the new policy, I understand that we are to complete an “Interim RPPR” for this application. Does that mean that we do NOT include a progress report section in the 12-page Research Strategy section of the application? (01/06/2017)

You would still provide a brief progress report in the Research Strategy section of the application. Peer reviewers will still need that context when reading/rating the overall research strategy for the proposed renewal period.

Are there any differences in the format of the Interim RPPR? (01/06/2017)
The format of the Interim RPPR is very similar to that of the annual RPPR. The notable differences being the Interim RPPR does not have sections F (Changes), and H (Budget). Likewise, the following items do not require responses: B.1.a, B.6, D.2, G.10, G.11, and G.12.

The Final RPPR does have a new section: Section I (Outcomes) https://grants.nih.gov/images/Final-RPPR-Project_Outcomes.png

Will the information reported under Project Outcomes be made public? (01/06/2017)
Yes. The information submitted in this section will be accessible to the general public via NIH’s Research Portfolio On-line Reporting Tools (RePORT). Thus, PD/PI’s are encouraged to ensure the narrative is understandable to a lay person audience. The report form itself includes the following instruction:

Provide a concise summary of the outcomes or findings of the award (no more than 8,000 characters) that:

◆ is written for the general public in in clear, concise, and comprehensible language;
◆ is suitable for dissemination to the general public, as the information may be available electronically;
◆ does not include proprietary, confidential information or trade secrets; and
includes up to six images (images are optional)

If my Type 2 is not selected for funding will I have to submit another Interim RPPR? (01/09/2017)
No. If the Type 2 is not selected for funding, the Interim RPPR will be treated by NIH staff as the institution’s Final RPPR.
### Legislative Actions to Reduce Regulatory Burden Matrix

#### Council on Governmental Relations

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Research Policy Board</td>
<td>Established by the Director of OMB. 10 or fewer federal members (OIRA, OSTP, HHS, NSF and others that support or regulate research). 9-12 representatives of academic or other non-profit research institutions or organizations with relevant expertise. Appointed through a formal process including nomination by members of the research community. The process would be established by the Secretary (in consultation with the Federal membership). This is likely in error, as in previous iterations the RPB was established by the HHS Secretary due to HELP jurisdiction, now the OMB Director. The board is charged with coordinating and improving regulations and policies; discussing policy and regulatory gaps and challenges; and ongoing assessment of regulatory burden. Expert subcommittees can be formed as needed. Not explicitly tasked with addressing prospective regulations and policies. Report to Congress and GAO evaluation. Sunsets 9/30/20.</td>
<td>Not addressed.</td>
<td>Not addressed.</td>
</tr>
<tr>
<td>Interagency Working Group on Research Regulations</td>
<td>Not addressed.</td>
<td>To be established by OMB in coordination with OSTP. Charged with reviewing existing regulations and making recommendations for eliminating, streamlining or improving regulations and processes with the goal of reducing burden on researchers and IHEs. Directed to consult with stakeholders, an improvement over the existing research business models (interagency) working group. Requires a report to congressional committees annually for the first four years.</td>
<td>Not addressed.</td>
</tr>
<tr>
<td>Subrecipient Monitoring - reduce unnecessary or redundant oversight.</td>
<td>NIH Director directed to reduce administrative burden, including possible exemption where the subrecipient is subject to single audit and use of collaborative grant models or other structures allowing for multiple prime awardees.</td>
<td>Not addressed.</td>
<td>Not addressed.</td>
</tr>
</tbody>
</table>

**Recommendations** - National Academies - amend the UG to clarify applicability to IHEs only for project and performance monitoring. GAO - target higher risk subrecipients.
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Micropurchase Threshold - Increase to $10,000 with the opportunity for higher thresholds. <strong>Recommendations</strong>: National Academies. GAO - target higher risk purchases.</td>
<td>Not addressed.</td>
<td>$10,000 or higher threshold as determined by the head of the relevant executive agency and consistent with audit findings, institutional risk assessment, or State law. Applicable only to NSF, NASA and NIST.</td>
<td>$10,000 or higher threshold as determined by the head of the relevant executive agency and consistent with clean audit findings, institutional risk assessment, or State law. Grants, cooperative agreements, and contracts for all federal agencies.</td>
</tr>
<tr>
<td>Review Financial Conflict of Interest Policies - harmonizing policies and reducing burden - <strong>Recommendations</strong>: National Academies - Federal-wide policy to be developed by Congress and OSTP; NSB and GAO - evaluation of the 2011 revisions to the PHS COI regulations.</td>
<td>Within two years of enactment. Led by the HHS Secretary. Review to include the minimum threshold for reporting and just-in-time reporting.</td>
<td>Not addressed.</td>
<td>Not addressed.</td>
</tr>
<tr>
<td>Review Animal Research Regulations - goal of reducing administrative burden. <strong>Recommendations</strong>: National Academies: OSTP to convene - goal of unified federal approach. NSB - engage all regulatory, independent and certification bodies.</td>
<td>Within two years of enactment. NIH, USDA and FDA are charged with identifying and eliminating inconsistent, overlapping or unnecessarily duplicative regulations and policies and improving coordination.</td>
<td>Not addressed.</td>
<td>Not addressed.</td>
</tr>
<tr>
<td>Clarify or Affirm Alternatives to Effort Reporting - <strong>Recommendations</strong>: NSB: OMB issue a memo of clarification indicating that the payroll certification method is acceptable to the Federal Government. National Academies: OMB affirm that IHEs may take advantage of the flexibility of the UG for documenting personnel expenses.</td>
<td>Directs the HHS Secretary to clarify applicability of the Uniform Guidance for management and certification systems, including those for documentation of personnel expenses. It would be our understanding that the intent is that the HHS Secretary affirm the flexibility under the UG in documenting personnel expenses.</td>
<td>Not addressed.</td>
<td>Not addressed.</td>
</tr>
<tr>
<td>Unified Grant Format - <strong>Recommendations</strong>: National Academies</td>
<td>Not addressed.</td>
<td>Working group to consider a simplified, unified grant format for use by all agencies.</td>
<td>Not addressed.</td>

<table>
<thead>
<tr>
<th>Regulations Affecting Research Institutions Published Since January 2016</th>
<th>Issued</th>
<th>Effective Date</th>
<th>Implications of the Regulatory Freeze</th>
</tr>
</thead>
<tbody>
<tr>
<td>Federal Policy for the Protection of Human Subjects (Common Rule)</td>
<td>January 19, 2017</td>
<td>January 19, 2018</td>
<td>The rule will be postponed 60 days pending review by “a department or agency head appointed or designated by the President after noon on January 20, 2017” or other designee. This shouldn’t affect the implementation date and it is not clear where this will lead. COGR has raised concerns with respect to the Common Rule, most recently in a letter to the new administration and meeting with OIRA and agency staff, and it was included in a list of regulations that the House Freedom Caucus recommends Trump target for removal/elimination in his first 100 days in office. Whether the removal of proposed changes to non-identified biospecimens and resulting reduction in proposed costs will make this less of a target for elimination is unknown. The rule could also be overturned by Congress but it is unlikely to be overturned via the Conressional Review Act and legislation that would allow Congress to overturn several rules at once has only passed the House.</td>
</tr>
<tr>
<td>Department of Education’s Final Rule on Open Licensing Requirements for Competitive Grant Programs</td>
<td>January 19, 2017</td>
<td>March 20, 2017</td>
<td>The rule will be postponed 60 days pending review by “a department or agency head appointed or designated by the President after noon on January 20, 2017” or other designee. Per the memorandum from the new administration, “where appropriate and as permitted by applicable law, [agency heads] should consider proposing for notice and comment a rule to delay the effective date for regulations beyond that 60- day period.” COGR is considering whether to request that this rule be rescinded.</td>
</tr>
<tr>
<td>Updates to the Uniform Guidance (including updates to the procurement rule and the micro-purchase threshold)</td>
<td>Pending</td>
<td>Pending</td>
<td>The new administration has asked that agencies not send regulations to the Office of the Federal Register until a department or agency head appointed or designated by the President after noon on January 20, 2017, reviews and approves the regulation and if regulations have been sent, that they immediately be withdrawn. The memorandum also references guidance documents and “covers any agency statement of general applicability and future effect ‘that sets forth a policy on a statutory, regulatory, or technical issue or an interpretation of a statutory or regulatory issue.’ OMB is following this process, which is delaying release of Federal Register updates to the UG, as well as the release of FAQs. The National Defense Authorization Act and the American Competitiveness and Innovation Act (both of which have been signed into law) establish a $10,000 micro-purchase threshold with provisions for higher levels. The Uniform Guidance will need to be updated to reflect the statutes.</td>

¹ Any of the authorities may be over-ridden by a special term or condition of award.
² Except where specified otherwise in this matrix, the terms and conditions of award, or the applicable program solicitation or award notice.
³ This action requires the prior written approval of the cognizant NSF Program Officer.
⁴ Rearrangement and reconstruction costs under $25,000 may be approved by grantees.
⁵ Unless funds are being moved into the "Other" category of participant support.
⁶ Waived, funds added to the amount available for the project.
⁷ Required for the PI and any other individuals specifically named in the Notice of Award.
⁸ Waived, but costs not specifically covered in Subpart F are subject to the NIH Grants Policy Statement (NHGPR).
⁹ Waived, unless change in scope. For the purposes of Kirschstein-National Research Service Award (NRSA) programs, this term does not apply. NIH will continue to use the terms trainees, trainee-related expenses, and trainee travel in accordance with NRSA Regulations. Participant support costs are only allowable when identified in specific Funding Opportunity Announcements (FOAs).
¹⁰ Waived unless change in scope and except when subrecipient is foreign.
¹¹ Waived except when Notice of Award indicates prior approval is required.
¹² Waived unless change in scope.
¹³ Waived for alterations and renovations costing up to $500,000, unless change in scope or rebudgeting into R&A exceeds 25% of budget period total.
¹⁴ See Rearrangement and Reconversion Costs within NIH Grants Policy Statement Chapter 7.9.1.

\(^1\) Any of the authorities may be over-ridden by a special term or condition of award.

\(^2\) Except where specified otherwise in this matrix, the terms and conditions of award, or the applicable program solicitation or award notice.

\(^3\) This action requires the prior written approval of the cognizant NSF Program Officer.

\(^4\) If requested and approved by the Federal awarding agency, the PI may be required to include the costs.

\(^5\) Waived, funds added to the amount available for the project.

\(^6\) Waived, but costs not specifically covered in Subpart F are subject to the NIH Grants Policy Statement (NIHGPS).

\(^7\) Due to the limited availability of funds, as authorized by the Federal awarding agency, the PI may be required to include the costs.

\(^8\) Waived, unless change in scope.

\(^9\) Waived unless change in scope and except when subrecipient is foreign.

\(^10\) Waived except when Notice of Award indicates prior approval is required.

\(^11\) Waived unless change in scope.

\(^12\) Waived for alterations and renovations costing up to $500,000, unless change in scope or rebudgeting into A&R exceeds 25% of budget period total.

\(^13\) See Rearrangement and Reconversion Costs within NIH Grants Policy Statement Chapter 7.9.1.

## Statutory/Regulatory/and Executive Based Requirements

<table>
<thead>
<tr>
<th>National Policy Requirements Applicable to all research agencies:</th>
<th>Type of Award</th>
<th>Type of Recipient</th>
<th>Specific Situation</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. The quality of the human environment, and provide help the agency may need to comply with the National Environmental Policy Act (NEPA, at 42 U.S.C. 4321, et. seq.) and to prepare Environmental Impact Statements or other required environmental documentation. In such cases, the recipient agrees to take no action that will have an adverse environmental impact (e.g., physical disturbance of a site such as breaking of ground) until the agency provides written notification of compliance with the environmental impact analysis process.</td>
<td>All</td>
<td>All</td>
<td>All actions that may affect the environment</td>
</tr>
<tr>
<td>b. Flood-prone areas, and provide help the agency may need to comply with the National Flood Insurance Act of 1968 and Flood Disaster Protection Act of 1973 (42 U.S.C. 4001, et. seq.), which require flood insurance, when available, for Federally assisted construction or acquisition in flood-prone areas. DOE at 10 CFR Part 1022</td>
<td>All</td>
<td>All</td>
<td>Awards involving construction, land acquisition or development, with some exceptions [see 42 U.S.C. 4001, et. seq.].</td>
</tr>
<tr>
<td>c. Coastal barriers, and provide help the agency may need to comply with the Coastal Barriers Resource Act (16 U.S.C. 3501, et. seq.), concerning preservation of barrier resources. EPA at 40 CFR Part 6</td>
<td>Grants, cooperative agreements, and other “financial assistance” (see 42 U.S.C. 4003).</td>
<td>All</td>
<td>Awards that may affect barriers along the Atlantic and Gulf coasts and Great Lakes’ shores</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>42 U.S.C. 4012a prohibits awards for acquisition or construction in flood-prone areas (Federal Emergency Management Agency publishes lists of such areas in the Federal Register), unless recipient has required insurance. If action is in a floodplain, Executive Order 11988 [3 CFR, 1977 Comp., p. 117] specifies additional pre-award procedures for Federal agencies. Recipients are to apply requirements to subawards (“financial assistance,” defined at 42 U.S.C. 4003, includes indirect Federal assistance).</td>
</tr>
<tr>
<td>d. All existing or proposed component of the National Wild and Scenic Rivers system, and provide help the agency may need to comply with the Wild and Scenic Rivers Act of 1968 (16 U.S.C. 1271, et seq.). EPA at 40 CFR Part 6</td>
<td>Grants, cooperative agreements, and other “financial assistance” (see 16 U.S.C. 3502).</td>
<td>All</td>
<td>Awards that may affect existing or proposed element of National Wild and Scenic Rivers system.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Requirements flow to subawards (16 U.S.C. 3502 includes indirect assistance as “financial assistance”).</td>
</tr>
</tbody>
</table>

<td>All</td>
<td>In accordance with the Executive Order, &quot;grantees are encouraged to adopt and enforce on-the-job seat belt policies and programs for their employees when operating company-owned, rented, or personally owned vehicles.&quot;</td>
</tr>
</tbody>
</table>

**e) National Security Guidelines**

By signing the agreement or accepting funds under this agreement, the recipient assures it will comply with the following requirements:
### Statutory/Regulatory/and Executive Based Requirements

<table>
<thead>
<tr>
<th>National Policy Requirements Applicable to all research agencies:</th>
<th>Used For:</th>
<th>Requirement(s) that should be noted by the recipient</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type of Award</strong></td>
<td><strong>Type of Recipient</strong></td>
<td><strong>Specific Situation</strong></td>
</tr>
<tr>
<td>1. Executive Order 13224, Blocking Property and Prohibiting Transactions with Persons who Commit, Threaten to Commit, or Support Terrorism, dated September 23, 2001. Executive Order 13224 gives the U.S. government a powerful tool to impede terrorist funding and is part of our national commitment to lead the international effort to bring a halt to the evil of terrorist activity. President Bush issued Executive Order 13224 pursuant to the authorities of the International Emergency Economic Powers Act (50 U.S.C. 1701 et seq.), the National Emergencies Act (50 U.S.C. 1601 et seq.), section 5 of the United Nations Participation Act of 1945, as amended (22 U.S.C. 287c) (UNPA), and section 301 of title 3, United States Code.</td>
<td>All</td>
<td>In general terms, the Order provides a means by which to disrupt the financial support network for terrorists and terrorist organizations by authorizing the U.S. government to designate and block the assets of foreign individuals and entities that commit, or pose a significant risk of committing, acts of terrorism. In addition, because of the pervasive-ness and expansiveness of the financial founda-tions of foreign terrorists, the Order authorizes the U.S. government to block the assets of individuals and entities that provide support, services, or assist-ance to, or otherwise associate with, terrorists and terrorist organiza-tions designated under the Order, as well as their subsidiaries, front organizations, agents, and associates.</td>
</tr>
<tr>
<td>2. Select Agents and Toxins P.L. 107-188: Public Health Security &amp; Bioterrorism Preparedness Response Act of 2002, Title II sections 201-231</td>
<td>As applicable</td>
<td>Research with or storage of Select Agents and Toxins Institution must be registered with CDC and or USDA prior to beginning work with agents. Investigator must be licensed prior to beginning work. NIH Term of Award includes notice that registration must be complete before using NIH funds and that no funds may be used for Select Agent Research if certification is denied. USDA inserts a term indicating that the grantee has primary responsibility for complying with Title II of the Public Health Security and Bioterrorism Preparedness and Response Act of 2002, Public Law 107-188, and the regulations promulgated thereunder in 7 CFR Part 331, 9 CFR Part 121, and 42 CFR Part 72. For guidance on a biosecurity plan that includes physical security of facilities and access controls to prevent unauthorized entries see Departmental Manual 9610-1, USDA Security Policies and Procedures for Biosafety Level-3 Facilities (available via <a href="http://www.usda.gov/directives/index.html">http://www.usda.gov/directives/index.html</a>) Other State and Local regulations may apply</td>
</tr>
</tbody>
</table>

**P.L. 107-56 The USA Patriot Act of 2001 Section 175b www.cdc.gov/od/sap**

I. NIH Implementation of the Research General Terms and Conditions

a. The Research General Terms and Conditions apply to all NIH grants and cooperative agreements with the exception of the automatic carryover provision found in 2 CFR § 200.308(d)(3). Automatic carryover authority will be indicated on the Notice of Award (NoA) (See II.d below).

b. NIH Implementation of the Research General Terms and Conditions includes: 1) DHHS codification of 2 CFR §200 in 45 CFR Part 75; 2) conditions on activities and expenditure of funds in statutory requirements, such as those included in appropriations acts detailed at: http://grants.nih.gov/grants/policy/appropriations_info.htm; and 3) the NIH Grants Policy Statement.

c. For certain funding mechanisms, NIH implements streamlined requirements for progress report submission, the Notice of Award (NoA), and financial reporting. Known as the Streamlined Noncompeting Award Process (SNAP), NIH routinely applies SNAP to most Research Project (R-series) awards (except R35s, R41s, and R43s), and Career Development Awards (K-series). NIH grantees are expected to follow the SNAP process for those awards that are issued under the SNAP, as indicated on the NoA. Agency-specific requirements listed below will indicate where differences exist between SNAP and non-SNAP grants. Additional information on SNAP can be found in the NIHGPS, at 8.4.1.2, “Streamlined Noncompeting Award Process”.

II. Prior Approval Requirements Not Included in or Modified from the Research General Terms and Conditions

a. Transfer of funds budgeted for participant support costs to other categories of expense (200.308(c)(1)(v)): Waived, unless change in scope. For the purposes of Kirschstein- NRSA programs, this term does not apply. NIH will continue to use the terms trainees, trainee-related expenses, and trainee travel in accordance with NRSA Regulations. Participant support costs are only allowable when identified in specific FOAs.

b. Subawarding, transferring or contracting out any work under a Federal award (200.308(c)(1)(vi)): NIH prior approval is required for the transfer of a significant part of the research or substantive programmatic effort only when the transfer represents a change of scope unless the transfer is to a foreign entity. If the transfer is to a foreign entity, prior approval must be obtained in order to complete the appropriate administrative assurances.

c. Initiate a one-time extension of the period of performance by up to 12 months (200.308(d)(2)): Recipients are required to notify NIH of their initiation of a one-time no-cost extension. Recipients are encouraged to use the No-Cost Extension Notification feature in the eRA Commons and can submit notifications up to the
last day of the current end date, essentially waiving the 10-day requirement.

d. Carry forward unobligated balances to subsequent periods of performance (200.308(d)(3)): NIH prior approval may be required for carryover of unobligated balances on all P mechanisms except P01s; cooperative agreements (U’s); Institutional National Research Service Awards (T’s); Phase I SBIR & STTR (R43, R41); clinical trials (regardless of mechanism) and awards to individuals. The NIH Notice of Award will state whether prior approval is or is not required for carry over.

e. Subawards based on fixed amounts at any dollar amount, provided the subawards meet the requirements for fixed amount awards in 200.201(200.332): NIH prior approval is required in order for recipients to provide subawards based on fixed amounts (as defined in 2 CFR 200.45) to which the conditions in 2 CFR 200.201 apply.

f. Direct charge the salaries of administrative and clerical staff (200.413(c)(3)): NIH prior approval is not required to rebudget funds to direct charge the salaries of administrative and clerical staff if the following conditions are met: administrative or clerical services are integral to the project or activity; individuals involved can be specifically identified with the project or activity; the costs are not also recovered as indirect costs. The only time a prior approval request would need to be submitted is when additional funds are requested for such a position or the incurrence of such costs constitutes a change of scope.

g. Direct charge special arrangements and alterations costs incurred specifically for a Federal award (200.462(a)): NIH prior approval is required for Alterations and Renovations that exceed $500,000.

III. Allowable Direct Costs Aside from Those in 2 CFR 200, Subpart E

a. The allowability of direct costs not specifically covered by the provisions of 2 CFR 200, Subpart E shall be in accordance with the NIHGPS, 45 CFR Part 75, or the NIH Funding Opportunity Announcement published in the NIH Guide for Grants and Contracts, if more current.

IV. Contact Information

a. Contact Information for Technical Matters

The NIH Scientific Program Official as identified on the Notice of Award is responsible for the scientific monitoring of the research.

b. Contact Information for Administrative Matters

The NIH Grants Management Officers/Specialist as identified on the Notice of Award is the official to be notified when required by the General Terms and Conditions.

c. Contact Information for Intellectual Property Matters

The NIH point of contact for intellectual property matters is:
Division of Extramural Inventions and Technology Resources  
Office of Policy for Extramural Research Administration, NIH  
6705 Rockledge Dr., Rm. 1136, MSC 7980  
Bethesda, MD 20892-7980  
Telephone: 301/435-1986

Inventions are required to be reported using Interagency Edison (located at http://www.iedison.gov/).

V. Agency-Specific Requirements Related to Articles in The Research General Terms And Conditions

Part II Subpart B of the NIHGPS includes additional policy guidance as well as terms and conditions that vary from standard terms and conditions because of the type of grant, grantee, or grant-supported activity. These terms and conditions may apply in addition to or in lieu of those in the Research General Terms and Conditions. Each section of Part II Subpart B of the NIHGPS specifies how the coverage relates to Section II Subpart A of the NIHGPS (11/16 or its successor), and consequently to the Research General Terms and Conditions.

Part II Subpart B includes:
◆ Multiple Program Director/Principal Investigator Applications and Awards
◆ Construction, Modernization, or Major Alteration and Renovation of Research Facilities
◆ Ruth L. Kirschstein National Research Service Awards
◆ Research Career Development Awards
◆ Modular Applications and Awards
◆ Support of Scientific Meetings (Conference Grants)
◆ Consortium Agreements
◆ Grants to Foreign Institutions, International Organizations, and Domestic Grants with Foreign Components
◆ Grants to Federal Institutions and Payments to Federal Employees Under Grants
◆ Grants to For-Profit Organizations
◆ Research Patient Care Costs

The Office of Policy for Extramural Research Administration (OPERA) is responsible for developing and maintaining the NIH GPS. Interim changes to NIH grants policy will be published in the NIH Guide for Grants and Contracts. Each change will be described, including its applicability and effective date.

VI. Revised Budget Requirements

a. While a modified, streamlined, progress report is still a feature of grants awarded under the Streamlined Non-competing Award Process (SNAP) authorities, a streamlined version of the RPPR has replaced the eSNAP module in the
eRA Commons. For all SNAP awards, the progress report is submitted using this streamlined version of the RPPR that does not include detailed budget information.

b. For non-SNAP awards, revised budget information should be submitted according to the instructions in Section H of the RPPR Instruction Guide.

VII. Technical Reporting

NIH requires grantees to report on scientific progress using the Research Performance Progress Report (RPPR) module in eRA Commons. Annual progress reports submitted in any format other than the RPPR will not be processed by the NIH and will require resubmission through the RPPR.

As of January 1, 2017, NIH has replaced the Final Progress Report with the Final RPPR (F-RPPR). Generally, the format will be the same as the annual RPPR, making it easier for recipients to navigate through the F-RPPR based on familiarity with the existing format of the annual RPPR. Effective February 9, 2017, if the recipient organization has submitted a renewal application on or before the date by which an F-RPPR would be required for the current competitive segment, then submission of an “Interim-RPPR” via eRA Commons is now required. Based on this requirement, NIH has discontinued the policy for renewal applications whereby, “whether funded or not,” the progress report contained in the renewal application may serve in lieu of a separate final progress report.

VIII. Financial Reporting

a. Generally, for SNAP awards, a Federal Financial Report (FFR) is required at the end of a competitive segment only. It must be submitted within 120 days after the end of the competitive segment and must report the cumulative support awarded for the entire competitive segment. An FFR must be submitted at this time whether or not a competing continuation award is made.

b. For non-SNAP awards, the FFR is required annually. The report must be submitted for each budget period, no later than 90 days after the end of the calendar quarter in which the budget period ends. The report must also cover any authorized extension in time of the budget period. For non-SNAP awards, the final FFR must be submitted within 120 days after the end of the competitive segment.

c. For grants eligible for automatic carryover, the FFR must specify the amount to be carried over to the next budget period. The notification must be provided under item 12, “Remarks,” on the FFR.

d. If more frequent reporting is required, the NoA will specify both the frequency and due date.

e. FFRs must be submitted electronically to NIH using the FFR system located in the eRA Commons. Questions concerning specific financial matters should be directed to the Government Accounting Branch, 301-451-9210, or visit the Government Accounting web-page at https://ofm.od.nih.gov/Pages/
XI. Incremental Funding Actions

a. SNAP
   1. Instructions for submitting SNAP progress reports are included in the RPPR Instruction Guide.
   2. Career Development Awards that are issued under SNAP are to follow the RPPR instructions for SNAP and the CDA instructions of the RPR at Section 7.1.
   3. NIH will use the quarterly FFR cash transaction data submitted to the Payment Management System (PMS) to monitor the financial aspects of SNAP awards. Final FFR expenditure data is required to be submitted to NIH within 120 days of the end of a competitive segment (see 200.343).

b. Non-SNAP
   1. Instructions for submitting non-SNAP progress reports are included in the RPPR Instruction Guide.
   2. Institutional Research Training Grant, Including Ruth L. Kirschstein National Research Service Awards are to follow the specific training grant instructions of the RPPR at Section 7.4.
   3. A FFR is required to be reported annually to NIH for non-SNAP awards. Final FFR expenditure data is required to be submitted to NIH within 120 days of the end of a competitive segment (see 200.343).
Knowledge Check

AIS editors

The Q&As at §1390.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 1300 has been understood. Note: For the answer key for §1390.1, see §1390.3, which appears on a separate page (page 1390:5) for testing purposes.

Discussion topics at §1390.2 are designed to engender dialogue among staff on general issues of importance in the field.

§1390.1 Q&As

1. The following circular primarily addresses application processing:
   (a) A-21
   (b) A-87
   (c) Both (a) and (b)
   (d) None of the above

2. The circulars are issued by which of the following:
   (a) National Institutes of Health
   (b) National Science Foundation
   (c) Office of Management and Budget
   (d) General Accountability Office

3. Administrative and clerical costs on federal grants and contracts are governed by
   (a) OMB A-110
   (b) OMB A-21
   (c) OMB A-133, Compliance Supplement
   (d) Appendix material to Joy of Cooking

4. Which of the following is NOT a major funding mechanism used in sponsored research:
   (a) Contract
   (b) Gift
   (c) Grant
   (d) Cooperative agreement
5. Put simply, indirect costs on sponsored projects are costs that are
(a) Not easily and readily identified with a particular project
(b) Generally easily identified with a particular project
(c) Both (a) and (b)
(d) Neither (a) nor (b)

6. In determining the level of risk a subrecipient represents, the following factors are often considered EXCEPT
(a) Size of the subaward
(b) Size of the entity and length of time in business
(c) Geographic location of the subrecipient
(d) Past performance of the entity

7. Which of the following best describes a “material finding” under an audit?
(a) An internal control deficiency
(b) Noncompliance with applicable laws, regulations, or agreement terms and conditions of an inconsequential nature
(c) Level of uncertainty or doubt as to allowability or appropriateness
(d) Noncompliance with applicable laws, regulations, or agreement terms and conditions of a substantive nature

8. Cost sharing or matching in connection with a federal grant means that portion of project or program costs
(a) Not borne by the federal sponsor
(b) Not included in the budget
(c) Not available until after the award is closed out
(d) That are always less than $5,000

9. Which of the following would NOT be on the list of compliance items reviewed during an audit:
(a) Auditors will test to make sure that the entity actually spent the money before requesting reimbursement from the government.
(b) Auditors will verify that the science used under the grant meets acceptable community standards as established by peer review committees.
(c) Auditors will test to see if cost sharing commitments were met, the claimed cost sharing was documented, and all the costs were allowable.
(d) Auditors will make sure that the purchasing policies of the entity comply with federal law and then test to see that those policies are followed.
1390.2 **Discussion Topics**

1. It is said that a research administrator should prepare for an audit during the entire award life cycle. What does this mean and how can it be implemented?

2. What role does “judgment” play in determining the validity of expenses charged to federal awards?

3. The regulatory environment surrounding sponsored research has become increasingly complex over the years. Do you agree or disagree with this statement? Why?

4. What is “award monitoring”? Why is it important?

5. Carol Langguth, of the USDA’s National Institute of Food Safety, spoke at the 2009 NCURA Annual Meeting in Washington, D.C. Langguth provided the audience with a heads up on some audit issues identified by her oversight staff, so institutions could be sure to avoid these errors:

   - Drawdowns in excess of expenditures and/or occurring beyond 90 days after grant expiration
   - Improper pooling/co-mingling of funds
   - Insufficient matching
   - Untimely closeout of grants
   - Financial reports don’t reconcile with accounting records and are filed late or not at all
   - Noncompliant time and effort reporting
   - Noncompliant subrecipient monitoring

   Langguth also mentioned some common problems with applications, including the following:

   - Budget: does not match the narrative or all budget items are not explained in the narrative; doesn’t include base salary and work months; proposal is for multiple years, but budget for only one year
   - Costs: meals not justified; auditing and clerical costs not justified
   - Consultants/subcontractors: no justification for excessive pay for consultants/speakers; consultants rate of pay missing; no letter of intent or statement of work for consultants/subcontractors; subcontract duration exceeds award duration
   - Problems with commitments exceeding 100%; effort percentages missing for some projects
   - Human subjects/animal care approval signed by subcontractor’s authorized representative and not that of the awardee

   Do any of these apply to your institution? Before answering, remember to include in your review all applications — not just those going to the USDA. What can
you do to better monitor your practices to avoid these common problems?

6. With the increased scrutiny on transparency and accountability coming from the Obama administration and Congress, what is your institution doing to be sure your practices could pass the so-called “newspaper test” (that is, what if a story about your practices appeared on the front page of your local newspaper — would it portray your institution in a favorable or unfavorable light)?
¶1390.3  **Answer Key**

Following are the correct answers to the questions included at ¶1390.1.

1. (d) None of the above

2. (c) Office of Management and Budget

3. (b) OMB A-21

4. (b) Gift

5. (a) Not easily and readily identified with a particular project

6. (c) Geographic location of the subrecipient

7. (d) Noncompliance with applicable laws, regulations, or agreement terms and conditions of a substantive nature

8. (a) Not borne by the federal sponsor

9. (b) Auditors will verify that the science used under the grant meets acceptable community standards as established by peer review committees.

¶1501 Introduction
Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter on research compliance addresses a particularly critical topic for research administration.

If the major issues and concerns of research administration in the 21st century had to be summarized in only one word, there is very little doubt that the word would be “compliance.” One needs only to read occasional headlines announcing yet another dramatic case of noncompliance or misconduct in connection with a research program at a college or university to appreciate this.

Stephen Erickson of Boston College and Alice Tangredi-Hannon of Yale University have prepared an excellent overview of the research compliance topic. This chapter is not a catalogue of all of the subjects about which compliance requirements exist. Rather, it is a very thoughtful discussion of what compliance means in the context of sponsored programs and how one might go about developing an effective program of research compliance.

Drawing on sources as diverse as the U. S. Sentencing Guidelines, the results of NIH compliance site visits, and the Council on Governmental Relations (COGR) publication, “Managing Externally Funded Research Programs,” Erickson and Tangredi-Hannon have collected and summarized the essential requirements for an effective research compliance program. They correctly identify the process of assessing compliance as one that is absolutely essential to an effective program. Assessment as a one-time effort will not produce the desired outcomes. Compliance assessment needs to become a regular ongoing activity within the institution. The authors have effectively conveyed the message that it is “all about integrity” and fostering a “culture of compliance.”

Clearly, the federal government is focused on monitoring regulatory and programmatic compliance at colleges and universities. This chapter will continue to respond to the information needs of research administrators over time through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶1505, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶1520), practical tools (at ¶1530), case studies (¶1540), and relevant statistics and survey results (at ¶1560). A “knowledge check” containing Q&As and discussion topics is included at ¶1590.
¶1505 Research Compliance

Stephen Erickson

Boston College

Alice Tangredi-Hannon
University Research Compliance Officer
Yale University

This chapter provides an overview of why research compliance is important to an institution and will help guide an institution in developing a research compliance program and/or assessing the continued effectiveness of an existing program. The chapter discusses the importance of top-level institutional commitment and the appointment of an office and/or individual to oversee research compliance. Further, the chapter outlines the process of developing a research compliance program and the importance of conducting ongoing assessments to determine compliance and mitigate risks.

¶1505.1 Why Research Compliance Is Important

For a scientist, integrity embodies above all the individual’s commitment to intellectual honesty and personal responsibility. It is an aspect of moral character and experience. For an institution, it is a commitment to creating an environment that promotes responsible conduct by embracing standards of excellence, trustworthiness, and lawfulness and then assessing whether researchers and administrators perceive that an environment with high levels of integrity have been created.1

Universities in Society

As nonprofit institutions, universities have a public mission. The public depends on university research to be conducted in an objective and honest way. University research may form the basis of public policy. The creation of medical therapies, drugs, and devices depends on the basic and clinical research performed by universities and affiliated hospitals. The development of knowledge through research as well as contributions to the arts are additional ways universities fulfill, in part, their public mission. These are but a few examples of the social context of university research.

It is not enough, however, to simply create knowledge. The public mission requires that academic work must be disseminated through, for example, publications, public performances or presentations, and the licensing of intellectual property. A key element in the appropriate dissemination of knowledge is that the research must be performed ethically and honestly, in keeping with the accepted standards in the given academic

field. Furthermore, the reporting of research results whether to sponsors or via publications must be done in an objective and honest manner.

Just as the conduct and reporting of research must be done in an honest manner, universities have a fiduciary responsibility to manage the funding of research projects appropriately regardless of the source of funding. Any perception that finances are mismanaged calls into question the integrity of the entire research program as well as the institution’s ability to satisfy its fiduciary responsibilities.

The research enterprise, to the greatest extent possible, also must be free of individual or institutional conflicts of interest. As noted by the Association of American Universities, “The partnership between research universities and their principal research sponsors — including the federal government — must be based on the conviction that universities are accountable for the research they perform.” Great care must be given to ensure the transparency of business relationships because even the perception that a conflict exists can damage the public trust.

Preserving Public Trust in Research and Institution’s Fiduciary Role

The public will support science only if it can trust the people and the institutions that conduct research. Major social institutions, including research institutions, are expected to be accountable to the public. Fostering an environment that promotes integrity in the conduct of research is an important part of that accountability.3

Public trust in universities must be held by not just the general population, but also government agencies (at all levels), public and private research sponsors, alumni, donors, and the press. Some of the situations that jeopardize public trust in universities include the following:
(a) Misuse or mismanagement of sponsored funding (This occurs when proposal budgets are artificially inflated, when effort is not reported appropriately, and when funds are spent in conflict with sponsor policies.)
(b) Expenditure of funds in ways contrary to their intended purposes
(c) Instances of research misconduct
(d) Real or perceived conflicts of interest (In the public’s eye, COI can easily lead to a perception, accurate or not, that research results are biased, or that universities are more concerned with private rather than public interests.)

Public support is essential to universities sustaining themselves as viable entities. Public distrust of university research or financial management would strike at the core of university existence. Trust is fragile and can be severely diminished by occurrences of financial mismanagement, poor audit findings, cases of research misconduct, and even the perception that research results are biased due to conflicts of interest.

3 Institute of Medicine and National Research Council, op. cit., p. 16.
Accepting Compliance Requirements

When an institution accepts sponsored funding, it is accepting and agreeing to comply with certain conditions in the areas outlined in Figure 1.

Even when the expectations are not explicitly stated, in order to maintain the integrity of the research and scholarly enterprise, the institution must understand that the topics listed in Figure 1 constitute fundamental aspects of all that an institution of higher education must satisfy as a part of maintaining the public trust.

What does acceptance of compliance requirements mean for an institution? It means the following:

◆ The highest levels of administration understand that compliance is important.

◆ Those responsible for performing the work under sponsored funding are aware of sponsor policies and what it takes to be in compliance.
◆ Universities must have policies and procedures that are consistent with compliance requirements.
◆ Universities need to educate those who are responsible for various aspects of compliance including faculty, administrative staff, and students, as appropriate to a given program. Education needs to include both the external and internal environments, i.e., sponsor requirements as well as university policies and procedures.
◆ Compliance responsibilities must be clearly assigned and understood. The creation of a “roles and responsibilities” document can take many forms, but it is essential. The exercise of creating a written document will assure that duplication of effort is avoided, that everyone understands who is responsible for what, and that all compliance aspects are covered.
◆ Compliance assessment must be an ongoing effort. Depending on institutional culture, compliance assessment needs to cover policy and procedure development, as well as determine whether compliance with sponsor policies and internal policies and procedures is being achieved.

1505.2 Statement of Principles

It is not unusual for an institution to have a mission statement under which it operates. In order to fulfill that mission, principles are also defined and promoted. These principles further the mission and the success of the organization by articulating what the institution considers to be good practices and what its belief systems are. Similarly, when developing a sponsored projects compliance program, the expectations of the program need to be clearly understood by the senior officials promoting the compliance principles and the individuals working with them.

Example

The Trustees of the University of Pennsylvania have promulgated a statement of principles in regard to its sponsored projects compliance program. The following statement of principles articulates the university’s expectation of the community and provides information as to how the community will maintain an ethical and compliant environment: “In order to ensure the public trust in Penn’s considerable research enterprise, we must maintain the highest standards of integrity and expectations of ethical behavior. In maintaining this principle, Penn continues to encourage and develop a highly ethical and compliant environment through education and training. The integrity with which we conduct sponsored programs is a community effort involving faculty, staff and students.”

When adopting or developing a statement of principles, institutions may further define the institution’s goals and include specific activities and/or good practices such as the following:

◆ Voluntarily commit to a culture of the highest ethical standards that encourages and promotes an environment of compliance
◆ Uphold the institution’s commitment to internal and external sponsor policies, regulations, laws, and award terms and conditions
◆ Seriously consider the value of sponsor guidance
◆ Commit to the mantra of “doing the right thing”
◆ Achieve the research goals of the sponsored project (May seem obvious but should be stated so as to never lose perspective.)

1505.3 Risks of Noncompliance

Failure to successfully articulate and carry out an institution’s principles of operation may result in risks relating to noncompliance. The exposures associated with a determination of noncompliance can vary significantly. Depending on the severity of the issue, an institution may experience the following:

◆ Costly fines and/or penalties
  • Penalties under the False Claims Act include treble damages and fines of between $5,000 and $10,000 per false claim
◆ Reduced research funding either as a grantee or subrecipient
◆ Sponsor-imposed special award terms and conditions
◆ Loss of expanded or waiver of authorities
◆ Enhanced sponsor monitoring program
◆ Designation as an “exceptional” or “high-risk” institution
◆ Acquiescence to an Institutional Integrity Agreement
◆ Suspension/debarment from receiving federal funds
◆ Reduction in student enrollment
◆ Reduction in donations
◆ Compromise of the reputation of the following:
  • Principal investigators
  • Research administrators
  • Trustees/governing boards
  • The overall institution
◆ Loss of public trust
◆ Public demand for institutional accountability
Included in Figure 2 are some situations and associated fines that institutions have suffered and that could possibly damage their reputations and public trust.

1505.4 **Benefits of an Effective Compliance Program**

It should not be assumed that developing a sponsored projects compliance program is an inexpensive endeavor. Nevertheless, to not have a program in place can be very costly as evidenced by the penalties indicated in Figure 2. Avoiding such negative consequences is a reason in and of itself to have a program in place. In addition, an effective compliance program can help to accomplish the following:

- Protect the institution from liability by limiting the exposure of the following:
  - Trustees
  - Senior officers
  - Principal investigators
  - Key business administrators
- Mitigate risk of potential civil and criminal penalties of those considered to be compliant
- Improve overall management of sponsored projects by ensuring good stewardship of funds and thereby building the following:
  - Sponsor confidence
  - Public confidence
- Provide for effective stewardship of institutional resources

1505.5 **Compliance Program Considerations**

In developing a sponsored projects compliance program, institutions have taken into consideration the following:

- Results of the National Institutes of Health (NIH) Office of Policy for Extramural Research Administration (OPERA) compliance site visits
- Elements of the U.S. Sentencing Guidelines
- The November 2005 Department of Health and Human Services (HHS) Office of Inspector General (OIG) draft guidance
- The Council on Governmental Relations (COGR) publication entitled *Managing Externally Funded Research Programs: A Guide to Effective Management Practices*

Each of these is discussed separately below.

**OPERA Compliance Site Visits**

In many cases OPERA’s compliance visits have been a wake-up call to grantees to start the process of self-assessment. The visits revealed core problems and reinforced NIH expectations of its grantees. For some grantees, these visits became the impetus to formalize a compliance program.

What exactly did OPERA discover during these visits? It found the following:

- Inadequate resources
◆ Lack of institutional staff’s understanding of roles and responsibilities
◆ Inadequate staff training and education
◆ Outdated or nonexistent policies and procedures
◆ Inadequate management systems (e.g., effort reporting, financial management)
◆ Perception that internal control systems are not necessary

As a result of these findings, OPERA defined a set of fundamental principles for establishing a sponsored projects compliance program. OPERA’s recommendations to grantees were designed not only to correct the findings cited above but also to provide guidance on how an effective compliance program can be achieved. In presentations regarding the not-for-cause compliance site visits, OPERA describes what was learned, but more importantly what institutions should have in place as part of a sponsored projects compliance program.

As paraphrased from OPERA’s presentation, it recommends the following:
◆ An effective culture of compliance must be established from the “top” and be an institutional expectation.
◆ A mechanism for concerns to be heard should be established.
◆ Personnel need to understand their responsibilities.
◆ Training and education are critical.
◆ Good communication throughout the institution is essential.
◆ Adequate systems must be in place to support an effective compliance program.
◆ It is important to take a proactive stand regarding compliance before, rather than after, a catastrophe occurs.5

U.S. Sentencing Guidelines

The U.S. Sentencing Guidelines, including in particular the amendment to Chapter 8 (§8B2.1, Effective Compliance and Ethics Program), are not required to be adopted by educational institutions. However, some institutions have embraced the basic tenets of the Guidelines and have built compliance programs using the tenets as their core principles. The purpose of the amendment to Chapter 8 is to assist organizations in mitigating civil or criminal penalties by possibly lowering the so-called “culpability scores” that a defendant would receive if convicted. The lowering of such “culpability scores” is accomplished in part by putting into place an effective compliance and ethics program.

The Guidelines contain seven steps viewed as the minimum necessary for an effective program of compliance and ethics. As paraphrased from the Guidelines, they include the following:

(1) The organization should establish standards and procedures to prevent and detect criminal conduct.

(2) The organization’s governing authority shall be knowledgeable about the content and operation of the compliance and ethics program and shall exercise reasonable oversight with respect to the implementation and effectiveness of the compliance and ethics program.

   (a) High-level personnel of the organization shall ensure that the organization has an effective compliance and ethics program. Specific individual(s) within high-level personnel shall be assigned overall responsibility for the compliance and ethics program.

   (b) Specific individual(s) within the organization shall be delegated day-to-day operational responsibility for the compliance and ethics program. Individual(s) with operational responsibility shall report periodically to high-level personnel and, as appropriate, to the governing authority, or an appropriate subgroup of the governing authority, on the effectiveness of the compliance and ethics program. To carry out such operational responsibility, such individual(s) shall be given adequate resources, appropriate authority, and direct access to the governing authority or an appropriate subgroup of the governing authority.

(3) The organization shall use reasonable efforts not to include within the substantial authority personnel of the organization any individual whom the organization knew, or should have known through the exercise of due diligence, has engaged in illegal activities or other conduct inconsistent with an effective compliance and ethics program.

(4) The organization shall take reasonable steps to communicate periodically and in a practical manner its standards and procedures, and other aspects of the compliance and ethics program, to the individuals referred to in (2)(b) by conducting effective training programs and otherwise disseminating information appropriate to such individuals’ respective roles and responsibilities.

(5) The individuals referred to in (2)(a) are the members of the governing authority, high-level personnel, substantial authority personnel, the organization’s employees, and, as appropriate, the organization’s agents.

(6) The organization shall take reasonable steps to

   • ensure that the organization’s compliance and ethics program is followed, including monitoring and auditing to detect criminal conduct;

   • evaluate periodically the effectiveness of the organization’s compliance and ethics program; and

   • have and publicize a system, which may include mechanisms that allow for anonymity or confidentiality, whereby the organization’s employees and agents may report or seek guidance regarding potential or actual criminal conduct without fear of retaliation.
(7) The organization’s compliance and ethics program shall be promoted and enforced consistently throughout the organization through (a) appropriate incentives to perform in accordance with the compliance and ethics program; and (b) appropriate disciplinary measures for engaging in criminal conduct and for failing to take reasonable steps to prevent or detect criminal conduct.

After criminal conduct has been detected, the organization shall take reasonable steps to respond appropriately to the criminal conduct and to prevent further similar criminal conduct, including making any necessary modifications to the organization’s compliance and ethics program.6

OIG Draft Guidance on Compliance Programs
In November 2005, the Department of Health and Human Services (HHS) Office of Inspector General (OIG) published proposed guidance in the Federal Register for comment. In June 2006, HHS OIG announced that it would not be going forward with issuing final guidance. Instead, the Research Business Models Subcommittee of the National Science and Technology Council will be developing broader, voluntary compliance guidance. The proposed guidance is still valuable, however, in that it “sets forth its [OIG’s] general views on the value and fundamental principles of compliance programs for colleges and universities and other recipients of PHS awards for biomedical and behavioral research and the specific elements that these award recipients should consider when developing and implementing an effective compliance program.”7

Reminder
Simply stated, institutions should consider
◆ establishing compliance standards and procedures;
◆ assigning high-level personnel to oversee compliance;
◆ ensuring that discretionary authority is not delegated to individuals with a propensity for illegal activities (e.g., through background screening);
◆ effectively communicating to employees about compliance standards and procedures (e.g., training);
◆ taking reasonable steps to ensure compliance with standards through monitoring, auditing, and reporting systems (e.g., a compliance hot line);
◆ adequately and consistently enforcing standards, including, as appropriate, discipline for offenders; and
◆ responding to infractions and taking steps to prevent subsequent re-occurrences.

Specifically, the proposed HHS OIG guidance contains the following eight recommended elements of a successful compliance program:

1. Implementing written policies and procedures
2. Designating a compliance officer and compliance committee
3. Conducting effective training and education
4. Developing effective lines of communication
5. Conducting internal monitoring and auditing
6. Enforcing standards through well-publicized disciplinary guidelines
7. Responding promptly to detected problems and undertaking corrective action
8. Defining roles and responsibilities and assigning oversight responsibility

Council on Governmental Relation's Recommended Practices

A publication by the Council on Governmental Relations (COGR), *Managing Externally Funded Research Programs: A Guide to Effective Management Practices*, provides “practices” valuable in the development of a compliance program that will assist in mitigating risk. COGR identifies eight practices that constitute an effective institutional compliance program:

1. The institution has written policies and practices covering the programmatic conduct and the administrative and financial management of sponsored programs.
2. The institution has clearly established lines of responsibility, i.e., a delineation of the roles and responsibilities, for all sponsored projects and administrative personnel involved in the conduct and management of sponsored programs.
3. The institutional leadership is knowledgeable and supportive of an effective compliance program.
4. An education program is in place for both externally mandated and institutionally determined compliance requirements.
5. The institution has a program in place that creates a climate that encourages compliance including appropriate incentives and protections for employees who report noncompliance.
6. The institution has systems designed to detect noncompliance with federal, state, and local regulations.
7. When instances of noncompliance are determined, the institution implements corrective actions to minimize the re-occurrence of similar problems.
8. The institution does ongoing risk assessment as an essential component of the design, implementation, and modification of its compliance program.8

---

It is not surprising that the sources discussed echo a similar theme, because they are based primarily on the U.S. Sentencing Guidelines. When viewed from another perspective, one can see that they contain common elements because they are an articulation of common sense prerequisites for a compliance program.

**Codes of Conduct**

Many universities have in place compliance programs that incorporate the components outlined in the U.S. Sentencing Guidelines as well as the components of the HHS OIG proposed guidance. In the case of some institutions, their trustees or regents have required that a statement or code of conduct be developed to prevent and deter criminal conduct.

Unfortunately, a statement or code of conduct alone does not establish an environment of compliance. Rather, having an organizational culture that encourages ethical conduct and embraces an institution’s ethical value system is critical. Leadership in this regard must come from the “top,” i.e., governing board, president, and senior academic and administrative officials.

Institutions starting to design a compliance program that does not have in place either a “code of conduct” or “standards of ethical conduct” may want to engage representatives from the institutional community in its design. Faculty members in particular may take great interest in the development of such a code and may at times question its necessity. Senior officials need to be prepared to address the importance of such standards. The lack of expressed standards does not imply bad behavior, but the existence of such standards helps to articulate to the community the expectations under which the institution operates.

For many state institutions, a code or standards of conduct may in fact exist due to state statute. Although required by state law, the existence of a code or standards of conduct may not always be known to individuals within the institution. Periodic communications of the expectations can only enhance the institution’s commitment in encouraging an environment of compliance.

**Example**

In *Effective Compliance Systems: A Practical Guide for Educational Institutions*, the University of Texas (U.T.) System describes the process it employs in making employees aware of compliance, which starts at the highest levels: “An example of general messages to employees is the yearly statement of operating philosophy, which is sent to each U.T. System employee by their chief executive officer. This is a positive statement of the operating philosophy of the institution and includes heavy emphasis on ‘doing the right thing.’ Besides this annual reminder to all employees, the chief executive officer delivers a videotaped message to all new employees about the operating philosophy and compliance as a part of the New Employee Orientation. Finally, the chief
executive ensures the importance of the compliance program by communicating to all employees the requirement for annual general compliance training.\textsuperscript{9}

Continued communication of expectations to employees from the executive leadership of the institution is paramount and enables the establishment of effective operational compliance programs.

\section{Research Compliance Program Development}

As noted earlier, in order to be effective, research compliance programs need support from the highest levels of an institution’s administration. The creation and development of the program requires such support. Furthermore, in order for the program to be viable, continued and clear commitment is critical.

There are many types of support that are required. Obviously, the program and its various components need sufficient budgetary support, adequate allocation of resources, and appropriate staffing levels. In addition, there should be a published statement that the institution is committed to research compliance.

The public statement at some institutions will come from the president, while at other institutions, it may emanate from the chief academic officer (i.e., provost or academic vice president). The level from which this public support comes should be consistent with institutional practice for other similar matters. The institutional officer articulating this statement should be high enough in the organization to ensure that the stated commitment will have the desired effect on the rest of the administration and the faculty. The individual should also be high enough in the administration to be able to ensure that the necessary resources are actually committed. If the latter is not the case, the statement of support will be regarded as an ideal, but one that lacks credibility.

There is no single best way of developing a research compliance program. Programs must be developed consistent with the institution’s culture. If an institution is governed in a centralized manner and decision making is “top down,” then the basic elements of the research compliance program should be designed to take that into account. On the other hand, if an institution is decentralized, creating a research compliance program founded on centralized decision making will very likely be unsuccessful.

Figure 3 (page 1505:14) illustrates that there are alternative ways of approaching the development of a research compliance program based on whether the institution is centralized or decentralized. The diagram is not comprehensive in that it only illustrates the major steps. One could, for instance, also add a level of complexity if one were to add the variable of whether the institution is large or small, or whether it is public or private.

Program Implementation

High Level Support and Commitment Required Throughout the Process
As noted previously, support from the upper levels of the university is absolutely essential to the success of a research compliance program. The bar along the left side of Figure 3 indicates how such support is a constant and must continue throughout the entire process, irrespective of other considerations, such as whether the institution is centralized or decentralized.

**Research Compliance Executive Officer**

As outlined in Figure 3, the first step in the process is to appoint an individual or entity that is responsible for leading the development of the program. This would be a single person — the Research Compliance Executive Officer — in the centralized model or a Project Committee in the decentralized model. Since even in the decentralized model there should be a point person, the person appointing the Project Committee (i.e., the Academic Vice President/Provost) would fill that role.

If the program development is to be done by an individual, that person cannot act in a vacuum. Input should be sought from an Advisory Committee that might be composed of the compliance-related offices and the chairs of the compliance committee. If, on the other hand, the development of the program is to be accomplished by a Project Committee, it would be wise to have that committee composed of people having compliance-related responsibilities. While the composition of the Project Committee is important, it is even more important that those involved in implementing the compliance program be consulted and their views taken seriously. While support for the development of the research compliance program from the highest level of the institution is essential, it is vital that the program have the “buy in” from those responsible for putting it into effect.

**Program Status and Goals**

Figure 1 (on page 1503:3) categorizes the various issues included in research compliance. In developing a research compliance program, however, an institution will give varying weight to these issues in terms of how much attention needs to be given to each. There are several criteria that should be used to make informed decisions concerning on which issues the institution must focus.

In order to make the appropriate decisions over research compliance program content, an objective and honest assessment of current status and future goals needs to be done in a number of areas:

- **Awareness of issues**: What level of awareness of the various issues do the institution and key players have? This includes awareness of the importance of the issues, the compliance requirements, and the risks of noncompliance.

- **Awareness of best practices**: Research should be done on what other institutions have done in terms of complying with the various issues, which approaches have been successful, and which approach(es) would fit best for an institution.

- **Awareness of external audit results**: As noted above, the risks of noncompliance should be known. Developing a compliance awareness can be furthered by making available the results of audits performed at other institutions. Reviewing these is helpful in determining actual risk. To be complete, however, the review should
include an awareness of which issues hold the most potential risk. One can gain some perspective on potential risk by reviewing such documents as the Work Plan published annually by the Department of Health and Human Services Office of the Inspector General.\[10\]

◆ **Assessment of institution’s status on each issue:** Once awareness of the various issues is achieved, that knowledge should be applied to an assessment of how well the institution is doing in terms of basic compliance as well as best practices. To be effective, the assessment must be done as objectively as possible. The institution enters the assessment from the perspective that discovered problems are not an indication of failure as much as simply an indication that improvements must be made. Two main goals in this assessment will be to determine who is currently responsible for compliance on each issue and what exposures exist.

◆ **Conduct a policy inventory:** It is very helpful to include as a part of the assessment process, a comprehensive review of existing policies and procedures. This review could also include a review of the compliance-related forms. The purpose of the inventory is to determine that current policies and procedures are up to date. A review of other institutions’ policies as well as recognized best practices should be a part of this process as a means of ensuring that the institution has appropriate policies and procedures in all areas where needed.

    One point needs to be emphasized: *Assessments, to be effective, must be done objectively and without fear of what might be found.* While self-assessments performed by offices and committees having compliance-related responsibilities may be convenient, heavy reliance on self-assessments at the development stage of the research compliance program is not the best way to ensure objectivity. Obviously these offices and committees must be consulted, but the assessments are best done by others having no self-interest in the findings.

**Program Involvement**

Once the assessments are completed, and the current status and goals of the program are determined, the institution should engage in a “Roles and Responsibilities Project.” As a result of the assessments, the institution has documentation on who is currently involved in the various compliance issues. The institution also has vital information on where exposures exist as well as best practices. By combining this information, the institution can develop a matrix of compliance issues in which the issues are broken down into procedural components, and the responsible units or individuals are identified.

This can be done in a number of different ways and formats. An abbreviated example of one format is provided in Figure 4.

Within each box in Figure 4, there should be an indication of who holds such responsibilities as implementation, review, and approval. The listed procedures should

be specific and narrowly defined. This will make the completion of the matrix much easier than if the procedures are stated broadly. Listed procedures should not include multiple functions since multiple individuals will be listed as having primary responsibility when, in fact, they may have responsibility for only part of what is listed.

As mentioned, the matrix found in Figure 4 is not a comprehensive example. To be complete the matrix should have such entities and individuals as the following:

- Sponsored Projects Office
- Principal Investigator
- Department Administrator
- Dean
- Department Chair
- Compliance Committee (each specified)
- Institutional Official (each specified)
- Compliance Offices (e.g., Environmental Health and Safety)
- Internal Audit
- Purchasing
- Human Resources

The suggested matrix is not the only way to document roles and responsibilities. It can also be done in a document organized by unit, where each unit’s research-compliance responsibilities are listed and/or described in narrative fashion. Another model would be to outline each issue in narrative form and describe procedures and roles accorded to various offices and individuals.

Finally, once the roles and responsibilities are defined, it is often helpful to create organizational charts for research compliance issues. The purpose of these charts is to illustrate the interaction between and among offices. They are also a good way to make evident the lines of responsibility, authority, and institutional support.

---

11 This list is drawn in part from a NCURA Sponsored Projects Administration II conference presentation.
Ensuring Long-Term Success: Compliance Awareness Program

How does one even begin designing an effective sponsored projects compliance awareness program? Who is the audience? What should the program’s content include? How should the program be delivered: Should it be Web based or instructor led? Should an overall program be developed from the start or should it be done in “baby steps”? All excellent questions but in order to answer any of them, it is important to note that an institution must be flexible; no one approach fits all situations or all organizations.

By now it should be obvious that buy in from the “top” is essential in creating a compliance awareness program, as is the identification of a key individual (an executive director of compliance or compliance officer) to oversee the program. A commitment of technical, human, and financial resources is imperative. These requirements apply regardless if the program covers all regulatory requirements when designed or if the program is gradually built, addressing one requirement or set of requirements at a time.

Some institutions begin a compliance program based on the topic “du jour,” usually determined by external influences and what is occurring on the national scene. In some cases, the genesis of a program may be the result of an audit. Regardless of the program’s origin, an opportunity exists with any assessment to enhance the environment.

In the example below, a single area of compliance — effort reporting — is used to demonstrate how the compliance assessment process can occur. Though sponsored projects compliance is broader than a single regulatory issue, effort reporting was selected as the topic for the example as it has the attention of the federal government performing audits and institutions, whether or not the institutions are paying fines. In response to the effort-reporting concern, institutions should take stock and assess their current performance, which in turn can help determine if internal changes are necessary and the cost of those changes. Below is an abbreviated outline of some of the necessary steps an institution can take as part of such assessment.

Create a Work Plan
◆ It is important to develop a timetable or work plan identifying the steps in the process and the anticipated roll-out date of a program.

Assessment
◆ Determine if weaknesses exist with current effort-reporting process:

- Perform an assessment of the effectiveness of the existing process to better understand the contents of the effort-reporting program. Craft an inventory of federal and institution requirements against which the assessment would be measured. In general, the assessment includes

  - the review of the policies/procedures of the institution and a determination that the requirements of federal regulations are covered.
• Review recent A-133 audits, internal audits, or other external audits performed that included a sampling of effort reports. In addition, a sample audit may be performed to review the following issues:
  - Is the community fulfilling the requirements of the existing policies?
  - Are the appropriate individuals signing the effort report?
  - Did a “suitable” means of verification that the work was performed exist for those forms requiring such documentation?
  - Are forms dated?
  - Are there arithmetic errors?
    - Do percentages add up to 100 percent?
    - Are sponsor-imposed salary caps calculated correctly?
  - Are the forms completed in a timely fashion?
  - Are cost sharing commitments accounted for?
  - Is the minimum commitment to the sponsor fulfilled? If effort is less than what was committed and if required, is there appropriate documentation supporting the change in commitment?
  - Are research faculty charged 100 percent on sponsored projects engaged in nonsponsored projects activities, e.g., writing new applications, serving on university committees?
  - Are payroll controls in place to protect the integrity of the payroll process?
  - Do cost transfers of salary agree with certified effort reports or vice versa?
  - Does the Disclosure Statement (DS-2) require updating?

Analysis
◆ Analyze the results of the assessment, determining strengths, weaknesses, and the need for change in policies, procedures, and manuals.
◆ Prepare a report identifying findings and recommendations for educational program content, audience, process for identifying individuals post rollout, and method(s) of delivery.
◆ A cost analysis of program implementation may be an additional activity to complete.
Seek Approval to Move Forward
◆ Approval must be sought from the individual(s) authorized to sanction new programs and projects. Depending on the process of approval (including financial support) within the institution, an allowance for time must be built into the work plan.

Develop Educational Materials
◆ Begin revising policies, procedures, and sponsored projects handbook to address perceived problems and findings.
  • Make these materials easily accessible.
◆ Develop program content.

Communicate
◆ The “top” communicates the commitment and also announces the program, its purpose, who is required to participate, anticipated completion date, and how individuals new to the organization will be identified. The communication should also identify the key individual taking the lead in rolling out the program.
  • Communications may be done in multiple steps and in various venues with different audiences during this process. It is critical that the information is consistent, clear, and updated as needed without being overly burdensome.

Rollout
◆ During this entire process some institutions may employ the use of an advisory committee to review content and discuss what delivery methodology would work best depending on the audience. If piloting an educational program such as effort-reporting principles, the content may vary depending on the audience, which may require different presentations.

1505.8 Ensuring Long-Term Success: Compliance Assessment Process

Research institutions should evaluate and enhance the integrity of their research environments using a process of self-assessment and external peer review in an ongoing process that provides input for their continuous quality improvement.12

Once the research compliance program is established, it is critical that ongoing assessments be instituted. There are four key aspects to a research compliance assessment program:
◆ First, assessments are performed to determine which compliance activities are being conducted and managed well, and which may need improvement.

---

12 Institute of Medicine and National Research Council, _op. cit._, pp. 13 and 130.
Second, assessments are useful tools in educating those responsible for aspects of research compliance regarding best practices.

Third, the assessment program should evolve into an initiative that is ongoing and self-sustaining.

Fourth, an effective assessment program can help to significantly reduce negative audit findings.

Key Aspects of the Assessment Process

The research compliance assessment process is similar to a compliance audit in that it reviews actual practices in compliance with laws, regulations, and policies. The process also reviews compliance with the institution’s policies and procedures.

The research compliance assessment process, however, is not a “snap-shot” process. Rather, a key characteristic of an effective assessment program is that it is ongoing and designed to be woven into the fabric of research compliance activities.

The assessment process should also be designed to create a working relationship between the research compliance office and the offices and committees having compliance-related responsibilities. One aspect of assessment that facilitates this relationship is that assessment findings are treated differently from audit findings. The results of formal internal audits are reported up the organizational line through the administration and to the governing board. Generally, assessment findings are reported to the office or the committee whose activities are being assessed. Problems and remedies are discussed, and monitoring and follow-up procedures are agreed upon. Occasionally, assessment results will be referred to the institutional official having responsibilities for a given compliance activity. This would occur when significant noncompliance is discovered that should be or may have to be reported to an external entity (e.g., research sponsor). It might also occur if recommendations resulting from an assessment would require a commitment of additional institutional resources. Finally, the institutional official would be consulted if the office or committee being assessed is nonresponsive to recommendations and/or refuses to cooperate in the assessment process.

Another key element of the assessment process is to provide an educational and informational resource to compliance offices and committees. While this can be addressed on an issue-by-issue basis, the research compliance office may become a central clearinghouse for research compliance materials. The research compliance Web site can be a valuable tool in establishing this clearinghouse of compliance materials with hyperlinks to online resources.

The assessment process should be designed to be a self-sustaining program. Creating a self-sustaining program could be done by educating offices and committees having research compliance responsibilities to perform self-assessments and to create a structure in which compliance awareness is built into everyday life.

A distinction was made earlier between audits and assessments. In one respect, however, the assessment process can be viewed as a “pre-audit” function. If successful, the assessment process will help offices and committees build their compliance awareness and create internal procedures and practices that enhance research compliance.
The natural result of this will not only be better-managed programs, but the exposure to negative audit findings will be lessened.

**Self-Sustaining Assessment Program**

Figure 5 illustrates the basic elements of how a research compliance program can be designed to be self-sustaining.

As shown in Figure 5, the Research Compliance Office has a dual assessment role:

◆ First, it conducts independent assessments of compliance-related programs. Though the assessment is conducted collegially, it is absolutely essential that the Research Compliance Office preserve its ability to perform assessments objectively.

◆ Second, it assists offices and committees having compliance-related responsibilities to develop and perform self-assessments. At first, the Research Compliance Office will have an educational function in that it informs the offices and committees of best practices and procedures for creating and conducting effective self-assessments. The Research Compliance Office role then evolves into one of monitoring to ensure that self-assessments are conducted by offices and committees appropriately and in ways that will achieve meaningful results.

Once the self-assessment program is established, the need for independent assessments will be reduced. It cannot, however, be completely eliminated, and the Research Compliance Office should schedule periodic reviews of compliance-related programs. The frequency will depend on several factors, among which are the effectiveness of self-assessments and the history of compliance/noncompliance of given programs.
1505.9 Conclusion

The rollout of a comprehensive research compliance program is a great accomplishment. It is, however, the beginning of a continuing process. Once in place, required updating of information and content as well as periodic assessments of research compliance functions are necessary as is the identification of individuals new to the institution or new to roles having a responsibility in this area. This is the compliance continuum.

Figure 6 illustrates that sponsored projects compliance is a continuum. Neither the support from the top nor the subsequent activities should ever “end.” If embraced by the institution, the adoption of this circle of events will not only assist in mitigating risk but will become part of the culture of the institution.
1520 Supplementary Material

This section includes expanded coverage of topics relating to research compliance. These materials are culled from a variety of authoritative sources.

1520.1 The Costs of Research Misconduct

John Dahlberg, Office of Research Integrity, U.S. Department of Health and Human Services

ORI regularly receives queries asking for its assessment of the costs associated with research misconduct investigations and of the questioned research itself. First, there is the cost to taxpayers who support this office, which is responsible for overseeing both the reviews of misconduct cases, handled by the Division of Investigative Oversight (DIO), and the education and research efforts carried out by the Division of Education and Integrity (DEI). This cost is currently about $9 million per year.

There is also the cost to cash-strapped institutions of carrying out inquiries and investigations into allegations of research misconduct. ORI does not track this, but clearly the time and resources needed for major cases has on occasion reached into the millions.

Equally important are the costs resulting from the misconduct itself. Some of the relevant cost elements were carefully considered by ORI, the National Institutes of Health (NIH), and court officials when it became necessary for the federal court in Burlington, Vermont, to calculate the damages resulting from the research misconduct of Dr. Eric Poehlman prior to his sentencing hearing. Dr. Poehlman had pled guilty to criminal and civil charges arising from a major scientific misconduct case at the University of Vermont, and ORI was asked to assist in evaluating the costs to the injured party in this case, the funding agency, NIH, and to other parties. NIH officials took the lead in evaluating how falsified data in funded grant applications would have deprived more worthy applicants of the opportunity to obtain funding and testified to that effect during the sentencing hearing. ORI noted that Dr. Poehlman’s misconduct had led to a number of costs that were significant but could not easily be calculated, if at all.

For example, the University of Vermont, despite having done an exemplary job of investigating a case of misconduct involving an internationally recognized scientist and having cooperated fully with ORI and the Department of Justice, was unfairly linked with the misconduct. The hundreds of volunteers from the Burlington area who had participated in the rather extensive procedures carried out in Dr.

---

2 John Dahlberg, Ph.D. is the director of the Division of Investigative Oversight at the Office of Research Integrity, www.ori.hhs.gov.
Poehlman’s research protocols were dismayed to hear that his research results had been falsified, thereby undermining the university’s ability to continue to attract volunteers for its clinical studies. Also significant was the impact of the misconduct on the many collaborators and co-authors on the more than 200 published papers authored by Dr. Poehlman, but not directly involved in Dr. Poehlman’s scientific misconduct. A number of young scientists and physicians had Dr. Poehlman as a co-author on all or nearly all of their own publications, leading inevitably to concern and mistrust by others of their scientific output and to serious obstacles in finding new research positions.

Last, there is the cost associated with falsified publications. It would be virtually impossible to estimate how many laboratories attempt to reproduce falsified and fabricated results and how much such efforts cost scientists in time and resources. Often, these costs are borne by graduate students and postdoctoral fellows who can ill-afford the time wasted on chasing after irreproducible results.

ORI recently received a perceptive letter from Professor Eliane S. Azevêdo, Emeritus Professor of Medicine, Nucleus of Bioethics, Faculty of Medicine of Bahia, Federal University of Bahia, Brazil, who commented on secondary adverse consequences of a large body of research carried out at the University of Alabama at Birmingham that has led to 16 retractions of papers by Drs. Judith Thomas and Juan Contreras. ORI recently made findings against both researchers, leading to a 10-year debarment for Dr. Thomas and a three-year debarment for Dr. Contreras.

Professor Azevêdo was particularly concerned about how review articles and meta-analyses can perpetuate fraudulent scientific claims even after the original papers have been retracted.

For example, she notes (with minor edits by ORI): “...ORI Newsletter, Vol. 17, No. 4, entitled ‘A Major Case of Misconduct Involving Non-human Primates,’ ... left the reader with a disturbing question regarding the unrecoverable echo of its bad effect on medical practice. The retracted publications, dated from 1997 through 2005, add up to 16. So, there was plenty of time to construct a school of false ideas in medical science either through teaching, medical practice, and review papers or through meta-analysis data.”

Dr. Azevêdo continues to point out, “It is generally accepted that modern medicine must mostly be rooted in evidence produced by scientific publications. Medical professors, students, and clinicians are constantly seeking new findings in medicine aiming to offer the best for the patients. Thus, review articles on specific subject and data from meta analysis are preferable sources for updating medical knowledge. However, if this precious source of scientific information happens to be based on publications that become retracted, the harm on science will not be dismissed. The retracted publications made by single journals will have not reached review papers or through meta-analysis data.”

“As an example, a review by Knechtle SJ, published in the Philos Trans R Soc Lond B Biol Sci, 2001, May 29;356(1409):681-9, entitled ‘Treatment with immunotoxin’ cites four publications from the Thomas Laboratory that have been retracted be-
cause of false claims: Contreras, J.L., et al., 1998, *Transplantation* 65,1159-1169; Contreras, J.L., et al., 1999, *Transplantation* 68, 215-219; Thomas, J.M., et al., 1997, *Transplantation* 64, 124-135; and Thomas, J.M., et al., 1997, *Transplantation* 68, 1660-1673. Not only were the misleading papers cited, but the reviewer seemed, at the time, impressed by the Thomas work, so page 686 states, ‘Studies by J M Thomas and others, also in collaboration with the Neville Laboratory, initially focused on combining the IT with donor bone marrow infusion (Thomas et al., 1997). This laboratory, with extensive experience in donor bone marrow infusion as an adjunct to tolerance induction....’ Unfortunately, the 1997 Thomas et al. has now been retracted.”

Professor Azevêdo certainly makes an important note, to which it could be added that when papers providing results on clinical studies are plagiarized wholesale, as happens with some regularity, the risk to having the duplicated data be overrepresented in meta-analyses is very real and possibly significant, thus posing a possible additional cost to the scientific enterprise and possibly even having an adverse impact on how patients are treated.

11520.2 **Types of Noncompliance Determinations**
Office for Human Research Protections

This document provides a list of occurrences of noncompliance that the Office for Human Research Protections (OHRP) has made in compliance oversight determination letters in recent years (the document is dated February 2009). It contains a total of 51 problem areas accompanied by explanations of findings. OHRP oversees human subjects protections in research supported by the Public Health Service, including the National Institutes of Health.

Questions have been raised about the drop in determination letters and cases opened by OHRP in recent years. The total for 2010 was 18 letters posted at its Web site (www.hhs.gov/ohrp/compliance/letters), compared to 36 in 2009, 34 in 2008 and 37 in 2007. OHRP posted 86 letters in 2006; its all-time high was 146 letters posted in 2002.

**Initial and Continuing Review**

1. **Research Conducted without IRB Review and/or Approval.** In accordance with HHS regulations at 45 CFR 46.103(b) and 46.109(a), the IRB must review and approve all non-exempt human subject research covered by an assurance before the research can be conducted.

2. **Failure of IRB to Review HHS Grant Applications.** HHS regulations at 45 CFR 46.103(f) require that an institution with an approved assurance shall certify that each application or proposal for research covered by the assurance has been reviewed and approved by an IRB designated under the institution’s federalwide assurance (see “IRB Review of Applications for HHS Support” www.dhhs.gov/ohrp/humansubjects/guidance/aplrev.htm).

3. **IRB Lacks Sufficient Information to Make Determinations Required for Approval of Research.** OHRP determined that the IRB, when reviewing protocol applications, lacked sufficient information to make the determinations required for approval of research under HHS regulations at 45 CFR 46.111. For example, the IRB reviewed insufficient information regarding (a) risks to subjects and how they are minimized; (b) subject recruitment and enrollment procedures; (c) the equitable selection of subjects; (d) provisions to protect the privacy of subjects and maintain the confidentiality of data; and (e) additional safeguards to protect the rights and welfare of subjects who are likely to be vulnerable.

4. **Inadequate IRB Review at Convened Meetings.** In accordance with HHS regulations at 45 CFR 46.108(b), review of proposed research must be conducted by the IRB at convened meetings at which a majority of the members of the IRB are present, including at least one member whose primary concerns are in nonscientific areas, except where expedited review is appropriate under HHS regulations at 45

---

1 This material is taken from OHRP, Division of Compliance Oversight, “OHRP Compliance Oversight Activities: Determinations of Noncompliance, 02/04/2009,” www.hhs.gov/ohrp/compliance/findings.
CFR 46.110(b). OHRP determined have determined that little substantive review took place at convened meetings. Protocols undergoing initial/continuing review and protocol amendments undergoing review were neither individually presented nor discussed at a convened meeting of the IRB. Furthermore, OHRP had noted little evidence that IRB approval of research was consistently based on consideration of the determinations required under HHS regulations at 45 CFR 46.111. Specifically, the IRB appeared not to have considered systematically and rigorously such issues as risks to subjects and how they are minimized, equitable selection of subjects and subject recruitment, privacy and confidentiality protections, and additional safeguards for subjects likely to be vulnerable to coercion or undue influence.

(5) Members Present at Convened IRB Meetings Lacked the Expertise to Make Determinations Required for Approval of Research. HHS regulations at 45 CFR 46.107(a) provide, among other things, that each IRB shall have at least five members, with varying backgrounds to promote complete and adequate review of research activities commonly conducted by the institution. In addition, the regulations provide that the IRB be sufficiently qualified through the experience and expertise of its members to promote respect for its advice and counsel in safeguarding the rights and welfare of human subjects and be able to ascertain the acceptability of proposed research in terms of institutional commitments and regulations, applicable law, and standards of professional conduct and practice. The convened IRB, when reviewing protocol applications, must have sufficient expertise among the members present at the meeting to make the determinations required for approval of research under HHS regulations at 45 CFR 46.111. OHRP determined that the members of the IRB present at convened meetings did not have the background and expertise necessary to review the research being proposed.

(6) Approval of Research Not Approved by the IRB. HHS regulations at 45 CFR 46.113 require that the IRB have authority to suspend or terminate approval of research that is not being conducted in accordance with the IRB’s requirements or that has been associated with unexpected serious harm to subjects. In addition, HHS regulations at 45 CFR 46.112 provide that non-exempt human subjects research that
has been approved by an IRB may be subject to further appropriate review and approval or disapproval by officials of the institution. However, such officials may not approve non-exempt human subjects research if it has not been approved by an IRB. OHRP determined that the IRB voted to suspend research, and that an institutional official rescinded or delayed that suspension, in violation of HHS regulations at 45 CFR 46.113 and 112.

(7) Contingent Approval of Research with Substantive Changes and no Additional Review by the Convened IRB. OHRP determined that the IRB frequently approved research contingent upon substantive modifications or clarifications that were directly relevant to the determinations required by the IRB under HHS regulations at 45 CFR 46.111 without requiring additional review by the convened IRB. OHRP noted that when the convened IRB requests substantive clarifications or modifications regarding the protocol or informed consent documents that the IRB needs in order to make the determinations required by the IRB under HHS regulations at 45 CFR 46.111, IRB approval of the proposed research must be deferred, pending subsequent review by the convened IRB of responsive material, unless the research is eligible for review under an expedited review procedure.

(8) IRB Meeting Convened without Quorum (No Nonscientist Present). HHS regulations at 45 CFR 46.108(b) require that, except when an expedited review procedure is used, research be reviewed at convened meetings at which a majority of the members of the IRB are present, including at least one member whose primary concerns are in a nonscientific area (hereinafter referred to as “nonscientist”). OHRP determined that the IRB failed to meet this requirement for certain IRB meetings. Thus, any actions taken at these meetings that required a quorum were not valid under the HHS regulations at 45 CFR part 46. OHRP emphasized that should the quorum fail during a meeting (e.g., those with conflicts being excused, early departures, absence of a nonscientist member), the IRB may not take further actions or votes that require a quorum unless the quorum is restored.

(9) IRB Meeting Convened without Quorum (Lack of a Majority). HHS regulations at 45 CFR 46.108 require that, except when an expedited review procedure is used, the IRB review proposed research at convened meetings at which a majority of the members of the IRB are present. OHRP determined that the IRB failed to meet this requirement for certain IRB meetings. Thus, any actions taken at these meetings that required a quorum were not valid under the HHS regulations at 45 CFR part 46. OHRP emphasized that should the quorum fail during a meeting (e.g., those with conflicts being excused, early departures, absence of a nonscientist member), the IRB may not take further actions or votes that require a quorum unless the quorum can be restored.

(10) IRB Members with Conflicting Interest Participated in IRB Review of Research. HHS regulations at 45 CFR 46.107(e) stipulate that no IRB member may participate in the IRB’s initial or continuing review of a project in which the member has a conflicting interest, except to provide information requested by the IRB. OHRP determined that IRB members inappropriately participated in the initial and continuing review of protocols for which they had a conflicting interest, for example, by
voting on protocols on which they were investigators.

(11) **Inadequate Continuing Review.** Continuing review of research must be substantive and meaningful. HHS regulations describe at 45 CFR 46.111 (and at subparts B, C, and D of 45 CFR part 46 when applicable) the criteria that must be satisfied in order for the IRB to approve research. These criteria must be satisfied when the IRB conducts continuing review of research either at a convened meeting or under an expedited review procedure. These criteria include, among other things, determinations by the IRB regarding risks, potential benefits, informed consent, and additional safeguards for subjects likely to be vulnerable to coercion or undue influence. OHRP determined that continuing review of research by the IRB was not substantive and meaningful.

(12) **Failure to Conduct Continuing Review at Least Once per Year.** HHS regulations at 45 CFR 46.109(e) require that continuing review of research be conducted by the IRB at intervals appropriate to the degree of risk, but not less than once per year. The regulations make no provision for any grace period extending the conduct of the research beyond the expiration date of IRB approval. Additionally, where the convened IRB specifies conditions for approval of a protocol that are to be verified as being satisfied by the IRB chairperson or another IRB member designated by the chairperson, continuing review must occur no later than one year after the date the protocol was reviewed by the convened IRB, not on the anniversary of the date the IRB chairperson or his or her designee verifies that IRB-specified conditions for approval have been satisfied. OHRP determined that the IRB failed to conduct continuing review of research at least once per year and that in some cases the IRB has granted extensions beyond the expiration date of IRB approval.

(13) **Continuing Review for Follow up of Subjects in Research Protocols.** HHS regulations at 45 CFR 46.109(e) state that an IRB shall conduct continuing review of research covered by this policy at intervals appropriate to the degree of risk, but not less than once per year. HHS regulations at 45 CFR 46.102(f) define human subject as a living individual about whom an investigator (whether professional or student) conducting research obtains (1) data through intervention or interaction with the individual, or (2) identifiable private information. Even where (i) the research is permanently closed to the enrollment of new subjects; and (ii) all subjects have completed all research-related interventions, continuing review is required as long as the research remains active for long-term follow-up of subjects and continues to involve non-exempt human subjects research. Furthermore, continuing IRB review of research is required where the remaining research activities are limited to data analysis of individually identifiable private information (see 63 FR 60364-60367, category (8)). OHRP determined that continuing review did not occur in protocols involving follow-up activities.

**Expedited Review Procedures**

(14) **Inappropriate Use of Expedited Review Procedures for Initial or Continuing IRB Review.** HHS regulations at 45 CFR 46.108(b) require that the IRB review proposed research at convened meetings at which a majority of the members of the IRB
are present, including at least one member whose primary concerns are in nonscientific areas, except where expedited review is appropriate under HHS regulations at 45 CFR 46.110. HHS regulations at 45 CFR 46.110(b)(1) limit the use of expedited review procedures for initial or continuing review to specific research categories published in the Federal Register at 63 FR 60364-60367 (see www.dhhs.gov/ohrp/humansubjects/guidance/expedited98.htm) when the research is determined to involve no more than minimal risk. OHRP determined that:

(a) The IRB inappropriately applied expedited review to research that involved minimal risk but did not appear in the categories of research published in the Federal Register.

(b) The IRB inappropriately applied expedited review to research that involved greater than minimal risk.

(15) Inappropriate Use of Expedited Review Procedures for Review of Protocol Changes. HHS regulations at 45 CFR 46.108(b) require that the IRB review proposed research at convened meetings at which a majority of the members of the IRB are present, including at least one member whose primary concerns are in nonscientific areas, except where expedited review is appropriate under HHS regulations at 45 CFR 46.110. HHS regulations at 45 CFR 46.110(b)(2) permit use of expedited procedures for review of minor changes in previously approved research during the period for which approval is authorized. OHRP determined that the IRB has employed expedited procedures to review changes that were more than minor.

(16) Failure to Advise IRB Members of Expedited Approvals. HHS regulations at 45 CFR 46.110(c) require that all IRB members be advised of research proposals that have been approved under an expedited review procedure. OHRP determined that all IRB members were not advised of (a) research protocols approved at time of initial or continuing review under an expedited review procedure, or (b) minor changes in research protocols approved under an expedited review procedure.

(17) Expedited Review Conducted by Someone Other than an IRB Member. HHS regulations at 45 CFR 46.110(b) state that under an expedited review procedure, the review may be carried out by the IRB chairperson or by one or more experienced reviewers designated by the chairperson from among the members of the IRB. OHRP determined that an individual who was not a member of the IRB approved human subject research purportedly under an expedited review procedure, in violation of HHS regulations at 45 CFR 46.103(b), 45 CFR 46.109(a) and 45 CFR 46.110(b).

Reporting of Unanticipated Problems, Noncompliance, Suspensions, and Terminations

(18) Failure to Report Unanticipated Problems, Noncompliance, Suspensions, and Terminations, to IRB, Institutional Officials, and OHRP. OHRP determined that unanticipated problems involving risks to subjects or others or serious or continuing noncompliance or suspensions or terminations of IRB approval were not reported to appropriate institutional officials or the IRB or OHRP or the head of the sponsoring federal department or agency as required by HHS regulations at 45 CFR 46.103(a) and 46.103(b)(5).
IRB Review of Protocol Changes

(19) Changes to Research Initiated Without IRB Review and Approval. HHS regulations at 45 CFR 46.103(b)(4)(iii) require that the IRB review and approve all proposed changes in a research activity, during the period for which IRB approval has already been given, prior to initiation of such changes, except when necessary to eliminate apparent immediate hazards to the subjects. OHRP found no documentation that the IRB reviewed and approved protocol changes prior to initiation or that certain protocol changes were initiated without IRB approval and/or approval, in circumstances where the changes were not necessary to eliminate apparent immediate hazards to the subjects.

(20) Inadequate IRB Review and/or Approval of Protocol Changes. HHS regulations at 45 CFR 46.103(b)(4)(iii) require that the IRB review and approve all proposed changes in a research activity, during the period for which IRB approval has already been given, prior to initiation of such changes, except when necessary to eliminate apparent immediate hazards to the subjects. OHRP determined that the IRB’s procedures for reviewing protocol modifications were inadequate. In some cases, the IRB chairperson or designated IRB reviewer from among the IRB members approved such modifications in the absence of a complete description of the proposed changes.

OHRP noted that when reviewing proposed changes to research, the IRB must also receive sufficient information to make the determinations required for approval of research under HHS regulations at 45 CFR 46.111 and, when applicable, under subparts B, C, and D of 45 CFR part 46, although OHRP did not cite these regulatory provisions when making this determination in the past.

Application of Exemptions

(21) Inappropriate Application of Exempt Categories of Research. HHS regulations at 45 CFR 46.101(b) delineate six specific categories of research that are exempt from the requirements of 45 CFR part 46. OHRP determined that the institution applied an exemption to research activities that exceed these categories.

(22) Inappropriate Application of Exemption 4. HHS regulations at 45 CFR 46.101(b)(4) exempt research that only involves the collection or study of existing data, documents, records, pathologic specimens, or diagnostic specimens provided specified conditions are met. OHRP noted that such materials must already exist at the time the research is proposed. OHRP determined instances where this exemption was applied to research involving data, documents, pathologic specimens, or diagnostic specimens that did not exist at the time the research was proposed.

(23) Inappropriate Application of Exemption 2 for Research Involving Children. HHS regulations at 45 CFR 46.401(b) stipulate that the exemption at 45 CFR 46.101(b)(2) for research involving survey or interview procedures or observations of public behavior does not apply to research covered by 45 CFR part 46, subpart D (Additional Protections for Children Involved as Subjects in Research), except for research involving observation of public behavior when the investigators do not participate in the activities being observed. OHRP determined that exemption 2 was inappropriately applied to survey and observational research involving children.
Informed Consent

(24) Failure of the Investigator to Obtain the Legally Effective Informed Consent of Subjects or of the IRB to Appropriately Waive the Requirements to Obtain Informed Consent. HHS regulations at 45 CFR 45.116 state that no investigator may involve a human being as a subject in research covered by the regulations unless (a) the investigator has obtained the legally effective informed consent of the subjects or the subject’s legally authorized representative, or (b) the IRB has waived the requirements to obtain informed consent in accordance with 45 CFR 46.116(c) or (d), or in accordance with the provisions for waiver of informed consent for research in emergent settings published in the *Federal Register*, Vol. 61, pp. 51531-51533. OHRP determined that the investigator initiated human subject research without obtaining legally effective informed consent of subjects and without the IRB appropriately waiving these requirements.

(25) Failure to Document Informed Consent or of the IRB to Appropriately Waive the Requirement to Document Informed Consent. HHS regulations at 45 CFR 46.117(a) require that informed consent be documented by the use of a written consent form approved by the IRB and that is signed by the subject, or the subject’s legally authorized representative, unless the IRB waives this requirement in accordance with 45 CFR 46.117(c). OHRP determined that informed consent was not documented by a written consent form signed by the subject(s) for this research and there was no IRB waiver of this requirement.

(26) Failure to Provide a Copy of the Informed Consent Document (ICD) to the Subject or the Subject’s Legally Authorized Representative. HHS regulations at 45 CFR 46.117(a) require that informed consent be documented by the use of a written consent form approved by the IRB and signed by the subject or the subject’s legally authorized representative unless the requirement for documentation of informed consent has been waived by the IRB in accordance with HHS regulations at 45 CFR 46.117(c). The regulations further require that a copy of the informed consent document shall be given to the person signing the form. OHRP determined that a copy of the informed consent document was not provided to the person signing the informed consent form.

(27) Inadequate ICD for Specific Research/Lack of Basic Elements. HHS regulations at 45 CFR 46.116(a) require that when seeking informed consent specific information shall be provided to each subject unless the IRB approves a consent procedure that does not include, or that alters, some or all of the required basic elements of informed consent provided in accordance with 45 CFR 46.116 (c) or (d). OHRP determined that the informed consent documents reviewed and approved by the IRB failed to include and/or adequately address the following basic elements required by HHS regulations at 45 CFR 46.116(a):

(a) Section 46.116(a)(1): (i) A statement that the study involves research; (ii) an explanation of the purposes of the research; (iii) the expected duration of the subject’s participation; and (iv) a complete description of the procedures to be followed, and identification of any procedures that are experimental.
(b) Section 46.116(a)(2): A description of any reasonably foreseeable risks and discomforts.

(c) Section 46.116(a)(3): A description of any benefits to the subject or others that may reasonably be expected from the research.

(d) Section 46.116(a)(4): A disclosure of appropriate alternative procedures or courses of treatment, if any, that might be advantageous to the subject.

(e) Section 46.116(a)(5): A statement describing the extent, if any, to which confidentiality of records identifying the subject will be maintained.

(f) Section 46.116(a)(6): For research involving more than minimal risk, an explanation as to whether any compensation and an explanation as to whether any medical treatments are available if injury occurs and, if so, what they consist of, or where further information may be obtained.

(g) Section 46.116(a)(7): An explanation of whom to contact for answers to pertinent questions about the research and research subjects' rights (should include someone other than the investigator), and whom to contact in the event of a research-related injury to the subject.

(h) Section 46.116(a)(8): A statement that participation is voluntary, refusal to participate will involve no penalty or loss of benefits to which the subject is otherwise entitled, and the subject may discontinue participation at any time without penalty or loss of benefits to which the subject is otherwise entitled.

Moreover, OHRP found no documentation that the IRB approved a consent procedure that did not include, or that altered, some of the required basic elements of informed consent noted above in accordance with 45 CFR 46.116(c) or (d).

(28) Inadequate ICD for Specific Research/Lack of Additional Elements. HHS regulations at 45 CFR 46.116(b) require that, when appropriate, additional elements of information shall be provided to subjects. OHRP determined that the following additional elements of informed consent should have been included in the informed consent documents under HHS regulations at 45 CFR 46.116(b):

(a) Section 46.116(b)(1): A statement that the particular treatment or procedure may involve risks to the subject (or to the embryo or fetus, if the subject is or may become pregnant) that are currently unforeseeable;

(b) Section 46.116(b)(2): Anticipated circumstances under which the subject's participation may be terminated by the investigator without regard to the subject's consent.

(c) Section 46.116(b)(3): Any additional costs to the subject that may result from participation in the research;

(d) Section 46.116(b)(4): The consequences of a subject's decision to withdraw from the research and procedures for orderly termination of participation by the subject.

(e) Section 46.116(b)(5): A statement that significant new findings developed during the course of the research that may relate to the subject's willingness to continue participation will be provided to the subject.
(f) Section 46.116(b)(6): The approximate number of subjects involved in the study.

Moreover, OHRP found no documentation that the IRB approved a consent procedure that did not include, or that altered, some of the required additional elements noted above in accordance with 45 CFR 46.116(c) or (d).

(29) **ICD Language too Complex.** HHS regulations at 45 CFR 46.116 require that informed consent information be in language understandable to the subject or the subject’s legally authorized representative. OHRP determined that the informed consent information provided to subjects would not be understandable to some subjects.

(30) **Exculpatory Language in ICDs.** HHS regulations at 45 CFR 46.116 prohibit the inclusion of any exculpatory language in informed consent through which the subject is made to waive, or appear to waive, any of the subject’s legal rights. OHRP determined certain language in the IRB-approved informed consent documents was exculpatory.

(31) **Enrollment Procedures did not Minimize Possibility of Coercion or Undue Influence.** HHS regulations at 45 CFR 46.116 require that investigators seek the legally effective informed consent of subjects under circumstances that minimize the possibility of coercion or undue influence. OHRP determined that informed consent was not sought from prospective subjects under circumstances that minimized the possibility of coercion or undue influence.

**IRB Membership, Expertise, Staff, Support, and Workload**

(32) **Failure To Have An Unaffiliated IRB Member.** HHS regulations at 45 CFR 46.107(d) require that each IRB include at least one member who is not otherwise affiliated with the institution and who is not part of the immediate family of a person who is affiliated with the institution. OHRP determined that the IRB did not include any such member.

(33) **Lack of Prisoner/Prisoner Representative for IRB Review of Research Involving Prisoners.** HHS regulations at 45 CFR 46.304 require that at least one member of an IRB that reviews research involving prisoners be a prisoner, or a prisoner representative with appropriate background and experience to serve in that capacity, except that where a particular research project is reviewed by more than one IRB only one IRB need satisfy this requirement. When the convened IRB reviews research involving prisoners (including initial review, continuing review, review of protocol modifications, and review of unanticipated problems involving risks to subjects or others), the prisoner or prisoner representative must be present as a voting member. OHRP determined that the IRB failed to meet this requirement when reviewing research projects involving prisoners.

(34) **IRB Chairperson and Members Lack Sufficient Understanding of HHS Regulations.** HHS regulations at 45 CFR 46.107(a) provide, among other things, that the IRB shall be sufficiently qualified through the experience and expertise of its members to promote respect for its advice and counsel in safeguarding the rights and welfare of human subjects and shall be able to ascertain the acceptability of
proposed research in terms of institutional commitments and regulations, applicable law, and standards of professional conduct and practice. OHRP determined that the IRB chairperson and/or IRB members lacked a detailed understanding of the specific requirements of the HHS regulations for the protection of human subjects. As a result, IRB determinations sometimes deviated from these requirements.

(35) **Designation of an Additional IRB under an FWA without Prior OHRP Approval.** HHS regulations at 45 CFR 46.103(b) state, in part, that assurances applicable to federally supported or conducted research shall include designation of one or more IRBs established in accordance with the requirements of the regulations, and for which provisions are made for meeting space and sufficient staff to support the IRB’s review and recordkeeping duties. Designation of additional IRBs under an FWA requires prior notification of and approval by OHRP. OHRP determined that the institution established an additional IRB that reviews research covered by its FWA without such approval.

(36) **Inadequate IRB Resources.** HHS regulations at 45 CFR 46.103(b)(2) require that institutions provide meeting space and sufficient staff to support the IRB’s review and recordkeeping duties. OHRP determined that the IRB lacked sufficient meeting space and/or staff to support the IRB’s review and recordkeeping duties.

(37) **Lack of IRB Knowledge of Local Research Context.** HHS regulations at 45 CFR 46.107(a) require, among other things, that the IRB be (a) sufficiently qualified through the diversity of the members, including consideration of race, gender, and cultural backgrounds and sensitivity to such issues as community attitudes, to promote respect for its advice and counsel; and (b) able to ascertain the acceptability of proposed research in terms of institutional commitments and regulations, applicable law, and standards of professional conduct and practice. Institutions have a responsibility to ensure that all IRBs designated under an OHRP-approved Assurance possess sufficient knowledge of the local research context to satisfy these requirements. OHRP determined that the IRB did not have the background and expertise to review the above-referenced research based on its failure to include members with sufficient understanding of the cultural conditions, including the social, economic, and political status, of the subject population.

OHRP noted that the IRB also must have sufficient background and expertise regarding the local research context in order to make the determinations required for approval of research as described within HHS regulations at 45 CFR 46.111 and applicable subparts, although OHRP did not cite this regulatory provision when making this determination in the past.

(38) **Lack of IRB Professional Competence to Review Specific Research Activities.** HHS regulations at 45 CFR 46.107(a) require, among other things, that the IRB possess the professional competence necessary to review specific research activities. OHRP determined that the IRB did not possess the professional competence necessary to review specific research activities.

OHRP noted that the IRB also must have sufficient professional competence in order to make the determinations required for approval of research under HHS regulations at 45 CFR 46.111, although OHRP did not cite this regulatory provision.
when making this determination in the past. OHRP also noted that under HHS regulations at 45 CFR 46.107(f) an IRB may, in its discretion, invite individuals with competence in special areas to assist in the review of issues which are beyond or in addition to that available on the IRB and IRB’s cited for this determination did not seek to invite individuals with competence in relevant special areas, although this was not noted when the determinations were originally made by OHRP.

**IRB Documentation, Findings, and Procedures**

(39) **Lack of Appropriate Written IRB Procedures.** OHRP determined that the institution did not have written IRB procedures that adequately describe the following activities, as required by HHS regulations at 45 CFR 46.103(a) and 46.103(b)(4) and (5):

(a) The procedures that the IRB will follow for conducting its initial review of research.

(b) The procedures that the IRB will follow for conducting its continuing review of research.

(c) The procedures that the IRB will follow for reporting its findings and actions to investigators and the institution.

(d) The procedures that the IRB will follow for determining which projects require review more often than annually.

(e) The procedures that the IRB will follow for determining which projects need verification from sources other than the investigators that no material changes have occurred since previous IRB review.

(f) The procedures that the IRB will follow for ensuring prompt reporting to the IRB of proposed changes in a research activity, and for ensuring that such changes in approved research, during the period for which IRB approval has already been given, may not be initiated without IRB review and approval except when necessary to eliminate apparent immediate hazards to the subject.

(g) The procedures for ensuring prompt reporting to the IRB, appropriate institutional officials, any department or agency head, and OHRP of: (a) any unanticipated problems involving risks to subjects or others; (b) any serious or continuing noncompliance with 45 CFR part 46 or the requirements or determinations of the IRB; and (c) any suspension or termination of IRB approval.

(40) **Failure of an Institution Engaged In HHS-Conducted or –Supported Research to Hold an OHRP-Approved FWA.** HHS regulations at 45 CFR 46.103(a) require that each institution “engaged” in human subjects research provide OHRP with a satisfactory assurance to comply with the regulations, unless the research is exempt under 45 CFR 46.101(b). (Please see OHRP guidance at www.dhhs.gov/ohrp/humansubjects/guidance/engage08.pdf.)

In general, an institution is considered *engaged* in a particular non-exempt human subjects research project when its employees or agents for the purposes of the research project obtain: (1) data about the subjects of the research through intervention or interaction with them; (2) identifiable private information about the subjects
of the research; or (3) the informed consent of human subjects for the research [45 CFR 46.102(d), (f)].

OHRP determined that the institution was engaged in human subject research under a particular project and the institution was not covered by an OHRP-approved FWA for this research. If the project in question is ongoing, OHRP noted that involvement of the unassured institution in non-exempt human subject research activities under the specified HHS award must be suspended until OHRP approved an FWA, unless it is determined that it is in subjects’ best interest to continue.

(41) Inadequate IRB Records. OHRP determined that IRB records fail to include all the documentation required by HHS regulations at 45 CFR 46.115(a).

(42) Inadequate IRB Minutes. HHS regulations at 45 CFR 46.115(a)(2) require that minutes of IRB meetings be in sufficient detail to show attendance at the meetings; actions taken by the IRB; the vote on these actions including the number of members voting for, against, and abstaining; the basis for requiring changes in or disapproving research; and a written summary of the discussion of controverted issues and their resolution. OHRP determined that minutes of IRB meetings failed to meet these requirements.

(43) Poorly Maintained IRB Files. HHS regulations at 45 CFR 46.115(a) require that the institution prepare and maintain adequate documentation of IRB activities. OHRP found that in numerous instances among the IRB files examined by OHRP, it was difficult to reconstruct a complete history of all IRB actions related to the review and approval of the protocol. In some instances, OHRP could not determine what the IRB actually approved.

(44) Failure of IRB to Determine That Criteria for IRB Approval Are Satisfied. HHS regulations at 45 CFR 46.111 delineate the criteria that must be satisfied in order for an IRB to approve research covered by the regulations. OHRP determined that for certain research the IRB failed to determine that the following requirements were satisfied:

(a) Risks to subjects are minimized.

(b) Risks to subjects are reasonable in relation to anticipated benefits, if any, to subjects, and the importance of the knowledge that may reasonably be expected to result.

(c) Selection of subjects is equitable.

(d) Informed consent will be sought from each prospective subject or the subject’s legally authorized representative.

(e) Informed consent will be appropriately documented.

(f) When appropriate, the research plan makes adequate provision for monitoring the data collected to ensure the safety of subjects.

(g) When appropriate, there are adequate provisions to protect the privacy of subjects and to maintain the confidentiality of data.

(h) When some or all of the subjects are likely to be vulnerable to coercion or undue influence, additional safeguards have been included in the study to protect the rights and welfare of vulnerable subjects.
(45) **Failure of IRB to Make Required Findings When Reviewing Research Involving Children.** HHS regulations at 45 CFR 46.404-407 require specific findings on the part of the IRB for approval of research involving children. OHRP determined that the IRB did not make the required findings when reviewing research involving children.

(46) **Failure of IRB to Make Required Findings When Reviewing Research Involving Prisoners.** HHS regulations at 45 CFR 46.305-306 require specific findings on the part of the IRB for approval of research involving prisoners. OHRP determined that the IRB failed to make the required findings when reviewing such research. OHRP also determined that the IRB approved research involving prisoners even though the research failed to satisfy subpart C criteria.

(47) **Failure of IRB to Make and Document Required Findings for Waiver of Informed Consent.** HHS regulations at 45 CFR 46.116(c) and (d) require that the IRB find and document specific criteria when approving waiver or alteration of some or all of the required elements of informed consent. OHRP determined that the IRB failed to satisfy these requirements.

(48) **Failure to Make Required Findings for IRB Waiver of a Signed Informed Consent Document.** HHS regulations at 45 CFR 46.117(c) requires specific findings on the part of the IRB for waiver of the requirements for the investigator to obtain a signed consent form from all subjects. OHRP determined that the IRB failed to make the required findings when approving such waivers.

(49) **Inadequate Retention of IRB Records.** HHS regulations at 45 CFR 46.115(b) require that IRB records be retained for at least 3 years, and records relating to research that is conducted be retained for at least 3 years after completion of the research. All records must be accessible for inspection and copying by authorized representatives of HHS at reasonable times and in a reasonable manner. OHRP determined that the institution failed to retain IRB records OR records relating to research for at least 3 years after completion of the research at that study site.

(50) **Failure to Notify Investigators/Institution of IRB Actions.** HHS regulations at 45 CFR 46.109(d) require that an IRB notify investigators and the institution in writing of its decision to approve or disapprove the proposed research activity, or of modifications required to secure IRB approval of the research activity. If the IRB decides to disapprove a research activity, it shall include in its written notification a statement of the reasons for its decision and give the investigator an opportunity to respond in person or in writing. OHRP determined that the IRB did not notify investigators and the institution in writing of its decision to approve or disapprove proposed research or of modifications required to secure IRB approval of the research.
Other

(51) Failure of Signatory Official to Fulfill Obligations. HHS regulations at 45 CFR 46.103(c) require that an institution’s assurance of compliance with the regulations for the protection of human subjects shall be executed by an individual authorized to act for the institution and to assume on behalf of the institution the obligations imposed by the regulations. OHRP determined that the Signatory Official failed to fulfill his or her obligations imposed by the HHS regulations for the protection of human subjects and the institution’s FWA.

OHRP noted that HHS regulations at 45 CFR 46.103(a) require that each institution engaged in research which is covered by this policy and which is conducted or supported by a federal department or agency shall provide written assurance satisfactory to the department or agency head that it will comply with the requirements set forth in the regulations, although we did not cite this regulatory provision when making this determination in the past. Similarly, Public Law 99-158 Sec. 491(a) requires that the HHS Secretary shall by regulation require that each entity which applies for a grant, contract, or cooperative agreement under this act for any project or program which involves the conduct of biomedical or behavioral research involving human subjects submit in or with its application for such grant, contract, or cooperative agreement assurances satisfactory to the secretary.
Federal Oversight of Animals in Research: Who Does What

AIS editors

Ensuring the appropriate care and management of any animals used in research is an important component of any institution’s research policy. There are primarily two agencies charged with ensuring the welfare of laboratory research animals used by federal grantee institutions: the U.S. Department of Agriculture and the Public Health Service (National Institutes of Health). Together these agencies establish guidelines and requirements for the proper treatment and care of animals used in research. Two pieces of legislation and a set of principles provide the framework the agencies follow to set the institutional practices concerning animals’ care and use:

- Animal Welfare Act, 7 USC §2131 et. seq. (enforced by USDA’s Animal and Plant Health Inspection Service, APHIS)

The Food and Drug Administration’s Center for Veterinary Medicine (CVM) regulates the manufacture and distribution of food additives and drugs that will be given to animals from which human foods are derived as well as those for pet (or companion) animals. CVM is also responsible for regulating drugs, devices, and food additives given to, or used on, animals.

Framework for Responsibilities

APHIS, FDA, and NIH recently renewed a 20-year memorandum of understanding concerning laboratory animal welfare (MOU 225-06-4000). Among other things, the MOU provides an overview of the responsibilities of each federal agency, which may prove helpful to research administrators. (Link to MOU: http://grants.nih.gov/grants/olaw/references/finalmou.htm.)

As stated in the MOU, common features in the agencies’ programs include “standards and policies aimed at promoting laboratory animal welfare, the maintenance of registries/inventories of institutions and facilities subject to agency policies and regulations, the periodic conduct of routine and ‘for cause’ inspections or site visits, efforts designed to promote voluntary compliance, and the application of a range of sanctions when necessary.”

Individual agency responsibilities are outlined in the MOU as follows:

- Animal and Plant Health Inspection Service (www.aphis.usda.gov). APHIS has primary responsibility for overseeing compliance with the Animal Welfare Act and its implementing regulations (9 CFR Chapter 1, Subchapter A, Parts 1–3.) “The USDA regulations establish standards for the humane treatment of laboratory animals and a registration/licensing procedure for identifying institutions that breed, sell, transport, hold, and use such animals. Compliance...is monitored by an active inspection program that provides for periodic inspections by veterinary medical officers or suitably trained paraprofessionals. Serious
noncompliance is dealt with by procedures that range from civil penalties, to the issuance of ‘cease and desist’ orders, to the confiscation of animals.”
