◆ financial statements of a college or university (or other entity covered by the circular) are presented fairly in all material respects in accordance with generally accepted accounting principles (GAAP); and

◆ Schedule of Expenditures for Federal Awards is presented fairly in all material respects in relation to the financial statements of the organization taken as a whole.

Auditing Compliance. In addition to the requirements of GAGAS, Circular A-133 requires the auditor “to determine whether the auditee has complied with laws, regulations, and the provisions of contracts or grant agreements that may have a direct and material effect on each of its major programs.”

Award documents impose numerous terms and conditions on colleges and universities. Many of the requirements imposed in this context will not be audited as part of the Circular A-133 examination. Instead, the auditor, with the blessing of A-133, will concentrate — exclusively or predominantly — on the 14 compliance requirements listed in the OMB A-133 Compliance Supplement (see ¶1305.13 for a discussion of these 14 requirements).

The Compliance Supplement essentially is an audit guide fashioned to save auditors significant amounts of time and effort in researching rules and requirements associated with federal programs. If the Compliance Supplement did not exist, individual auditors would have to determine which laws and regulations could have a direct and material effect on individual federal programs. By formulating the Compliance Supplement, OMB — and the federal agencies that provide information to OMB — are ensuring that the independent auditor will address those matters that are of greatest federal concern. (Copies of the OMB A-133 Compliance Supplement, which is issued annually usually in the Spring, can be found at www.whitehouse.gov/omb/circulars.)

Part 2 of the Compliance Supplement sets out a matrix of the 14 compliance requirements and the Catalog of Federal Domestic Assistance (CFDA) numbers of the programs to which they apply. The auditor is instructed to identify the CFDA number for the program and then determine from the matrix whether a particular requirement applies. Section ____.500 of the circular, which the Compliance Supplement reinforces, states the following:

Section ____.500 of Circular A-133

For those Federal programs not covered in the compliance supplement, the auditor should use the types of compliance requirements contained in the compliance supplement as guidance for identifying the types of compliance requirements to test, and determine the requirements governing the Federal program by reviewing the provisions of contracts and grant agreements and the laws and regulations referred to in such contracts and grant agreements.

In other words, if the program is not covered specifically in the Compliance Supplement, the auditor must study the laws and regulations and the terms and conditions of award documents that are relevant to the 14 compliance requirements that have been arrayed as part of the matrix. Under these circumstances, the auditor will design an
Supplementary Material

Auditing Internal Controls

Internal controls are those policies, procedures, and processes that provide reasonable assurance that an organization is operating efficiently and effectively, has reliable financial reporting, and is compliant with applicable laws and regulations. Examples of internal controls include the following:

- Written policies and procedures
- Segregation of duties
- Approvals and authorizations
- Monitoring and reporting
- Verification
- Physical restrictions
- Documentation

For purposes of the A-133 audit, there are two levels to an auditor’s internal control work. First, the auditor will determine whether internal controls at the organizational and financial statement level are designed properly and in place. Then, the auditor will determine whether internal controls over compliance are implemented with regard to federal programs. In other words, there is an audit of internal control over financial reporting and an audit of internal control over compliance related to major federal programs.

Reminder

The compliance requirements identified by the auditor, in most cases, arise from OMB Circular A-110 and the cost principles for educational institutions, OMB Circular A-21. Institutions may play an important but subtle role at this juncture of the audit by (1) making the CFDA numbers available so auditors can use the Compliance Supplement to the maximum extent possible, and (2) ensuring that auditors who will perform the field work understand the nature of the supplement’s cross-cutting requirements. Because, in some cases, independent auditors will have to perform additional research, the institution also may help identify the requirements of programs not included in the Compliance Supplement that should be subjected to specific kinds of compliance testing. Nothing precludes the institution from helping the auditor formulate the audit program in these circumstances.
Circular A-133, §___.105 defines internal control as

... a process, effected by an entity’s management and other personnel, designed to provide reasonable assurance regarding the achievement of objectives in the following categories:

(1) Effectiveness and efficiency of operations;
(2) Reliability of financial reporting; and
(3) Compliance with applicable laws and regulations.

For purposes of the A-133 audit, there are two levels to an auditor’s internal control work. First, the auditor determines whether internal controls at the organizational and financial statement level have been designed properly and placed in operation. Then, the auditor determines whether the internal controls over compliance have been established and implemented with regard to federal programs. In other words, there is an audit of internal control over financial reporting and an audit of internal control over compliance related to major federal programs.

For federal government agencies and various pass-through organizations, internal controls over federal programs are of great concern. Those internal controls largely represent the institution’s administration of sponsored programs — those policies and procedures and checks and balances that are in place to comply with the terms and conditions of specific federal awards and related federal laws and regulations.

Circular A-133 defines internal controls for compliance as

... a process — effected by an entity’s management and other personnel — designed to provide reasonable assurance regarding the achievement of the following objectives for Federal programs:

(1) Transactions are properly recorded and accounted for to:
   (i) Permit the preparation of reliable financial statements and Federal reports;
   (ii) Maintain accountability over assets; and
   (iii) Demonstrate compliance with laws, regulations, and other compliance requirements;

(2) Transactions are executed in compliance with:
   (i) Laws, regulations, and the provisions of contracts or grant agreements that could have a direct and material effect on a Federal program; and
   (ii) Any other laws and regulations that are identified in the compliance supplements; and

(3) Funds, property, and other assets are safeguarded against loss from unauthorized use or disposition.

Section ___.500(c) of Circular A-133 instructs the auditor to plan the audit so that it achieves a “low assessed level of control risk” for major programs, as set out in the
**OMB A-133 Compliance Supplement.** Translated, this means that the auditor must determine whether both the institution’s internal control system for financial reporting and for compliance reduce to a low level the likelihood of a material misstatement related to the financial statements or to one of the assertions covered by the 14 compliance requirements of the Compliance Supplement. (For a discussion of the importance of internal control testing in the compliance arena, see Figure 3120.2-1, page 3120:15.)

If, in the conduct of the internal control study and evaluation, the auditor concludes that the internal control system is so poorly designed that it could not prevent or detect noncompliance, he or she is not expected to conduct testing to see whether the control system works as intended. Such a review, it is assumed, would have no value. However, the auditor would be required to assess the severity of the deficiency and issue a finding depending upon its likelihood of impacting the financial reporting (see A-133, §___.500(c)(3)).

**A-133 Compliance Supplement and Internal Controls.** Internal controls have become an auditing “hot topic” recently, and it is recommended that colleges and universities assess the strengths and vulnerabilities of their systems (for examples of internal control deficiencies, see Figure 3120.2-2, page 3120.16). Part 6 of the Compliance

---

**More Findings in the Future?**

Audits of and reports on internal control under GAGAS and A-133 on or after December 15, 2007, have the potential to produce more findings than in the past. This is because standard-setting bodies have revised their standards, and a new set of definitions apply to communicating internal control deficiencies in financial audits. These new definitions may lower the threshold for what were previously termed “reportable conditions,” which may result in an increase in the number of findings the auditor must include in the audit report and in communications to the management, audit committees, and “those charged with governance.”

**Revised Standards:** To move towards reasonable conformity among the different accounting standards, GAO adopted and incorporated the AICPA’s Statement of Auditing Standards (SAS) 112 terms and their definitions into the January 2007 revision of GAGAS for purposes of financial audits (GAGAS 5.11). OMB issued a notice revising Circular A-133 by adopting the SAS 112/GAGAS terms and definitions (72 Fed. Reg. 35080, June 26, 2007). To further conform Circular A-133 to the new terminology, OMB worked with the AICPA, and the AICPA (72 Fed. Reg. 35080, June 26, 2007) released Auditing Interpretation No. 1 to define these terms with regard to A-133 compliance audits.

SAS 112 is available at www.aicpa.org/download/members/div/auditstd/AU-00325.PDF. The AICPA interpretation can be found at www.aicpa.org/download/auditstd/interpretations/Interpretation_No_1_9325.pdf.

The AICPA has issued guidance for auditors to use in evaluating deficiencies in internal controls over compliance in a single audit. The October 2007 guidance is published as GAQC Alert #62 in Government Auditing Standards and Circular A-133 Audits (GAS-A133 Alert), available from AICPA, and also is posted in full on the AICPA Web site at http://gaqc.aicpa.org/Resources/Archived+GAQC+Update+Newsletters/GAQC+Alert+No.+62.htm.
Supplement deals with internal controls. The purpose of this part is to help the auditor and the auditee identify internal control features, which, if in place and working, may be an indicator of internal control over federal programs. The AICPA has issued guidance for auditors to use in evaluating deficiencies in internal controls over compliance in a single audit. (The October 2007 guidance is published as GAQC Alert #62 in Government Auditing Standards and Circular A-133 Audits (GAS-A133 Alert), available from AICPA, and also is posted in full on the AICPA Web site at http://gaqc.aicpa.org/Resources/Archived+GAQC+Update+Newsletters/GAQC+Alert+No.+62.htm.)

Part 6 of the Compliance Supplement lists five components of internal control that, if present, should reasonably assure compliance:

1. **Control Environment**: The foundation for all other internal control components by providing discipline and structure
2. **Risk Assessment**: The information from which will determine how risks should be managed
3. **Control Activities**: The policies and procedures that put into effect management’s policies
4. **Information and Communication**: The identification, capture, and exchange of information in a form and time frame that enable people to carry out their responsibilities
5. **Monitoring**: Assesses the quality of internal control performance on an ongoing basis

For each of the Compliance Supplement’s compliance requirements, except for N. Special Tests and Provisions, the supplement suggests actions that would satisfy these internal control components (see for example Figure 3120.2-3, page 3120:17). In its introduction to the part, however, OMB stipulates that these internal control features are *not* requirements, and an institution may address internal controls differently. Despite this disclaimer, independent auditors tend to view the features identified in Part 6 as standard practices expected for all types of institutions (see Figure 3120.2-4, page 3120:19).
Figure 3120.2-1: National Single Audit Sampling Project

There has been a belief in the federal audit community and among the federal Inspector Generals in particular that the quality of the A-133 audits has not been particularly good. As a result, the National Single Audit Sampling Project was conducted under the auspices of the President’s Council on Integrity and Efficiency whose goals were to determine the quality of single audits, establish a statistically based measure of audit quality and recommend changes in single (A-133) audit requirements, standards, and procedures to improve the quality of the single audit. The results of the project were released in summer 2007 (available at www.ignet.gov/pande/audit/NatSamProjRptFINAL2.pdf).

In the National Single Audit Sampling Project, a significant percentage of audits were found to have inadequately documented compliance testing. The project suggests just how important internal controls over federal programs are to the government. The project did not review internal control over financial reporting, only internal control over compliance.

In reviewing 208 audits, the statistical sampling showed that a significant percentage were of limited reliability because of significant deficiencies or material reporting errors. Most prevalent among the deficiencies were lack of documentation of the understanding of internal controls over compliance requirements, not documenting the testing of internal controls in some compliance requirements, and no documentation of compliance testing.

The project results contained three recommendations: (1) revise and improve single audit standards, criteria, and guidance; (2) establish minimum requirements for training on performing single audits; and (3) review and enhance processes to address unacceptable single audits.

Changes Ahead. Although it is too soon to know the full extent of the fallout from the President’s Council on Integrity and Efficiency’s National Single Audit Sampling Project’s final report, the Office of Management and Budget (OMB) has indicated that it is preparing to implement the report’s recommendation that affect the agency. OMB is preparing draft amendments to Circular A-133 to be completed by June 2008. The amendments will likely

◆ provide additional guidance to auditors on how to identify major programs;
◆ clarify when audit findings must be reported;
◆ emphasize that auditors must provide more specific documentation of audit activities and findings for major programs; and
◆ clarify the requirements for sample selection.
**Figure 3120.2-2: GAGAS Examples of Deficiencies in Internal Control**

a. Insufficient control consciousness within the organization, for example the tone at the top and the control environment. Control deficiencies in other components of internal control could lead the auditor to conclude that weaknesses exist in the control environment.

b. Ineffective oversight by those charged with governance of the entity’s financial reporting, performance reporting, or internal control, or an ineffective overall governance structure.

c. Control systems that did not prevent or detect material misstatements so that it was later necessary to restate previously issued financial statements or operational results. Control systems that did not prevent or detect material misstatements in performance or operational results so that it was later necessary to make significant corrections to those results.

d. Control systems that did not prevent or detect material misstatements identified by the auditor. This includes misstatements involving estimation and judgment for which the auditor identifies potential material adjustments and corrections of the recorded amounts.

e. An ineffective internal audit function or risk assessment function at an entity for which such functions are important to the monitoring or risk assessment component of internal control, such as for a very large or highly complex entity.

f. Identification of fraud of any magnitude on the part of senior management.

g. Failure by management or those charged with governance to assess the effect of a significant deficiency previously communicated to them and either to correct it or to conclude that it will not be corrected.

h. Inadequate controls for the safeguarding of assets.

i. Evidence of intentional override of internal control by those in authority to the detriment of the overall objectives of the system.

j. Deficiencies in the design or operation of internal control that could result in violations of laws, regulations, provisions of contracts or grant agreements, fraud, or abuse having a direct and material effect on the financial statements or the audit objective.

k. Inadequate design of information systems (IS) general and application controls that prevent the information system from providing complete and accurate information consistent with financial or performance reporting objectives and other current needs.

l. Failure of an application control caused by a deficiency in the design or operation of an IS general control.

m. Employees or management who lack the qualifications and training to fulfill their assigned functions.

*Source: Government Accounting Standards, Appendix I, Supplemental Guidance, A.04.*
Figure 3120.2-3: Suggested Internal Control Procedures for A. Activities Allowed or Unallowed and B. Allowable Costs/Cost Principles

Control Objectives

To provide reasonable assurance that Federal awards are expended only for allowable activities and that the costs of goods and services charged to Federal awards are allowable and in accordance with the applicable cost principles.

Control Environment

- Management sets reasonable budgets for Federal and non-Federal programs so that no incentive exists to miscode expenditures.
- Management enforces appropriate penalties for misappropriation or misuse of funds.
- Organization-wide cognizance of need for separate identification of allowable Federal costs.
- Management provides personnel approving and pre-auditing expenditures with a list of allowable and unallowable expenditures.

Risk Assessment

- Process for assessing risks resulting from changes to cost accounting systems.
- Key manager has a sufficient understanding of staff, processes, and controls to identify where unallowable activities or costs could be charged to a Federal program and not be detected.

Control Activities

- Accountability provided for charges and costs between Federal and non-Federal activities.
- Process in place for timely updating of procedures for changes in activities allowed and cost principles.
- Computations checked for accuracy.
- Supporting documentation compared to list of allowable and unallowable expenditures.
- Adjustments to unallowable costs made where appropriate and follow-up action taken to determine the cause.
- Adequate segregation of duties in review and authorization of costs.
- Accountability for authorization is fixed in an individual who is knowledgeable of the requirements for determining activities allowed and allowable costs.

Information and Communication

- Reports, such as a comparison of budget to actual, provided to appropriate management for review on a timely basis.
- Establishment of internal and external communication channels on activities and costs allowed.
- Training programs, both formal and informal, provide knowledge and skills necessary to determine activities and costs allowed.
- Interaction between management and staff regarding questionable costs.

continued
Grant agreements (including referenced program laws, regulations, handbooks, etc.) and cost principles circulars available to staff responsible for determining activities allowed and allowable costs under Federal awards.

**Monitoring**
- Management reviews supporting documentation of allowable cost information.
- Flow of information from Federal agency to appropriate management personnel.
- Comparisons made with budget and expectations of allowable costs.
- Analytic reviews (e.g., comparison of budget to actual or prior year to current year) and audits performed.

*Source*: OMB Circular A-133 Compliance Supplement
Figure 3120.2-4: Examples of the Five Components of Internal Control

(1) Control Environment sets the tone of an organization influencing the control consciousness of its people. It is the foundation for all other components of internal control, providing discipline and structure.

- Sense of conducting operations ethically, as evidenced by a code of conduct or other verbal or written directive.
- If there is a governing Board, the Board has established an Audit Committee or equivalent that is responsible for engaging the auditor, receiving all reports and communications from the auditor, and ensuring that audit findings and recommendations are adequately addressed.
- Management’s positive responsiveness to prior questioned costs and control recommendation.
- Management’s respect for and adherence to program compliance requirements.
- Key managers’ responsibilities clearly defined.
- Key managers have adequate knowledge and experience to discharge their responsibilities.
- Staff knowledgeable about compliance requirements and being given responsibility to communicate all instances of noncompliance to management.
- Management’s commitment to competence ensures that staff receive adequate training to perform their duties.
- Management’s support of adequate information and reporting system.

(2) Risk Assessment is the entity’s identification and analysis of risks relevant to achievement of its objectives, forming a basis for determining how the risks should be managed.

- Program managers and staff understand and have identified key compliance objectives.
- Organizational structure provides identification of risks of noncompliance:
  — Key managers have been given responsibility to identify and communicate changes.
  — Employees who require close supervision (e.g., are inexperienced) are identified.
  — Management has identified and assessed complex operations, programs, or projects.
  — Management is aware of results of monitoring, audits, and reviews and considers related risk of noncompliance.
- Process established to implement changes in program objectives and procedures.

(3) Control Activities are the policies and procedures that help ensure that management’s directives are carried out.

- Operating policies and procedures clearly written and communicated.
- Procedures in place to implement changes in laws, regulations, guidance, and funding agreements affecting Federal awards.
- Management prohibition against intervention or overriding established controls.
- Adequate segregation of duties provided between performance, review, and recordkeeping of a task.
- Computer and program controls should include:
  — Data entry controls, e.g., edit checks.

continued
Figure 3120.2-4 (continued)

— Exception reporting.
— Access controls.
— Reviews of input and output data.
— Computer general controls and security controls.

• Supervision of employees commensurate with their level of competence.
• Personnel with adequate knowledge and experience to discharge responsibilities.
• Equipment, inventories, cash, and other assets secured physically and periodically counted and compared to recorded amounts.
• If there is a governing Board, the Board conducts regular meetings where financial information is reviewed and the results of program activities and accomplishments are discussed. Written documentation is maintained of the matters addressed at such meetings.

(4) Information and Communication are the identification, capture, and exchange of information in a form and time frame that enable people to carry out their responsibilities.

• Accounting system provides for separate identification of Federal and non-Federal transactions and allocation of transactions applicable to both.
• Adequate source documentation exists to support amounts and items reported.
• Recordkeeping system is established to ensure that accounting records and documentation are retained for the time period required by applicable requirements, such as the A-102 Common Rule (§____.42), OMB Circular A-110 (§____.53), and the provisions of laws, regulations, contracts or grant agreements applicable to the program.
• Reports provided timely to managers for review and appropriate action.
• Accurate information is accessible to those who need it.
• Reconciliations and reviews ensure accuracy of reports.
• Established internal and external communication channels.
   — Staff meetings.
   — Bulletin boards.
   — Memos, circulation files, e-mail.
   — Surveys, suggestion box.
• Employees’ duties and control responsibilities effectively communicated.
• Channels of communication for people to report suspected improprieties established.
• Actions taken as a result of communications received.
• Established channels of communication between the pass-through entity and subrecipients.

(5) Monitoring is a process that assesses the quality of internal control performance over time.

• Ongoing monitoring built-in through independent reconciliations, staff meeting feedback, rotating staff, supervisory review, and management review of reports.

continued
**Figure 3120.2-4 (continued)**

- Periodic site visits performed at decentralized locations (including subrecipients) and checks performed to determine whether procedures are being followed as intended.
- Follow up on irregularities and deficiencies to determine the cause.
- Internal quality control reviews performed.
- Management meets with program monitors, auditors, and reviewers to evaluate the condition of the program and controls.
- Internal audit routinely tests for compliance with Federal requirements.
- If there is a governing Board, the Board reviews the results of all monitoring or audit reports and periodically assesses the adequacy of corrective action.

*Source: OMB Circular A-133 Compliance Supplement, Part 6*
\section{What Happens During a ‘Site Review’?}

AIS editors

Site visits are often used as a tool for monitoring compliance, sometimes on the part of federal agencies, other times used by recipients to monitor subrecipients. After initial discussions with institutional representatives, NIH provides each institution with guidance on the topics and expectations for each subject matter discussion. This guidance includes information to enable institutional representatives to self-select the staff members for participation in the site visit.

NIH asks for materials to be submitted in advance related to the identified subject area of the site review (e.g., copies of policies, forms, procedures, manuals, and organization charts). During the preparation period, the members of the NIH site visit team discuss their respective topic areas with the institution’s staff members and answer questions about the site visit process.

In general, the site visits are conducted over one and one-half days using a structured format. Each visit begins with a plenary session to orient participants to the structure and goals of the activity, followed by breakout sessions to discuss specific topics. During the closing session, the site visit team shares observations and findings with institutional officials.

According to NIH, as its site visit practices evolved, a half-day collaborative educational outreach seminar, presented by the NIH site visit team, was added. Topics include a compliance overview, the partnership between science and administration, administration for faculty/principal investigators (PI), research contracts, financial conflict of interest, financial management of sponsored projects, data and safety monitoring, and extramural intellectual property. The seminar is characterized as “education” rather than “training” because of the value added in understanding not only what is required, but also why it is required. This distinction is important in securing faculty buy-in and thereby developing and sustaining a culture of compliance.

\textbf{Example: Site Review of FCOI}

NIH illustrates its approach to site reviews at http://grants.nih.gov/grants/compliance/compendium_2002.htm. In the following example, although the site review team was looking for compliance with the NIH financial conflict of interest regulations, the approach taken is not unique to these requirements.

The NIH site review team prepared for the series of visits by reviewing FCOI policies and other pertinent documents provided by the participating grantee institutions prior to the site review. During the one-day review, institutional officials were engaged in discussions about the FCOI program (e.g., its organization, policies, and procedures). The team also met with faculty and investigators who had experience with the institution’s FCOI program, preferably related to an NIH grant, to determine their understanding of their reporting responsibilities and institutional requirements. The institution was asked to select the individuals who met with the NIH site review team.
At the end of the day, the site review team provided their observations, identifying areas of noncompliance and recommendations concerning implementation. If areas of noncompliance were noted, the institution was expected to formally address and resolve the issues after the site review.

Materials Reviewed
◆ The institution’s written, enforced policy concerning research investigators’ financial conflict of interest
◆ Organizational charts that show where the conflict of interest function resides
◆ The guidelines created by the institution for the Designated Official to identify financial conflict of interest
◆ A description of the enforcement mechanisms and sanctions used to implement the institutional financial conflict of interest policy
◆ Financial conflict of interest files maintained by the institution
◆ Minutes of conflict of interest meetings for the past two calendar years
◆ Determinations/findings made by the Designated Official
◆ Management plans, action plans, activities, agreements, or other documents used to manage, reduce, or eliminate conflicts
◆ Correspondence, if any, between the institution and NIH relating to the financial conflict of interest process

Institutional Representation
The institution was asked to include the following types of staff members to participate in this subject area discussion based on guidance from NIH:
◆ Designated Official
◆ Conflict of interest committee members from current committee roster
◆ Investigator who had an identified conflict of interest or who had been through the financial disclosure process

Information Discussed
◆ Operational aspects of the institutional financial conflict of interest process as well as the roles and responsibilities of the Designated Official and any financial conflict of interest committee members, if such a committee exists
◆ How research investigators and others are affected by the institutional financial conflict of interest policy
◆ How to improve the financial conflict of interest process at the institutions and between the institution and NIH
◆ How the institutions share/inform the IRB(s) of conflict of interest issues pertinent to IRB activities
◆ How institutions view the issue of institutional conflict of interest
More than a few independent auditors who audit federal grants and cooperative agreements are fond of stating, “If it’s not documented, it didn’t happen.” But like a lot of assertions that are made affecting the field of federal fund management, this one deserves a closer look. Not surprisingly, these auditors — whether they come from a governmental audit organization or a public accounting firm — are basing such statements on their judgments about the sufficiency and appropriateness of the evidence they gather to provide bases for their findings, conclusions, and opinions.

Industry and governmental auditing standards instruct them that sufficiency is a quantitative and qualitative measure of whether there is enough evidence to persuade a knowledgeable person that conclusions are reasonable. Appropriateness, on the other hand, is a measure of the quality of evidence that encompasses its relevance, validity, and reliability. The audit standards discuss the types of evidence that might be gathered, including physical, testimonial, documentary, and analytical. They also indicate that each type has its own strengths and weaknesses and that certain contrasts are useful in judging the appropriateness of the evidence. For example, among others, the stated contrasts include the following:

- Examination of original documents is generally more reliable than examination of copies.
- Evidence obtained when internal control is effective is generally more reliable than evidence obtained when internal control is weak or nonexistent.
- Evidence obtained through direct physical examination, observation, computation, and inspection is generally more reliable than evidence obtained indirectly.
- Testimonial evidence obtained from an individual who is not biased and has direct knowledge about the area is generally more reliable than testimonial evidence obtained from an individual who is biased or has indirect or partial knowledge about the area.

The use of the word “generally” is instructive. It shows that judgment must continue to be exercised about the relative strength of evidence that grantees generate and retain and that auditors review. It is not oversimplification to point out that having a lot of weak documentary evidence — or not much strong documentary evidence — can be a recipe for a protracted and possibly unpleasant grant audit resolution process involving questioned costs. But, while accurate, current, and complete grant documents are an ideal antidote to that condition, recipients and subrecipients also should be ready to introduce alternative-types of evidence, such as work product and knowledgeable staff statements, when an auditor identifies any documentary gaps.

Be Sure to Consider Records Disposal, Too

With very few exceptions required by federal statute, the standard duration for federal grant record retention is three years. According to the uniform policies crafted by the Office of Management and Budget for recipients and subrecipients (see Circular A-110, 2 CFR 215.53), the trigger that starts that three-year clock ticking is “the date of submission of the final expenditure report or, for awards that are renewed quarterly or annually, from the date of submission of the quarterly or annual financial report, as authorized by the federal awarding agency.”

Nowhere in those policies is there an explicit statement instructing recipients or subrecipients about when and how to dispose of the records. There is an interesting hint contained in the policy, however, about access to the records by officials of the federal awarding agency, its inspector general, the Comptroller General of the United States, and any of their duly authorized representatives. This wording also, perhaps, highlights the vulnerability of retaining grant records any longer than needed. The applicable section states, “The rights of access... are not limited to the required retention period but shall last as long as the records are retained.” In other words, as long as the institution has them, they can be examined.

Many grantee and subgrantee organizations are probably guilty of some inertia when it comes to records retention. They simply don’t get around to routine disposal of records, and the abundance of caution that often surrounds federal grant management can reinforce their tendencies. However, if everyone does what they are supposed to do (financial and performance reporting, auditing, and audit resolution) in the timely manner required by the applicable federal policies, the three-year record retention period should be more than enough time to complete the required tasks. In the exceptional case where any litigation, claim, or audit is started before the expiration of the three-year period, the requirements direct the recipient to extend the time period until all matters related to those events are resolved and any final action is taken.

In conclusion, a records disposal policy that is solidly grounded in the cited requirements is probably a good idea. It’ll reduce an organization’s exposure and probably save a significant amount of storage space. The method used for disposal is up to the institution.
How to Work with Internal Audit: Leveraging Internal Audit for Success

Raina Rose Tagle, Kimberly Ginn, and Ashley Deihr, Baker Tilly

Beyond “Gotcha:” The Role of Internal Audit in Today’s University

Who doesn’t have a horror story about interacting with auditors? Tales abound of auditors who showed up unannounced and demand to have hundreds of pages of documentation photocopied, questioned legitimate expenses due to lack of knowledge, or re-filed the department’s documentation in the wrong order. Internal auditors are sometimes perceived as the “bad guys” or “watchdogs,” leading many university personnel to be uncomfortable with or wary of working with internal audit.

But there is good news! A paradigm shift has been occurring over the past few years in how internal audit professionals operate. In fact, if you play your cards right, modern internal audit departments can be pleasant to work with, and even helpful. If you haven’t already, sometime in your career you will almost certainly interact with internal auditors, so why not make the best of it?

This article is the first in a three-part series that examines best practices in working with internal audit, including hints for making the experience go more smoothly (and hopefully, for staying out of trouble!). This first article provides background on the profession, contrasts the goals of traditional and more modern internal audit functions, and reviews types of internal audit projects and how these projects can actually be helpful. In the second article, we will describe the nuts and bolts of the internal audit process and provide terminology for “talking the talk” when interacting with internal auditors. The third article will provide specific ideas for leveraging internal audit to help your department, whether your institution’s internal audit model is traditional or more modern. Look for the second and third articles in upcoming issues of NCURA Magazine.

Traditional versus Modern Approaches to Internal Audit

In recent years, “modern” internal auditors have expanded their focus beyond just having “findings” in the form of inappropriate expenses or inaccurately recorded costs to proactively assisting organizations with enhancing internal controls, increasing efficiencies, and optimizing processes. These internal auditors collaborate with auditees to understand how things happen today, what could go wrong, and what needs to change to strengthen internal controls, keeping in mind the goals of the department and the need to be as efficient as possible with limited resources. These auditors will summarize “observations” regarding risks to the auditees, make “recommendations” for enhanced internal controls or efficiency measures that could mitigate the risks, and assist departments in making necessary changes. “Modern” internal audit departments are designed to help, and we aim to give you the tools you need to leverage their skills to the benefit of your department and institution (Figure 3120.5-1).

1 This article is reprinted from the NCURA Magazine, January/February 2010, Volume XLII, No. 1, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Internal Audit Engagements

It is important to remember that internal auditors do more than just financial audits (although this is still an important part of their job in order to protect the assets of your organization). Internal auditors perform several other types of engagements, as well. It is sometimes possible for a department to request an audit. Understanding the various types of audit activities may help you to get the most out of the experience:

◆ Compliance Audits: Reviewing a department or process to assess compliance with relevant internal policies and procedures, as well as external regulations. For example, internal auditors might review the institution’s cost-sharing policy for compliance with Office of Management and Budget Circular A-21 and National Institutes of Health and other sponsor requirements.

◆ Operational Audits: Reviewing a department or process to identify ways to make it work better or to use fewer resources. For example, internal auditors might review the operations of the procurement department to validate that the best choices are being made to save the university money, while still making purchases in a timely manner.

◆ Risk Assessments: Looking at everything that could go wrong in an institution (including the possibility of missed opportunities), and determining what the biggest risks are. Internal audit generally performs an entity-wide risk assessment on an annual basis to provide the foundation for its annual audit plan; however, it may also perform a risk assessment for a school or department. For example, prior to performing a financial audit at the medical school, internal auditors might perform a risk assessment in order to determine what departments are more likely to have something go wrong, and then focus audit efforts on those departments.

◆ Fraud Investigations: Examining allegations of fraud and performing a variety of audit procedures, including detailed testing, interviews, and analytical assessments, to determine whether fraud has occurred, how it occurred, and what amount of money and other assets were involved. For example, internal auditors at many institutions are responsible for investigating allegations made via the university’s anonymous hotline.
Positive Impacts of Internal Audit Engagements

Each of these types of engagements can have positive impacts, both for the university as a whole and for the department being reviewed. At an institution-wide level, internal audit can provide a comprehensive and concise view of risk throughout the organization, help management and administrators to balance competing priorities with limited resources, and provide practical advice for streamlining processes and strengthening internal controls.

At a departmental level, your internal auditors can also provide valuable assistance by:

◆ Helping to identify fraud, waste, or abuse in your group that could be jeopardizing your mission or wasting resources. If one of your researchers were stealing valuable equipment, you’d want to know, right?

◆ Reviewing your processes and internal controls, and sharing relevant recommendations to improve efficiency and compliance in your department. You may be pleasantly surprised to find that, rather than adding additional bureaucratic levels, an audit could actually include recommending the removal of unnecessary controls!

◆ Having a strong voice that gets management’s attention, support, and funding for changes such as additional resources, enhanced processes or better systems via internal audit’s usually direct reporting relationship to senior management and the audit committee of the board of trustees. For example, your internal auditors might recommend that your department cannot function effectively without an additional administrative FTE. Wouldn’t it be nice to get some additional help?

We hope that you will start to put some of this knowledge into practice – not only to survive the audit process but also to add value to your organization.

Leveraging Internal Audit for Success
Raina Rose Tagle, Kimberly Ginn, and Ashley Deihr, Baker Tilly

Surviving an Audit: The Basics
When you get a notification that your department will be audited, what is your first thought? Is it, “Wait, who is coming? Why my department? What will I have to do? And how long is this going to last?”

Welcome back to our three-part series on working with internal audit, including some insight into these questions and hints for staying out of trouble. In the first article, we discussed the past, present, and future of the internal audit profession and how certain types of internal audits can actually be helpful. In this second article, we share with you the nuts and bolts of the internal audit process and provide terminology for “talking the talk” when interacting with internal auditors. Look for our third article, offering specific ideas for leveraging internal audit to help your department, in an upcoming issue of NCURA Magazine.

Like many disciplines, internal auditors are guided by a professional association that promulgates standards, provides certifications, and shares best practices for the profession (see the Institute of Internal Auditors (IIA) website at www.theiia.org). While common components comprise most internal audit processes, HOW the audit process unfolds will be impacted by your internal auditor’s mentality (e.g., “gotcha” versus helpful ally) and can be greatly influenced by your taking proactive steps to make the process go more smoothly. To arm you with knowledge and tactics to enhance your experience with internal audits, we outline participants in the audit process, the typical phases in the process, approaches for addressing prevalent challenges, and key terminology.

Participants in the Audit Process
A solid first step in surviving an audit is understanding where you fit into the process. Depending on your institution and the audit scope, there could be a handful or more than a dozen of individuals participating in the audit process, typically including the following:

Audit Committee: This Board of Trustees committee oversees the performance of the internal audit function, approves the annual plan drafted by internal audit, and reviews the audit results. Internal audit’s ultimate fealty is to the audit committee.

Executive Leadership and Management: On a day-to-day basis, internal auditors report administratively to one or more members of the institution’s executive leadership, such as a chief financial officer or an executive vice president. Internal audits should work collaboratively with executive management on annual audit planning, and should share audit results with management before reporting to the audit committee.

1 This article is reprinted from the NCURA Magazine, March/April 2010, Volume XLII, No. 2. It is used with permission of the publisher.
Department: Each internal audit addresses the activities of one or more departments – either an academic area (such as biology or mechanical engineering) or a functional area (such as sponsored research or procurement). Ideally, internal auditors gain context for the audit by discussing the department’s strategies and operations with the head of the department, and collaborate with department administration to accomplish the audit.

Process Owner: Internal auditors work with “process owners” to understand policies, procedures, and internal controls at a detailed level. For example, the head of the accounts payable function may be the process owner for payment of vendor invoices.

The Audit Process and How You Fit In
So, you may be asking, “How can I help in this process?” Or, perhaps more likely, “How can I make this process easier for me?” Well, start by understanding the overall audit process and specific actions that you can take to minimize the pain involved in an audit.

In the following sections, we outline challenges that you may encounter when you’re being audited and related ways to influence the audit process for the betterment of the audit, your department, and your institution.

Figure 3120.6-1. Most internal audits involve four phases

<table>
<thead>
<tr>
<th>Phase 1 - Audit Planning</th>
<th>Phase 2 - Access Design of Internal Controls</th>
<th>Phase 3 - Test Transactions and Analyze Results</th>
<th>Phase 4 - Reporting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Determine the audit objectives, scope, timing, and necessary resources to conduct the audit</td>
<td>Gather information about the process to be audited, and assess the adequacy of internal controls.</td>
<td>Conduct interviews, test transactions, analyze the results of the testing, and formulate preliminary observations and findings.</td>
<td>Communicate the results of the audit to the department, management, and the audit committee.</td>
</tr>
</tbody>
</table>

Phase I – Audit Planning
In the Audit Planning phase, the auditors determine their objectives, scope, timing, and resources needed for the audit. At this point, the auditors have decided broadly what they are going to audit (e.g., the effort reporting process). However, the specific faculty and staff, time period, department, and other foci may not yet have been decided, and this is where you can provide input.

Figure 3120.6-2. Phase I – Audit Planning

<table>
<thead>
<tr>
<th>Audit Challenges</th>
<th>Suggested Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inefficiency and Disruption to Operations: The auditors do not know whom to ask for what types of information, so they ask everyone for everything, resulting in duplicated effort (on your part!).</td>
<td>Designate an Audit Liaison: Assign an audit liaison from your department to work directly with the auditors, enabling more direct and effective communication. Likewise, ask your internal audit team to designate a main point of contact for your department.</td>
</tr>
<tr>
<td>Miscommunication: The auditors ask for something (using their terminology, not yours) and you try to respond, but give them the wrong thing.</td>
<td>Educate the Auditors: Take the time to teach the auditors how you describe your department so that you are speaking the same language. Educate Yourself: Understand and use audit lingo to bridge any communication gap (and re-read this article!).</td>
</tr>
</tbody>
</table>
Supplementary Material

<table>
<thead>
<tr>
<th>Audit Challenges</th>
<th>Suggested Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheduling Issues: The auditors are asking for large quantities of documentation, but your staff is busy with month-end reporting.</td>
<td>Proactively Share Conflicts: Provide your schedule and any timing constraints to the auditors as soon as you are notified of a pending audit.</td>
</tr>
<tr>
<td>No New Information: The auditors have a bunch of findings, but you already knew about all of them. Now they have wasted your time and the institution’s resources by taking your watch to tell you what time it is.</td>
<td>Disclose Known Issues: Outline your department’s strengths and weaknesses so that the internal auditors will spend less time finding things that you already know and will potentially allocate more time to collaborating with you on practical solutions to address your department’s issues.</td>
</tr>
<tr>
<td>Confusion about the Audit’s Purpose: You don’t understand why your department was selected and why you have to do what amounts to a second job in supporting the audit.</td>
<td>Ask Questions: To increase your ability to provide the auditors with what they need, ask the auditors how the audit area was selected. It could be the result of a theft of petty cash, a process new to your institution (such as automated effort reporting), an area of focus for government auditors (such as human subject privacy or direct charging of administrative costs), or a request from the audit committee.</td>
</tr>
</tbody>
</table>

**Phase 2 – Assess Design of Internal Controls**

In this phase, the auditor gathers information about the process to be audited and assesses the adequacy of internal controls. Auditors use the information learned through the first two phases to design the audit work program, including any transaction testing procedures that they may plan to perform in order to assess compliance with your specific policies, procedures, and/or sponsor requirements.

**Figure 3120.6-3. Phase 2 – Assess Design of Internal Controls**

<table>
<thead>
<tr>
<th>Audit Challenges</th>
<th>Suggested Actions</th>
</tr>
</thead>
</table>
| Misunderstanding of Your Processes and Controls: The auditors can’t seem to understand how your processes work. | **Illustrate:** Use real life documents to show exactly how the process works. Invite the auditors to sit with you and observe as you perform your responsibilities that relate to the audit.  
**Describe the Department’s Activities:** Remember that auditors are generally not scientists. Walk them through the scientific aspects of your programs at a high level to enable them to understand better the purpose of your research and the related financial transactions. For example, the auditors may question non-travel-related food items that are not typically allowed to be charged to a grant. If you have explained that your human research subjects donate blood, then the auditors will be more likely to understand the appropriateness of charging the cost of cookies and orange juice to a grant.  
**Review the Work before Conclusions Are Made:** Ask to review the draft documentation that the auditors create of your processes and controls to ensure their accuracy before the auditors design testing plans, or report control weaknesses, based on this documentation. |

**Phase 3 – Test Transactions and Analyze Results**

This phase can include gathering documentation, conducting interviews, performing testing procedures, analyzing the results of the testing, and formulating preliminary observations and findings.

</table>
**Key Terminology**

The following summarizes the key activities and “buzz” words related to the audit process, organized by phase of the audit:

**Phase 1 - Audit Planning**
- **Risk Assessment**: The process of reviewing an institution’s operations and determining the areas of greatest exposure.
- **Audit Plan**: The annual blueprint for what areas will be reviewed by internal audit, created based on the results of the Risk Assessment.
- **Opening Conference**: The initial meeting between internal audit and department management and process owner(s), discussing the audit work to be performed.
- **Audit Scope and Approach**: The areas that the audit will address (Scope) and the related audit activities (Approach).
- **Information Request**: List of files, policies, procedures, or other information that internal audit will need to complete its work.
- **Process**: Series of activities or tasks that produces a specific outcome (e.g., charging costs to a grant).

**Phase 2 - Assess Design of Internal Controls**
- **Interviews**: Meetings with knowledgeable personnel to better understand the processes and operations of the department.
- **Process Documentation**: Visual representation of the flow of information or work steps involved in completing specific processes.
- **Internal Control**: A process, including policies, procedures, monitoring techniques, and attitudes, that helps to achieve a desired result.
- **Design of Controls**: How well internal controls would address related risks if the controls operated as intended.
- **Risk Mitigation**: Actions taken to reduce the exposure/impact of what could go wrong.
- **Audit Work Program**: Detailed procedures that guide internal audit in the completion of the project.

**Phase 3 - Test Transactions and Analyze Results**
- **Fieldwork**: Action steps necessary for internal audit to carry out their work to achieve the objectives of the audit.
- **Testing Procedures**: Processes for determining the effectiveness of controls and existence of risk(s); may include sample selection, interviews, process walkthroughs, and transaction testing.
- **Audit Findings**: Observations noted during fieldwork that are inconsistent with proper practices; findings typically highlight an increased risk to the institution/
organization or a failure of controls.
◆ Recommendations: Suggested changes or enhancements to policies or processes to strengthen internal controls or improve efficiency and effectiveness.

**Phase 4 - Reporting**
◆ Draft Audit Report: The result of internal audit’s work, typically in a memo form detailing the audit’s background and scope, work performed, summary of observations, and recommendations.
◆ Closing Conference: Review of the draft report with department management and/or process owner(s) to ensure understanding and agreement among both parties before information is shared with executive management.
◆ Management’s Response: Management’s reaction to the audit report, and its plan for addressing the observations and recommendations raised.
◆ Final Audit Report: Version of the audit report, including Management’s Response, which is presented to the Audit Committee and signifies the completion of the audit.

You have probably noticed that communication is a pervasive theme throughout this article, both by the auditors and by the audit participants. If you feel out of the loop, contact your internal auditor as soon as possible. Remember that internal auditors are people, too (hey, we know what you’re thinking!). Your proactive attention and engagement can go a long way toward making an audit more useful, and less painful, for you and your department.

3120.7  **Tips for Owning Your Next A-133 Audit¹**
Adrienne Larmett, Ashley Deihr, and Kimberly Ginn, Baker Tilly

**Introduction**
Audit: a word synonymous with panic...dread...root canal. Let’s face it; audits are not always the most pleasant of experiences. In fact, there are a number of other activities we would rather be focused on, such as managing high-risk subrecipients, memorizing export control regulations, or reading the new Office of Management and Budget (OMB) Uniform Guidance cover to cover. However, if your institution expends more than $500,000 (increasing to $750,000 come December 26, 2014) in federal funds or awards per year, you must submit to a single audit, more commonly known as the OMB Circular A-133 audit (or “A-133 audit” for short), on an annual basis.

On a scale from “Internal Audit” to “Office of Inspector General Audit,” the A-133 audit falls somewhere in the middle in terms of the level of stress induced. Traditionally the A-133 audit has been the federal government’s way of obtaining reasonable assurance, via an independent third party auditor (i.e., a certified public accounting firm), that institutions are being good stewards of federal award funds and are in compliance with applicable federal, state, sponsor, and other award-specific regulations. Many view the A-133 audit as a “necessary evil”- something that has to be done in order for your institution to receive the funding to perform some really fantastic research.

Although the A-133 audit is routine and fairly standard from year to year, it has a way of turning even the most proactive managers into reactive participants. Even when you have a great relationship with your A-133 auditors, the process can sometimes feel like an advanced game of “fetch”. But it doesn’t have to be that way! Below we outline some tips for taking back control of your next A-133 audit.

**Tips for owning the audit process**

1. **Designate a Dedicated Audit Liaison**
Many institutions allocate relatively small portions of time from a number of their Post-Award and Grant Accounting Directors and Managers to the A-133 audit. Unfortunately, this takes research administrators away from their key functions and can hinder your day-to-day operations. One best practice is to assign a dedicated audit liaison whose sole responsibility during the A-133 audit is to interact with the external audit team and coordinate your institution’s response (e.g., meetings, document requests, logistics, etc.) By having a designated audit liaison, the audit process will go more smoothly, research administrators will be able to focus on their core job responsibilities (administering research!), and the audit will not detract from institutional operations. Depending on the size of your institution this person does not have to be full time, and may work on other compliance activities during other times of the year.

¹ This article is reprinted from the *NCURA Magazine*, October / November 2014, Volume XLVI, No. 5. It is used with permission of the publisher.
2. Make Logistics Work for You
Auditors often prefer that your institution use the audit firm’s technology (e.g., Sharepoint sites) for document uploads, which can be time-consuming and inconvenient for your institution. Discuss these logistics at the beginning of the audit process and agree upon a sharing mechanism that works for your institution as well as the audit team. This will ultimately enable you to meet document request deadlines and keep the audit timeline moving forward while not overburdening your institutional resources.

3. Hold Auditors to a Time Schedule
It can sometimes feel that auditors create a “one-way street” with deadlines. The auditors may set seemingly unreasonable timelines for your institution, or want to hold meetings according to their schedules. To avoid these timing challenges, develop and agree to a joint timeline upfront, and hold the team accountable to that schedule. In addition, encourage the participation of audit managers and partners throughout the audit so that they are informed of any issues in a timely manner. This may help prevent a last minute time crunch during audit manager or partner review.

4. Educate your A-133 audit team
You know your institution better than anyone. Consider sharing policies, processes, documented controls etc. with your audit team in advance; it can help save time (and frustration) on the tail-end.

5. Be Prepared and Responsive
Being prepared allows you to more easily and quickly respond to questions and requests. To prepare:
◆ Review meeting agendas and understand the purpose of each meeting in advance.
◆ Review and have all documentation readily available.
◆ Anticipate questions related to the documentation requested.
◆ Maintain documentation of your procedures, systems, and internal controls.
◆ Re-familiarize yourself and your team with your protocols, controls, and records.
◆ Know and understand relevant regulations and guidance.
◆ Document appropriate approvals and maintain an audit trail of supporting documentation.
◆ Establish a method to leverage lessons learned from past audits.

6. Listen Carefully
Listen carefully in order to understand the auditor’s questions before answering. Ask for clarification when you do not understand the auditors’ questions, assumptions, or conclusions. Rather than debating, try to clarify misunderstandings with positive rather than negative statements.
7. Answer the Question Being Asked
   ◆ Provide only the requested information. Don’t answer unasked questions.
   ◆ Respond to questions with straightforward, honest, and complete answers.
   ◆ Remember that it’s ok to say, “I don’t know, but I will get back to you with the answer.”
   ◆ Limit your answers and comments to areas where you have first-hand knowledge and/or supporting documentation. If you don’t have the information, rather than speculating, bring in the correct person to provide the answer.
   ◆ Politely decline to answer questions you don’t fully understand until a central administrative contact within your department or school is present.

8. Participate Actively
Don’t be a passive participant in meetings. Rather, make it a point to take notes (e.g., questions asked and answers given, documents requested and provided, discussions of complex issues), keep copies of documents provided, and ensure that all original records provided to the audit team are returned at the end of the audit. In addition, use meetings as an opportunity to learn from your auditors, including ways to improve the process for next time, or how to better document controls.

9. Don’t Wait for Reporting and Findings
If, in the course of the audit, you find inappropriate charges or inadequate procedures (e.g., untimely cost transfers, unallowable charges), resolve the issue immediately rather than waiting for the audit report to be finalized.

10. Don’t Always Accept Initial Findings
If findings are stated, work through them with the auditors. Provide additional documentation or back-up to support your position. This will enable the audit team to make a full evaluation of the situation and potentially come to a different conclusion. While your institution has the right to dispute findings, under certain circumstances it may be best to accept a finding gracefully and work to correct the error as soon as possible.

11. Be Professional at All Times
The audit team is most likely working in your office and may be listening to or observing your behavior and comments.

Conclusion
The A-133 audit process will always present complexities and unforeseen challenges. However, it does not have to perpetually invoke your “fight or flight response.” By taking ownership, planning, and adopting a proactive, positive attitude, your institution can take meaningful steps to make the process less stressful and mutually beneficial to all parties.
About the Authors

Adrienne Larmett, MBA, is a Senior Consultant with the Higher Education and Research Institutions practice at Baker Tilly. With more than 11 years of experience, Adrienne specializes in sponsored research compliance, and grants administration consulting. Prior to joining Baker Tilly, she worked in research administration positions at Temple University and the University of Pennsylvania.

Ashley Deihr, CPA, CFE, is a Manager with the Higher Education and Research Institutions practice at Baker Tilly. With 10 years of experience, Ashley specializes in sponsored research compliance, and financial accounting and management.

Kimberly Ginn, CIA, is a Partner with the Higher Education and Research Institutions practice at Baker Tilly. With more than 13 years of experience, Kimberly provides consulting services to many higher education institutions, with a specific focus on sponsored research operations and compliance. Prior to joining the firm, Kimberly worked as internal auditor for the Department of Defense Office of Inspector General conducting contract, procurement, and environmental audits.
3120.8 **Federal Agencies Single Audit Contacts for UG Implementation**

Council on Financial Assistance Reform

The list below of agency point of contacts is available to address questions from the grantee and audit communities related to the implementation of the Uniform Guidance.

Contact the National Single Audit Coordinators when you have a technical audit question regarding your single audit such as the determination of your Federal cognizant or oversight audit agency, the due date for audit submission, major program determination, identification of direct and material compliance requirements or single audit quality issues.

Contact the SA Key Management Liaisons when you have a question that is directly related to a specific Federal program such the applicability of the administrative, cost and Single Audit requirements for that program, the prior approval process on certain costs for that program, the due date for financial or technical reports or resolution of single audit findings for that program.

### Single Audit Contacts

Contact the National Single Audit Coordinators when you have a technical audit question regarding your single audit such as the determination of your Federal cognizant or oversight audit agency, the due date for audit submission, major program determination, identification of direct and material compliance requirements or Single audit quality issues.

Contact the SA Key Management Liaisons when you have a question that is directly related to a specific Federal program such the applicability of the administrative, cost and Single Audit requirements for that program, the prior approval process on certain costs for that program, the due date for financial or technical reports or resolution of single audit findings for that program.

This section includes practical guidance and tools — checklists, flowcharts, etc. — relating to interactions with auditors. These materials are culled from a variety of authoritative sources.

**Checklist of Documentation Practices for Audit Follow Up**

AIS editors

OMB Circular A-133 provides only broad guidance regarding follow-up on prior audit findings. It is up to the awarding agencies and recipient institutions to determine the kinds of documentation and tracking systems to use to accomplish basic audit follow-up. The following is a list of suggested practices:

- An official audit resolution file should be established for each audit report.
- Each file should contain, at a minimum, the following documents:
  - audit report data obtained from the Federal Audit Clearinghouse (http://harvester.census.gov/sac)
  - a listing of the audit findings requiring resolution
  - a copy of the audit report or pages of the audit report that provide relevant information to the resolution of the audit findings, including the findings, the auditee’s corrective action plan or response to the findings, the section on the status of prior year findings, and the portion of the Schedule of Expenditures of Federal Awards relating to the findings
  - a listing of the triage decisions for each audit finding
  - documentation of all correspondence/communication with the auditee, the auditor, and other appropriate individuals, including corrective action plans and necessary work papers
  - a copy of any final determination letters or management decisions issued
  - an audit clearance document indicating that all corrective actions have been taken
  - documentation pertaining to audit follow-up activities, e.g., documentation from the auditee substantiating the corrective action taken, results of any monitoring visits, relevant information from the next year’s audit that reports whether appropriate corrective action was taken on a prior year finding
  - documented evaluations or conclusions that support the adequacy of the corrective actions taken by the auditee

◆ Each official file should also contain, as appropriate, the following documents:
  • documented evidence of technical assistance provided
  • comments from legal counsel or independent audit personnel
  • any necessary concurrences for resolution of findings involving large amounts of questioned costs
  • documents concerning any unique circumstances
Checklist for Conducting an Entrance Conference.

When arranging for an entrance conference between the audit coordinator or team and the auditor field staff consider that this may be the last opportunity for the institution to reach agreement or to reaffirm understandings with the auditors on important aspects of the audit process (see ¶3105.4). Some of the key topics that should be addressed at the entrance conference include the following:

- **Scope of Audit.** Obtain an agreement with the auditors concerning the full scope of the audit, including the extent of testing procedures for the compliance requirements. This could be presented in the form of a “scope document,” which details the overall intent of, as well as topical areas to be covered in, the audit. Identify which of the institution’s activities are considered to be “major programs,” which (if any) related entities, such as affiliated foundations, hospitals, or laboratories, are to be covered, and what methods of obtaining data (transactions to be tested, persons to be interviewed, etc.) the auditors plan to use.

- **Timetable.** Establish a timetable that includes an indication of when the following is likely to happen: information requests will be issued, on-site fieldwork is to begin and end, a draft audit report is available, and a final report is issued. Estimated milestone dates should also be discussed.

- **Compliance Requirements.** If the institution receives funds from any federal grant program that is not listed in the A-133 Compliance Supplement, the institution and the auditors should discuss and agree on what the compliance requirements are for that program. This is simply a matter of making sure that all parties understand and agree on what the applicable requirements are because it is these requirements the auditor will test to reach an opinion on the institution’s compliance.

- **Documents to Be Provided.** Discuss the documents and other information the institution has compiled or intends to make available to the auditors and reach agreement on whether that information is adequate. If not, determine what further information the auditors will require and when the institution will provide it. In this regard, the institution and the auditors should agree on the contact(s) from whom to request the various types of information.

- **Work Papers.** Confirm with the auditors that they will provide the institution with copies of audit work papers as it requests. (This issue should have been addressed as part of the auditor engagement process.) The institution may need access to the work papers if there are adverse findings that it wishes to contest. Equally important, the auditors’ work papers may be an issue if the federal government questions the adequacy of the audit.

- **Potential Adverse Findings.** Obtain the agreement of the audit field staff to discuss potential adverse findings with the institution as problem areas are discovered, ensuring adequate time to correct misunderstandings or resolve potential problems. The institution should schedule frequent meetings, — at least weekly — and maintain daily personal contact with the auditors in order to respond promptly to any questions or concerns.
❑ **Adverse Findings in Draft Form.** Obtain a commitment from the auditors to present any adverse findings not resolved during the field work in draft report form, so the institution can prepare a response for inclusion in the final report. The institution and the auditors also should agree on the circumstances under which the auditors would contact federal officials during the audit. At a minimum, the institution should obtain the commitment of the auditors to inform the institution of such a contact.

❑ **‘Illegal Acts.’** Because findings of “illegal acts” during the audit may require immediate reports to appropriate officials outside of the college or university, the institution should ascertain from the auditors the kind of conduct that they consider to be “illegal acts.” This is an important consideration because the definition of “illegal acts” in *Government Auditing Standards* is not precise, and a report of an illegal act almost certainly will result in further scrutiny (by other audit officials, an agency inspector general, etc.) even if the assertion is ultimately shown to be unfounded.

❑ **Exit Interview.** Obtain a commitment for an exit conference with the field staff so that the institution will have an opportunity to resolve audit findings and anticipate adverse findings that cannot be resolved and will be reflected in the audit report. The institution should consider recording the entrance and exit conferences and, at a minimum, keep minutes of those conferences. (The institution should inform the auditor of its intent to record the exist interview and should provide copies to the auditors to avoid potential misunderstandings.)
\[\textbf{3190} \textbf{Knowledge Check}\]

AIS editors

The Q&As at \[3190.1\] are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 3100 has been understood. 

*Note:* For the answer key for \[3190.1\], see \[3190.3\], which appears on a separate page (page 3190:5) for testing purposes.

Discussion topics at \[3190.2\] are designed to engender dialogue among staff on general issues of importance in the field.

\[\textbf{3190.1} \textbf{Q&As}\]

1. The following typically is conducted to ensure the institution has infrastructure to properly manage a particular award in accordance with sponsor guidelines:
   (a) Program-specific audit
   (b) Internal audit
   (c) Entrance conference
   (d) Exit conference

2. Internal controls should be periodically tested for all of the following EXCEPT:
   (a) Compliance
   (b) Location
   (c) Reliability
   (d) Integrity

3. A-133 audits generally are conducted by
   (a) Outside audit firms
   (b) Agency program staff
   (c) Representatives of a federal office of inspector general
   (d) An institution’s general or legal counsel

4. Typically, an audit letter from a federal agency will include all of the following EXCEPT:
   (a) The program or topical area to be covered during the audit
   (b) The estimated start and end dates
   (c) The anticipated amount of time for fieldwork
   (d) The cost of the audit
5. The sample is a test of the whole population and _____ takes the results of the sample and draws conclusions for the entire population. What word(s) complete(s) the blank?

(a) Fieldwork
(b) Extrapolation
(c) Statistical investigation
(d) Corrective action

6. During the course of the fieldwork, the OSP should remain involved by doing all of the following EXCEPT:

(a) Observe the daily activities of and requesting daily status updates from the audit team.
(b) Make a concerted effort to keep the audit on schedule.
(c) Periodically request a listing of any potential questioned costs or findings.
(d) Meet with all individuals to be interviewed by the auditors to “coach” them on the appropriate responses.

7. Final audit reports issued by federal agencies typically do NOT include which of the following sections:

(a) A statement of the scope and objectives of the audit
(b) The institution’s formal written response to the audit findings and recommendations
(c) Names of principal investigators and project staff who were interviewed by the auditors
(d) An executive summary

8. Which of the following is NOT true of OIG audit reports?

(a) They are often available on agency Web sites.
(b) They are usually published in the Federal Register.
(c) They can help an institution become aware of potential areas of federal agency concerns.
(d) They can aid an institution in conducting a self-assessment.

9. According to ¶3105, which of the following is TRUE?

(a) The outcome of an audit is heavily dependent on the institution’s preparedness.
(b) The audit readiness process is standardized from institution to institution.
(c) Background of external auditors is standard across federal agencies.
(d) Once the audit letter is received, little can be done to prepare for audit.

3190.2 Discussion Topics

1. Discuss the differences between internal and external audits. Be sure to include in your discussion “who” is doing the audit in each case and what they are likely to be looking for.

2. Discuss the role of “documentation” as a tool for compliance and as a tool to help an institution prepare for an audit.

3. An institution can proactively evaluate its preparedness and readiness for an audit by conducting a self-assessment of its internal controls. How can this self-assessment process be streamlined? How often should such self-assessment be undertaken? Discuss how published audit reports by the various offices of inspectors general could assist in this effort.

4. Audits can consume much staff time and be disruptive to normal workflow. How can the impact of an audit be mitigated?

5. What is meant by an internal control? What internal controls are in place at your institution and how do they further your institution’s goals of effective grants administration? Is there one set of controls regardless of the source of funding? Or do the controls for federal-sponsored funding differ from those in place for industry-sponsored awards?

6. The NSF OIG audits of effort reporting at colleges and universities (see ¶3320.5) are routinely concluding that the A-133 audit is not sufficient to satisfy the A-21 requirement of an independent evaluation of the payroll distribution system. What process is your institution using to ensure that this evaluation is being properly done?

7. Properly accounting for American Recovery and Reinvestment Act funds may require certain adjustments to your audit preparation. How is your office responding?
13190.3 **Answer Key**

1. (a) Program-specific audit
2. (b) Location
3. (a) Outside audit firms
4. (d) The cost of the audit
5. (b) Extrapolation
6. (d) Meet with all individuals to be interviewed by the auditors to “coach” them on the appropriate responses.
7. (c) Names of principal investigators and project staff who were interviewed by the auditors
8. (b) They are usually published in the *Federal Register*.
9. (a) The outcome of an audit is heavily dependent on the institution’s preparedness.

Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter provides general descriptions of and strategies for managing the post-award functions in a sponsored programs office.

In the usual life cycle of a grant, there is both a “pre-award” and a “post-award” phase. The pre-award phase includes the preparation of the proposal, its submission, any subsequent negotiation of award terms and conditions, acceptance of the award, and initiation of the project. The post-award phase includes everything that happens from the time the award has been initiated until the project has been completed and the award closed out. Jane Youngers of the University of Texas Health Science Center at San Antonio identifies and explicates the full range of post-award functions that are typically required for the administration of sponsored projects, whether funded by grants, contracts, or cooperative agreements.

Youngers has assembled a very complete collection of post-award topics, both financial and nonfinancial. Among the topics that Youngers addresses are award terms and conditions, allowable costs, effort certification, cost transfers, subrecipient monitoring, and award reporting and closeout. For most of these topics, Youngers has included illustrations of institutional policies, procedures, forms, and policy guidelines from leading research universities, both public and private. These illustrations are particularly useful for those charged with the responsibility of reviewing and improving the policies, procedures, and forms at their own institution. As Youngers so clearly points out, post-award administration covers a multitude of issues and topics. Failure to adequately address any of these topics could easily land an institution on the front page of the local newspaper.

Chapter 3300 will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶3305, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶3320), practical tools (at ¶3330), case studies (¶3340), and statistics and survey results (at ¶3360). A “knowledge check” containing Q&As and discussion topics is included at ¶3390.
¶3305 Post-Award Administration

Jane A. Youngers, Assistant Vice President for Research and Sponsored Programs (emeritus)
The University of Texas Health Science Center at San Antonio

The purpose of this chapter is not to visit the specific requirements of each regulation or policy that makes up post-award administration. Rather, the discussion focuses on management for post-award administration. Because the federal government is the primary sponsor of college and university sponsored programs, emphasis is placed on the federal requirements relating to post-award administration. In fact, as one examines the policies and procedures of most institutions, it becomes apparent that most of the systems in place mirror the federal requirements.

This chapter focuses on major institutional systems requirements per se and addresses them in the context of major post-award functions.

¶3305.1 Overview of Post-Award Administration

At its simplest, post-award administration is what happens after the proposal is submitted and the award is made. This area covers a multitude of policy issues and processes both financial and nonfinancial. When an institution receives an award from an external sponsor, it agrees to certain terms and conditions. In addition to conducting the work proposed, the institution also agrees to be a good steward of external funds. The post-award administrative function is in place to ensure good stewardship.

Assistance to Faculty

However, good stewardship is not the only important purpose that the post-award administrative function performs. It should be the mission of any office or unit that provides post-award administration to provide assistance to faculty members as they conduct the funded project and to the department/unit administrators that provide the frontline sponsored programs administrative tasks. That assistance can be provided in many forms — from producing easy to understand periodic reports that allow the investigator to know the ongoing financial status of the project to assisting with the closeout of the award, to providing appropriate information and training to the department/unit administrator, to anything in between.

¶3305.2 Organization and Staffing Considerations

There is no one correct way to organize the post-award functions of project administration. At some institutions, there is a clear delineation of pre-award and post-award activities. Once the proposal is submitted and an award has been made, further administration is turned over to the post-award administration unit or staff. For a majority of institutions, the traditional sponsored programs office handles preaward and post-award nonfinancial matters such as the issuance of subawards and obtaining post-award approval from sponsors, where required. (For a full discussion of pre-award administration, see Chapter 2500.)
Another model that is clearly becoming more popular is the consolidation of the pre- and post-award functions into one sponsored programs office creating, in effect, one-stop shopping. Each institution must decide for itself what works best in its organizational structure and culture. Likewise, the resources required to perform the post-award project administration function are highly dependent on the amount of external funding, the mix of such funding, and the structure of project administration at the particular institution.

Organizational structure is particularly important. The amount and type of centralized support is highly dependent upon the support at the institutional college, departmental, or individual research-unit level. If the institution has strong departmental administration personnel, it is less likely that the post-award office will need to provide extensive day-to-day administration on an individual project level. Likewise, without strong administrative support at the project level, the post-award office will be the office of first resort for investigators. (For an overview of institutional organizational models, see Chapter 300.)

**Staffing Concerns**

The amount of staffing required for the post-award function of sponsored programs administration is a direct result of the organizational structure of the institution. In addition, depending on the functions of the post-award office, staffing may have a direct relationship to the institution’s cash flow position. Because one of the traditional functions of a post-award administration office is cash management, including letter of credit drawdown and billing, having the correct amount of staffing makes a difference in the amount of unreimbursed costs an institution carries. Not to be ignored are the spate of recent audit settlements involving post-award issues and the increasing interest by the federal government, as the primary sponsor at most institutions, in post-award administration requirements such as effort certification, cost transfers, and subrecipient monitoring. These types of activities have caused many institutions to increase their post-award administrative staffing.

While staffing-level metrics have often been attempted, no universal models have been developed. Why? As stated above, organizational structure plays a large role and the precise functions in any one office dictate the staffing levels. While one institution may have three individuals charged with monitoring the financial status of the award and producing financial reports to external sponsors, another may have five individuals who not only perform those tasks but also invoice sponsors. Consequently, it is incumbent upon the institution itself to determine the tasks that need to be performed and the amount of staffing necessary to accomplish those tasks.

**3305.3 Communication Issues**

As with any administrative function of an institution, communication both within the post-award administrative units and to their community — including departmental and project staff, investigators, and the external sponsor — is paramount.

There are many ways communication can be accomplished. At the institutional level, a sponsored programs administration Web site is often used as the format to
post policies, reference grantee requirements, and announce new initiatives. Some institutions have established a listserv for investigators and administrators as an effective way of communicating policies. Others have developed investigator guides. (For a full discussion of communication issues, see Chapter 500.)

It is also important that each individual and institutional office (both centrally and at the department/unit level) understand its specific role and responsibilities in project administration. A sample of an investigator responsibility statement is shown in Figure 1.

---

**Figure 1: Sample Investigator’s Responsibilities**

Although University XYZ is legally accountable to the sponsor as the official recipient of a grant or contract, the principal investigator or project director is responsible for the proper fiscal management and conduct of the project. To assist the faculty member in this very important responsibility, the university provides supporting administrative services and has established policies and procedures to help meet both sponsor and university administrative requirements. The university is, ultimately, legally and financially responsible and accountable to the sponsor for the performance of the sponsored activity and the proper use of funds, but without the full cooperation and vigilance of the PI, the university would fail in its stewardship role. In the truest sense, therefore, the sponsored programs process is a joint effort between the PI and the university; both must do their parts well in order to achieve success.

The PI must comply with all the terms and conditions imposed by the sponsor and see that project funds are managed efficiently and effectively within approved budgets. The PI must initiate all required approvals for budgetary and programmatic changes that may be necessary during the project. The PI is likewise responsible for the preparation and timely submission of technical reports and any other required deliverables.

In addition, the PI must ensure that all project members are familiar with and comply with the intellectual property and publication clauses of the grant or contract, with federal policies regarding research safety, protections, and integrity, and with applicable U.S. export control regulations. Inventions and copyrightable material produced under sponsored projects must be governed by the specific terms of the award received from the sponsor and must be handled in accordance with university policy.

Projects are conducted as a function of the appropriate academic unit (department, college, or institute). If the project is over-expended or if auditors disallow an expenditure, the university must ask the appropriate academic unit to cover this cost.

The PI has a responsibility to the sponsor, the department, the college or institute, and the university to ensure that the requirements of the sponsored project are met and the policies of the university are followed. Research policies are found at ______________________.

*Source:* Adapted from Pennsylvania State University materials.
Training and Education

Not to be dismissed are the training and educational opportunities that the post-administration office should afford the sponsored research community. Some institutions have made such training and educational programs mandatory at the investigator and/or department/unit administrator level. At present the federal government has not mandated any administrative training requirements at the post-award level.¹

Many years ago, the Department of Health and Human Services (HHS) Office of Inspector General’s (OIG) “Draft OIG Compliance Program Guidance for Recipients of PHS Research Awards” did suggest that an appropriate compliance program should include “the training of appropriate administrators, both at the institution and department levels, faculty (including principal investigators), other staff, and contractors on award administration and other program requirements.”² The proposed guidance continued: “For example, administrative personnel who manage award funding should receive detailed training on federal cost principles and grant administration regulations and policies.”

Whether mandatory or voluntary, there are many areas of post-award administration that the research administrator may wish to consider offering training in, such as allowable costs, effort certification, and understanding financial ledgers and reports. (For a full discussion of training and education issues, see Chapter 1100.)

Department-Level Training. Often such training and education programs are aimed at the departmental administrator. Many institutions have developed comprehensive training programs for department administrators that range from voluntary to mandatory. Post-award topics as part of such multisession programs include:

- budget and expenditure rules and regulations,
- special considerations for budgeting,
- awards and negotiation,
- project setup,
- changes in awards,
- research salary and personnel issues,
- research accounting roles and responsibilities,
- F&A (facilities and administrative) costs,
- reports, and
- audits.

¹ That is not to say that there are not mandatory training requirements in certain areas such as use of human subjects, animals, and other regulatory arenas.
² 70 Fed. Reg. 71312 (Nov. 28, 2005). Subsequent to publishing the proposed guidance, the HHS OIG announced that it would not be going forward with issuing final guidance. Instead, the OIG recommended that broader, voluntary compliance guidance be developed.
Informal Gatherings. There are opportunities for more informal exchange of information and education as well that either serve to supplement the more formal training programs or simply provide information and exchange. Some sponsored programs offices present a series of brown-bag lunch sessions on the fiscal management of sponsored projects with the sole purpose of providing department staff with more detail, examples, and discussion about the day-to-day fiscal management aspects of sponsored projects. One institution holds financial administrator breakfasts to provide an opportunity for business office managers, department/unit staff, and faculty to discuss current issues in the financial administration of sponsored projects and to interact with post-award administration staff.

§3305.4 Resources

A well-trained staff with well-defined responsibilities for certain functions is paramount to success in post-award administration. Post-award administrators need to have access to current regulations and clearly written and consistently enforceable institutional policies to rely on. If they are charged with financial monitoring and/or reporting, it is critical to have a financial system in place that provides accurate, reliable information that is easily accessed.

Desk References

Important items that the post-award administrator should provide to his or her staff are desk manuals that provide resource information, sample reports, examples, correspondence, etc. and details on the execution of certain procedures. Publications such as this compendium not only serve as useful teaching and reference tools, but also keep the post-award administrator abreast of the latest developments in the post-award arena.

Professional Associations

Organizations such as the National Council of University Research Administrators (NCURA) are invaluable to the post-award administrator. Offering a diverse variety of programs including meetings, video conferences, publications, and the like, NCURA provides the sponsored programs administrator career-long learning opportunities.

Not to be dismissed in any discussion of resources is the value of networking with other administrators in sponsored programs. In fact, other than knowing the fundamentals of sponsored programs administration and having adequate institutional policies, a network of contacts at other institutions is the most valuable tool one can have. Through NCURA’s national and regional programs, such contacts can be initiated and when issues arise, there are others to contact for assistance.

Finally, in the past few years, the Internet has emerged as an invaluable resource to the post-award administrator. Most institutions publish their policies and procedures on the Web and by accessing those, the post-award administrator can locate valuable resource information.
Overview of Post-Award Requirements

The Uniform Guidance, Subpart D establishes the key requirements for post-award administration. Specifically, it sets forth the minimum standards that an organization must meet in order to be a recipient of federal assistance awards. Those requirements are in the areas of

- financial and program management,
- property standards,
- procurement standards,
- performance and financial monitoring and reporting,
- subrecipient monitoring and management,
- record retention and access,
- remedies for noncompliance,
- closeout including post-closeout adjustments and continuing responsibilities, and
- collection of amounts due.

Regulations applicable to contracts are contained in the Federal Acquisition Regulation (the FAR). While the FAR at times is more precise (e.g., in property reporting) or restrictive (e.g., in record retention requirements), it is generally assumed that if an organization meets the requirements of the Uniform Guidance, it will also meet, with exceptions, the requirements of the FAR.

Also included in the Uniform Guidance and absolutely necessary for successful post-award administration at universities are Subpart B, Cost Principles and its annual Compliance Supplement.

The combination of the regulations and policy requirements of these documents form the basis of post-award administrative requirements. (For a full discussion of the Uniform Guidance, see Chapter 1300.)

Institutional Policies and Practices

The manager of the post-award function must have sound institutional policies to rely upon as well as the appropriate means of communication and diligent enforcement of those policies. Success in the post-award area can only come through that combination of critical factors.

It is also important to review established policies and procedures to ascertain whether they are up to date and whether they are being appropriately followed. Of import to note is that various federal audits have found fault with institutions for not following their own published policies.

---

3 The Uniform Guidance can be found at https://www.ecfr.gov/cgi-bin/text idx7tpl=/ecfrbrowse/Title02/2cfr200_main_02.tpl
4 The website for the Federal Acquisition Regulation is http://acquisition.gov/comp/far/index.html.
Key Requirements
There are a multitude of requirements and tasks as part of post-award administration. Rather than attempt to cover the universe, a number of critical tasks are discussed in the following sections with emphasis placed on addressing these issues through sound policies, procedures, and educational initiatives. The topics discussed below are those post-award administrative processes/tasks that are notably significant and, in part, include the following:
◆ Award terms and conditions
◆ Allowable costs
◆ Prior approvals
◆ Effort certification
◆ Equipment
◆ Cost transfers
◆ Program Income
◆ Award reporting and closeout

Research administrators should please note that where examples are provided, these are only examples. They may not meet a particular institution’s needs, and they should not replace or substitute for the exact specifications of various statutes and regulations.

3305.6 Award Terms and Conditions
Post-award administration begins the moment an award is received. The award document must be reviewed to ascertain its terms and conditions, with respect to requirements for both financial management and nonfinancial management. Identifying any special terms and conditions at the outset and communicating those requirements is critical to assure appropriate management of the award.

Internal Notification of Award
The post-award administrator must make certain that each individual or unit involved in post-award administration understands the award terms and conditions. Some institutions accomplish this by the production of an internal notice of award that not only sets forth key information about the award, but also provides the investigator and his or her administrative unit guidance on items such as required prior approvals, award restrictions, and reporting. A sample internal notice of grant award is included as Figure 2.

Communication about invoicing and payment steps is necessary. All parties should also understand how payment will be made and, if required, who is responsible for invoicing the sponsor. For most awards billing and payment requirements
are addressed centrally; however, there may be some awards where payment is based on project milestones or more detail is required on an invoice than is provided centrally.

**Remarks:**

Example: Award not made under expanded authorities; agency approval is required for carryforward of balances into continuing year; rebudgeting in excess of 25% of total award; all foreign travel; any subawards. Progress reports are due annually, 60 days prior to end of period. No human subjects may be used until IRB approval is submitted to agency. Any publications should include the following notice: “__________.”

**Accounting Instruction:**

Example: Accounting to send invoice quarterly [agency, agency address]. Final invoice is due within 90 days of the end of the project period.

October 2017  Sponsored Research Administration
**Award Modifications**

It is also important that any award modifications be processed in a timely fashion and that the terms of the modification are communicated appropriately to the investigator and department/unit administrator. With most grants, such as those single project awards from the National Institutes of Health (NIH) and the National Science Foundation (NSF) where a new account number is not always necessary, many institutions automatically extend the award into the next budget period to allow for continued payroll, etc.

Whether or not to maintain the same account number for the continuation of a project is a procedural question that the post-award administrator must address. Here is one area where the post-award administration policies can assist the investigator and department/unit administrator. In most financial systems, payroll would not need to be redone if the account number stays the same across all years of the project or a project period.

- Many institutions look at the award terms and conditions to assist them in developing their internal practices in this area. Determining criteria often used in developing practices include the following:
  - Is the award a renewal (a new project period) or simply a continuation of an existing award?
  - Can unobligated balances be automatically carried forward or is permission required from the agency with carry-forward balances restricted until such approval is granted?
  - Are annual financial reports required?

For example, the NIH makes research project awards (commonly called R01s) for a fixed number of years known as the project period. Using the above as criteria, because a financial report is only needed at the end of the project period most institutions would only establish one account that carries through each of the years of the entire project period. When the award is renewed through a competitive submission, most institutions would then establish another account for the next project period. Where financial reports are required on an annual basis or where approval is needed to carry forward balances into the next year, most institutions establish a separate account for each year.

### 3305.7 Allowable Costs

Assuring that only allowable costs are charged to sponsored programs accounts is paramount to the post-award function. This is an area where a strong institutional policy and the development of criteria for allowability consistent with the requirements of Subpart E of the Uniform Guidance is crucial. Determinations about the appropriateness of costs are typically first made at the investigator or department level. The post-award administrator should also accept that one of his or her primary roles is to support the department/unit administrator in making costing decisions and to provide resources and documentation of cost policies to that administrator. Consequently the post-award administrator should consider developing a matrix of allowable costs citing examples and exceptions.
One such matrix is included as Figure 3. A flowchart for determining allowability of costs can also be a useful educational tool; a sample is included as Figure 4 (on page 3305:13).

Finally, any discussion of allowability should include how costs are properly allocated to a project. One way of doing this might be to provide statements documenting a cost to a project. For example, some institutions require certain specific statements of allocability on reimbursement vouchers such as “this cost is made in support of the objectives of the project.” It would also be useful to develop cost allocation guidance as part of an allowable cost policy such as the example included as Figure 5).

**Figure 3: Sample Direct Cost Guidelines**

The federal government is the largest sponsor of research and other scholarly activities at University XYZ. For that reason, the cost policies of the federal government, contained in the Uniform Guidance, 2 CFR Part E, set the standard for all sponsored activities.

For a cost to be allowable and chargeable to a sponsored program, it must meet the following tests:

◆ Reasonable (Would a prudent person incur this expense?),
◆ Allocable (Is the expense beneficial to the project?), and
◆ Consistent with institutional costing practices (Is the expense treated the same way regardless of source of funds?)

If the sponsored agreement specifically states that the expense is unallowable, it cannot be charged to the project irrespective of its appropriateness to the project.

The table below provides information regarding the allowability of some of the most common items of costs charged as direct. In the case of an inconsistency between the provisions of a specific agreement and the provisions below, the provisions of the specific agreement should govern. It is also recognized that University XYZ enters into agreements with private sponsors who have no specific rules regarding costing policies. If those agreements are not for research projects but are for other activities, certain exceptions to the following guidelines may be made.

<table>
<thead>
<tr>
<th>Direct Cost</th>
<th>Normal Treatment</th>
</tr>
</thead>
</table>
| Salaries, Wages, and Benefits | Costs of personnel are allowable on sponsored agreements to the extent supported by actual effort performed on the project and approved in the award budget. An individual’s base salary must be used to compute the cost charged to a sponsored agreement; extra compensation or supplemental pay for work on sponsored programs is unallowable except in extraordinary circumstances. Administrative and clerical costs are generally recovered through indirect costs and not charged directly to the project. To be charged as a direct cost the following conditions must be met:  
  • Administrative or clerical salaries are integral to a project or activity;  
  • Individuals involved can be specifically identified with the project or activity;  
  • The costs are explicitly included in the budget or have the prior written approval of the awarding agency  
The institution has established XX% as the minimum level of effort for administrative and clerical personnel to be included in the project budget. |

| Equipment                                 | Scientific or Special Purpose Equipment: allowable when the equipment is necessary and will be used primarily, or exclusively, for the project(s) to which the costs will be charged.  
   General Purpose Equipment such as office equipment: unallowable without the prior written approval of the awarding agency.  
   Note that the University’s equipment definition is an acquisition cost of $____ and a useful service life of ___ year or more. Software and computers that do meet the definition are considered supplies. |
| Internet Costs                            | Costs of internet connections from a person’s home are generally unallowable.                                                                                                                                                                                                     |
| Local Telephone (including monthly instrument charges) | Local telephone costs are generally unallowable as a direct cost. However, there are certain circumstances where these charges may be directly charged to a research project such as instances where participants are required to call into a specific telephone line. |
| Long Distance Telephone                   | Allowable when specifically identified with a specific project.                                                                                                                                                                                                                  |
| Materials (supplies, purchased materials, etc.) | Project supplies: Items such as chemicals, laboratory supplies, and even pens, pencils, folders, notebooks, and the like that can be identified as being “exclusively for the support of” a sponsored program are allowable.  
   Office supplies: Items commonly found in any office such as wall clocks, calendars, waste cans, letterhead, staplers, etc. that would likely be used for purposes other than the award are unallowable except in special circumstances.  
   Computing equipment and software: These are allowable costs if they do not meet the Institution’s definition of equipment (see above). |
| Memberships (scientific or professional societies) | Unallowable unless specifically approved by the sponsor.                                                                                                                                                                                                                       |
| Postage                                   | Routine postage charges: unallowable except where a project requires specifically identifiable large mailings or the like.  
   Special mailing or delivery charges: Allowable when necessary for the success or completion of a project (example: overnight delivery charges for shipment of perishable research materials to collaborators or from suppliers) |
<p>| Pre-Agreement Costs                       | Unallowable unless approved under the provisions of the specific funding agency.                                                                                                                                                                                                 |</p>

Figure 5: Sample Policy on Allowable Costs

Uniform Guidance, Subpart E

The Uniform Guidance Subpart E, Cost Principles, establishes the principles for determining costs applicable to agreements with educational institutions. For a cost to be allowable it must be

- **Reasonable**
  A prudent person would have purchased this item and paid this price

- **Allocable**
  Expenses can be allocated to the federally funded activity based on the benefit derived, cause and effect, or other equitable relationship

- **Consistently Treated**
  Like expenses must be treated the same in like circumstances.

- **Allowable**
  Permitted as a direct cost under the specific grant or contract.

*Reasonable:*

A cost may be considered reasonable if the nature of the goods or services, and the price paid for the goods or services, reflects the action that a prudent person would have taken given the prevailing circumstances at the time the decision to incur the cost was made.

To determine if an expenditure is reasonable, ask yourself the following questions:

1. Is the cost a type generally recognized as necessary for the operation of the institution or the performance of the sponsored agreement?
2. Does incurring this expenditure violate any requirements or policies such as institutional policy, federal and state laws and regulations, and sponsored terms and conditions?
3. Have the individuals incurring this cost acted with due prudence (discretion and good sense) under the circumstances? Have they considered their responsibilities to the institution and the sponsor?
4. Were the actions that were taken with respect to incurring the cost consistent with established institutional policies and practices applicable to the work of the institution, including sponsored agreements?

*Allocable:*

A cost is allocable to a particular agreement if the goods or services involved can be directly assigned to that agreement.

To determine if an expenditure is allocable, ask yourself the following questions:

1. Is it incurred solely to advance the work under the sponsored agreement?
2. Does it benefit both the sponsored agreement and other projects in proportions that can be approximated through the use of reasonable methods?
3. Is it necessary for the overall operations of the institution and, in light of sponsored agreement rules and regulations, is it deemed to be assignable in part to the sponsored project?
Expense Allocation Policies

If an expenditure solely benefits one project, it should be charged directly to that project. However, sometimes an expenditure can benefit two or more projects. Lab chemicals are an example of an expense that could potentially benefit more than one project. When this occurs the expenditure must be charged in the same proportions as the benefits on the respective projects. Two methods can be used for allocating an allowable direct cost to two or more awards:

**The Proportional Benefit Rule**
The proportional benefit rule applies when it is possible to determine the proportional benefit of the cost to each project. The cost is allocated according to the proportion of benefit provided to each of the projects.

**The Interrelationship Rule**
The interrelationship rule applies when it is not possible to determine the proportional benefit to each project because of the interrelationship of the work involved. The cost is distributed on any reasonable and rational basis because the proportional benefit cannot be identified and applied to the individual projects.

Following are examples of allocation methodologies:

- **Allocation based upon usage**: The cost of lab supplies allocated based upon the quantity used on each project.
- **Allocation based upon number of experiments**: The cost of syringes allocated based upon the number of experiments performed for each project.
- **Allocation based upon number of hours**: The cost of computer equipment allocated based upon the number of hours logged on for each project.
- **Allocation based upon the number of clients served**: The cost of personality tests allocated based upon the number of clients served.
- **Allocation based upon effort**: The cost of lab supplies proportionally allocated based upon the PI’s percentage of effort charged to each project.

**Consistently Treated:**
All costs incurred for the same purpose in like circumstances must be treated uniformly either as direct costs or as facilities and administrative costs. Since certain costs such as administrative and clerical staff salaries and office supplies are normally treated as F&A costs, these costs cannot be charged directly to federal agreements unless the circumstances related to a particular project are clearly different from the normal operations of the institution.

**Allowable:**
Costs expressly unallowable or mutually agreed to be unallowable shall be identified and excluded from any billing, claim, application, or proposal related to a sponsored research project.

Sponsoring agencies use the term “allowable” to mean permitted as a direct cost under the terms of a specific grant or contract. Expenditures that are generally allowable for federal reimbursement may not necessarily be permitted under the terms of a specific grant or contract.

**Source:** Adapted from the University of Washington materials.
Administrative and Clerical Salaries

A challenging area in allowable costing is the requirements of the Uniform Guidance concerning administrative and clerical salaries. Part 200.413 states, in part, “The salaries of administrative and clerical staff should normally be treated as indirect (F&A) costs. Direct charging of these costs may be appropriate only if all of the following conditions are met:

1) Administrative or clerical services are integral to a project or activity;
2) Individuals involved can be specifically identified with the project or activity;
3) Such costs are explicitly included in the budget or have the prior written approval of the Federal awarding agency; and
4) The costs are also not recovered as indirect costs.

There are many schools of thought regarding compliance in this area. At some institutions, there are very stringent requirements that must be met prior to putting administrative or clerical salaries on a sponsored project. At others, the requirements are not so stringent. Clearly, though, one of the purposes of the restrictive language is to stop the practice of clerical support at low percentages being charged to the so-called “single-investigator laboratory bench” project.

One relatively successful approach has been to stipulate a minimum percent effort that must be met before administrative or clerical salaries can be charged — this minimum percentage varies from 10 to 20 percent. This is also an area where periodic monitoring of salaries charged to projects can keep the research administrator informed as to what is happening at the institution.

13305.8 Prior Approvals

Regardless of which central office assists in obtaining any required prior approvals necessary for project or budgetary changes, investigators and their administrators should be aware of when such prior approvals are required and whether they can be granted institutionally or whether agency approval is required. Again, many institutions have developed matrices of such prior approval requirements that are either posted to their Web sites or available by another means to investigators and their administrative units. A sample prior-approval matrix that illustrates prior-approval authorities is included as Figure 6.

It should also be noted that the research agencies typically apply the government’s Research Terms and Conditions to research awards as well as adapting the regulations to meet their own criteria in areas such as prior approvals. That is why it is important to understand the terms and conditions of the specific award in question and to make reference to any further award conditions. The Research Terms and Conditions and the agency implementations can be found at https://nsf.gov/awards/managing/rtc.jsp

Institutions of higher education are required to comply with the Office of Management and Budget’s (OMB) “2 CFR 200: Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards” referred to as “Uniform Guidance” as well as agency specific policies and guidelines to support the charging of personal services to federal awards. Institutions were previously subject to the cost principles under OMB A-21, J.10 which provided prescriptive examples to support personal services (i.e. salary and wages) charged to federal awards.

Uniform Guidance addressed this with significant changes to the institutional requirements for supporting salary and wages charged to federal awards. Section 200.430 removed the prescriptive examples found in A-21 and includes guidance on the types of compensation that are allowable to charge directly to federal awards as well as the documentation standards for supporting these charges. With this flexibility, Uniform Guidance requires greater accountability of institutions through strong internal controls. Institutions now have the flexibility to retain their current effort reporting systems or they may choose to move to another system (such as a project based verification system) provided they meet the documentation standards below.

The standards for documentation of personal expenses must be based on records that accurately reflect the work performed. These records must:

- Be supported by a system of internal controls which provides reasonable assurance that charges are accurate, allowable, and properly allocated.
- Be incorporated into the official records of the institution.
- Reasonably reflect the total activity for which the employee is compensated by the institutions, not exceeding 100% of compensated activities as defined by the institutions definition of Institutional Base Salary (IBS).
- Encompass both federal and other activities compensated by the institution on an integrated basis, but may include the use of subsidiary records as defined by the institutions written policy.
- Comply with the institutions established accounting policies and practices for treatment of incidental work.
- Support the distribution of the employee’s salary or wages among specific activities or cost objectives if the employee works on more than one federal award; a federal award and non-federal award; an indirect activity and a direct cost activity, two or more indirect activities which are allocated using different allocation bases; or an unallowable activity and a direct or indirect cost activity.
- Budget estimates (i.e. estimates determined before the services are performed) alone do not qualify as support for charges to federal awards, but may be used for interim accounting purposes, provided that:
  - The system for establishing the estimates produces reasonable approximations of the activity performed.

\(^5\) This section was written and reviewed by Jerry Fife and Mary Beth Rudofski of the Point Consulting Group
Significant changes in the corresponding work activity (as defined by the institutions policies) are identified and entered into the records in a timely manner. Short term (such as one or two months) fluctuations between workload categories need not be considered if the distribution of salaries and wages is reasonable over the longer term.

The institutions system of internal controls includes processes to review after-the-fact interim charges made to federal awards based on budget estimates. All necessary adjustment must be made such that the final amount charge to the federal award is accurate, allowable and properly allocated.

Because practices vary as to the activity constituting a full workload (IBS) records may reflect categories of activities expressed as a percentage distribution of total activities.

It is recognized that teaching, research, service, and administration are often inextricably intermingled in an academic setting. When recording salaries and wages charged to federal awards, a precise assessment of factors that contribute to costs is therefore not always feasible, nor is it expected.

**3305.10 Equipment**

Under the guidance provided by OMB Circular A-110, institutions are allowed to set the “capitalization level” of equipment at any amount up to $5,000, with the other determinant being that the equipment must have a useful service life of one year or more. For institutions with modified total direct cost (MTDC) facilities and administrative (F&A) rates, it is important that, whatever the capitalization level, the post-award administration office recognize that these costs will be exempt from F&A charges. Often institutions create specific budget subcodes that apply to capitalized equipment and, through their accounting systems, are able to automatically exclude these costs from F&A calculations.

**Budget Deviations**

There are two areas relating to equipment that deserve particular attention from the post-award administrator. First, investigators and department/unit administrators need to recognize the effect of budget deviations on F&A assessment. If equipment is budgeted but supplies are purchased instead, it must be understood that the supplies category is subject to F&A charges such that each freed-up dollar will be available at a lesser amount once the F&A calculation is made (see example below).

**Example**

If equipment costing $10,000 is not purchased and an institution’s F&A rate is 50% MTDC, the amount of direct costs available for expenditure is not $10,000, but rather $6,667 with the remainder necessary for reimbursement of F&A costs. Obviously, if the reverse happens — equipment is not anticipated but is purchased — there will be F&A costs freed up for direct cost expenditure in the same ratio.
Fabricated Equipment
The second area that requires close attention from the post-award administrator concerns fabricated equipment. Because equipment is not always available off the shelf in the configuration necessary for research, investigators often make it themselves using various components. It would not be unusual for the fabricated piece of equipment to reach the capitalization rate and be exempt from F&A calculations. Institutions should have a policy that addresses equipment capitalization so there is no question as to when and how these instances of fabrication are addressed. A sample fabricated equipment policy is included as Figure 7.

13305.11 Cost Transfers
The transfer of costs either into or out of a sponsored programs account is often the subject of federal audit scrutiny and is an area needing particular attention from the post-award administrator. An enforced institutional policy should be in place and a procedure for approval of cost transfers should be widely disseminated.

Approvals
Another essential element that the post-award administration manager should consider is the approval process for cost transfers. For many institutions, late transfers (more than 90 days late) require additional approvals and place more stringent

---

Figure 7: Sample Fabricated Equipment Policy
(assumes $5,000 capitalization level)

Definition and Policy Statement. Fabricated equipment is defined as an item of equipment that is built or assembled from individual parts by an investigator and/or other sponsored project personnel, an internal shop, or an external shop. When a completed item of fabricated equipment has an aggregate cost of $5,000 or more and when that item will be recorded as capital equipment in XYZ University’s property management system, the individual component costs associated with the equipment fabrication (regardless of the individual amounts) will not be assessed the facilities and administrative (F&A) cost rate. This policy became effective __________.

Guidelines for Determining Applicability of Policy. The following guidelines apply in determining whether a given instance constitutes fabrication:

- This policy is intended for instances of original fabrication. Any subsequent modifications to the equipment or replacement of individual parts after the original fabrication do not qualify for F&A rate exemption under this policy, unless the subsequent modification/replacement itself costs $5,000 or more and extends the useful life of the equipment.
- There should be a 1:1 correlation between a single fabrication and a single sponsored project. Only in rare circumstances, and with explicit disclosure to and approval by the sponsors, will the costs of a single fabrication be permitted to be charged to more than one sponsored project.
- An original fabrication is expected to be started and completed within a single project period.
- Except in extremely rare circumstances, the individual items that comprise the fabrication are
expected to be in the same physical space (i.e., one room).

- The F&A rate exemption on fabrication costs applies only in instances where ownership of the completed item rests with XYZ University. If the sponsor will retain ownership (title), the exemption does not apply.
- The applicability of this policy is intended for instances where a single piece of equipment is created through extensive construction or assemblage, often involving shop services. An instance where components are simply connected together in a system, such as when individual computers and servers are joined to create a network, does not constitute a fabrication.

**Procedures.** Fabricated equipment should be identified prior to the acquisition of component parts of services related to the fabrication. This identification can initially be made in the sponsored project proposal budget or later using the ________ form. In addition to identifying the fabrication in the proposal budget or the ________ form, the Fabricated Equipment Form must be completed to provide specific information necessary to ensure that the circumstances constitute a fabrication and later to track the fabricated item. The Fabricated Equipment Form can be obtained at [list Web site or office location here].

Costs that should be budgeted and charged to a sponsored account include materials and supplies necessary for the fabrication, as well as any internal or external shop service fees. Although project personnel may participate in the fabrication, their salaries will not be exempt from the F&A rate assessment. Only labor costs that are implicit in the internal or external shop rates will be F&A exempt. Labor, travel, and other costs associated with the services of an outside party in a fabrication should be incorporated in the external shop service fees.

Acquisitions related to the (F&A-exempt) fabrication should be charged to the following budget subcode: xxx. Costs charged to budget subcode xxx will not be assessed the F&A rate.

Once the XYZ Office of Sponsored Programs (OSP) and the XYZ Property Office have reviewed and approved the use of budget subcode xxx for a fabrication, OSP will open budget subcode xxx on the sponsored project account. This budget subcode is to be used solely for the purpose of accumulating the individual charges associated with this fabricated equipment, regardless of the individual amounts. Most individual charges will be in amounts less than $5,000, but where an individual item in a fabrication costs $5,000 or more, that charge should be recorded against budget subcode xxx, not the usual equipment budget subcode. Once budget subcode xxx is opened on an account, it is only to be used for the specific fabrication project for which it was approved. No other project expenses should be recorded against budget subcode xxx.

At the same time budget subcode xxx is created, the Property Office will assign an inventory tag number and will provide the number to the principal investigator. This number should be referenced in all acquisitions made for the fabrication. When the fabrication is completed, the principal investigator should alert the Property Office and OSP. The OSP will initiate an accounting entry to transfer the individual costs to the normal capital equipment budget subcode. The Property Office will tag the fabricated item and record it in XYZ University’s property system.

**When the F&A Rate Exemption Does Not Apply.** If a fabricated equipment item will have an aggregate cost of less than $5,000, the individual costs for all acquisitions made for the fabrication should be budgeted and charged to the normally used supplies and other budget subcodes. These budget subcodes will be assessed F&A. Budget subcode xxx should not be used. In this case, an inventory tag number will not be assigned as the fabricated item does not meet the capitalization requirements.
criteria for the allowability of transfers. For others, early transfers are almost pro forma when their financial systems do not allow multiple accounts to be charged for one purchase and allocation must be made across two or more accounts.

**Payroll Transfers**

Payroll transfers can be particularly problematic especially when such a transfer is made after the payroll or effort certification for the period in question has already been made. At some institutions, transfers of payroll costs to federal awards are not allowable. Others allow such transfers if they are adequately justified and if the effort certification is revised and signed by the employee whose payroll costs are being transferred.

**Institutional Policies**

It is important that the institutional policy address the timeliness of cost transfers as well as the reasons for the transfer. Again having a policy and ensuring that it is adequately understood by the campus research community is key. A sample cost transfer policy is included as Figure 8. A sample cost transfer explanation and justification form is included as Figure 9 (on page 3305:25).

One useful mechanism a post-award manager can use that will limit the amount of cost transfers is to establish accounts prior to the receipt of awards. Typically these accounts are established so that payroll appointments can be made or equipment with long lead delivery times can be ordered. Advance accounts also allow the institution to take advantage of any prior-approval authorities they may have. A policy should be established that defines the terms of such advance accounts; typically, in order to establish such an advance account, the institution requires that the department take responsibility for costs should the anticipated agreement not materialize.

“Pre-award,” “at risk,” or “advance spending” accounts generally are authorized when the anticipated award is a standard grant from a known federal agency. There is always some risk, however. Further, if the institution needs to negotiate terms, it might be in a weakened position if some of the money has already been

---

Source: Adapted from a Northwestern University policy.
To comply with the cost allowability and allocability requirements of Uniform Guidance Subpart E, it is necessary to explain and justify transfers of charges into federal awards from other federal accounts, nonfederal accounts, or institutional accounts that may be involved with cost sharing requirements.

In some instances, a cost transfer is unavoidable. This policy and accompanying guidance sets forth the procedures and approvals necessary for a cost transfer.

When the need for a cost transfer arises, the Cost Transfer Explanation and Justification Request (the Request) must be completed and signed. The explanation for the cost transfer must be clearly stated and must be sufficient for an independent reviewer (i.e., a federal auditor) to understand the transfer and conclude that it is appropriate. According to federal regulations, “An explanation which merely states that the transfer was made ‘to correct an error’ or ‘to transfer to correct project’ is not sufficient.” Consequently, the Request may be returned to the administrative unit without approval because of insufficient explanation.

Cost transfers should be accomplished within 90 days of when the original charge was made. The 90-day time limitation applies when transferring expenses to a sponsored agreement. No time limit exists for removing expenditures from a federally sponsored agreement. If inappropriate expenditures are discovered on federal projects, they must be removed without regard to time limits.

Cost transfers that involve payroll charges require special treatment. If such a transfer is made after effort certification for the period in question has been accomplished, a revised effort certification form must be completed and signed by the affected employee.

Cost transfers made solely for the purpose of spending down the project funds are not allowable.

**Documentation Guidance**

Listed below are several examples of cost transfer documentation that do not meet the requirements described above, a description of the improvements needed in the documentation, and a suggestion as to how the description could be improved to meet the requirements.

1. **Questionable explanation:** Transfer of supplies that were charged to the department in error.
   
   **Issue:** This explanation does not adequately explain why the wrong account was charged and why/how the charge is appropriate to the account being debited, nor does it describe how the error occurred. The explanation should be expanded to better describe the reason why the account being charged is appropriate and how the amount being transferred was determined.
   
   **Acceptable explanation:** The supplies being transferred were purchased using a procurement card (p-card). The administrative assistant did not review the p-card transactions by the deadline, causing the transactions to be expensed to the department account. Going forward, the administrative assistant will review all p-card purchases and assign the correct account number, if applicable, to be charged prior to the deadline.

2. **Questionable explanation:** Transfer of overage to related project.
   
   **Acceptable explanation:** The supplies to be transferred are used on related projects. Supplies should be shared equally on both projects; thus 50% of the cost of these items is being transferred.

3. **Questionable explanation:** To correct account incorrectly charged due to clerical error.
   
   **Issue:** Insufficient explanation of why and how the clerical error occurred and why the error was not corrected earlier. In general this explanation is only adequate if a transposition error occurred and such circumstances should be included in the description.
Acceptable explanation: The research assistant in the lab who ordered the supplies used an account number of a project that was terminated. He has been instructed to use the new account number. In the future, all supply orders will be reviewed and approved by an appropriate department administrator prior to submission of the order so that such errors can be prevented.

4. Questionable explanation: Payroll appointment form was not processed in time.

Issue: The explanation does not adequately address why the payroll appointment was not processed in time. The description should be expanded to better explain the circumstances of the delay in processing the appointment and the specific plan to avoid such occurrences in the future.

Acceptable explanation: The administrator was informed of a faculty member’s effort distribution change after the deadline for payroll appointments for the January payroll. The faculty member has been requested to communicate changes in effort in a timelier manner in the future in order to avoid such circumstances.

5. Questionable explanation: To charge a portion of the lab technician’s salary to the project.

Issue: The reason for the transfer is missing and there is no indication of why the payroll appointment was incorrectly made at the time the charge was generated. The description should be expanded to include a description of the individual’s role on the project, the portion of salary being moved, and how the portion of the salary was determined.

Acceptable explanation: Transfer 50% of the lab technician’s salary to Dr. Smith’s project. This individual performed experiments with mice and split his time equally between Dr. Smith’s NIH project and his NSF project. We have talked with the lab technician and Dr. Smith to ensure that more information about the projects is shared in the future, which will better ensure that no such errors will occur in the future.

6. Questionable explanation: Move charge from department.

Issue: The reason for the transfer is not stated. The description should be expanded to explain how the charge benefits the grant being charged and why the charge was not originally posted to the grant.

Acceptable explanation: The start date of the grant was December 1. However, the account number was not established in the accounting system until January 15. The PI needed to purchase some materials to begin work on the project in December, thus the costs for the materials were charged to the department until the account was established. In the future, we will request an advance account for such charges.

7. Questionable explanation: To charge 10.58% of Dr. Wilson’s salary to the research grant and close the account.

Issue: Actual effort is to be estimated as closely as is reasonably possible. The use of very precise estimations is only allowable to the extent that the individual’s effort can be confirmed with such precision. Increasing payroll for the sole purpose of expending project funds is not an appropriate or allowable use of sponsored project funds.

Acceptable explanation: Dr. Wilson worked 10% of her time in January on the grant project. The payroll transfer is being made to reflect this effort.

Source: Adapted from Vanderbilt University materials.
spent. However, if institutions are judicious about establishing advance accounts, the risk is minimal.

### 3305.12 Application of F&A Costs

Institutional F&A rates may not always be allowable on particular sponsored programs awards or, if they are allowable, may not be allowable at the federally negotiated rates. Consequently it is important that institutional systems either allow for such variations or that the post-award administration office be able to appropriately levy the allowable rates. One area that is sometimes difficult for the post-award administrator is the determination of on-campus and off-campus rate applicability. While most often determined at the time of proposal submission, it is important that the on-campus and off-campus rates be well defined so that the appropriate rates are being used on sponsored projects.
In most cases, the definition of on- and off-campus rates is contained in the F&A cost negotiation agreement signed by the cognizant audit agency and the institution. Often, “off campus” is defined as applicable when more than 50 percent of the project takes place in facilities or locations that are not owned or leased by the institution. Some institutions further define the off-campus rate as applicable when the project location is a certain distance (such as more than 50 miles) from campus. The negotiation agreement should be the guide.

**13305.13 Cost Sharing**

Along with effort certification, concern about compliance with cost sharing requirements and commitments has also reached epic proportions in the sponsored research community. Cost sharing compliance has become more visible because of its intersection with faculty effort commitment versus payroll area.

Institutions have also become more sensitive to the amount of cost sharing commitments made. Why? Cost sharing has an impact on an institution’s F&A rate, as any cost sharing provided as a part of an organized research project must be included in the institution’s modified total direct cost (MTDC) base. Any increase in the MTDC base will deflate the F&A rate.

**Documentation**

Documentation of cost sharing can be very challenging to the post-award administrator. There are a number of ways that this task can be accomplished. At some institutions, companion accounts paralleling the sponsored project account are established and cost sharing expenses are recorded in the companion account. Other institutions have separate budget or expense codes in the federal project account that record the cost sharing. For those institutions where neither of the above options is feasible, memorandum records are established and kept with the project file.

Regardless of how documentation is provided, it is important to track cost sharing beyond just the project level because the institution needs to track it in the entirety in order to properly include it in the F&A MTDC base.

**13305.14 Program Income**

Program income is defined in the Uniform Guidance as “gross income earned by the recipient that is directly generated by a supported activity or earned as a result of a Federal award.” Program income can come in many forms including fees for services performed, sale of research materials such as animal models or reagents, and fees from participants at conferences or symposia. For research projects, program income is additive to the project, but it can also be deductive or used as cost sharing. At most institutions, a separate account is set up to handle any anticipated program income. This is an area where it is also appropriate to establish institutional procedural and other guidance. An example of such is included as Figure 10.
\[\textbf{\textnumero 3305.15 Subrecipient Payments and Monitoring}\]

Overseeing the administration of subrecipient agreements and the ensuing monitoring requirements imposed by Uniform Guidance is a challenge to most post-award administrative offices. (For a full discussion of administering subawards, see Chapter 3700.)

\textbf{Invoicing}

The invoicing requirements for subawardees should be clearly outlined in the subaward document. Usually the subawardee is directed to submit invoices to the post-award office, which reviews the invoice and submits it for approval to the investigator. The subaward document should also clearly state when final invoices are due so that they may be received and paid prior to the deadline for the prime institution’s financial report submission. Two methods are most often employed for the final invoice.

The prime institution will make the deadline date for invoices 60 days after termination; that provides a month’s cushion to receive and pay the final invoice (prime

\begin{table}[h]
\centering
\begin{tabular}{|l|}
\hline
\textbf{Figure 10: Sample Program Income Procedures and Guidelines} \\
Program income is gross income earned as a result of activities part or all of which are paid for as a direct cost by a federally sponsored grant or contract. Examples of program income include the following:  \\
1. Fees for services performed, such as laboratory tests.  \\
2. Money received from the use, sale, or rental of equipment purchased with project funds.  \\
3. Sales of supplies or equipment purchased or fabricated with project funds.  \\
4. Sale of software, tapes, or publications.  \\
5. Sale of research materials such as animal models or reagents.  \\
6. Fees from participants at conferences or symposia.  \\

The use of program income is defined in the grant agreement; if a research project is being performed, program income is usually additive, meaning that any program income is treated as additional funding available for the conduct of the research project. Other agreements may indicate that the program income is to be treated as deductive (the amount of program income earned is subtracted from the federal obligation leaving the funding the same, but from two sources), or program income can be stipulated as being used to meet any matching or cost sharing requirements of the project.  \\

When program income is either anticipated as part of a project or begins to be earned as part of a project, a separate account should be established to receive the income. The program income budget period will coincide with the total approved project period of the award. Program income may only be used for allocable project costs in accordance with the costing regulations established by the sponsor.  \\

The amount and disposition of the program income will be reported in the final financial report of the parent grant to the sponsor. Final disposition of unexpended program income will be made upon termination of the related sponsored project.  \\
\textit{Source: Adapted from University of Washington materials.}
\end{tabular}
\end{table}
recipients generally have 90 - 120 days after termination to pay final invoices). Other institutions will terminate the subawardee one month prior to the termination of their own agreement to assure that final invoices are received in a timely manner.

Subaward invoices should include the same documentation and detail that is required of the prime award.

**Monitoring**

Subrecipient monitoring requirements are set forth in the Uniform Guidance and its annual Compliance Supplement. The post-award administrator should establish procedures that will allow him or her to address the requirements. The first of these is the review of a subrecipient’s annual audit of federal funds reports. Depending on the subrecipient, institutions have set up various mechanisms for receipt and review of these audit reports. When the subawardee is another college, university, or large nonprofit research institution, the report is usually requested at the time of subagreement issuance. While a sample request for the audit report is included as Figure 11, the Uniform Guidance does state that the federal clearinghouse should be used to document the subrecipient’s compliance with the annual audit requirement.

**Figure 11: Sample Request for Federal Funds Audit Information**

Reference:  (name of subawardee)  
Agreement Number:  

XYZ University (XYZ) is required by the Uniform Guidance to determine if our subrecipients have met the audit requirements of the circular and whether they are in compliance with federal laws and regulations. 

Please check the appropriate items below, sign, and return to the address indicated below. I certify to the following:

D (1) We are not subject to the audit requirements of the Uniform Guidance because our organization expended no more than $750,000 in federal funds during the fiscal year ended ________________.

D (2) We have completed our annual federal funds audit for our fiscal year that ended _________ and

D Financial statements received an unqualified opinion from our independent certified public accountants; the administration for federal projects has been audited in accordance with the Uniform Guidance, and there were no material instances of noncompliance with federal laws and regulations or reportable conditions; and there were no findings in the single audit report that are specifically related to awards from XYZ.

D We have completed our annual federal funds audit, and material noncompliance issues and/or reportable conditions were noted. A copy of the audit report and our response is attached.

D There were findings in the single audit report that are specifically related to a prime award from XYZ. A listing of awards and the explanation of the findings as they relate to the prime award is attached.

D (3) We have not completed our annual federal funds audit. We expect the audit to be completed by ___________.

Name (typed or printed)  
Title  
Signature  
Date  

RETURN THIS CERTIFICATION AND DOCUMENTS, IF APPLICABLE, TO THE AS SOON AS POSSIBLE. IF YOU PREFER TO EMAIL THIS CERTIFICATION, THE EMAIL ADDRESS IS ______________.
When the subawardee organization does not meet the minimum requirements for an the annual federal funds audit, some institutions use a pre-award qualification questionnaire to determine whether the organization has the policies and procedures in place to adequately assure compliance with subawardee requirements. Issues that may be addressed in the questionnaire could include what systems the subawardee has in place to assure appropriate fund management, such as information on their accounting system, salary policies, purchasing procedures, and the like.

Because the Uniform Guidance allows the prime institution to make risk determinations based on size of awards, program complexity, and pass-through percentages, there is no one standard utilized for monitoring activities. Most institutions rely on their faculty investigator to monitor subawardee performance and, through approval of subawardee invoices, monitor and approve costs. Because the faculty investigator plays such a large part in this process, it may be useful for the post-award administrator to develop a set of expectations for the investigator. A sample memorandum that can be used to do this is included as Figure 12.

**Desk Audits.** The post-award administrator may wish to make use of periodic desk audits of subawardee invoices when the amount of funding passed through warrants such an audit or when the subawardee is unknown or determined to be a risk.

**International Collaborations.** Subawards to foreign institutions pose particular challenges. For most organizations, risk determinations for foreign institutions are related to whether that institution is a federal grantee. An institution could make the assumption that if the entity meets the requirements to be a federal grantee, its policies and procedures must be adequate. (For a full discussion of international collaborations, see Chapter 3500.)

### ¶3305.16 Award Reporting and Closeout

Accurate and timely closeout of awards is one of the last steps in the post-award administration process. Award closeout is not just the responsibility of the post-award manager, but also that of the investigator (who must file technical reports, for example) and others at the institution (who also might be required to submit required invention and property reports, for example), where applicable. Even in the financial area, the assistance of the investigator and/or the department/unit administrator is often critical to properly closeout an award.

**Notice of Closeout**

Many institutions have developed award closeout procedures and policies that provide advance notice to investigators and department/unit administrators so that encumbrances can be cleared and any necessary account cleanup started. An example of such a closeout procedure is included as Figure 13.

A challenging part of closing out an award is making certain that all “trailing charges” have hit a project account. Trailing charges are those that typically are not expensed to a project account until the next one or two ledger cycles. Typical trailing...
The post-award administrator needs to understand the service center’s billing cycles and plan for them accordingly in the closeout process. At some institutions, the service centers themselves have been put on notice that their charges must be made in a timely fashion (with a period specified) or the account may not be able to accept the charges.

### Subrecipient Billing

Another type of trailing charge often encountered is subrecipient billing. Regardless of the internal review and approval process for subrecipient invoices, it is often the subrecipients themselves that submit late invoices. Care should be taken to specify

**Figure 12: Sample PI Subrecipient Monitoring Memorandum**

To:

From:

RE: Subaward to
Under federal award

We have recently issued the referenced subaward for work to be conducted under your federal award. It is attached for your files. As the prime grantee, both XYZ University and you, as principal investigator/project director, have certain obligations for oversight of the entire project. These obligations include appropriate monitoring of a subawardee’s performance and costs.

As you are aware, the subawardee is required to submit periodic invoices to the XYZ Accounting Department. In turn, the XYZ Accounting Department will prepare a voucher for payment and send that to you along with the subawardee’s invoice for review, approval, and payment authorization.

Prior to your approval, you should review the invoice to determine that the amount being requested for payment is consistent with the accomplishments of the subawardee during the billing period. Normally, you would most likely be familiar with the subawardee’s performance through telephone conversations, technical meetings, progress reports, or site visits. If you believe there are problems with the invoice, such as equipment purchased without any required prior approval or more labor charged than you believe was expended, you should not approve the invoice for payment. Rather, you should consult with your department/administrative unit and XYZ Office of Sponsored Programs to resolve these issues. In addition, you should not authorize payment until the subawardee has signed the subaward agreement. You will receive a copy of the fully signed agreement from my office.

Final invoices should only be approved for payment if you are satisfied that the subawardee has completed its performance under the award and that the costs incurred are appropriate for that performance.

Should it be necessary to terminate the award early, you should notify XYZ Office of Sponsored Programs in writing. We will then coordinate the termination with you.

If you have any questions about your obligations with respect to subawards issued under your grant, please feel free to contact XYZ Office of Sponsored Programs.

cc: Department/Administrative Unit Administrator (w/encl.)

---

charges include internal service center costs for animal per diem, shops, or printing. The post-award administrator needs to understand the service center’s billing cycles and plan for them accordingly in the closeout process. At some institutions, the service centers themselves have been put on notice that their charges must be made in a timely fashion (with a period specified) or the account may not be able to accept the charges.
clearly up front in the subrecipient agreement that invoices received beyond a certain time after the termination date of the agreement may not be honored.

¶3305.17 Incoming and Outgoing Investigators

Faculty investigators arrive and depart institutions on a regular basis. For investigators leaving the institution, it is generally a requirement that a relinquishing statement or estimated statement of expenses be prepared in a timely manner. At some institutions, the estimate is prepared using actual and anticipated expenses at date of termination along with a reasonable contingency (10 to 15 percent) to allow for any unanticipated expenses or trailing charges. In doing so, it is likely that the unexpended balance shown on the final financial report will not be less than anticipated and the institution can assure itself that all of its expenses are covered.

Going back to the sponsor because the costs were underestimated is a time-consuming and not always successful experience. When a faculty member departs, it is important to review and approve any equipment that is departing with the investigator to assure that the institution has the right to transfer such equipment. Any other reports needed (such as invention statements, effort certifications, etc.) should be completed prior to the investigator’s departure. Finally institutions should make sure that the faculty investigator is not delinquent on any technical reports. If technical reports are to be submitted after the faculty member has left the institution, the faculty member should clearly understand his or her responsibility to do so.

Accepting Transferred Awards

For incoming investigators, it is important to establish contact early with the investigator’s former institution in order to transfer ongoing awards in a timely manner. Because transferring awards are rarely received prior to the investigator’s arrival at the institution, it may be necessary to create advance accounts for them using established institutional procedures.

¶3305.18 Special Issues for Smaller Institutions

The smaller institution, sometimes referred to as a predominantly undergraduate institution (PUI) or non-research-intensive institution, faces particular challenges in post-award administration. It is not uncommon in such institutions to find post-award functions located in the institutional business office and the manager of post-award may have a number of other nonsponsored research-related duties as well. (For a full discussion of special issues for PUIs, see Chapter 2300.)

Sponsored Programs ‘Generalists’

Unfortunately the regulations and policies of granting agencies do not make distinctions for the size of a grantee’s funding portfolios. The administrator at the smaller institution must be much more of a generalist than his or her counterpart at a larger institution. Consequently it is essential that the administrator have the resources necessary to fulfill his or her responsibilities, including institutional policies with respect to sponsored programs.
The closeout process for a sponsored research account begins when the account is approaching the termination date of the award. While a funding sponsor may require other closeout reporting or documentation (e.g., technical, property, or intellectual property reporting), the following outlines the closeout process with respect to financial reporting.

1. Ninety (90) days before the account expiration, a first notice is sent to the appropriate department/unit administrator from Sponsored Programs Accounting (SPA). This notice states that the account is about to expire and that the administrator should begin monitoring the account more closely. The same notice is again sent at sixty (60) days and thirty (30) days prior to the expiration date. These notices explain what actions are needed by the department, such as requesting an extension to the account, if necessary, processing appointment forms to move payroll charges to new accounts, and reviewing ledgers to determine what entries are outstanding and what corrective entries may be required.

2. The third week of the month following the end of the project, a draft report of expenditures will be sent to the Principal Investigator (PI) and the department/unit administrator. They will have three (3) weeks to return one signed copy to SPA specifying any outstanding corrections and/or obligations that need to occur before the final financial report can be submitted to the sponsor. PIs who are not able to meet this deadline should notify SPA who, in turn, will notify the sponsor that the report may be delayed.

3. Once the draft report is returned to SPA, any necessary adjustment and closeout entries will be made. SPA will also conduct a review of F&A (indirect) cost charges for accuracy. A final report is then prepared by the accountant and submitted to the SPA manager for review and signature. The amount reported must match what is on the institutional ledger. The report is submitted to the sponsor and a copy is sent to the PI.

4. If the draft report is not returned by the PI, the SPA accountant will use the University ledger generated in the second month after the termination month and prepare a final report to the sponsor based on that information and close the account.

5. After the final report has been submitted, the department/unit will have the responsibility to make sure that any specified outstanding transactions are appropriately recorded on the accounting ledgers and any inappropriate charges are removed.

It is very important that financial reporting is done on a timely basis. Most sponsors require a financial report within ninety (90) to one hundred twenty (120) days of the termination date. If a department does not provide the required information to SPA to meet the reporting deadline, the University could be in jeopardy of not being reimbursed for its costs or losing administrative privileges or rights granted by the sponsor. Costs that are not reimbursed due to a lack of response become the responsibility of the department/unit.

Figure 13: Sample Financial Closeout Procedure

The closeout process for a sponsored research account begins when the account is approaching the termination date of the award. While a funding sponsor may require other closeout reporting or documentation (e.g., technical, property, or intellectual property reporting), the following outlines the closeout process with respect to financial reporting.

1. Ninety (90) days before the account expiration, a first notice is sent to the appropriate department/unit administrator from Sponsored Programs Accounting (SPA). This notice states that the account is about to expire and that the administrator should begin monitoring the account more closely. The same notice is again sent at sixty (60) days and thirty (30) days prior to the expiration date. These notices explain what actions are needed by the department, such as requesting an extension to the account, if necessary, processing appointment forms to move payroll charges to new accounts, and reviewing ledgers to determine what entries are outstanding and what corrective entries may be required.

2. The third week of the month following the end of the project, a draft report of expenditures will be sent to the Principal Investigator (PI) and the department/unit administrator. They will have three (3) weeks to return one signed copy to SPA specifying any outstanding corrections and/or obligations that need to occur before the final financial report can be submitted to the sponsor. PIs who are not able to meet this deadline should notify SPA who, in turn, will notify the sponsor that the report may be delayed.

3. Once the draft report is returned to SPA, any necessary adjustment and closeout entries will be made. SPA will also conduct a review of F&A (indirect) cost charges for accuracy. A final report is then prepared by the accountant and submitted to the SPA manager for review and signature. The amount reported must match what is on the institutional ledger. The report is submitted to the sponsor and a copy is sent to the PI.

4. If the draft report is not returned by the PI, the SPA accountant will use the University ledger generated in the second month after the termination month and prepare a final report to the sponsor based on that information and close the account.

5. After the final report has been submitted, the department/unit will have the responsibility to make sure that any specified outstanding transactions are appropriately recorded on the accounting ledgers and any inappropriate charges are removed.

It is very important that financial reporting is done on a timely basis. Most sponsors require a financial report within ninety (90) to one hundred twenty (120) days of the termination date. If a department does not provide the required information to SPA to meet the reporting deadline, the University could be in jeopardy of not being reimbursed for its costs or losing administrative privileges or rights granted by the sponsor. Costs that are not reimbursed due to a lack of response become the responsibility of the department/unit.

Faculty Salaries and Release Time

One of the issues raised most often by administrators at smaller institutions concerns faculty salaries and release time. At most smaller institutions, faculty members carry full teaching loads and the addition of a sponsored program does not always mean that the teaching load is relieved. Consequently there are frequent issues surrounding faculty compensation and whether the faculty member’s base salary can be increased to allow for the increased workload. Caution should be used in this area. It is important that the post-award administrator understand the federal costing regulation requirements. The Uniform Guidance Subpart E addresses institutional base salary and provides addresses “extra service” compensation.

§3305.19 Risk Areas and Critical Success Factors

The annual audit plans of the major sponsors of college and university sponsored programs provide a good view of the risk areas that need special attention from the post-award administrator. Audit findings and settlements also provide the administrator a bird’s-eye view of areas that should be of concern. Finally the Uniform Guidance Annual Compliance Supplement gives insight into areas of audit interest. In recent years, areas of risk centered on payroll and effort certification, allowable costs, cost transfers, program income, and subrecipient monitoring. (All of which are discussed above.)

Sponsored research administrators often find themselves having to make decisions based on interpretations of regulations that are not always definitive. Many grey areas exist where judgment calls need to be made. It is for this reason that heavy reliance is placed on policy and training/education programs.

Steps to Mitigate Institutional Risks

What steps might the managers of post-award administrative functions take to lessen institutional risks? Having clear written policies and procedures that are not only in place but enforced is key. Periodic monitoring of identified key risk areas is essential. For example, it may be wise to look at administrative salaries that are being charged to awards and ask

◆ Are they appropriate to the type of award?
◆ Are adequate payroll documentation procedures in place?
◆ What about cost transfers — is one department/unit consistently requesting transfers more than others are?

Internal Audits. Internal audits also can be a critical success factor. If the institution has a program of regular department or unit audits, the post-award administrator may wish to request that sponsored programs administrative procedures become a component of such an internal audit. In addition if there are particular areas of concern, a management review conducted by the internal audit department can determine whether such concerns should be further investigated or are invalid. (For additional information on internal audits, see Chapter 3100.)
Self-Assessments
Post-award administrators may wish to undertake an institutional self-assessment. Many institutions have used the Council on Governmental Relation’s document, *Managing Externally Funded Research Programs: A Guide to Effective Management Practices*, to conduct such a self-assessment. The document sets forth certain principles that are considered keys to compliance. Each principle is then subdivided into practices, defined as measurable conditions that highlight critical components in carrying out each principle. Indicators are given for each practice that provide a suggested measure to use against an institution’s policies and procedures to ascertain whether those policies and procedures are sufficient to assure compliance with administrative requirements. (For additional information on self-assessments, see Chapter 3900.)

¶3305.20 Conclusion
As shown throughout this chapter, post-award administration covers a myriad of topics and tasks and is an integral part of an institution’s stewardship activities with respect to external funds. The challenges posed by sponsor requirements and resultant institutional policies are many and provide post-award administrators an endless variety of issues and circumstances to address. Certainly boredom is never an issue for the post-award administrator!

---

¶3320 **Supplementary Material**

This section includes expanded coverage of topics relating to post-award administration. These materials are culled from a variety of authoritative sources.

¶3320.1 **Compliance with Requirements Relating to Program Income**

Jane Youngers, Assistant Vice President for Research, The University of Texas Health Science Center at San Antonio

Every sponsored program office should have a policy dealing with program income. This has been a requirement of federal grants and cooperative agreements for some time and the National Institutes of Health (NIH) began focusing on program income after the investigation of a Big Ten university revealed a substantial amount of unreported program income. Program income is also a compliance requirement of the A-133 audit (Part III, section J).

Program income is defined as gross income that is directly generated by a federally or nonfederally supported grant or earned as a result of a sponsored award. Examples include: fees for services performed, such as lab tests; proceeds from the sale of products, such as software, tapes, or publications; proceeds from the sale of research materials, such as animal models; fees from participants in conferences or symposia; proceeds from the sale or rental of equipment, supplies, or property purchased with project funds; and license fees and royalties from patents and copyrights.

Excluded from the definition of program income is interest earned on advances of federal funds or receipt of the principal of loans, rebates, credits, or discounts, and any interest earned on the principal. (See also discussion of program income at ¶3305.14.)

**Use Separate Accounts**

The best way to track program income is to establish a separate account for each program that generates such income. Not all program income is reportable. For example, unless otherwise specified in the terms and conditions of the award, income from license fees and royalties for patents and copyrighted materials do not need to be reported. While program income is defined as gross income, only net income is reportable.

The reporting obligations exist only for the life of the award unless the terms of the award specify otherwise.

**A-110 Provides Guidance**

Guidance for program income for federal grants and cooperative agreements is contained in OMB Circular A-110. The circular instructs federal agencies to require fund recipients to handle program income in one of three ways:

---

(1) Add it to available project funds and use it to meet program objectives.
(2) Use it to meet the nonfederal (cost sharing) share of the project.
(3) Deduct it from the total project or program allowable costs.

For research awards, the additive approach (in (1) above) automatically applies unless otherwise specified in award terms and conditions. For nonresearch awards, the deductive approach (in (3) above) automatically applies, unless otherwise specified in the award terms and conditions.

Restrictions on program income for nonfederal awards vary widely, and the best advice is to check the award conditions before assuming no requirements apply.

**Develop the Policy First, Then Review It**

The first step in achieving compliance regarding program income is to develop a policy. Once a policy is complete, it should be reviewed periodically to make sure it is up-to-date. Items that should be covered in the policy include the following:

◆ The requirements for program income for federal grants and cooperative agreements, as indicated above, including a review of the award for specific terms and conditions (such as the deductive method for nonresearch awards)
◆ A requirement that a separate account be established for each award, as appropriate, to capture and track program income
◆ Inclusion of an item on the proposal routing form that discloses whether program income is anticipated
◆ Roles and responsibilities (who does what) and related procedures at each step in the life cycle of the project

The success of properly capturing and reporting program income relies on identification of such by the principal investigator (PI). The departmental administrator also can assist in this process by keeping the sponsored programs office informed. As such, it is critical that the institution’s policy is widely circulated, and that PIs and administrators receive training as often as needed.

**Establish a Monitoring System**

A monitoring system will help ensure continuous compliance with your program income policy. Designing and implementing a program income monitoring system can be a challenge because program income can be difficult to identify. One possible method is to review departmental revenue; another might be to review any deposits made to a federal account.

Program income represents another compliance area where the proper design and implementation of a policy is necessary. As is the case with most sponsored programs issues, the keys to successful compliance are ongoing communication between sponsored program offices and the PIs and departmental administrators, reinforced by a good monitoring system.
\subsection{Overview of Effort Reporting}

Understanding effort reporting will aid an institution in developing an effective effort reporting or effort certification policy. Institutions should remember to take steps to ensure the policy is widely distributed and well understood by all appropriate faculty and staff. Figure 3320.2-1 provides an overview of effort reporting basics. (See also discussion at §3305.9.)

\begin{figure}
\begin{center}
\begin{tabular}{|l|}
\hline
D. EFFORT REPORTING BASICS, WITH ROLES AND RESPONSIBILITIES*
\hline
This section defines and describes effort reporting, and includes a short explanation of the roles and responsibilities of various offices and positions at an institution.
\hline
WHAT IS EFFORT REPORTING?
Effort reporting is the mechanism used to confirm that salaries and wages charged to each sponsored agreement are reasonable in relation to the actual work performed. Certification of an effort report must reasonably reflect the activity for which the employee is compensated by the institution. Cost sharing commitments must also be confirmed, either through the effort report, or through some other reporting mechanism.

Some institutions do not use the terms “effort reporting” and “effort report.” However, these institutions still require a confirmation (certification) that the salaries and wages charged to each sponsored agreement are reasonable in relation to the actual work performed. The mechanism for certification may be through a payroll action form, a salary certification form, or other official institutional document. For simplification purposes, “effort reporting” and “effort report” are the terms used throughout this document.

WHY MUST EFFORT BE CONFIRMED/CERTIFIED?
Federal regulations (e.g., Circular A-21) require that institutions receiving federal awards maintain systems and procedures documenting the distribution of activity, and associated payroll charges, to each individual sponsored agreement.

\end{tabular}
\end{center}
\end{figure}

continued
WHO MUST REPORT EFFORT?

Any person paid (or with a commitment) on a federally sponsored award must certify that the salary paid (or the commitment) is reasonable in relation to the effort (activity) devoted to the award. The individual faculty or staff member may report his/her own effort, or a “responsible person with/using suitable means of verification that the work was performed” may report for the individual.

HOW MUST EFFORT BE REPORTED?

The government does not prescribe a standard method for providing the assurances required under Circular A-21, but identifies specific criteria for an acceptable method and provides examples of acceptable methods (e.g., Plan-Confirmation, After-the-Fact Activity Records). Each institution must develop its own system for effort reporting.

WHEN MUST EFFORT BE REPORTED?

The timing of effort reporting is determined by the method the institution chooses to confirm the effort. For example, the Plan Confirmation methodology requires that “at least annually a statement will be signed…,” and that some form of verification take place whenever there is a “significant change in work activity that is directly or indirectly charged to sponsored agreements…” The After-the-Fact Activity Records methodology requires that for “professorial and professional staff … each academic term, but no less frequently than every six months. For other employees, unless alternate arrangements are agreed to …no less frequently than monthly …”

IS THERE A “BEST WAY” TO DO EFFORT REPORTING?

There are effective approaches, though no “best way.” Circular A-21, in its policy guidance, states: “Each institution … should be encouraged to conduct research and educational activities in a manner consonant with its own academic philosophies and institutional objectives.” Though this language provides for institutional discretion, certain standards must be followed. For example, Circular A-21 states: “The method must recognize the principle of after the fact confirmation or determination so that costs distributed represent actual costs…”

ROLES AND RESPONSIBILITIES

An institution should have an effort reporting policy that defines roles and responsibilities of various offices and individuals at the institution. Upon establishing the policy, a number of offices might have the day-to-day responsibility for managing the effort reporting process. Responsibility could rest with one, or a
number of the following offices: Research Administration, the Controller’s Office, the Vice President of Research, Grant and Contracts Accounting, Sponsored Programs Administration, Cost Analysis, Payroll, or the Budget Office. Regardless of where responsibilities lie, an effective effort reporting system requires coordination between two or more of the offices listed above. Furthermore, those offices with responsibility must also have the authority to enforce institutional policies.

Effort reporting requires active engagement with the business administrators from the academic dean and department offices. Those offices responsible for managing the process should establish a mutually supportive relationship with these business administrators.

The methodology used by an institution (e.g., Plan Confirmation, After-the-fact Activity Records) affects the roles and responsibilities of those involved with effort reporting. Generally, however, effort reports are generated at the central level and are made available at the department level. Ideally, departmental business administrators play an active role in pre-reviewing, distributing, and monitoring the confirmation of effort reports. Faculty members and other individuals responsible for the actual certification should work with their respective administrators when there are questions.

All effort reports should be certified by the individual, or a “responsible person with/using suitable means of verification that the work was performed.” The certification should include language to the effect that the report reasonably reflects the activities for which the employee is compensated for the applicable time period, and/or that the reported salary allocations are reasonable in relation to the work performed. A recommended practice is to retain the original certified effort reports at the responsible central level.

When effort is less than the salaries and wages charged to a sponsored agreement, or less than the cost sharing commitments, additional actions, such as a salary reallocation or cost transfer could be necessary. This could involve actions from the department business administrator, individuals from the payroll office, and/or other applicable offices, and requires well-defined accounting procedures to properly document any applicable transactions.

Effort reports must be archived according to the institution’s record retention policies, agency requirements, Federal Acquisition Regulations (i.e., FAR, 52.215-2(f), “The Contractor shall make available at its office at all reasonable times the records, materials, and other evidence … for examination, audit, or reproduction, until 3 years after final payment … or for any shorter period specified in subpart 4.7 … or for any longer period required by statute or by other clauses of this contract”), and Circular A-110 requirements (i.e., section .53, Retention and access requirements for records. – “Financial records … shall be retained for a period of three years from the date of submission of the final expenditure report…”)

© Copyright 2007 Council on Governmental Relations.
**Figure 3320.2-1: Effort Reporting Basics** (continued)

Education is a critical component of the effort reporting process. Central administration should have the primary responsibility for implementing an educational program. The program may need to vary by the effort reporting role or responsibility of an individual. Regardless of the role or responsibility, the program should include, at a minimum, the principle concepts of effort reporting and the effort reporting processes.

Reviewing Cost Transfers

AIS editors

Cost transfers — both into and out of a sponsored programs account — continue to be the subject of recent federal audit activity. Cost transfers often are closely reviewed during OIG audits. Circular A-21, *Cost Principles for Educational Institutions*, allows cost transfers to funded projects when they are reasonable, allowable, allocable, adequately supported, and timely and requires adequate internal controls for monitoring grant accounts.

For example, when one project is in an over-run condition, a principal investigator may decide that the excess costs should be transferred to an unrelated federal project that still has unexpended funds. This practice is impermissible under Circular A-21. Circular A-21 states clearly that such practices are impermissible as follows: “Any costs allocable to a particular sponsored agreement under the standards provided in this Circular may not be shifted to other sponsored agreements in order to meet deficiencies caused by overruns or other fund considerations, to avoid restrictions imposed by law or by terms of the sponsored agreement, or for other reasons of convenience.”

The Department of Health and Human Services (HHS) Office of Inspector General in an audit report has acknowledged, “Transfer of costs from one funding source to another may be proper for closely related work supported by more than one funding source,” the report stated. “However, frequent, tardy, or inadequately supported transfers, particularly if they involve projects with significant cost overruns or unexpended fund balances, raise serious questions about the appropriateness of the transfers and the overall reliability of the university’s accounting system and internal controls.”

In another cost transfer audit, the HHS OIG goes on to clarify that cost transfers allow grantees to move expenses from one funding source to another. An expense initially charged to one grant may later be transferred to another to correct an accounting error. Also, if a cost benefits more than one project, cost transfers may allocate costs among benefitted projects. Accordingly, a grantee may not make a cost transfer to a Federal grant if the cost does not benefit grant objectives, or if the cost should be charged to another grant from industry, foreign governments, or other sponsors. A grantee may not transfer costs to a Federal grant to meet deficiencies caused by overruns, for other fund considerations, or for ‘reasons of convenience’ (Attachment, section C.4 of OMB Circular A-21).²

---

With respect to internal controls for monitoring grant accounts, Circular A-110, Subpart C, §215.21, “Standards for Financial Management Systems,” states that an institution’s financial management system should provide (among other things):

1. effective controls and accountability for all funds, property, and other assets,
2. adequate safeguards to assure assets are used solely for authorized purposes,
3. written procedures for reasonableness, allocability, and allowability of costs in accordance with cost principles and terms of the award, and
4. accounting records that are supported by documentation.

In most audits, findings related to cost transfers rest on the fact that the documentation is not sufficient to justify the transfer or the reason why it is late. Auditors have faulted universities for not following their own cost transfers procedures, including undocumented and unauthorized transfers. They examine late cost transfers with particular care to determine whether they are permissible under the provisions of the circular and grant policies. Allegations surrounding mischarged cost transfers also figured in the recent settlement agreement between Yale University and the Department of Justice (see www.usdoj.gov/usao/ct/Press2008/20081223-1.html).

In addition to A-21, agency grants management policies often address cost transfers. The National Institutes of Health (NIH) Grants Policy Statement (Part II, Subpart A) serves as a good reference for cost transfer issues (see Figure 3320.3-1). Following is a list of some compliance risks related to cost transfers and ideas for mitigating such risks.

### Audit Documentation
Documents that auditors often request and review for cost transfer audits include

- cost transfer supporting documentation;
- background information on the cost transfers;
- the accounting system reports;
- transaction reports;
- monthly payroll expense detail reports; and
- the documentation regarding persons authorized to initiate and approve cost transfers.
An excessive number of cost transfers within the institution. The NIH Grants Policy Statement contains language indicating that excessive cost transfers may be an indication of poor internal controls. In essence, an excessive number of cost transfers begs the question, “Why can’t you charge the correct project the first time?”

Transfers made near or after the end of a project that result in additional charges to a federal project. Transfers of this nature are suspect because they give the appearance of either utilizing unexpended funds or moving deficits to another project, and in both instances the presumption is that the costs are unallowable.

Transfers that give the appearance of moving deficits from one federal project to another. These types of cost transfers are specifically mentioned as highly questionable in the NIH guidance and often are questioned by auditors. These transfers are difficult to adequately defend.

Salary cost transfers that are made after effort has been certified. Effort certification indicates that effort has been reviewed and judged to be reasonable. Auditors view any change in effort that constitutes an additional charge to a federal project and occurs after this certification as highly suspect.

Transfers that provide an inadequate explanation. Transfers explained by statements such as “to charge correct project” or “to correct error” would
not be considered sufficient documentation in the event of an audit. Proper documentation includes an adequate explanation of the specific nature of the error and/or any other reason for the cost transfer; the way in which the error occurred; and if 90 days or more have passed since the original charge, the reason why the transfer was not processed in a timely manner and how the situation will be prevented forwarding the future.

◆ **Transfers made more than 90 days after the discovery of the error.** The NIH Grants Policy Statement indicates that transfers should be accomplished within 90 days of the discovery of the error. Does this mean that if an error is discovered 120 days after the date of the transaction that you have an additional 90 days to correct the error? In discussions with federal auditors, it is clear that they expect responsible individuals to review charges on a monthly basis; thus, many institutions are adopting a 90 days from the date of the initial transaction rule in their cost transfer policies, rather than adopting the NIH language.

To mitigate the risk associated with cost transfers, institutions should ensure that their policies are current, their practices comply with their policy, and training is provided periodically. Of greatest interest to the government auditors are those transfers that result in additional charges to federal programs. Cost transfers should be monitored centrally to determine that the institution does not have an excessive number of transfers and that each transfer has an adequate explanation and a certification of the correctness of the new charge by a responsible organizational official.

Additional review and approval processes should be in place for cost transfers that occur more than 90 days from the date of discovery, are made near the end of the project, give the appearance of moving deficits to another federal project, or recertify effort. Approval of these transfers should be made on an exception basis. Institutions should discuss each of these transfer scenarios and decide under what circumstances they are willing to approve these transfers. One common approach is to review each transfer individually based on the circumstances. Above all, careful written documentation is a key to successfully defending these transfers.

Figure 3320.3-2 offers some tips for reviewing your cost transfer policies and practices. Figure 3320.3-3 provides an overview of a cost transfer audit undertaken by the HHS OIG.
Some of the things encountered by HHS OIG in conducting its cost transfers reviews are included below. Institutions would be wise to learn from the mistakes of others.

**System problems** —
- Accounting system does not identify cost transfers
- Transfers done manually, not through the system
- Source document must be reviewed to determine if it is a true cost transfer

**Transaction problems** —
- No documentation of reason for transfer
- Salary and effort transfer after certification
- Transfers from nonfederal to federal grants
- Significant time delay before transfer
- Transfers to next budget period
- Reliance on PI’s “word”

**Lack of documentation** —
- Full explanation of transfer
- Justification for transfer
- Authorization of transfer
- Certification of correctness for effort

Figure 3320.3-3: Process Behind a Cost Transfer Audit

It may be helpful to review the methodology used by Department of Health and Human Services Office of Inspector General in conducting a cost transfer audit of Thomas Jefferson University.

**Objective.** The objective of the audit was “to determine whether the University cost transfers to federally funded grants were documented” in accordance with federal requirements.

**Scope.** OIG audited cost transfers totaling $7,336,960 made between July 1, 2002, and June 30, 2004. It selected a statistical sample of 136 cost transfers totaling $994,840, from a universe of 3,494. OIG’s universe consisted of labor and other direct cost transfers greater than $100 made to federally funded grants during the period July 1, 2002, through June 30, 2004. Fieldwork was conducted onsite.

**Methodology.** To determine if cost transfers complied with federal requirements OIG:

- reviewed applicable criteria in federal law and regulations, agency specific requirements, and university policies and procedures;
- interviewed university personnel regarding cost transfer procedures;
- drew a sample of cost transfers made to federal grants during our audit period; and
- reviewed documents provided by the university to explain sampled cost transfers.

To draw a sample of cost transfers, OIG used a database provided by the university. The university database consisted of all cost transfers to federally funded grants during our audit period. To validate the accuracy of this database, OIG also verified that certain cost transfers, documented in NIH records, were included in the University cost transfer database.

**Results.** The university generally documented cost transfers to federally funded grants in accordance with federal requirements and through documentation and explanation was able to justify all the transfers. No recommendations were reported.

The previously voluntary policy of placing full-text, peer-reviewed journal articles arising from National Institutes of Health (NIH)-funded research in the National Library of Medicine’s PubMed Central (PMC) has now been mandatory for over a year. A provision in the 2009 Consolidated Appropriations Act (P.L. 111-8), signed into law by President Obama on March 11, makes permanent the policy. When it was implemented last April, the mandatory policy was subject to annual renewal.

Compliance with the NIH policy is a statutory requirement and a term and condition of the grant award and cooperative agreement, in accordance with the NIH Grants Policy Statement. For contracts, the NIH includes this requirement in all research & development solicitations and awards under Section H, Special Contract Requirements.

In the Jan. 11, 2008, NIH Guide notice announcing the revised policy, NIH wrote that institutions and investigators are responsible for ensuring that any publishing or copyright agreements concerning submitted articles fully comply with the policy. The requirement that institutions as well as investigators are responsible for compliance is a rather new concept, as publication of research results has traditionally been something investigators did on their own. Perhaps one of the best things research administrators could do is create a policy that gives investigators the tools to negotiate directly with journal editors.

Background. Congress imposed the requirements on NIH in the fiscal year (FY) 2008 consolidated appropriations act (P.L. 110-161). The policy is a term and condition of award for all NIH grants and cooperative agreements active in FY 2008 or beyond, and for all contracts awarded after April 7, 2008. Section 218 of P.L. 110-161 states

The Director of the National Institutes of Health shall require that all investigators funded by the NIH submit or have submitted for them to the National Library of Medicine’s PubMed Central an electronic version of their final, peer-reviewed manuscripts upon acceptance for publication, to be made publicly available no later than 12 months after the official date of publication: Provided, That the NIH shall implement the public access policy in a manner consistent with copyright law.

According to NIH, easy access to NIH-funded research will help advance science and improve human health. The policy builds upon the experience with NIH’s voluntary policy, which was published in 2005, and has three goals: (1) A central collection of NIH-funded research publications (the “archive”) preserves vital published research findings for years to come. (2) The archive is an information resource for scientists to research publications and for NIH to manage better its entire research investment. (3) The archive makes available to the public research publications resulting from NIH-funded research.
**Important Dates.** There are two key dates to the policy:

- **April 7, 2008.** As of this date, final peer-reviewed manuscripts arising from NIH funds must be submitted to PubMed Central upon acceptance for publication.
- **May 25, 2008.** As of this date, NIH applications, proposals, and progress reports must include the PubMed Central reference number when citing a paper that falls under the policy and is authored or co-authored by the investigator, or arose from the investigator’s NIH award.

**Ongoing Implementation.** NIH estimates that there are approximately 80,000 articles published each year that arise from NIH funds; this total, according to NIH, “serves as the target for the Public Access Policy.” The policy “success rate” rose from 19% of all NIH-funded papers to 56% of all NIH-funded papers during the first five months after the mandatory requirement took effect (April–August 2008).

NIH published in the Feb. 18, 2009, *Federal Register* an analysis of comments it received in 2008 on implementation of the Public Access Policy and a summary of the changes it made in response to the feedback. Included in the report is NIH’s reiteration of the consequences if a researcher does not submit the manuscript as required. Compliance is both a statutory requirement and a condition of award. If grantees do not comply with the policy, NIH said it may undertake one or more enforcement actions, depending on the severity and duration of the non-compliance. Grantees will have an opportunity to correct the deficiencies before an enforcement action is taken, but NIH also may place special conditions on awards, preclude the grantee from obtaining future awards for a specific time period, or impose additional monitoring.

According to the notice, NIH expects to “continually monitor and refine the communications and procedures surrounding” its policy. Changes will be governed by advice and feedback from stakeholders, questions to the help desk, and paper collections rates. NIH is exploring ways to enhance the utilities on PubMed and integrate them with bibliographic information on the eRA Commons Profile. This could eventually provide a way for project directors/principal investigators and other authors to track their papers that arise from NIH funds, associate them with NIH awards, and automatically obtain PubMed Central Identifiers (PMCID) as they become available. NIH also is exploring ways to facilitate the reporting of papers arising from NIH awards by NIH project number. This should help institutions monitor compliance with the policy.

---

**Training Resource**

NIH has prepared a set of training slides that can be downloaded and customized to help institutions in training authors in complying with the Public Access Policy. Link: http://publicaccess.nih.gov/communications.htm
What Should Your Policy Address?

It is important to ensure your compliance process covers the three main components of the NIH policy — relating to copyright, submission, and citations. NIH offers the following “point to consider”:

◆ What submission method will be used?
◆ What version of the paper will be made available on PMC?
◆ Who will submit the paper?
◆ When will it be submitted?
◆ Who will approve the submission?
◆ When can the paper be made public on PMC?

A final peer-reviewed manuscript is defined by NIH as the author’s final manuscript of a peer-reviewed paper accepted for journal publication, including all modifications from the peer review process. The final peer-reviewed manuscript includes all graphics and supplemental materials that are associated with the article. A final published article is defined as the journal’s authoritative copy of the paper, including all modifications from the publishing peer review process, copyediting and stylistic edits, and formatting changes.

NIH outlines four submission “methods,” which authors can use, as appropriate for them and consistent with their publishing agreement:

(1) Publish in a journal that deposits all NIH-funded final published articles in PMC without author involvement.

(2) Make arrangements to have a publisher deposit a specific final published article in PMC.

(3) Deposit the final peer-reviewed manuscript in PMC yourself via the NIH Manuscript Submission System (NIHMS).

(4) Complete the submission process for a final peer-reviewed manuscript that the publisher has deposited via the NIHMS.

(Link: http://publicaccess.nih.gov/submit_process.htm.)

With two of these methods (A and B) publishers voluntarily submit final published articles directly to PubMed Central. With the other two (C and D), authors and publishers can submit final peer-reviewed manuscripts to PMC via the NIHMS.

According to NIH, “Authors should work with the publisher before any rights are transferred to ensure that all conditions of the NIH Public Access Policy can be met. Authors should avoid signing any agreements with publishers that do not allow the author to comply with the NIH Public Access Policy.” Before an article is submitted for publication, the journal’s author instructions should be reviewed for any particular information about the NIH Public Access Policy. (For a database of author instructions, see resources section below.) When an article is submitted for
publication, the investigator should inform the journal that the article is subject to
the NIH policy.

The investigator should review the publisher’s copyright transfer or publication
agreement to make sure it specifically allows for deposit of the final peer-reviewed
manuscript in PMC. If it does not, the investigator should attach an author adden-
dum. NIH has developed recommended language (see http://publicaccess.nih.
gov/FAQ.htm, Question C3) for such an addendum as follows: *Journal acknowledges
that Author retains the right to provide a copy of the final manuscript to the NIH upon
acceptance for Journal publication, for public archiving in PubMed Central as soon as pos-
sible but no later than 12 months after publication by Journal.* Some institutions, such as
Washington University (http://becker.wustl.edu/pdf/NIH-Addendum-108.pdf),
have developed a form using the language.

Beginning with the May 25, 2008, NIH proposal deadline, any applications, pro-
posals, or progress reports made to the NIH must include the PMC or NIH manu-
script submission reference number when citing applicable articles arising from
NIH-funded research (see http://publicaccess.nih.gov/citation_methods.htm).

Figure 1530.5-1 provides additional tips for putting together a compliance pol-
icy/process. Included in Figure 3320.4-2 is a timeline of event surrounding imple-
mentation of the mandatory policy.

Figure 3320.5-1 Compliance Advice from NIH

NIH offers the following advice to investigators, which could also prove helpful to research administrators:

- **Have you identified the key players at your institution who can help successfully implement the policy?**
- **Does your institution wish to develop or amend a standard copyright transfer agreement for all institutional authors?** A standard copyright transfer agreement may make it easier for faculty, students and employees to comply with the policy, and decrease questions and confusion.
- **What institutional policies and guidance may need to be modified to implement the Public Access Policy?** Institutions may wish to consider modifying formal guidance for peer-reviewed publications arising from NIH funds. This guidance may include faculty and student handbooks. Institutions may also wish to consider internal procedures and quality assurance checks for submitting funding-related submissions to NIH in light of changes to the Public Access Policy.
- **Does your institution wish to develop a plan to inform potential authors about the policy change, its implications and how they can comply?** Institutions may want to announce the policy change internally and incorporate discussions of Public Access into training for institutional staff, faculty and students. NIH has an FAQ on policy and online training on how to submit articles that institutions may want to modify or disseminate.
- **Do staff who may receive questions from your authors know where to go for help?** Institutions may also wish to designate internal leads who can answer questions on the policy.
- **Does your institution wish to designate an individual or department to help investigators submit their own manuscripts?** Many university libraries support the Public Access policy by offering training on the policy and submission, and answering questions about the policy, copyright and the submission process. Other institutional officials, such as grants and contract staff and legal counsel, may receive questions about the policy from faculty. It may be helpful to identify staff likely to receive these questions in advance, and ensure that they have the ability to answer these questions directly or refer authors to the right place.
- **Is your institution aware of the multitude of resources freely available online?**
- **Does your institution wish to participate in any public resources on compliance?** The research, publishing and medical library communities have developed a number of Internet resources to support and understand public access.

Figure 3320.5-2 Timeline: NIH’s Implementation of Its Mandatory Public Access Policy

March 2009: Legislation Makes Policy Permanent. A provision in the 2009 Consolidated Appropriations Act (P.L. 111-8), signed into law by President Obama on March 11, makes permanent NIH’s public access policy. The law states, “The director of NIH shall require in the current fiscal year and thereafter that all investigators funded by the NIH submit or have submitted for them to the National Library of Medicine’s PubMed Central an electronic version of their final, peer-reviewed manuscripts upon acceptance for publication: Provided, That the NIH shall implement the public access policy in a manner consistent with copyright law.” When implemented last April, the mandatory policy was subject to annual renewal. Link: http://grants.nih.gov/grants/guide/notice-files/NOT-OD-09-071.html.

Jan. 2009: Bill to Scrap Policy Introduced. John Conyers, D-Mich., and four colleagues introduce H.R. 801, Fair Copyright in Research Works Act, which would put the NIH policy on hold. In introducing a similar bill last session, Conyers said it “would restore intellectual property protections for scientists, researchers, and publishers until a more thorough analysis of the access issues and a determination of an appropriate policy can be performed by the Register of Copyrights in consultation with economic experts.” Link: http://thomas.loc.gov.

Sept. 2008: Preliminary Analysis of Comments. In response to a public meeting and a request for information on its mandatory public access policy, NIH received “613 unduplicated comments from a broad cross-section of the public, including NIH-funded investigators, members of the general public, patient advocates, professional organizations, and publishers.” In follow up, NIH issues a 29-page analysis. Link: http://publicaccess.nih.gov/analysis_of_comments.nih_public_access_policy.pdf.

Sept. 2008: Compliance Reminder. NIH issues a notice that “provides important reminders concerning grantee demonstration of compliance and the location of citations for papers in applications, proposals and progress reports.” It also states that in FY 2009, NIH will begin notifying PDs/PIs “if citations of papers included in applications, proposals or progress reports appear to fall under the policy but lack a demonstration of compliance.” Link: http://grants.nih.gov/grants/guide/notice-files/NOT-OD-08-119.html.

May 2008: FAQs Updated. In recent additions to its FAQs, NIH speaks to the consequences if grantees fail to comply and other clarifications. Link: http://publicaccess.nih.gov/FAQ.htm.

Jan. 2008: FAQs Posted and Website Established. NIH establishes a Web portal and posts FAQs providing authors, their institutions, and their publishers with guidance on the implementation of the policy. Link: http://publicaccess.nih.gov.
Figure 3320.5-2 Timeline (continued)

3320.5  **Time and Effort Reporting: Recent Audit Findings**  

AIS editors

Perhaps the most problematic area that has been and continues to be audited by both the HHS OIG and the NSF OIG is labor charges, with a focus on time and effort reporting. The NSF OIG initiated audits of effort reporting at universities that received significant amounts of NSF funds. The HHS OIG includes the payroll distribution system and effort reporting in its audits. A review of findings in the OIG audit reports involving time and effort reporting can be instructive in assisting institutions develop effective internal controls and policies in this area (see also ¶3305.5 and ¶3320.2).

The principles that govern how colleges and universities must document time and effort on federal grants and contracts appear primarily in section J.10 of OMB Circular A-21, *Cost Principles for Educational Institutions*. The provision recognizes that in an academic setting, teaching, research, service, and administration are often inextricably intermingled. A precise assessment of factors that contribute to costs is not always feasible, nor is it expected. Reliance, therefore, is placed on estimates in which a degree of tolerance is appropriate. ... There is no single best method for documenting the distribution of charges for personal services. Methods for apportioning salaries and wages, however, must meet the criteria [in section J].

The circular requires each grantee to maintain a system of distributing salary charges to federal grants that results in a reasonable allocation of salary charges to each grant. The salary distribution system must include a periodic review to confirm the reasonableness of salary charges to federal projects. In the case of faculty and other professional employees, that confirmation may be provided as infrequently as every six months or even once a year (depending on the type of effort reporting system). These confirmations are usually in the form of an effort or activity report or a salary distribution report and must be signed either by the employees whose salary charges are being confirmed, or by “responsible persons with suitable means of verification that the work was performed.” These signatures confirm that “the distribution of activity represents a reasonable estimate of the work performed,” or that the salary distribution is “reasonable in relation to the work performed.”

**General Payroll System Requirements**

Section J.10.b. of the circular (2 CFR Part 220, Appendix A) sets out the general requirements for the payroll distribution system. The section sets out six payroll distribution standards, all of which should be reviewed and measured for compliance during an internal audit of the payroll system and before the government conducts an audit. Auditors cite the following six standards and discuss findings in relation to them:

“(a) The payroll distribution system will be incorporated into the official records of the institution; reasonably reflect the activity for which the employee is compensated by the institution; and encompass both sponsored and all other activities on an integrated basis....”
Unofficial records alone are not sufficient to satisfy this standard, although they may supplement the official records.

“(b) The method must recognize the principle of after-the-fact confirmation or determination so that costs distributed represent actual costs ... Direct cost activities and F&A cost activities may be confirmed by responsible persons with suitable means of verification that the work was performed. Confirmation by the employee is not a requirement for either direct or F&A cost activities if other responsible persons make appropriate confirmations.”

This standard has been raised in a number of audits, primarily because the “responsible person” did not have direct knowledge of the work performed or sufficient documentation to verify the effort.

“(c) The payroll distribution system will allow confirmation of activity allocable to each sponsored agreement and each of the categories of activity needed to identify F&A costs and the functions to which they are allocable.”

Universities have been held accountable when a PI charges 100% of effort to a grant and the records show that, for example, he taught a course during the time period.

“(d) Practices vary among institutions and within institutions as to the activity constituting a full workload. Therefore, the payroll distribution system may reflect categories of activities expressed as a percentage distribution of total activities.”

“(e) Direct and F&A charges may be made initially to sponsored agreements on the basis of estimates made before services are performed. When such estimates are used, significant changes in the corresponding work activity must be identified and entered into the payroll distribution system.”

NSF has cited universities for not meeting this standard because the institution has no clear definition of “significant changes” or has not accurately accounted for changes in effort.

“(f) The system will provide for independent internal evaluations to ensure the system’s effectiveness and compliance with the above standards.”

In the recent NSF time and effort reporting audits, the universities were found to be in noncompliance because they had relied on the A-133 audit to satisfy this requirement. This, NSF asserted, was insufficient.

**Document Requests from Auditors**

For labor/time and effort reporting audits, auditors usually will request the following types of documentation:
NSF OIG: Effort Reporting Audits

FY 2010
Audit of Effort Reporting System, University of Delaware, (OIG 10-1-008)
Effort Reporting System, Washington University in St. Louis (OIG 10-1-005)
Audit of Effort Reporting System, University of Nevada, Reno (OIG 10-1-003)
Effort Reporting System, University of Wisconsin, Madison (OIG 10-1-002)
Payroll Distribution and Effort Reporting System, the Research Foundation of SUNY, Stony Brook (OIG 10-1-001)

FY 2009
Purdue University, Effort Reporting System (OIG 09-1-013)
Arizona State University, Effort Reporting System (OIG 09-1-012)
Audit of Effort Reporting System, Georgia Institute of Technology (OIG 09-1-009)
Audit of Effort Reporting System, Cornell University (OIG 09-1-008)
Audit of Effort Reporting System, University of Arizona (OIG 09-1-006)

FY 2008
Audit of Labor Effort Reporting System, Vanderbilt University (OIG 08-1-014)
Audit of Effort Reporting System, University of California - San Diego (OIG 08-1-010)
Audit of Labor Effort Reporting System, University of Illinois at Urbana-Champaign (OIG 08-1-005)
Audit of Payroll Distribution System, University of Utah, Salt Lake City (OIG 08-01-002)
Audit of Effort Reporting System, University of California, Berkeley (OIG 08-1-004)

FY 2007
Audit of Payroll Distribution System, California Institute of Technology (OIG 07-01-013)

FY 2006
Audit of Effort Reporting System, University of Pennsylvania (OIG 06-1010)

Link to all audit reports: www.nsf.gov/oig/auditpubs.jsp.

◆ All policies and procedures relating to time and effort reporting and the payroll distribution system
◆ Award documents to determine whether the grant had any terms and conditions that would affect allowable labor charges to the award and whether the amount of effort pledged was actually expended and charged correctly
◆ Appointment letters or other documents supporting the approved annual salary for employees
◆ Fiscal Year Salary Change forms or other documents supporting the approved annual salary for employees
◆ or time records documenting 100 percent of each employee’s compensation as allocated to sponsored or non-sponsored research projects
◆ Documentation detailing the actual salary and wages charged to sponsored projects and other activities for each employee during each reporting period (e.g.,
Distribution of Payroll Expense Summary, Personnel Activity Reports), as well as approval and signoff

◆ Management reports detailing the actual salary and wages charged to sponsored projects and other activities for each employee during each reporting period
◆ PI confirmations certifying the total aggregate labor costs charged to each NSF award during the effort reporting period
◆ Other business documents used to verify work performed and proper charging
◆ Monthly financial reports showing total expenditures for each award, including salary and wages
◆ Internal audit and accountability reports with findings regarding the payroll distribution/effort reporting system or salary and wage cost
◆ Most recent A-133 audits

In addition to document and transaction review, auditors may conduct interviews, either by phone, e-mail, or during on-site visits, with appropriate personnel, including principal investigators, internal audit staff, and sponsored program and financial personnel. The purpose of the interviews is to corroborate the effort reported, the effort charged, and the effort committed; interviews also review the processes the university follows, such as how an individual who signs off on an effort report verifies that the work was actually performed or how a PI ascertains what work was actually performed on an award.

To determine whether labor costs were accurately recorded and charged to NSF, auditors compare the amounts in appointment letters or other documentation supporting salaries and wages paid to the amounts recorded in the official reports. For timeliness, they compare the date the effort reports were provided to business managers to the date they were approved and signed. They also review the institution’s policy and procedures regarding these actions.

Several of the NSF audits added as a specific objective a determination of whether the level of PI effort pledged in a grant proposal and award documents was actually contributed by the faculty member. Auditors reviewed processes for reporting and tracking PI effort and compared the effort pledged to the approximate actual percentage of actual effort.

Auditors also reviewed the most recent A-133 audit reports for any findings related to effort reporting. However, they also reviewed the audits and the work papers to determine whether the scope of the audits satisfied the A-21 requirement to conduct an “independent evaluation” of the payroll distribution system.

**Basic Findings**

Both the HHS and the NSF audits made similar findings with regard to university payroll distribution systems and effort reporting:

◆ *Effort reports signed by individuals with insufficient knowledge of the work performed.*
  Both agencies faulted universities for not providing sufficient training and information to those who signed off on effort reports.
◆ Missing or incomplete documentation that serve as the “suitable means for verification.” Auditors found that many university managers did not know what the term meant and what documentation they needed to satisfy the requirement.

◆ Policies and procedures do not reflect grants management regulations and requirements.

◆ Failure to follow the university’s policies and procedures, for example, on the deadline for submitting verified effort reports. Even though A-21 does not establish a deadline for submitting verified effort reports, the OIGs have held universities accountable for meeting the deadlines in their own policies.

◆ Failure to include all institutional effort in the effort percentage calculation or to calculate the percentages based on a normal work week when, in fact, a longer work week is the actual time spent. Effort report forms must account for all effort for which the individual is compensated by the institution. This would normally include all effort expended on institution-compensated sponsored research, administration, instruction, and unsponsored scholarly activity, clinical activity, and other activity. Even where the number of hours of effort the individual expends each week substantially exceeds the “normal” work week of 40 hours, it is necessary to base effort percentages on total effort, not just “normal” effort. Common manifestations or variations of this problem include the following:

  • Use of a “normal” 40-hour work week as the basis for the effort percentage calculation. As indicated above, this is not permissible if the employee actually averages more or less than 40 hours per week on institutional activities.

  • Use of an overly expansive concept of employees’ “own time.” Each institution is permitted, within reasonable limits, to define the activities for which it does or does not compensate its employees. Once those activities are defined, normally it does not matter for effort reporting purposes when the activities are performed. For example, the fact that a faculty member does administrative work or proposal writing on his or her “own time” — weekends or vacation — does not mean that the work is not institutional activity and may be excluded from the denominator of total effort. If the nature of the work makes it institutional activity, normally it must be included in total effort.

◆ Charging 100 percent of effort to a grant. While some faculty may have no duties other than research, most PIs also carry teaching or other administrative duties. In addition, time spent preparing grant applications may not be direct charged to the grant.

◆ Direct charging a grant for unrelated activities that were F&A or university charges. Several audits have faulted universities for charging the grant with unrelated work, and where the OIG finds that this is intentional, false claims act allegations may be filed.

◆ Inaccurate statements of effort on federal projects.
◆ Improper calculation of summer faculty compensation. Both HHS and NSF have found that calculations did not follow agency rules; in one audit, HHS labeled this “excessive compensation.” In at least one case, NSF OIG found that faculty had received salary increases in April, and the university should have prorated the salary for the summer, rather than using the increased rate.

◆ Failure to account for unfunded effort. If a payroll distribution system does not account for unfunded effort, both voluntary and involuntary, HHS and NSF audits will list this as an internal control weakness.

◆ Failure to reconcile effort report data with salary charges. Auditors compare the effort report data with documentation of salary to confirm the amount charged is accurate.

◆ Failure to adjust for significant changes in effort levels between effort reports. NSF has taken a particularly hard-line position on this finding, recommending that a university formally define “significant changes” in its policies and procedures.

◆ Failure to approve effort reports in the time frame specified in the university’s policies and procedures. Both NSF and HHS have faulted universities for late submission of approved effort reports, despite the fact that it is the university’s own deadline that has been missed, not one stated in a grants management circular.

◆ Effort committed in grant proposal not charged to the grant. Auditors are reviewing the grant document for time committed and checking the amount against the effort reports. If the time is reduced by 25 percent or more, the funding agency must approve the reduction in time.

◆ A-133 Audit Sufficiency. NSF auditors routinely concluded that the A-133 audits were not sufficient to satisfy the A-21 requirement of an independent evaluation of the payroll distribution system.

It should also be noted that, in a departure from the previous OIG audits in the series, in the recent audit of the University of Nevada-Reno released in fiscal 2010, the OIG also examined the university’s management of conflict of interest. In its 2009 semiannual report to Congress, OIG stated that it would be undertaking similar COI audits in the future, at the request of the U.S. Senate.

Recommendations from the OIG
One difference between the HHS and NSF audits is the specificity of the recommendations to address the audit findings. HHS audits of the payroll distribution system and time and effort reporting (unless they resulted in a settlement) generally conclude with the recommendations that the university improve its payroll distribution system to ensure that changes to planned activities are identified, annual effort certification procedures specify the means for verifying the actual work performed, and certifications are performed timely, or other similar phrases relating to the audit findings.

NSF audit recommendations, on the other hand, are far more prescriptive for policies and procedures and operations. Recommendations go beyond instructing...
the university to ensure that its policies and procedures comply with federal requirements. The audit reports have recommended that universities
◆ establish procedures so that business managers will know what types of documentation must be reviewed before verifying an effort report;
◆ require a written after-the-fact verification from the PI regarding the effort before a report may be verified;
◆ require hourly employee timesheets to itemize specific projects or activities or provide other documents that support 100 percent of the employee time on both sponsored and non-sponsored projects;
◆ define what constitutes “significant changes” in estimated labor effort for purposes of reallocation and establish acceptable tolerance limits for certifying such estimated labor effort; and
◆ hold department chairs accountable for timely submission of reports.

According to NSF, “there are many areas where the Circular does not prescribe specific and quantifiable standards. Accordingly, it is important for an institution to establish its own standards in these areas.”

With regard to the insufficiency of the A-133 audits to satisfy the “independent evaluation” criteria, one NSF audit report stated that “a comprehensive evaluation of the system should have included testing of salary charges to Federal awards to validate (i) confirmation reports were approved by certifying officials with suitable means of verification that the work was actually performed, (ii) the certifications were timely based on the university’s established standards, and (iii) the reported level of effort on the confirmation reports was accurate based on employee interviews.”

Now that the series of effort reporting audits has concluded, NSF intends to produce a report that details its findings and recommendations for NSF and ultimately the grantee community.
Ins and Outs of PI Transfers

Principal investigators (PIs) sometimes change jobs. And when one does, an institution must contend with the grants on which a PI is working. The most basic thing to remember is that everyone must agree to the transfer: the funding agency, the PI and his or her dean, the relinquishing institution, and the receiving institution. Establishing contact early in the process between both institutions can enhance the transfer of ongoing awards in a timely manner.

In most cases, the federal funding agency will accommodate the request to transfer a grant award by terminating the existing award at the original institution and making a new award to the new institution.

Internal Notification: Get Everyone Onboard

The first step for a PI who is planning to leave and transfer his grants is to contact the department chair or dean to seek concurrence that the grant should leave with the PI.

Are there other investigators working on the grant who will lose their jobs if the grant is transferred? Are other investigators willing to move with the grant? Are there research assistants from foreign countries with visas that are tied to the grant? Are there students working on the grant who are unable or unwilling to move with it? Assessing these sensitive questions will help the institution determine exactly how it wants to address the PI’s departure.

In addition to transferring the grant outright to the PI’s new institution, the university could opt to (1) assign a new PI; (2) assign a new PI and subcontract work to the prior PI at his new institution; or (3) transfer the grant to the new institution but subcontract work back to the prior institution. Each of these options is allowed by the funding agencies.

Equipment: Does It Stay or Go?

A more difficult issue to handle may be the question of laboratory equipment. All equipment issues need to be worked out well in advance of the PI’s transfer.

PIs frequently expect to take laboratory equipment with them when they leave an institution. The institution should review and approve any equipment that is departing with the investigator to assure that the institution has the right to transfer such equipment. It is also important for the institution to determine if other investigators are using the equipment in question.

The situation can become more complicated in those instances where a PI argues that the university purchased the equipment as a condition of her accepting a position at the university. Barring a written agreement, the university generally still retains ownership of the equipment but may wish to transfer it in any case. In some cases, the institution where the PI is going may have the equipment in question available for the PI’s use, or it may be willing to purchase it.
Inform the Sponsor

Once all parties have agreed in theory to the transfer of the grant, the relinquishing institution must complete a relinquishing statement and submit it to the funding agency. Funding agencies generally have established practices for transferring a grant and forms that must be completed by the investigator and the institution. These forms relinquish the original institution’s interests in the grant and provide an estimate of funds remaining. One tip to remember is that it is better to underestimate the balance of remaining funds than to overestimate it to avoid surprises later on.

Submission of the relinquishing statement starts the clock on the final status report that the relinquishing institution must file within 90 days. During this time, it should ensure that subcontractors are terminated, equipment is transferred, all purchasing has stopped, and that the PI prepares the final status report.

The new grantee institution, meanwhile, must submit a modified application for funding to the agency. It must detail the budget, explain how it meets requirements for supporting resources, submit an altered work statement (if appropriate), submit a new F&A rate, seek and obtain institutional review board (IRB) and institutional animal care and use committee (IACUC) approval when needed, and arrange for the acceptance of equipment from the sending institution, as appropriate.

IRB and IACUC approval is a key concern. It can take considerable time to gain approval, so the receiving institution will want to provide assistance for this process because funding agencies will not release funds for nonexempt research on human or animal subjects that it is not approved by the IRB or IACUC.

One final issue for the two institutions to consider before transferring a grant is their respective F&A rates. If the receiving institution has a higher F&A rate than the sending institution, it will be restricted to the lower level for the first budget period. If the receiving institution has a lower F&A rate, it will not be allowed to claim the higher rate of the old institution; however, funds may be rebudgeted in future budget periods.

A new notice of grant award will be generated by the funding agency, upon transfer of the grant. However, this will be adjusted if the relinquishing statement estimates turn out to be incorrect. The funding agency will determine how to transfer unexpended funds that the institution may possess.

Tie Up Loose Ends

Departments should be sure to find out who is using equipment before approving its transfer. This is particularly important in clinical trials. It is also not unheard of for a PI to mistakenly attempt to take with him equipment that was paid for by another grant or budget and is still committed for that purpose, so careful review of equipment is essential.

Another important loose end to tie up is the records related to a study. The institution must retain notebooks and study records for the period required by the
agency, so arrangements must be made for the PI to take copies of necessary records or to make copies for the university.

The institution should determine whether any reports are pending (such as invention statements, effort certifications, etc.) that should be completed prior to the investigator’s departure. Institutions should make sure that the PI is not delinquent on any technical reports.

Remember also to double check that the PI has not left behind animals without planning for their disposition. As the transfer date approaches, wrap up any remaining loose ends. Ensure that pagers and telephones are shut off, mail addresses are changed where necessary, and that standing purchase orders are cancelled.

**Receiving Institution.** While the sending institution is closing down the grant, the receiving institution needs to facilitate the arrival of the PI. If the institution requires any training for PIs, the PI should receive the training as soon as possible. Safety committee approvals for lab space or specific projects should be obtained, and advance spending accounts should be established by the administrative office for the grants that will be transferred.

Receiving institutions should request and review the original notice of grant award in order to become familiar with all the institutional requirements before accepting the grant. Cost sharing obligations, for example, will likely not be reflected in the relinquishing notice. Because transferring awards are rarely received prior to the investigator’s arrival at the institution, it may be necessary to create advance accounts for them using established institutional procedures.

**Anticipate Problems to Forestall Them**

So, even with all this advance notice and preparation, sometimes things do go wrong. Administrators should keep their ears to the ground to learn of potential problems so department chairs and deans can be notified promptly. For example, if the sponsored research administrator hears through the grapevine that a faculty member is planning to leave, be proactive and contact him or her.

Pay special attention to visa issues, because individuals whose visa eligibility relies on their continued work on a research project will need plenty of notice if the grant is transferred. Likewise, junior faculty members will want to know that research grants are moving so that they can plan accordingly.

Find out whether the departing PI intends to take specimens with him for future research. These need to be subject to material transfer agreements. And if the PI is continuing to conduct research on material that constitutes intellectual property (IP), remember that the rights to the IP are not automatically relinquished with the grant. The researcher is free to continue conducting research on the IP, but if it is commercialized, then both the sending and receiving institutions could have a stake in the patent and royalties related to the research.
For New PIs: How to Renew Your Grant

National Institutes of Allergy and Infectious Diseases, NIH

To keep your project funded once the grant ends, you will need to apply for support and undergo initial peer review again. This step is a common failure point for new investigators — one big change: you no longer have the new PI ladder as a leg up.

So it’s no surprise that a good strategy is essential. Start laying out a game plan by answering these questions:

◆ Do I want to continue the current project at roughly the same level of resources?
◆ When should I apply?
◆ How will I maintain funding if I don’t succeed on the first try?

Renewal or New?

Your situation and the science dictate whether it is more advantageous to renew your grant (submit a renewal) or apply with a "new" application. To make this decision, it may help to conceptualize the difference between long-term research goals and Specific Aims, your short-term objectives. If you think of your long-term goals as a bar, your Specific Aims are one segment. Whereas your goals may last a lifetime, you must complete your Specific Aims within the grant award period.

◆ Renewal. Choose a renewal if you want to continue your research toward the same goals you have been pursuing, but with new Specific Aims.

◆ New application. Choose a new application if you are planning a project that works toward new goals, even if you stay in the same field.

In both cases, reviewers judge the merits of the research, its relationship to your previous research, and the impact you have made on your field of science. If your research has gone well, peer reviewers are likely to give you an edge no matter which approach you take because you have a proven track record, and they know it takes time to build a successful research team.

Still, many experienced investigators feel it is advantageous to apply with a renewal if you have made progress and want to continue the same long-term project. Your peer reviewers take into account what you have accomplished when assessing the merits of your new application.

The following is what NIAID advises.

---

Overview

- To continue receiving funding, there are two choices: submit a renewal or apply with a "new" application. Know the criteria for deciding.

- Know how much a new application must be different in content and scope from the previous one.

- To avoid a gap, think about applying one or more review cycles early to gain extra time in case you must resubmit — if you can. Weigh the pros and cons, and ask your program officer for advice.

- In some cases, waiting to spend more time polishing your application is a better strategy than rushing to meet a receipt date.

- NIH does not set a time limit for submitting a renewal, but reviewers will probably be concerned by major gaps between projects.

Apply with a renewal if you . . .

1. Plan to continue your project under the same activity code (e.g., R01), with new Specific Aims.

2. Made progress and accomplished most of your Specific Aims. You didn't have to follow your original Research Plan as long as you made progress (you may have revised your Specific Aims in mid-course).
   - It's key that you successfully conducted relevant research, got results, and then used those results to pursue the next set of experiments.

3. Submitted under a request for applications (RFA) and the bullets above apply.
   - If the RFA no longer exists, you can submit an investigator-initiated renewal.
   - Use the parent program announcement; for example, an R01 uses the Parent R01. Read it carefully. You are playing by new rules, for example, new receipt dates, forms, page limits, and review criteria.

Even though you are submitting a renewal, consider changing your title to reflect the new Specific Aims you are proposing.

Apply with a new application if you want to . . .

1. Significantly change or expand the scope of your research.

2. Start over with a new idea (if the research is not going well or you have not accomplished several Specific Aims).
   - Though your application needs substantially different aims, it can be a spinoff of the original line of research.
• Be sure to use a new title.

3. Use a new activity code; for example, switch from an R01 to an R21.

4. Apply under a request for applications (RFA). The application is new even if you are continuing the same line of research. Follow all procedures for a new application. Note that this is an advantage of applying under an RFA: since you can use the application again, you get an extra try to get it funded.

If you have used up your one resubmission of your renewal application, talk to your program officer for advice on which if any aspects of the application to consider retaining.

Here’s another approach: split your project into two applications — one for a different set of research goals and one for a renewal to continue the existing project. Be careful not to dilute the original application’s quality. In your cover letter, state that you are using this approach.

What qualifies as a new application?

A new application should be substantially different in content and scope from the previous one, for example, new Specific Aims and a materially different Approach section. If you need help deciding which application type to use, talk to your program officer.

Decide When to Apply

Consider whether to apply early rather than wait until the last possible receipt date before you would incur a funding gap. To avoid a gap, think about applying one or more review cycles early to gain extra time in case you must resubmit. In FY 2010, roughly 36 percent of NIAID’s R01 renewals got a fundable percentile on the first try.

But here’s the catch: no matter when your application arrives, reviewers expect to see accomplishments. If your work is progressing slowly, it’s better to wait to get results that you can describe in the application. So ultimately your timing hinges on your comfort with your progress and the length of the grant (if you have a three-year award, you may not have enough data to apply early).

Pros and Cons of Being Early. Weigh the pros and cons for applying early, and ask your program officer for advice.

Pros
• If you apply early, you can get earlier feedback on your application.
• You can gain time to revise and resubmit if needed. A resubmission would not harm your chances of getting funded. eRA Commons keeps both versions; we could fund the earlier one if your resubmission fares worse.

Cons —
• If you apply before your research yields significant results, you could use
up the initial goodwill of the reviewers, who may feel your application is premature.

- Your application will likely be affected by the unknowable payline for the next fiscal year, which can make it harder to plan your strategy. We cannot fund your new grant until just before the old one ends.

In some cases, waiting to spend more time polishing your application is a better strategy than rushing to meet a receipt date, and the delay may have only a small impact on timing of an award.

Should you face a gap in funding despite your best efforts, you can extend your grant for one year at no cost through a “no-cost extension.”

**Resubmitting with a Different PI... Is It a New App or a Resubmission?**

That was the question posed in an August 29, 2011, posting to NIH’s “Rock Talk” blog. The answer is: “It’s a resubmission. If the overall scientific direction and approach of the project remain the same, it is still considered a resubmission application even if the principal investigator changes. Remember, a rationale for the change should be provided in the introduction.” Link: http://nexus.od.nih.gov/all/rock-talk

**No Time Limits . . . But**

Another timing issue is: How long can you wait to submit a renewal after your grant ends? NIH does not set a time limit, but reviewers will probably be concerned by major gaps between projects because the science has likely changed. Take this into account when writing the application, and prepare a new application if the research is dated.

If the research is current with the latest science, address the following points:

- Explain that your planned research is in sync with the science of your field.
- State what you have done during the hiatus.
- Highlight any new preliminary data.
Figure 3320.7-1: Renewal ‘How To’

A renewal should clearly link back to your previous grant’s Specific Aims, show progress, and not duplicate the aims of the previous grant.

Know These Do’s and Don’ts

Avoid a gap. Apply as early as you can before the end of your grant to avoid a break in funding.

Get preliminary data. Make sure you have data before sitting down to write.

- If your application is not funded after the second try and you need preliminary data for a new topic, you could apply for an Exploratory/Developmental Grant (R21) or Small Grant (R03).
- Make sure that grant doesn't overlap with plans for your R01.

Revisit the science. Review your Research Plan, especially the Significance section.

- Make sure it reflects the latest research in your field.
- Make sure you stress the impact of your research on the field.
- Describe the significance of the renewal in the larger science and health context too.
- Show the flow of the project in terms of your past and next steps. Describe how the new project is part of a logical progression for your research.
- Include most of this information in your progress report as well.

Showing progress is enough. You don't have to do everything you promised.

- Reviewers care more about whether you got meaningful results than conducted all the experiments you outlined in your application.
- Changing direction is okay as long as you have not changed the project's scope.
- Describe your work and highlight your successes in your progress report. Note these in the Significance section of your Research Strategy.

Revise even if your R01 application is nominated for selective pay.

- You may still need to wait until the end of the year to get funded even if your application is approved for selective pay.
- Even if you resubmit and get a worse score, we can fund the previous application and make the award provided the score is within the final payline at the end of the year.
- Keep in mind the length of time it may take from the date you apply to the date you get an award.

Keep up with your peers. Assess what the outside world (including reviewers) thinks of your research.

- Know who’s in your field and make sure they see you as a leader.
- Funding is about both science and self-marketing. Recognition primes others to consider you as a leader.
- Show accomplishments through publications, invitations to present, and conference abstracts.
- Request enough travel money to attend two or three meetings a year.
- Be specific about which meetings, where, and why in your budget justification.
- Meet reviewers at meetings.

Publish before you apply.

- Don't wait till the end of your grant to publish!
- Get your papers published or papers accepted for publication before you apply.

Both the Public Health Service Policy on Humane Care and Use of Laboratory Animals and the U.S. Department of Agriculture regulations under the Animal Welfare Act define the eight functions of an institutional animal care and use committee in more-or-less the same way. However, Jerry Collins, NIH Office of Laboratory Animal Welfare consultant, would add a “ninth, overarching” function to the list: “The IACUC must have in place means to get feedback on what happens to the animals after approval for their use has been granted.” Collins, who is also a professor of anesthesiology at Yale University School of Medicine, discussed his ninth IACUC function, which he said was “not on the list but essential to success,” as well as the standard eight, at a recent webinar sponsored by OLAW — IACUC Responsibilities Beyond Protocol Review and Facilities Inspection. Susan Silk, director of OLAW’s division of policy and education also spoke at the webinar.

So what are the eight functions of an IACUC as outlined in the PHS policy? Collins discussed them as follows:

1. Review animal program.
2. Inspect animal facilities.
3. Report results of 1 and 2 to the institutional official (IO).
   According to Collins, “These three functions constitute the mandated semianual evaluation of an animal program…. In fact for many institutions, these three functions and protocol review account for the majority of an IACUC’s time.”
4. Review animal care and use concerns.
5. Make recommendations to the IO about any aspect of an animal program, facilities, or personnel training.

   Functions four and five, Collins said, “have no set schedule, and, depending on your program, may occur infrequently. Although we do hope that in the spirit of number five, you have an ongoing dialogue with your IO about the status of your animal program.”
6. Review and approve, require modifications in (to secure approval), or withhold approval of proposed animal activities.
7. Review, require modifications to approve, or withhold approval of proposed significant changes to ongoing animal activities.
   “Numbers 6 and 7, typically, are referred to as protocol review and are viewed by many, mistakenly, as the only thing that an IACUC does. Note that 6 refers to the review of the initial protocol and 7 refers to proposed changes to an already approved protocol. In both of these functions, the IACUC is charged with requiring modifications to proposed animal activities, if needed, for approval,” Collins said.
8. Suspend an activity involving animals.

   The last function, according to Collins, is critical, “Although it is difficult, it is important that each member of the IACUC be willing to vote to suspend an activity
position at your institution to support a ‘culture of compliance’ that will facilitate the IACUC process.”

**Methods of Continuing Review Vary**

Under the PHS policy, an IACUC is required to conduct “continuing review of each previously approved, ongoing activity covered by this policy at appropriate intervals as determined by the IACUC, including complete review...at least once every three years.”

“When the policy was first enacted, many institutions interpreted this to mean simply that protocols had to be renewed every three years. While that is true, standard practice has evolved to a process of ongoing review throughout the life of an approved activity, thus providing the IACUC with ongoing feedback,” Collins said. Collins added, however, that the requirement to conduct continuing review does not mean a formal post-approval monitoring, or PAM, process needs to be established, nor does additional staff necessarily need to be hired. A formal PAM program is “merely only one way” for an institution to achieve compliance, He said.

Collins discussed examples of less-formal post-approval monitoring activities. If the answer is “yes” to any of the following at an institution, according to Collins, “you are conducting PAM”:

- Does your IACUC conduct annual protocol review?
- Does it track unexpected animal death or disease?
- Does it keep an eye on problem labs?
- Does the IACUC receive veterinary reports?
- Does it report noncompliance to OLAW?

**Relationship With IO Is Crucial**

Throughout his comments, Collins stressed the need for the IO to be involved in relevant IACUC activities and to have a good working relationship with the IACUC. He suggested giving the IO a copy of the PHS animal care policy (see http://grants.nih.gov/grants/olaw/references/phspol.htm). Collins also “strongly encouraged” IACUCs to help IOs to “do their own mini-inspection and then compare their impression with the most recent report they received from the IACUC about that same location. Hopefully, they will agree with your IACUC’s assessment.”

Semiannual reports provide another opportunity for IO interaction. “Do you and your IO get an accurate sense of your program from each semiannual report?” Collins asked. “How does your IO follow up on questions or concerns raised in the report? Things work best if there is a partnership between the IO and your IACUC. Does your IO meet on a regular basis with the IACUC chair or member of the IACUC staff?” Regarding the reports, Collins also noted that deficiencies described in a semiannual inspection should have a “reasonable, specific plan and schedule” for correcting each one. “Remember that it is up to the IO and the IACUC to determine the seriousness of all noted deficiencies,” he said. Collins also pointed out that such reports should include “minority opinions.”
Collins described another instance where the IACUC must work closely with the IO. “If the IACUC suspends an activity involving animals, the IO, in consultation with the IACUC, shall review the reasons for the suspension, take appropriate corrective action and report the action with a full explanation to OLAW,” Collins said, adding that “this is one of two IACUC functions that involve both the IO and the IACUC. The other is when, together, they determine if a deficiency is significant.” While IACUCs have the “responsibility” to suspend activities, this is shared with the IO, Collins said. The IO “may also do so, and it is very important that everyone understand that veterinarians have a similar authority to halt an activity if it is to protect the health or safety of animals,” Collins said.

Compliance Resources Are Available
After the presentation part of the webinar, Susan Silk answered stakeholders’ questions. When asked about common features of a good animal care and use program, Silk cited the important role of education in fostering a “culture of compliance” at an institution, the same term used by Collins.

Training — of investigators, research staff, animal facility personnel, IACUC members — such that everyone understands the system and what is expected of them is essential “to an effective, robust program,” Silk said. Another questioner sought assistance with disaster planning. Silk said the plan should address both animals and people. “Animal program personnel, such as the vet or facility manager, should be included in organizational planning. Plans should include consideration of immediate animal care and relocation, saving valuable research, humane disposition of animals — should that become necessary — and preservation of valuable strains through cryopreservation,” Silk said.

¶3320.9 Ensure Meeting Costs Are ‘Audit-Proof’

AIS editors

When an inspector general audit report detailing excessive spending of taxpayer funds by staff from the U.S. General Services Administration at a location with a reputation for less-than-serious business — Las Vegas — hit the media in early 2012, the fallout for the agency was swift and unfortunate. As a result, every out-of-town meeting conducted with government funds seemed vulnerable, despite the fact that such meetings it is allowable to charge the costs of meetings and conferences to federal grants where “the primary purpose is the dissemination of technical information” and the costs of “training provided for employee development,” according to the federal cost principles (Circular A-21 for colleges and universities).

Many savvy grantees and subgrantees recognized long ago that the line drawn by the federal government between allowable meeting, conference, and training expenses, and unallowable entertainment in grant-funded activities isn’t the clearest — so they exercise the kind of prudent judgment that was apparently lacking on the part of certain officials at GSA. They do this by reviewing the purposes and agendas of the sessions that their staffs seek to attend — and the locations — and by documenting how these activities relate to and benefit the grants. They also do it by opting for reasonable lower cost alternatives like teleconferencing and webinars and considering how the expenses associated with those events will look to a skeptical auditor.

A recent audit by NSF’s Office of Inspector General of the foundation’s practices regarding staff retreats could offer additional guidance in this area (www.nsf.gov/oig/12-2-009.pdf.). OIG reviewed nine NSF staff retreats and found “several areas in which NSF could improve internal control to better ensure cost containment and compliance with applicable standards.” The nine sampled retreats were selected from 95 held in fiscal years 2010 and 2011.

OIG found “a lack of support to ensure that retreat sites selected were the most cost effective as required by the Federal Travel Regulation (FTR)” and “because NSF had not set a standard for how much should be spent on refreshments at retreats, the amount that could be spent varied across the agency.” OIG recommended that NSF develop a policy incorporating the relevant FTR requirements that indicate a basis “for clear expectations of justification of cost, reasonableness of spending, and sufficiency of management oversight” and that it “reevaluate” holding staff retreats outside the Washington area, where NSF is headquartered.

---

§3320.10 NIH Domestic Awards to Transition to Payment Management System Subaccounts in FY 2014 and FY 2015
National Institutes of Health

Notice Number: NOT-OD-13-120
Key Dates: Release Date: September 26, 2013

Purpose
This guide notice alerts grantees to a change in the implementation timeline, previously announced in NOT-OD-13-112, for the NIH transition to new U.S. Department of Health and Human Services (HHS) payment policies for grant awards and use of Payment Management System (PMS) subaccounts.

NIH will transition all award payments to the PMS subaccounts by the end of FY 2015. To help minimize grantee burden for the transition in FY 2014, NIH will only establish PMS subaccounts for domestic awards that have new document numbers. However, in response to feedback from the grantee community, NIH has delayed the implementation for non-competing continuation awards to October 1, 2014, to allow grantees a year to prepare their systems to accommodate the changes.

This Guide Notice only applies to domestic awards. NIH transitioned the payment of grant awards to foreign institutions to PMS subaccounts throughout FY 2013; see NOT-OD-12-139 and NOT-OD-13-019. Also, see companion Notice NOT-OD-13-111 on transitioning payment of Federal Institutions and Individual Fellowships at Federal and Foreign Institutions to PMS subaccounts.

Background
Most payments for NIH domestic awards are currently made via pooled accounts in PMS, which is a centralized grants payment and cash management system operated by the Division of Payment Management (DPM) HHS.

Payments for NIH awards to Federal institutions, Federal Fellows and Foreign Fellows are currently made directly by the Office of Financial Management (OFM), NIH.

Revised Implementation Timeline
The transition of all NIH awards to PMS subaccounts is anticipated to take place in FY14 and FY15.

FY2014 Implementation Plans for Awards with New Document Numbers
Between October 1, 2013 and September 30, 2014, NIH will transition payment for all domestic awards with new document numbers (i.e., Type 1, Type 2, Type 4, Type 6, Type 7, and Type 9) from PMS pooled accounts (G accounts) to PMS subaccounts (P subaccounts). For these types of awards, PMS will establish subaccounts for each NIH award made on or after October 1, 2013. All subsequent non-competing continuation awards will be issued in subaccounts.
**Anticipated Implementation Plans in FY2014 and FY2015 for Type 3 Awards**

Please be aware that competitive revisions/supplements (Type 3s) issued to domestic awards in FY 2014 and FY 2015, will be issued in the same account as the parent award. If the parent award is in the pooled account at the time the Type 3 is issued, the Type 3 will be in the pooled account too. If the parent award was issued in a P subaccount at the time the Type 3 is issued, the Type 3 will also be in the P subaccount account.

**Anticipated FY2015 Implementation Plans for All Other Domestic Awards**

Between October 1, 2014 and September 30, 2015, NIH will transition payment for all continuing domestic awards (i.e., Type 5 and Type 8) that have not yet transitioned to subaccounts from PMS pooled accounts (G accounts) to PMS subaccounts (P subaccounts). For these types of awards, PMS will establish subaccounts for each NIH award made on or after October 1, 2014.

For domestic grants with a non-competing continuation year of funding in fiscal year (FY) 2015 (October 1, 2014 – September 30, 2015), NIH will use a technical process to shift the funding from PMS G accounts to PMS P subaccounts by issuing all FY 2015 non-competing continuation awards that have not yet transitioned to subaccounts as Type 4 awards (funded extension awards). This means that all domestic Type 5 awards (non-competing continuation awards) and Type 8 awards (non-competing continuation awards with a change of awarding Institute or Center), will be issued as Type 4s during the transition period. This enables NIH to separately track obligations and payments for grants that span the Federal FYs 2014 and 2015. In addition to changing the record Type and the document number for the FY 2015 award, NIH will change the project period end date of the FY 2014 award when the FY 2015 award is issued. The project period end date will be changed to the budget period end date. This effectively breaks the single competitive segment into two shorter “competitive segments.” The change will be reflected in the eRA Commons; however, NIH will not issue a revised Notice of Award (NoA) for the FY 2014 award. Therefore, the FY 2014 award becomes the final year of the first “competitive segment” and requires final Federal Financial Report (FFR) expenditure data. If the award is under Streamlined Non-competing Award Process (SNAP), the grantee will be required to submit FFR expenditure data that covers the project period from the original start date through the new project period end date.

NIH will make this transition as seamless as possible for grantees and NIH staff. Records for non-competing continuation progress reports (Type 5s), or in rare instances Type 8s, that have not yet transitioned to subaccounts will be converted to Type 4s. The conversion will be processed internally by NIH. There will be no change to the due dates, submission, or review of progress reports for domestic awards for FY 2015.

Please see below for procedural changes in carryover of funds for non-competing continuation awards issued in FY 2015.

Non-competing continuation progress reports (Type 5s), or in rare instances Type 8s, that were converted to Type 4s to accommodate the change in method of payment from the pooled accounting to subaccounts, require a final FFR for the prior year(s) of the competitive segment before any carryover funds would be available for drawdown in the PMS. However, this requirement does not change the carryover authority listed in Section III of the NoA. If the award was issued with automatic carryover authority, OFM will automatically authorize the carryover in the PMS P subaccount equal to the amount of unobligated balance reported on the FFR.* If the award was issued without carryover authority, OFM will automatically transfer the unobligated balance reported on the FFR to the PMS P subaccount; however, the grantee will still be required to submit a prior approval request to use carryover funds as detailed in the NIH Grants Policy Statement, Section 8.1.1.1. If the request is approved, a revised NoA reflecting the approved carryover amount will be issued and the authorized amount will be reflected in PMS. Failure to submit FFR expenditure data in a timely manner may affect future funding.

*In accordance with existing policy, the GMO will review unobligated balances in excess of 25 percent of the total authorized amount for the budget period and may request additional information from the grantee. If the GMO determines that some or all of the unobligated funds are not necessary to complete the project, the GMO may restrict the grantee’s authority to automatically carry over unobligated balances in the future, use the balance to reduce or offset NIH funding for a subsequent budget period, or use a combination of these actions. The GMO’s decision about the disposition of the reported unobligated balance will be reflected in the terms and conditions of the NoA.

An FFR to report expenditure information is not required for Kirschstein-NRSA individual fellowship awards.

Change in Processing of Funds Requested for Awards in PMS Subaccounts that are 90 days Beyond the Project Period End Date

When a federal grant expires, recipients can only use remaining grant funds to liquidate expenses incurred during the performance period. Federal grants management policy specifies that within 90 days of the project period end date the grant recipient must submit its final financial report for the grant, unless the awarding agency extends the project period end date or the reporting period due date. See NIH Grants Policy Statement Section 8.6 for more information on the grantee responsibilities for timely closeout is a grantee responsibility.

In an effort to promote more timely financial closeout of awards, PMS will now hold payment requests for funds in subaccounts for awards that are 90 days or more beyond the project period end date. Funds requests for these awards will not be processed unless, and until, the awarding Agency has approved the payment request.
**Frequently Asked Questions**

NIH will post answers to frequently asked questions on the transition to PMS sub-accounts on the following site: [http://grants.nih.gov/grants/frequent_questions.htm](http://grants.nih.gov/grants/frequent_questions.htm) under the Other Policies/Resource heading, Payment (PMS Subaccounts).

**Inquiries**

Please direct all inquiries to:

- Division of Grants Policy
- Office of Policy for Extramural Research Administration
- Office of Extramural Research
- National Institutes of Health
- Telephone: 301-435-0949
- Email: GrantsPolicy@od.nih.gov

National Science Foundation ARRA Recipient Reporting Frequently Asked Questions

National Science Foundation

March 10, 2014

1. Is ARRA reporting finished?

Recipient reporting for Recovery Act awards has been repealed by Congress as of February 1, 2014. Therefore, the January 2014 reporting cycle was the last time recipients will be required to report on their ARRA awards.

For more information about the completion of Section 1512 ARRA recipient reporting, please see the End of Recipient Reporting FAQs posted on the FederalReporting.gov home page.

2. My NSF ARRA award has not expired. Will NSF modify the award to remove the ARRA reporting requirements in the Terms and Conditions? Are there now other reporting requirements for my ARRA award?

Yes, NSF is amending ARRA awards which have not yet expired, to remove the ARRA reporting requirements from the award Terms and Conditions. Recipients should follow the Terms and Conditions of the award, including complying with all reporting requirements.

3. What is the timeline for the end of Section 1512 ARRA reporting?

- **February 1 - March 19, 11:59 P.M. Eastern Time**
  - Agencies and recipients review reports and make changes and corrections as needed. If you have questions, please review the End of Recipient Reporting FAQs on the FederalReporting.gov home page first, as you might find your answers there. If you still have questions, email the Help Desk at FederalReportingHelpDesk@ratb.gov.
  - Agencies and recipients can continue to submit Automated Data Change requests. (See Chapter 16 of the FederalReporting.gov User Guide for instructions.)

- **March 20**
  - The extended Quality Assurance period ends for recipients and agencies.
  - Recipients will not be able to login to Federal Reporting.gov.
  - The Help Desk closes.

- **May 1**
  - The final Recipient Data will be posted on Recovery.gov.

4. When can I file a final report on FederalReporting.gov for an ARRA award?

A project is considered final for ARRA reporting purposes when the following requirements are met:

- All ARRA funds associated with the award have been expended at the prime
recipient level.

- All or nearly all ARRA funds associated with the award have been invoiced and received. Per Office of Management and Budget (OMB) guidance, in instances where expenditures are reimbursed to recipients and invoices/receipts lag expenditures, a project may be marked as final when all funds have been expended, 75% or more of the funds awarded have been invoiced and received, and the project status is “Fully Completed.”

- No additional jobs will be funded.

- The project status is complete per agency requirements and/or performance measures.

- The project status is marked as “Fully Completed.”

Please note for NSF ARRA awards, recipients have 90 days after the expiration date of the award to liquidate all obligations incurred, draw down funds through ACM$, and submit all required reports. Please refer to the FAQs for Closeout of ARRA Awards for additional information about closure of your ARRA award.

5. What are the final report requirements? For a report to be considered final per OMB guidance:

The Final Report indicator must be “Yes,”

- The Project Status must be “Fully Completed,” and

- The Amount of ARRA Funds Received and Amount of ARRA Expenditure must match the award amount.

- In instances where the final prime recipient expenditures are less than the award amount listed on the report due to an amendment in the original agreement or if the project came in under budget, the recipient must provide a description in the “Quarterly Activities/Project Description for Prime and Sub-recipients” field explaining why the final amount in the “Total Federal Amount of ARRA Expenditure” field does not equal the amount in the “Amount of Award” field, and confirming that no more funds will be expended by the prime recipient.

6. Should I use the award amount from the NSF Award Notice for the “Amount of Award” field on my ARRA report?

No. For the “Amount of Award” field, recipients should enter the value from the field entitled “Funds Obligated to Date” in Research.gov. Any non-ARRA supplemental funding should not be included in award amount totals when completing ARRA quarterly reports.

7. How do I update my Central Contractor Registration (CCR)?

The CCR system was migrated into the comprehensive System for Award Management (SAM). The information previously maintained in CCR is contained within the Entity Management area in SAM, and users will need to create a new username and password to access the system, as the previous CCR password will not work in
SAM. The entire process to reactivate/update your CCR registration in SAM will require at least 3-5 days, and there is no fee to register at SAM.gov. For additional CCR assistance, please contact the SAM help desk at www.fsd.gov.

8. Why is it important to maintain current CCR and DUNS registration information?

It is the recipient’s responsibility to ensure that their CCR information is up-to-date, and that their registration is active and will remain active throughout the reporting cycle. If the registration expires or if the recipient’s CCR account has not been updated in SAM, the recipient will not be able to access FederalReporting.gov through March 19, 2014, unless the registration is reinstated. Maintaining current Points of Contact in the CCR record will ensure that CCR renewal reminders are received by the appropriate person(s) at the recipient organization.

It is also the recipient’s responsibility to ensure that their DUNS number and entity record is accurate and active with Dun and Bradstreet (D&B). While DUNS numbers do not expire, D&B does conduct routine and continuous data maintenance and outreach to verify operations at a location. When operations cannot be verified for a particular DUNS number, D&B may flag the DUNS number as “inactive,” which could interfere with successful reporting. In order to lookup, review, or modify a record at D&B, recipients may utilize the self-service webform at http://fedgov.dnb.com/webform. This application allows a recipient to look up their DUNS number, review the data on file, request changes if necessary, or request a new DUNS number if one does not already exist. Recipients can call (866) 705-5711 to verify that a DUNS number is active and to confirm other details about their entity.

9. To whom should I direct further questions regarding ARRA recipient reporting?

Any questions regarding ARRA recipient reporting may be directed to the NSF ARRA Recipient Reporting Team at NSFARRAReviewer@nsf.gov. NSF-specific ARRA reporting guidance is also available on our Recovery Act website at http://www.nsf.gov/recovery.
13320.12 NIH Opens Research Performance Progress Reports
National Institutes of Health

Notice Number: NOT-OD-14-064
Key Dates
Release Date: March 4, 2014
Related Announcements
NOT-OD-14-026; NOT-OD-13-113; NOT-OD-13-035; NOT-OD-13-061; NOT-OD-12-083
Issued by
National Institutes of Health (NIH)

Purpose
The National Institutes of Health (NIH) will open the Research Performance Progress Report (RPPR) for all type 5 non-SNAP progress reports following the April 24, 2014, eRA release.

Background
NIH requires use of the RPPR module to submit progress reports for Streamlined Non-competing Award Process (SNAP), fellowship, and multi-year funded awards. NIH is continuing efforts to implement the RPPR module for non-SNAP awards; please see details below.

RPPR for Non-SNAP Progress Reports
Federal Demonstration Partnership (FDP) institutions currently may opt to submit type 5 non-SNAP progress reports using the RPPR and NIH encourages FDP institutions to continue to do so.

On April 25, 2014, NIH will expand to all institutions the ability to submit type 5 non-SNAP progress reports using the RPPR. NIH encourages all institutions to use the RPPR to submit type 5 non-SNAP progress reports when access is available. While non-FDP institutions cannot submit type 5 non-SNAP progress reports using the RPPR until April 25, 2014, for institutions interested in learning more about non-SNAP RPPRs, an archive of a recent training session is available on the NIH RPPR webpage. Beginning on April 25, 2014, all institutions may use the RPPR for type 5 non-SNAP progress reports.

Non-SNAP progress reports not submitted using the RPPR must be submitted using the PHS 2590.

NIH anticipates requiring all grantee institutions to use the RPPR for non-SNAP progress reports beginning on October 17, 2014; however, a separate Guide Notice announcing the requirement will be issued on a future date. Note also, that NIH continues development of the RPPR for final progress reports and for administrative extensions (Type 4s; e.g., SBIR/STTR Fast-Track Phase II application). NIH will update the community as progress is made.

Additional information and resources on the RPPR, including the current RPPR
Instruction Guide and training archives, can be found at: http://grants.nih.gov/grants/rppr/.

Inquiries

General questions concerning using the eRA Commons and RPPR functionality should be directed to the eRA Commons Helpdesk at:

13320.13 Revised Timeline for Administrative Changes to NIH Domestic Awards to Transition to Payment Management System Subaccounts

National Institutes of Health

Notice Number: NOT-OD-14-103

Key Dates
Release Date: July 11, 2014
Related Announcements
NOT-OD-14-093
NOT-OD-13-120
NOT-OD-13-112
NOT-OD-13-111
NOT-OD-13-079
NOT-OD-12-139

Purpose
This Notice alerts grantees to a change in the implementation timeline, previously announced in NOT-OD-13-120 and NOT-OD-14-093, for the NIH transition to new U.S. Department of Health and Human Services (HHS) payment policies for domestic, non-competing continuation awards and use of Payment Management System (PMS) subaccounts. It also announces a change in how competitive revisions/administrative supplements (Type-3s) awards will be processed.

This Notice only applies to domestic non-competing continuation awards that have not yet transitioned to PMS subaccounts. In response to critical feedback from the grantee community, NIH requested an amendment to its subaccount implementation plan to delay the transition of domestic, non-competing continuation awards to PMS subaccounts for an additional year; e.g., now beginning October 1, 2015. HHS’s Office of the Assistant Secretary for Financial Resources recently approved the request. This additional time is provided to allow grantees to prepare their systems to accommodate the changes. Grantees with inadequate systems in place to appropriately manage this transition by October 1, 2015, may be unable to appropriately access PMS accounts and risk losing their ability to draw down funding. Grantees are advised that there will be no additional implementation delays considered and no exceptions granted to the deadline. As of October 1, 2015, NIH will utilize only subaccounts for awarding grant funds. Every grant that is awarded funding in FY 2016 (whether it be in the first, second, third or fourth quarter of FY 2016) will be in a subaccount.

NIH will continue transitioning payment of grant awards with new document numbers to domestic institutions to PMS subaccounts in FY 2015 as announced in Notice NOT-OD-13-120. The administrative changes announced in NOT-OD-14-093 will now apply to the transition that will occur between October 1, 2015 and September 30, 2016. This Notice reiterates those administrative changes for non-competing, continuation awards and highlights the revised implementation timelines and T-3 award process for all domestic awards.
Revised Implementation Timeline

The transition of all NIH awards to PMS subaccounts is anticipated to be complete by September 30, 2016.

Implementation for Domestic Awards with New Document Numbers

NIH will continue to transition payment for all domestic awards with new document numbers (i.e., Type 1, Type 2, Type 4, Type 6, Type 7, and Type 9) from PMS pooled accounts (G accounts) to PMS subaccounts (P subaccounts). For these types of awards, PMS will establish subaccounts for each NIH award made on or after October 1, 2013. All subsequent non-competing continuation awards to these grants will also be issued in subaccounts.

Implementation for Domestic Type 3 Awards

Please be aware that beginning with awards issued on/after October 1, 2015, competitive revisions/administrative supplements (Type 3s) issued to domestic awards, will now also be issued in a P subaccount. This is a change from the previously announced plan and is regardless of whether the parent grant is still in PMS pooled accounts (G accounts) or has transitioned to PMS subaccounts (P subaccounts).

Implementation for Domestic, Non-Competing Continuation Awards

Implementation for domestic, non-competing awards has been delayed by one fiscal year; this implementation will now occur between October 1, 2015 and September 30, 2016. NIH will transition payment for all continuing domestic awards (i.e., Type 5 and Type 8) that have not yet transitioned to subaccounts from PMS pooled accounts (G accounts) to PMS subaccounts (P subaccounts). For these types of awards, PMS will establish subaccounts for each NIH award made on or after October 1, 2015.

◆ For domestic grants with a non-competing continuation year of funding in fiscal year (FY) 2016 (October 1, 2015 – September 30, 2016), NIH will use a technical process to shift the funding from PMS G accounts to PMS P subaccounts by issuing all FY 2016 non-competing continuation awards that have not yet transitioned to subaccounts as Type 4 awards (funded extension awards). This means that all domestic Type 5 awards (non-competing continuation awards) and Type 8 awards (non-competing continuation awards with a change of awarding Institute or Center), will be issued as Type 4s during the transition period.

◆ In addition to changing the record Type and the document number for the FY 2016 award, NIH will change the project period end date of the FY 2015 award when the FY 2016 award is issued. The project period end date will be changed to the budget period end date. This effectively breaks the single competitive segment into two shorter “administrative segments.” The change will be reflected in the eRA Commons; however, NIH will not issue a revised Notice of Award (NoA) for the FY 2015 award.

◆ Therefore, the FY 2015 award becomes the final year of the first “administrative segment” and requires Federal Financial Report (FFR) expenditure data, which is
Supplementary Material

Applicable Policies for Non-Competing Continuation Awards

- Due Date for Subaccount Transitional FFR: the due date for Subaccount Transitional FFR expenditure reports is no later than 90 days after the end of the calendar quarter in which the budget period ended.

- Unliquidated Obligations on the Subaccount Transitional FFR: if there are unliquidated obligations at the end of the first “administratively shortened” competitive segment, these may be reported on the subaccount transitional FFR expenditure data report.

- Subaccount Transitional FFR for converted SNAP awards: If the award is under Streamlined Non-competing Award Process (SNAP), the grantee will be required to submit subaccount transitional FFR expenditure data that covers the project period from the original start date through the new project period end date.

- Due Date for Progress Reports: There will be no change to the due dates, submission, or review of progress reports for domestic awards for FY 2016.

Please see below for procedural changes in carryover of funds for non-competing continuation awards issued in FY 2016.

Change in Process to Carryover Funds and Federal Financial Reports for Domestic Non-Competing Continuation Awards during FY 2015 (October 1, 2015 – September 30, 2016)

Non-competing continuation progress reports (Type 5s), or in rare instances Type 8s, that were converted to Type 4s to accommodate the change in method of payment from the pooled accounting to subaccounts, require a final FFR for the prior year(s) of the competitive segment before any carryover funds would be available for drawdown in the PMS. However, this requirement does not change the carryover authority listed in Section III of the NoA. If the award was issued with automatic carryover authority, OFM will automatically authorize the carryover in the PMS P subaccount equal to the amount of unobligated balance reported on the FFR.* If the award was issued without carryover authority, OFM will automatically transfer the unobligated balance reported on the FFR to the PMS P subaccount; however, the grantee will still be required to submit a prior approval request to use carryover funds as detailed in the NIH Grants Policy Statement, Section 8.1.1.1. If the request is approved, a revised NoA reflecting the approved carryover amount will be issued and the authorized amount will be reflected in PMS. Failure to submit FFR expenditure data in a timely manner may affect future funding.

*In accordance with existing policy, the GMO will review unobligated balances in excess of 25 percent of the total authorized amount for the budget period and may request additional information from the grantee. If the GMO determines that
some or all of the unobligated funds are not necessary to complete the project, the GMO may restrict the grantee’s authority to automatically carry over unobligated balances in the future, use the balance to reduce or offset NIH funding for a subsequent budget period, or use a combination of these actions. The GMO’s decision about the disposition of the reported unobligated balance will be reflected in the terms and conditions of the NoA.

**Frequently Asked Questions**

NIH will post updated answers to frequently asked questions on the transition to PMS subaccounts on the following site: http://grants.nih.gov/grants/payment/faqs.htm based on this revised timeline.

3320.14 Reminder of Timeline for Administrative Changes to NIH Domestic Awards to Transition to Payment Management System Subaccounts

National Institutes of Health

Notice Number: NOT-OD-15-105
Key Dates
Release Date: May 28, 2015
Related Announcements
NOT-OD-14-103
NOT-OD-14-093
NOT-OD-13-120
NOT-OD-13-112
NOT-OD-13-111
NOT-OD-13-079
NOT-OD-12-139

Issued by National Institutes of Health (NIH)

Purpose
This Notice is intended to remind and reiterate the implementation timeline, previously announced in NOT-OD-14-103, for the NIH transition to new U.S. Department of Health and Human Services (HHS) payment policies for domestic, non-competing continuation awards and use of Payment Management System (PMS) subaccounts.

Implementation Timeline Reminder
As of October 1, 2015, NIH will utilize only subaccounts for awarding grant funds. Every grant that is awarded funding in FY 2016 (whether it be in the first, second, third or fourth quarter of FY 2016) will be in a subaccount. The transition of all NIH awards to PMS subaccounts will be complete by September 30, 2016. Grantees with inadequate systems in place to appropriately manage this transition by October 1, 2015, may be unable to appropriately access PMS accounts and risk losing their ability to draw down funding. Grantees are advised that there will be no additional implementation delays considered and no exceptions granted to the deadline.

Applicable Policies for Non-Competing Continuation Awards
A Subaccount Transitional FFR for all intent and purpose is equated to an annual FFR. Applicable policies for non-competing continuation awards include:

Due Date for Subaccount Transitional FFR: the due date for Subaccount Transitional FFR expenditure reports is no later than 90 days after the end of the calendar quarter in which the budget period ended.

Unliquidated Obligations on the Subaccount Transitional FFR: If there are unliquidated obligations at the end of the first “administratively shortened” competi-
tive segment, these may be reported on the subaccount transitional FFR expenditure data report.

**Subaccount Transitional FFR for converted SNAP awards:** If the award is under Streamlined Non-competing Award Process (SNAP), the grantee will be required to submit subaccount transitional FFR expenditure data that covers the project period from the original start date through the new project period end date.

**Due Date for Progress Reports:** There will be no change to the due dates, submission, or review of progress reports for domestic awards for FY 2016.

Recipients should use the SF-425 as they would for an annual FFR and mark “annual” in box 6. Additionally, grantees should enter “Subaccount Transitional FFR” in box 12.

Please see below for procedural changes in carryover of funds for non-competing continuation awards issued in FY 2016.

Carryover Funds and Federal Financial Reports for Domestic Non-Competing Continuation Awards during FY 2015 (October 1, 2015 – September 30, 2016)

The requirement to submit the Subaccount Transitional FFR for non-competing continuation awards is to ensure that approved balances will be transferred to the PMS P subaccount and made available to the grantee. This requirement does not change the carryover authority listed in Section III of the NoA. If the award was issued with automatic carryover authority, OFM will automatically authorize the carryover in the PMS P subaccount equal to the amount of unobligated balance reported on the FFR. If the award was issued without carryover authority, OFM will automatically transfer the unobligated balance reported on the FFR to the PMS P subaccount; however, the grantee will still be required to submit a prior approval request to use carryover funds as detailed in the NIH Grants Policy Statement, Section 8.1.1.1. Failure to submit this Subaccount Transitional FFR will affect the availability of those and future funds.

**Frequently Asked Questions**

NIH has posted updated answers to frequently asked questions on the transition to PMS subaccounts on the following site: http://grants.nih.gov/grants/payment/faqs.htm based on this implementation timeline.

Preparing for the Transition to NIH Subaccounts
James D. Luther, Duke University

Summary
Over the past several years and particularly with the rollout of the Uniform Guidance (Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards), there is renewed focus on timely financial reporting. Many federal agencies are implementing policies and practices to enforce timely submission of final project reporting and associated draw down of funds. Similarly, the focus on programmatic reporting is increasing as well. Universities vary greatly on their readiness to meet this enforcement; for those that are prepared, are adequately staffed, and have adequate IT and reporting transparency to manage this enforcement, the impact will likely be minimal. For others, the impact could be broad and significant and include financial risk, compliance risk, and disruption of business processes at both the departmental and central level and research in the lab. To adapt, these universities may need to restructure and revise core business practices for management of sponsored projects, and revise or create policies, technology solutions, training and monitoring. And it is likely that this will have to happen in a compressed timeframe. There has been an escalation in communication from federal agencies that confirms their commitment to closeout requirements.

This article will provide some context on what to expect as the Uniform Guidance (UG) drives even more enforcement, the background on the renewed enforcement, and one institution’s technology and business process initiatives that are underway to prepare.

Background
While previous decades have seen escalating compliance expectations imposed on universities, recent directives from federal sponsors regarding timely closeout and award management have significantly increased pressure on universities. What is the impetus for this increased concern? Universities are facing added pressure from federal agencies in response to the Government Accounting Office (GAO) reports and the Offices of Inspector General directing higher levels of enforcement for award management. Most notably was the July 2012 GAO report entitled Improving the Timeliness of Grant Closeouts by Federal Agencies and Other Grants Management Challenges in federally funded projects that had not been appropriately closed. The GAO cited some projects that were as late as 5-10 years past closing dates. In tight budget times, the potential of so many federal dollars remaining encumbered and unspent raised concerns across all agencies, and even rose to the level of congressional discussion. Offices of Inspector General began to issue strong directives to the agencies regarding improvement of closeout processes and fundamental award management. In response, many federal agencies are currently reviewing their grantee oversight models and considering methods to increase levels of transparen-

---

cy and accountability. For example, one agency’s approach has been to implement new reporting requirements, such as subaccount reporting to provide for increased transparency and reimbursement control.

This single change alone — transition to sub-accounting — may require institutions to devote extensive resources to significant technology support, changes in business process, and additional personnel.

Does this mean that federal agencies may potentially begin to deny reimbursement on projects that do not observe a timely 90 day close? It appears that this will indeed be the case, as agency enforcement of this requirement is more strictly imposed.

With a long history of productive agency/institutional partnership, all parties are committed to a timely and effective closeout; however, there may be obstacles within a university that can challenge this process. Some are easily surmountable, but others may have complex facets that require greater levels of coordination, re-sourcing, and internal policy change:

◆ Timing issues related to resource workload management (timely closeouts may be a challenge): The conflicting demands on institutional grant managers may be significant and require difficult prioritization among proposal submission, appropriate fiscal management of active projects, and closeout, each task with finite deadlines.

◆ Complexities of managing subrecipients: International subawardees, or awards that have more complex terms and conditions may pose additional problems in achieving a timely close.

◆ Institutions may struggle with timing issues related to postings that are entirely driven by the institution’s general ledger or payroll posting frequency which may only occur once per month.

◆ Late postings from service centers, vendors, and service providers may also need to be addressed.

The closeout process is complex and can be demanding if adequate personnel and system support are not readily available. Within 90 days, institutions must complete a final financial reconciliation of project expenses, ensure that all programmatic and financial requirements and documentation standards of subawards have been met, verify that effort has been appropriately managed and documented, close down any standing orders, outstanding encumbrances, remove all payroll assigned to the project and manage a final financial reconciliation. The issue is further exacerbated by limitations on resources dedicated to closeout and the variety and inconsistency of project closeout dates.

What, then, are the risks to the institution?

◆ Financial risk: universities incur a cost but due to other challenges are not able to draw down funds for reimbursement in time;

◆ Compliance risk: late financial and programmatic reports
Business disruption risk: pressure research administrators and principle investigators who are challenged to manage competing priorities may ultimately lead to reduced quality of research.

What role does the new Uniform Guidance play in addressing this issue?

OMB A-110 has long had a requirement for timely reporting but with expanded oversight and attention, the UG is reinforcing and clarifying the requirements. Section § 200.343 of the Uniform Guidance is very clear and states:

(a) The non-Federal entity must submit, no later than 90 calendar days after the end date of the period of performance, all financial, performance, and other reports as required by or the terms and conditions of the Federal award. The Federal awarding agency or pass-through entity may approve extensions when requested by the non-Federal entity.

(b) Unless the Federal awarding agency or pass-through entity authorizes an extension, a non-Federal entity must liquidate all obligations incurred under the Federal award not later than 90 calendar days after the end date of the period of performance as specified in the terms and conditions of the Federal award.

(c) The Federal awarding agency or pass-through entity should complete all closeout actions for Federal awards no later than one year after receipt and acceptance of all required final reports.

To summarize, the guidance reaffirms that all final reports (financial, performance, and other) and liquidation of obligations must occur within 90 days of the end date.

“Transparency, Enforcement and the Cash”: Subaccount Reporting

In response to the GAO report and audit pressure, many agencies are increasing their enforcement of these deadlines in advance of the implementation of the UG. Perhaps most compelling is the NIH announcement of a sweeping change to subaccounting financial reporting. While NSF had previously adopted the requirement that federal drawdowns must be done by individually funded project accounting, this has not previously been the practice at NIH. NIH announced its plans to transition to subaccounting in September, 2013 but delayed the transition start to 10/1/14. Other HHS agencies like HRSA are also communicating their planned enforcement.

Changing to subaccounting provides greater transparency as to the specifics of individual project financial accountability, and also enables the identification of late charging on projects past their closing end date. For institutions that have long relied on a consolidated drawdown process, this change is significant. The transition may require substantial technology support, institution-wide change in business process, and considerable drain on personnel resources. Aside from NSF and NIH, other federal agencies differ in their ability to readily enforce or support this change in financial systems, potentially creating a bifurcated business process at the institutional level.

Depending on the size of an institution’s portfolio, the transition to subaccount-
ing can be a significant business process change that may represent a >30 percent increase in annual FFR submission. Additionally, institutions may have to develop technology solutions to support a code-by-code draw process and may need to significantly increase their draws from 1-5 time/month to almost daily to ensure that there are no inadvertent internal timing issues that would cause the institution to miss the 90 day deadline.

**Duke University’s Approach**

As research administration at many institutions is highly decentralized, it is often challenging to develop institutional solutions to federal requirements that reflect best-practice and still allow the flexibility inherent in individual department culture and business environment. This is especially the case when there is a significant sense of urgency from the government competing with other institutional priorities outside of the research portfolio for resources and priority. The dilemma is further exacerbated when the changes necessary to meet new federal standards will impact university-wide systems, process and policy.

Changing what has been a traditional approach to timely closeout can become quite an extensive scope of work. Thus, prioritizing the risk, understanding upcoming deadlines, and assessing which policy/processes and technology items have the longest lead times, are critical to getting prepared. Following is a very high level summary of the approach that Duke University is taking:

A. Conduct “Readiness” analysis of upcoming end-dates
   a. What are the peak months of activity for closeouts? What are the competing priorities (proposal deadlines, academic & financial calendar)?

B. Identify the transactions/areas that create the greatest risk to an untimely closeout
   a. Are there G/L accounts or types of transactions that routinely cause late closeout? Possibly internal billing for recharge centers (e.g. lab animals and DNA sequencing); is there a consistent pattern of late invoicing from subawardees; is it problematic to manager closeout when faculty are cross-appointed or are “owned” by separate units?

C. Determine if internal business process and policies need to be revised.
   a. Examine the current Closeout Process – What tools are available to support the process, and are there early warning signals in the system to advise if a closeout is in danger of being late?
   b. Peer Invoicing Timeline – If late subrecipient billing is an issue, what measures can be taken to mitigate?
   c. Procurement Terms and Conditions – Is there consistent late invoicing among certain vendors, or is the internal process too slow?
   d. Internal billing (shared resources, clinical systems, student systems, etc.) – What systems can be improved to enhance timely and transparent billing?
e. Role of Parent – When internal “convenience” subaccounts are established, are the roles and “march in” rights of the parent clear so that internal subaccounts can be “taken over” if necessary to bring the project to close?

f. Cost Transfer policy – Should this be changed to eliminate late transfers that impede closing?

g. NCE Management – Is there a process for units to advise early in the project that a NCE will be requested?

h. FFR policy – Is there a clearly defined policy on FFR revisions, and a system that supports production of the FFR?

D. Evaluate impact on technology – what changes need to be made to:

a. Sponsored Programs Billing & Reporting Database

b. Improved LOC Draw process (code-by-code draw and increased frequency)

c. Tracking of Programmatic and Administrative Reports

d. Management Reporting to identify chronically slow units

E. Evaluate impact on training & education (faculty and staff)

F. Support from leadership for technology resources and eventual business process change (and associated disruption)

a. At Duke, we have a weekly meeting of senior leaders that includes the VP Finance, VP Human Resources, Vice Provost for Research, Vice Dean for Research, Executive Vice Dean Administration from the School of Medicine, and the Executive Vice Provost. This group meets twice a month with leadership from all primary research administration offices to address research support opportunities, improvement to technology and reducing faculty burden.

Critical to the success is evaluating the adequacy of functional resources in central offices, departments, and technology support to staff the initiative. Each university may need to ask: Do we need a dedicated implementation team that can assist with the technology and business process/policy work and then assist the departments during the transition.

As you assemble this project plan and associated team, it is critical that you consider the lead time for changes (what is the cycle time to get the necessary allocation of technology resources to make significant system changes), breadth and depth of stakeholder impact, financial risk, faculty burden, and departmental disruption.

**Conclusion**

The enforcement of the longstanding requirement to submit final financial and progress reports is accelerating at a significant pace and may catch many institutions by surprise. The ability to meet this requirement, and the implementation of subaccounting may require a consolidated and coordinated effort that addresses improvements to technology and changes to business process and policy. Some institutions, such as Duke, are fully acknowledging this and are meeting the requirement
with a project team that includes dedicated staff and strong representation from departments to address the compliance and financial risk in a manner that is supportive of the departments’ culture and the faculty research.

Editor’s Note: All, we are happy to hear that NIH will not implement the subaccounts payment policy until Oct. 1, 2015 per NIH NOT-OD-14-103.

Frequently Asked Questions about PMS Subaccounts
National Institutes of Health

I. General

A. Background

1. Why is NIH changing to PMS subaccounts?

NIH is transitioning to Payment Management System (PMS) subaccounts in response to a U.S. Department of Health and Human Services (HHS) directive to Agencies intended to enhance financial data integrity and financial closeout for all awards.

2. What is a competitive segment?

The initial project period recommended for support (usually up to 5 years) or each extension of a project period resulting from a renewal award. See applicable sections below for more information on impact of the transition to subaccounts on the competitive segment for your award type.

3. How do I know the fiscal year (FY) of the funds used to fund my award?

The Fiscal Year is a data field on the award located in SECTION I – AWARD DATA, in the Fiscal Information section as well as in the chart immediately below. See the following example:

Figure 3320.16-1

4. Will the Notice of Award (NoA) indicate the type of PMS subaccount?

In November 2013, NIH will place a “PMS Account Type” indicator on the award under the Fiscal Information header in Section I. See diagram in previous question for example. The indicator appears just above the “Fiscal Year.”

5. What is a type 4 award?

A type 4 award is a funded extension, for example Merit Extensions (4R37...) or Phase II Fasttrack SBIRs (4R44...).

For the subaccount transition, NIH is using type 4s as a technical solution to separately track obligations and payments for awards that are transitioning to PMS subaccounts during FY13, FY14, FY15 and FY16. The document number for the type 4 will increase by one letter (e.g., once the type 4 is issued, a document number of RCA123456A would become RCA123456B). The change in type and the change in document number do not affect the due date or submission process of the progress report. See applicable sections below for more information on the transition to sub-accounts for on your award type.

6. Are grantees required to terminate subawards then reissue them once the prime award has transitioned to a subaccount? Similarly, is there an expectation that grantees must handle ongoing commitments differently due to the subaccount transition? (Added 05/28/2015)

NIH does not require that grantees terminate then reissue subawards nor does it expect grantees to handle ongoing commitments in the remaining budget years of the project differently due solely to subaccount transition. In fact, Section III of the Type 4 NoA will state:

“This award was issued as a non-competing continuation with a change in document number. The original competitive segment has been divided into two administrative segments. This change was made solely to accommodate the HHS-mandated transition to Payment Management System (PMS) subaccounts. Therefore, costs may be allocated throughout the competitive segment as if it was not administratively divided.”

7. Will NIH continue to issue type 5 awards as type 4 awards after the transition? No, NIH will return to the standard use of the type 4s and 5s in future fiscal years.

B. Payment Management System

8. Who do I contact if I have questions on completing PMS forms or drawing down funds from PMS?

Should you require assistance in completing the PMS forms, please call PMS on (877) 614-5533 FREE or e-mail PMS at PMSSupport@psc.gov. Questions may also be directed to the ONE-DHHS Help Desk at http://www.dpm.psc.gov/help/help.aspx?explorer.event=true.

9. Where do I find more information on PMS registration and training?

Visit http://www.dpm.psc.gov/training/grant_recipient_international.aspx for
an overview of the PMS system. To register for PMS Grant Recipient Training
event=true

send an email to PMS_Training@psc.hhs.gov. See instructions on information
that must be included in the email.

II. Domestic Grantees

A. General

10. When is NIH transitioning domestic awards from PMS pooled accounts to PMS
subaccounts?

NIH will continue transitioning payment for all domestic awards with new docu-
ment numbers from PMS pooled accounts (G accounts) to PMS subaccounts (P
subaccounts) between October 1, 2013 and September 30, 2016. The payment for all
new (competing) NIH domestic awards made with FY14 and FY15 funds will use
PMS P subaccounts.

The transition of payment for non-competing continuation award will now be
delayed one year and will thus begin October 1, 2015. See NOT-OD-14-103, NOT-
OD-14-093, and NOT-OD-13-120 for more information.

11. How will the transition to subaccounts effect my competitive segment?

For continuing domestic awards issued in FY16 (awards issued after October 1,
2015) the competitive segment will become two mini “competitive segments”:
◆ the first segment begins at the budget period start date of the current competitive
segment and ends at budget period end date of the FY15 award and
◆ the second segment begins with the budget period start date of the FY16 award
and ends with the project period end date on that award.
◆ See example Change from Pooled Accounts to Subaccounts For Domestic Awards
FY16 (PDF - 94 KB)

12. What is the purpose of a Subaccount Transitional FFR? (Added 05/28/2015)

The Subaccount Transitional FFR is akin to an annual FFR. However, it enables NIH
to end the grant’s association with the pooled PMS payment account and transition
award payments to the PMS subaccount established for the grant, including trans-
ferring any carryover funds and unliquidated obligations remaining in the pooled
account. Note: Once NIH approves the Subaccount Transitional FFR, the grantee may
no longer access the pooled account; it must request payment from the subaccount.

13. Is there a different form for the Subaccount Transitional FFR? What type of
report is this considered? (Added 05/28/2015)

Grantees should use the SF-425 as they would for an annual FFR and mark “annual” in
box 6. Additionally, grantees should enter “Subaccount Transitional FFR” in box 12.

14. Is the P subaccount established in PMS with the issuance of the Type 4 Notice of
Award?
Yes.

15. Will both PMS G accounts and PMS P accounts be active at the same time?

NIH anticipates transitioning all new and continuing domestic awards made to the PMS P subaccount by the end of FY16, i.e., September 30, 2016.

All new (competing) domestic awards made in FY14 and FY15 will use PMS subaccounts (P subaccounts).

For non-competing continuing awards that have not yet transitioned to subaccounts, grants issued prior to October 1, 2015, will use the G account until the FY16 award is issued. Once the FY16 awards is issued, those FY16 awards will use the P subaccount and the grantee will submit an FFR for the FY15 award.

Some examples of awards that will remain in the pooled accounts, multi-year funded awards made prior to October 1, 2013 (e.g., DP3, C06) and awards in a no-cost extension made prior to October 1, 2015.

16. Will the PMS G account and the PMS P subaccount for a specific award have the same document number?

No. The document number will increase by one letter once the Notice of Award is issued that transitions the project award to a PMS P subaccount. For example, a document number of RCA123456A would become RCA123456B. See I.A.5 above.

17. If an award in the PMS G account receives a no-cost-extension in FY 2014 or FY 2015, will the funds remain in a G account or be transitioned to a P subaccount?

The funds will remain in the G account.

B. Carryover

18. Is NIH changing the carryover authority for domestic awards?

NIH is not changing the carryover authority for domestic awards. NIH is transitioning from pooled accounting to subaccounting beginning FY14 through FY16, which necessitates that domestic grantees report unobligated balances from previous FYs so those funds can be reobligated to the new subaccount in PMS for the award. The balance reported on the Subaccount Transitional FFR will be re-obligated in PMS regardless of the carryover authority for the award. If the award was issued with automatic carryover authority, the grantee may drawdown the carryover funds and obligate as they would now, once this Subaccount Transitional FFR has been processed. If the award was not issued with automatic carryover authority, the grantee may not drawdown or obligate the funds unless a prior approval request has been approved and a revised NoA reflecting the approved carryover amount has been issued.

See example Carryover on Domestic Awards from FY15 to FY16 (PDF - 133 KB)

*In accordance with existing policy, the GMO will review unobligated balances in excess of 25 percent of the total authorized amount for the budget period and may request additional information from the grantee as part of the review. If the GMO determines that some or all of the unobligated funds are not necessary to complete the project, the GMO may restrict the grantee’s authority to automatically carry over unobligated balances in the future, use the balance to reduce or offset funds.
NIH funding for a subsequent budget period, or use a combination of these actions. The GMO’s decision about the disposition of the reported unobligated balance will be reflected in the terms and conditions of the NoA.

19. Will carry over funds be added to the P subaccount once the Subaccount Transitional FFR is accepted?

Yes. Carry over funds are added to the P subaccount upon NIH’s acceptance of the Subaccount Transitional FRR.

20. Should the expenditures reported on the Subaccount Transitional FFR match the disbursements reflected in the PMS quarterly cash transaction report? What happens if they do not match when the Subaccount Transitional FFR is submitted?

These numbers—i.e., expenditures reported and PMS disbursements requested—do not need to match for NIH to accept the Subaccount Transitional FFR and add carry over funds to the P subaccount. However, the grantee is responsible for reconciling these amounts as soon as possible if a discrepancy exists. In this sense, NIH is reviewing the Subaccount Transitional FFR as an interim financial report rather than a final FFR for grant closeout.

C. Federal Financial Report Cash Transaction and Expenditure Data

Yes, domestic awards are in PMS P subaccounts, which require the completion of quarterly Federal Financial Report (SF 424) Cash Transaction data.

22. When completing the expenditure Subaccount Transitional FFR for the FY15 award, how do I reflect the unobligated amount from the previous segment to carryover to the new segment?

Whether there is carryover authority or not, in the new project period, the grantee must populate this amount in the field entitled “Unexpended Balance From Prior Project Period” at the top of the FFR (see screen shot below). Failure to file FFRs in a timely manner may affect future funding.

Figure 3320.16-2

23. How do I report unliquidated obligations on the FFR for a domestic FY15 award?

FY15 will be the last year for which NIH issues funds in pooled accounts for non-competing domestic awards; therefore, the FFR for the FY15 year will be the Subac-
count Transitional FFR for the “administratively shortened” competitive segment. If there are unliquidated obligations at the end of the “administratively shortened” competitive segment, this should be reported on the Subaccount Transitional FFR expenditure data report. See question Domestic C.2 for unobligated balances reported on this FFR.

24. My award was not issued under SNAP. Are there any changes to my FFR expenditure data reporting?

Awards not issued under SNAP are still required to submit FFR expenditure data annually. See NIH Grants Policy Statement, Section 8.4.1.5.2 Financial Expenditure Reports. However, the cumulative amount should only reflect the total for the competitive segment (see Domestic A.2).

For all awards issued with new document numbers (i.e., for award types 1, 2, 4, 6, 7, 9), the cumulative balance on the expenditure FFR will begin with the initial award issued under that document number.

For continuing non-SNAP awards converted from a type 5 to a type 4 in FY16 the cumulative totals will be based on the, “administratively shortened” competitive segments:

1) the first covering the period from the start of the competitive segment until the start of the Type 4.

2) the second covering the funding period from the start of the Type 4 award through the end of the competitive segment.

For all awards, if there was an unobligated balance from the previous award, it must be entered in the field entitled “Unexpended Balance From Prior Project Period” at the top of the FFR.

25. My award was issued under SNAP. Are there any changes to my FFR expenditure data reporting?

Yes, but only to accommodate the transition to subaccounts for FY16. For continuing awards under SNAP to domestic institutions that had not yet transitioned to subaccounts, grantees will need to submit a Subaccount Transitional FFR covering awards from FY15 and earlier (i.e., awards issued prior to October 1, 2015).

After FY16, when all awards have transitioned to subaccounts, the FFR reporting requirements will return to the standard process, which is generally as follows: for domestic awards under SNAP, an FFR is required only at the end of a competitive segment rather than annually. The FFR must be submitted within 90 days after the end of the competitive segment and must report on the cumulative support awarded for the entire segment (NIH Grants Policy Statement, Section 8.4.1.2.3 Modified Financial Reporting Requirements). Unobligated balances for awards issued in FY16 and beyond will be reflected in the PMS subaccount.

26. My award was issued under SNAP. How do I prepare my FFR expenditure data?

See NIH Grants Policy Statement, Section 8.4.1.2.3 Modified Financial Reporting Requirements.
If the award is a new award to the institution (Type 1, 2, 4, 6, 7, 9) issued in FY14 or later, only one FFR will be submitted for the award at the end of the competitive segment.

For SNAP awards to a domestic institution issued as a non-competing continuation award in FY16 for awards that have not yet transitioned to subaccounts, the grantee will submit two FFRs:

1) the first, a Subaccount Transitional FFR, covering the period from the start of the competitive segment until the start of the Type 4

2) the second covering the funding period from the start of the Type 4 award through the end of the competitive segment. If there was an unobligated balance from the previous award, it must be entered in the field entitled “Unexpended Balance From Prior Project Period” at the top of the FFR.

27. If there are changes to the expenditures that would impact the Subaccount Transitional FFR, does the report need to be revised or resubmitted? Or do all transactions posted after the end date, regardless of what year they relate to, post in the subaccount? (Added 05/28/2015)

As indicated in Section 8.4.1.5.3 of the NIH Grants Policy Statement: When the revision results in a balance due to NIH, the recipient must submit a revised report whenever the overcharge is discovered, no matter how long the lapse of time since the original due date of the report. Revised expenditure reports representing additional expenditures by the recipient that were not reported to NIH within the 90-day time frame may be submitted electronically through the eFSR/FFR system to OFM with an explanation for the revision. The explanation also should indicate why the revision is necessary and describe what action is being taken by the recipient to preclude similar situations in the future. This should be done as promptly as possible, but no later than 1 year from the due date of the original report for annual FFRs and no later than 60 calendar days from the due date of the original report for final FFRs (i.e., 180 days from the project end date). If an adjustment is to be made, the NIH awarding IC will advise the recipient of actions it will take to reflect the adjustment.

D. Payment Management System

28. I have questions about processing a batch drawdown of funds from PMS. Where should I direct my questions?

For more information on the PMS Payment File Upload Feature see http://www.dpm.psc.gov/grant_recipient/bulkpaymentfile/bulkpaymentfile.aspx?explorer.event=true.

For additional assistance with using the new bulk payment file feature in PMS, please contact the ONE-DHHS Help Desk at 1-877-614-5533 FREE or PMSSupport@psc.gov.
III. Foreign Grantees

A. General

29. When will NIH transition from fixed quarterly payments to PMS subaccounts?

NIH will transition payment for all new and continuing foreign awards from fixed quarterly payments to PMS subaccounts (B subaccounts) between October 1, 2012 and September 30, 2013. See NOT-OD-12-139 for more information.

30. Does this affect payment for foreign fellows?

Foreign fellows will continue to be paid by check or EFT during FY13. See section Fellows Training at Federal and Foreign Institutions A.3 below for information on the transition of these payments during FY14.

However, the policy announced in NOT-OD-12-139 does affect payment of the institutional allowance for foreign fellowships. Payments made to the foreign institution for institutional allowance will be made through PMS subaccount being with FY13 awards.

31. How will the transition to subaccounts affect my competitive segment?

For continuing foreign awards issued in FY13 (awards issued after October 1, 2012) the competitive segment will become two competitive segments:

the first begins at the budget period start date of the current competitive segment and ends at budget period end date of the FY12 award and second begins with the budget period start date of the FY13 award through the and ends with the project period end date of the current competitive segment.

See example Changes to Continuing Foreign Awards in FY13 (PDF - 69 KB)

B. Carryover

32. Is NIH changing the carryover authority for foreign awards?

NIH is not changing the carryover authority for foreign awards. NIH is changing the internal accounting systems used for payment of foreign awards, which necessitates that foreign grantees return unobligated balances from previous FYs so those funds can be tracked in the new accounting system of record. The balance returned to NIH will be re-obligated in PMS regardless of the carryover authority for the award. If the award was issued with automatic carryover authority, the grantee may drawdown the carryover funds and obligate as they would now.* If the award was not issued with automatic carryover authority, the grantee may not drawdown or obligate the funds unless a revised NoA reflecting the approved carryover amount has been issued.

See example Carryover on foreign Awards FY13 (PDF - 133 KB)

*In accordance with existing policy, the GMO will review unobligated balances in excess of 25 percent of the total authorized amount for the budget period and may request additional information from the grantee as part of the review. If the GMO determines that some or all of the unobligated funds are not necessary to complete the project, the GMO may restrict the grantee’s authority to automatically carry
over unobligated balances in the future, use the balance to reduce or offset NIH funding for a subsequent budget period, or use a combination of these actions. The GMO’s decision about the disposition of the reported unobligated balance will be reflected in the terms and conditions of the NoA.

33. Will foreign institutions need to return unobligated balances on continuing awards to NIH via check every year?

No, foreign grantees will need to return the unobligated balances on continuing award from FY12 and earlier (i.e. awards issued prior to October 1, 2012) to accommodate the transition to the new payment system in FY13 only. Unobligated balances for awards issued in FY13 and beyond will be reflected in the PMS.

C. Payment Management System

34. What if I drawdown funds, but cannot obligate them within three business days because I need to complete additional requirements from my country or my institution in order to be able to spend the funds?

This requirement is intended to minimize the time elapsing between the transfer of funds from the Federal government and disbursement by a grantee. Therefore, although the grant may be financed by advance payments, the intent is that grantees draw funds on an as-needed basis—specifically, no more than 3 days before the funds are needed. All Federal funds deposited by PMS in a grantee’s bank account as an unrestricted advance payment should be fully disbursed (checks written, signed, and issued to the payees) by the close of business the next workday after receipt of the funds. If there are constraints on the expenditure of funds, (e.g. your government requires authorization to expend funds from other countries), the funds should be fully disbursed by the close of business the day following availability of funds.

D. Federal Financial Report Expenditure Data

35. When completing the FFR for the FY13 award, how do I reflect the unobligated amount from the previous segment for the new segment?

Whether there is carryover authority or not, in the new project period, the grantee must populate this amount in the field entitled “Unexpended Balance From Prior Project Period” at the top of the FFR (see screen shot below). Failure to return unobligated balances in a timely manner may affect future funding.

**Figure 3320.16-3**
36. My award was not issued under SNAP. Are there any changes to my FFR expenditure data reporting?

My award was not issued under SNAP. Are there any changes to my FFR expenditure data reporting?

Foreign awards not issued under SNAP are still required to submit FFR expenditure data annually. See NIH Grants Policy Statement, http://grants.nih.gov/grants/policy/nihgps_2012/nihgps_2012.pdf, Section 8.4.1.5.2 Financial Expenditure Reports. However, the cumulative amount should only reflect the total for the competitive segment (see Foreign A.3). For FFRs for an FY13 award (Types 1, 2, 4, 7, 9), the cumulative balance on the FFR will begin with the FY13 award. If there was an unobligated balance from the previous award, it must be entered in the field entitled “Unexpended Balance From Prior Project Period” at the top of the FFR.

37. My award was issued under SNAP. How do I prepare my FFR expenditure data?

See NIH Grants Policy Statement, http://grants.nih.gov/grants/policy/nihgps_2012/nihgps_2012.pdf, Section 8.4.1.2.3 Modified Financial Reporting Requirements. Awards issued under SNAP to foreign institutions after October 1, 2012, foreign grantees are not required to report expenditure data annually via the FFR. For these awards, FFR expenditure data is required only at the end of a competitive segment (see Foreign A.3). If the award was issued as a non-competing continuation award in FY13 (Type 4), the grantee will submit one FFR covering the funding period from the start of the Type 4 award through the end of the competitive segment. If there was an unobligated balance from the previous award, it must be entered in the field entitled “Unexpended Balance From Prior Project Period” at the top of the FFR. If the FY13 award is a new award (Type 1, 2, 9), only one FFR will be submitted for the award at the end of the competitive segment.

E. Exchange Rate

38. What exchange rate should I use?

For initial awards issued after October 1, 2012 (Fiscal Year 2013) when preparing the FFR expenditure data grantees must use the currency rate in effect at the time the funds are drawn down from PMS.

IV. Fellows Training at Federal and Foreign Institutions

A. General

39. Why is NIH changing the payment method for Fellows training at Federal and foreign institutions?

In addition to the HHS directive mentioned in the first background question, the transition to PMS subaccount will provide Fellows training at Federal and foreign Institutions grantees with the ability to request funds electronically.

40. When will NIH transition payment for Fellows training at Federal and foreign institutions to PMS subaccounts?

NIH will transition payment for all new and continuing awards for Fellows train-
ing at Federal and foreign institutions to PMS subaccounts (B subaccounts) between October 1, 2013 and September 30, 2014. See NOT-OD-13-111 for more information.

41. Does this affect payment for fellows training at foreign sponsoring institutions (foreign fellows)?

Yes, but only for the stipend award and any travel reimbursement paid directly to the individual fellow in FY2014 and beyond. Fellows training at foreign sponsoring institutions will now be paid stipend and any travel reimbursement through the Payment Management System. However, the payment of the institutional allowance for foreign fellowships transitioned to PMS subaccounts in FY13 (see NOT-OD-12-139 for more information.)

42. How does this affect payment for fellows training at Federal sponsoring institutions (Federal fellows)?

Beginning with the FY2014 award, all payment for Federal fellows will be through PMS. NIH ICs will continue to administer the Institutional Allowance; however, all disbursements will be made through PMS.

B. Payment Management System

43. Who do I contact if I have questions on completing PMS forms for the Fellow?

Should you require assistance in completing the PMS forms for individuals, please call PMS on (877) 614-5533 FREE or e-mail PMS at PMSSupport@psc.gov. Questions may also be directed to the ONE-DHHS Help Desk at http://www.dpm.psc.gov/help/help.aspx?explorer.event=true.

V. Federal Grantees

A. General

44. Why is NIH changing the payment method for fellows training at Federal institutions?

In addition to the HHS directive mentioned in the first background question, the transition to PMS subaccount will provide Federal grantees with the ability to request funds electronically.

45. When will NIH transition Federal awards from check payments to PMS subaccounts?

NIH will transition payment for all new and continuing Federal awards to PMS subaccounts (B subaccounts) between October 1, 2013 and September 30, 2014. See NOT-OD-13-111 for more information.

46. How will the transition to subaccounts effect my competitive segment?

For continuing Federal awards issued in FY14 (awards issued after October 1, 2013) the competitive segment will become two mini “competitive segments”:

◆ the first segment begins at the budget period start date of the current competitive segment and ends at budget period end date of the FY13 award and
the second segment begins with the budget period start date of the FY14 award and ends with the project period end date on that award.

See example Change to Subaccounts For Federal Awards FY14, which is also applicable to Federal awards (PDF - 94 KB)

What You Need to Know About Financial Closeout of NIH Grants

National Institutes of Health

Megan Columbus:
Welcome to another edition of All About Grants. This is Megan Columbus from NIH’s Office of Extramural Research here today to talk about what administrators need to know about financial closeout of grants. I have with me Michelle Bulls, Director of OER’s Office for Policy for Extramural Research Administration. Michelle, can we start today by just explaining exactly what requirements there are for grantee closeout?

Michelle Bulls:
Absolutely, Megan. There are three required reports for our consideration of closeout. There’s the Federal Financial Report, there’s the Scientific Progress Report and the Final Invention Statement.

Megan Columbus:
And today we’re going to be talking about that financial report.

Michelle Bulls:
Yes. Today’s focus will be about the Federal Financial Report and the closeout of those and how our administrators need to understand what those requirements are from both the grantee’s perspective and the NIH’s perspective.

Megan Columbus:
Okay, so looking at the Federal Financial Report what does it entail?

Michelle Bulls:
Looking at the Federal Financial Report that is submitted to the agency, the Federal Financial Report cannot have an unliquidated obligation. The unobligated balances are okay because lots of times there’s continued support so that money can be carried forward unless there’s a restriction on the award at closeout. But for the most part there’s no opportunity to have any unliquidated obligations and all of the program income must be reported on the final financial reports.

Megan Columbus:
Can you define for me “unliquidated obligation”?

Michelle Bulls:
Yes. An unliquidated obligation is an invoice that the grantee has allotted money to pay, but it has not been paid because the invoice has not come into either from a subcontract support or from any other obligation. So they’ve obligated, but they haven’t actually allocated that money there. And so we cannot have any unliquidated obligations.

dated obligations showing on that final report. It has to be zero so all of those final invoices are paid and closed out within the grantee system.

*Megan Columbus:*  
And so the federal share and the federal outlay must match?

*Michelle Bulls:*  
The federal share and the federal outlay should match and if it doesn’t on a final report that’s okay. It’ll show as an unobligated balance, not unliquidated but unobligated balance. In other words, the federal share was this amount, the grantee outlaid a different amount and the balance is showing as unobligated.

*Megan Columbus:*  
In which case can we close out the grant?

*Michelle Bulls:*  
Yes. We actually can close out a grant with an unobligated balance on the books.

*Megan Columbus:*  
And what happens to that balance?

*Michelle Bulls:*  
The agency deobligates the funds and it goes back to Treasury.

*Megan Columbus:*  
Got it. So what can get in the way of being able to successfully close out a grant?

*Michelle Bulls:*  
So it’s very interesting because NIH has been having some really frank and different types of discussions with our grantees, specifically in the area of financial closeout, because a lot of times what grantees and the NIH agency doesn’t really necessarily highlight as a hindrance is the fact that the Expenditure Report that’s submitted to the agency and the Cash Report that’s submitted to the Payment Management System must equal. In other words they cannot be different. They must reconcile. They cannot have different balances on there. And this is something that has always been in the policy, but had not been highlighted before NIH adopted the HHS requirement for unilateral closeout. This is a main concern for us because if the two balances from both reports don’t equal, NIH can submit a closeout code but in the Payment Management System it stays open. And that’s a concern for our grantees because at that point we could essentially close the grant out, deobligate it at the cash transaction level and cause the grantee to go into debt status even though they show a zero unobligated balance on their Expenditure Report. And this has been something that we’ve been really trying to remind our grantees of and especially the administrators when we’re doing, you know, our updates and making sure that everyone understands that, yes, all three reports are required for closeout but that financial report is key to the ability to truly close that grant out in
our systems.

*Megan Columbus:*
If our grantees have questions about, and concerns about, closing out a particular grant who should they be speaking to at NIH?

*Michelle Bulls:*
They should be speaking to their grants management official that is outlined on the Notice of Award. If they have questions about the policy implications of closeout, which are truly generic, for instance, just talking about what does it mean to make sure that these reports are reconciled or what is the policy on that, then they should definitely come to OPERA, the grant’s policy, to address the generic policy. Before the actual details of what they need to do for a specific award, they definitely need to talk to their grants management official because their grants management official will tell them, you know, what they need to do and walk them through it.

*Megan Columbus:*
At the end of this we will give the email address for any questions that could go to OPERA.

*Michelle Bulls:*
General policies. We will not answer questions about the details of the award.

*Megan Columbus:*
Is there anything else our grantees need to know about this?

*Michelle Bulls:*
Yes, so one of the things that we have been talking about, Megan, is the adoption of the HHS Unilateral Closeout Policy. And what that requires the agency to do is to begin closing out grants at least 180 days after the end of the project period. Lots of times there’s a concern with our grantees, especially our administrators, where they are submitting reports to the agency with a zero balance and lots of times within the institution there’s another side of the house, typically the accounting side that submits the Payment Management Cash Report to the Payment Management System. And one of the things that we’ve noted is that the grantee really has to have a lot of internal discussion across the table from each side of the house on what the reports look like when they are submitted. They’re very different reports. The Expenditure Report captures the expenditures, the federal outlays and what has been obligated or expended by the grantee. And the Cash Report does focus solely on reporting the cash that was drawn down from the Payment Management System. The Cash Report is always, always due in a cash quarter. For our Expenditure Reports, it’s due 120 days after the project period ends. These two dates don’t necessarily match and that’s where the discrepancies come in. So grantees need to understand that there may be an instance where they need to either revise their Federal Cash Report to match the Federal Expenditure Report and that’s typically what has to happen otherwise the agency will be forced to close it out at the cash transaction amount.
which is, most of the time, lower than what was actually submitted on the Expenditure Report.

**Megan Columbus:**
So what I’m understanding is your strong advice to our community is make sure that everyone who’s submitting those financial reports, whether they be the Cash Transaction Reports or the Expenditure Reports, that they’re talking to each other making sure those are reconciled.

**Michelle Bulls:**
As best they can, absolutely.

**Megan Columbus:**
And so if there’s any problem with that who are they talking to?

**Michelle Bulls:**
Yes, so if there’s any problem with reconciling—and there may be some problems with reconciling, but the main takeaway here is that if they’re going to be late or delayed by more than 120 days after the end of the project period they need to begin to contact the agency, their IC official, the grants management official often and early to communicate this delay to them. Otherwise at that 180th day the grantee will go into unilateral closeout. And unilateral closeout does not take into account anything other than the agency has made a decision based on our discretion to enter into a closeout without their reports reconciling, which could create a debt for the grantee and we do not want that to happen.

**Megan Columbus:**
But if they talk to us during the time we may be able to have some wiggle room?

**Michelle Bulls:**
If they are talking with us and there’s a justification for why they’re delayed, the agency does have discretion to provide an extension. However, that is not something that will be considered very often even in a lot of the communications but—because it has to be a strong justification for why. But we do encourage our grantees to make sure that they stay in touch often and early, contacting the IC official, as well as the Closeout Center.

**Megan Columbus:**
Good to know. Thank you for joining us today.

**Michelle Bulls:**
Thanks, Megan.

**Megan Columbus:**
For NIH and OER, this is Megan Columbus.
Announcer:
If you have questions or concerns about the close out process please contact the grants management Specialist identified on the notice of award. For questions about the policy implications of closeout please contact the Office of Policy for Extramural Research - Division of Grants Policy at 301 435-0949 or you may email them at GrantsPolicy@mail.NIH.gov
This section includes practical guidance and tools relating to post-award administration. These materials are culled from a variety of authoritative sources.

**Tool for Reviewing Your Financial Management Practices**

AIS editors

Proper financial management does not happen by itself. It requires staff time, tools, and training to make sure that each university department is implementing sound and compliant financial management policies. An effective financial management process would likely include the following elements:

- **Audit Trails and Documentation.** These should be generated as part of the routine function of administering grants, not created after the fact.

- **Controls.** Controls over expenses must be in place to ensure that charges are in accordance with the terms of the grant agreement, any agency-specific requirements such as salary limitations, cost accounting standards, and the Office of Management and Budget circulars.

- **Monitoring.** Monitoring capabilities that provide good oversight of project expenses are essential. Monitoring tools should allow for review of actual expenses for allowability, accuracy, and comparison of actual vs. budgeted expenses. Your monitoring program should facilitate timely corrections of mischarges.

- **Reporting.** Reports should be made in a timely manner in compliance with the requirements of the grant and grant-making agency. Faulty reporting may be a symptom of a variety of problems, but often it’s a sign of underlying weakness because poor monitoring and controls generally make it difficult to generate accurate reports.

**Suggestions for Best Practice**

Below are some ideas for best practices to consider when developing or reviewing your financial management process:

- **Stay on Top of Policies and Procedures.** As in many things, compliance starts by writing down what’s expected of people. A formal set of policies and procedures is essential to compliance. In addition, there should be only one version of policies and procedures. Most likely they will be accessible online. Be sure to make them as user-friendly as possible, which could include development of frequently asked questions. As policies and procedures are revised and updated, be sure to highlight the changes to make them immediately obvious to users.

- **Create Consistency.** When the pre-award office allows a cost in a proposal, and the post-award office disallows it, they may be providing inconsistent advice and information. One institution met this challenge by setting up a detailed listing of roles and responsibilities so that only one position was responsible for making any given decision. Another possible practice is to have the central sponsored research
office conduct annual surveys to assess training needs and provide training where necessary. Another institution decided to bring the pre- and post-award offices together. Another institution left the offices separate but had them answer to the same official.

◆ **Improve Online Functionality.** Many online systems for accessing financial records are simply not useful. Data often are incomplete or out-of-date. These problems result in creation of “shadow” accounting systems that are built to serve specific needs but generally are not useful for compliance monitoring. Perhaps the best solution here is to budget funds to update and improve online systems, if at all possible, so that shadow systems will be phased out willingly.

◆ **Address Lack of Oversight.** Sometimes central sponsored office staff have no oversight of sponsored project expenses, yet the office has the expertise to judge when an expense is appropriate. One suggestion for at least in part off-setting this would be to have the central sponsored projects office perform a detailed pre-award budget review to make sure only allowable costs are included in the proposal. Central office staff could prepare project profiles and conduct start-up meetings with PIs and department administrators to explain the regulations and policies.

One university created an expenditure review training manual, which detailed procedures for monitoring expenses, including judging whether they are allowable, accurate, consistent, etc. The university also requires PIs to sign monthly expenditure reports certifying that they have reviewed and agree with the charges to the grant. Central sponsored offices could routinely review all — or a sample of — expenditures. At one university, that process serves to set the agenda for monthly meetings with business managers to address specific concerns, including pre-award expenditures, overdrafts, accounts nearing closeout, and accounts that have unusual balances or appear to be drawing down too quickly. Another best practice might be to assess each sponsored account annually. The assessment should look at subjects such as cost allowability and allocability, cost sharing, effort, cost transfers, subcontracts, under expenditures, accelerated spending, rebudgeting, and F&A calculations. This annual assessment will help head off problems before they get out of hand.

◆ **Clarify Cost Transfer Practices.** Like all policies, the cost transfer policy should be up-to-date with sponsor requirements, clear, formally adopted, and readily available. All cost transfers involving sponsored projects accounts could be reviewed by a research accounting specialist before being approved. In addition, higher-level authorization could be required for cost transfers that exceed certain thresholds.

◆ **Don’t Overlook Financial Status Reporting.** Financial status reports frequently are late, and principal investigators and departments often don’t see these reports for approval either before or after they are submitted to a sponsor. Dealing with this issue is akin to keeping any ongoing process moving on time. One university centrally monitors project end dates. Thirty days before close out, departments
receive a reminder of their responsibilities for closeout, including a due date of not more than 45 days following the end of the project. All financial reports, beginning 90 days prior to the project end, carry reminders to principal investigators to submit closing documents, record expenses, make adjustments, and eliminate outstanding encumbrances.

The importance of closeout is stressed to subcontractors with clauses in subcontract agreements that specify that all invoices must be submitted within 45 days (or in certain cases 60 days) of the end of the project. A sponsored project office could go to the extra step of reconciling accounts at the end of each budget year, rather than waiting for the end of the project, even in cases where no annual financial status report is required. This heads off problems early in the life of a project, limiting the potential costs.

◆ Strengthen Audit Function. In many well-designed compliance programs, the internal audit function plays a major role in conducting reviews of compliance with effort reporting, direct charging, overdraft, and cost transfer regulations. Internal auditors also have a wealth of expertise that should be tapped for non-audit roles. They could be involved in developing corrective action plans and in providing remedial and refresher compliance training. There could also be a mechanism for individuals to flag or bring forward problems that might have been missed.
13330.2 Suggestions for Reviewing Your Pcard Program
AIS editors

A purchasing or procurement card — or Pcard — is a form of credit card that allows goods and services to be procured without using a traditional purchasing process. Pcards are intended to provide a more efficient way to purchase certain items, such as supplies and travel, and, in many instances, a more effective method to track and verify these expenses. Overall, the use of Pcards for sponsored programs purchases seems to be providing the desired efficiencies; however, if proper controls are not implemented and followed, it is not surprising that they can be vulnerable to abuse or mismanagement.

The following are some ideas for best practices in this area, in part developed from an analysis of a recent audit report of a Pcard program released by the National Science Foundation (NSF) Office of Inspector General (OIG) (see Figure 13330.2-1). In that audit, the NSF OIG reminded the auditee that while its internal control structure for the Pcard program may contain the “basic characteristics of an effective internal control system,” the system needs to be monitored and applied properly to be effective “in preventing or detecting fraud.”

Suggested Practices
◆ Carefully consider who will be issued a Pcard. Some institutions restrict use of the Pcard to the departmental administrator, who makes purchases on behalf others, in order to minimize the number of cards distributed and the compliance risk.

◆ Require all Pcard holders to attend training and require all users to sign agreements regarding the proper use of Pcards. Institute periodic “refresher” training, as appropriate.

◆ Establish a system for review and approval of the charge after purchase — by both the purchaser and a third party (perhaps a supervisor or departmental administrator). Be sure the process requires “timely” approval. Make key information, such as that provided in reports from the purchase card vendor and/or receipts, available. Initial and periodic training for the supervisor/third party may also be appropriate.

◆ Consider whether placing limits on the use of the cards is appropriate. These limits can come in many forms. For instance, purchases may be limited to a specified dollar threshold that is applied to an item or to purchase amounts per day or per month; sometimes limits are placed on the types of items that may be purchased with the Pcard.

◆ Develop a monitoring process to ensure staff follow purchase card policy and procedures. You also may wish to conduct periodic risk assessments of the purchase card program.

◆ Conduct periodic audits of the Pcard program. Consider whether an audit by your internal auditor is sufficient or whether the services of an outside auditor may be appropriate.
◆ Consider separating key responsibility for ordering and receiving items acquired with Pcards so that the items are shipped to and received by a different person, perhaps in a different department, from the one who ordered the items.

◆ Ensure that proper documentation and records are retained.

---

**Figure 3330.2-1: What the OIG Found**

In a recent audit report, the NSF OIG noted deficiencies in three control activities that each contributed to fraud in a grantee’s purchase card program not being detected in a timely manner (see *Audit of the University Corporation for Atmospheric Research’s Purchase Card and Timekeeping Systems, OIG Report Number 08-1-003, www.nsf.gov/oig/08-1-003_UCAR.pdf*). According to the OIG, “Internal control effectiveness was diminished as a collaborative result of control activities not being performed.” Looking at the OIG’s findings and comments may be helpful to research administrators in reviewing their own Pcard policies and processes.

The OIG notes that federal regulations require recipients of federal awards to establish and maintain effective internal controls that help ensure taxpayers’ dollars are properly spent and to detect and prevent fraud, waste, and abuse. “This includes ensuring effective management and use of purchase cards.” The following is taken from the audit report:

**Control Activity: Supervisors Were not Required to Review Receipts.** To help ensure the validity of purchases, cardholders were required to maintain receipts supporting each purchase. Receipts are source documentation that provide an independent description, amount, and cost of items purchased. Each month, cardholders were required to download an electronic list of their transactions and reconcile it with their records. While an approving official (AO), who may or may not be the employee’s direct supervisor, was required to approve these transactions each month, they were not specifically required to review the receipts as part of the process. Because the AO was not required to review receipts and timely approve purchases, this materially degraded the effectiveness of the internal controls to prevent or detect the fraudulent purchases. The opportunity increases for cardholders to make fraudulent purchases without being detected, when purchases are not independently approved by reviewing source documentation or not approved in a timely manner. This opportunity can be significant if the number of cardholders and amount of funds spent by cardholders is itself significant.

**Control Activity: Responsibility for Ordering Not Segregated from the Receiving Process.** Separating key responsibilities amongst different staff, such as ordering and receiving goods and services, is another control activity that helps decrease the likelihood of fraud. Such segregation of ordering and receiving limits an organization’s exposure to staff purchasing, accepting, and recording goods and services that are unauthorized by management. Separating the ordering and receiving responsibilities is a fundamental principle of an effective internal control system and particularly critical in purchase card programs where the cardholder is responsible for ordering the goods, processing the invoices, and assigning descriptions to purchase transactions in the accounting system.

**Control Activity: Inventory of Equipment Is Not Required for Items Prone to Theft and Costing Under $5,000.** The auditee’s Property Manual encourages, but does not require, that each division’s property administrator maintain property records accounting for purchased items costing less than $5,000. However, we found that the auditee did not conduct inventories for items costing less than $5,000 which are susceptible to theft. Knowing that an inventory would not be conducted enabled the...
dishonest purchase cardholder to re-sell purchased goods with little concern that they would be
identified as missing. Also, the lack of an inventory to verify the existence of small-dollar equipment
prone to theft increases the likelihood of theft or loss of other equipment. Furthermore, property
managers within each division have the discretion to maintain records of this equipment. Having this
discretion could allow managers to decide in the future to not maintain records of the equipment
susceptible to theft. As evidenced by the fraud, allowing managers to exercise such discretion,
especially unchecked, results in inconsistent, incomplete, and inadequate accountability of equipment
under $5,000.

Information and Communication: Available Reports Not Provided to Users. An important part of an
effective internal control system is the process of timely identifying, collecting, and disseminating
information that managers need to carry out their responsibilities, including properly monitoring and
overseeing the purchase card activity. To ensure all purchases and transactions are authorized and
necessary, supervisors of cardholders, division managers, and other managers of the purchase card
program must receive and review reports about the purchases that have been made. These reports
should be used by employees at different stages in the purchase process and contribute to the overall
effectiveness of an internal control system.

Monitoring: Monitoring of Compliance with Purchasing Card Policy Is Minimal. Another important
part of an effective internal control system is monitoring the quality of performance of each control
activity over time. For the purchase card program, the monitoring process, as part of its routine
operations, should periodically verify whether employees are competently performing their control
activities to help prevent and detect fraudulent purchases. Deficiencies identified should be promptly
brought to management’s attention for action.

Risk Assessment: Periodic Risk Assessment Not Scheduled. A risk assessment provides management
with knowledge of vulnerabilities and weaknesses in program operations. It assesses the associated
risk of changes in economic, industry and internal operating conditions and the adequacy of the
control activities currently in place to address or mitigate these risks. As such, a regular scheduled risk
assessment of the purchase card program would likely have identified the inadequate segregation of
cardholder duties and supervisor and management oversight and monitoring.

Control Environment: Purchase Cardholders and Supervisors Not Sufficiently Trained. Cardholders
and supervisors need to understand their purchase card responsibilities and stewardship roles in
order to effectively execute their duties. This requires that they not only receive training before
assuming their duties, but also receive periodic refresher training thereafter. Additionally, it is
important that management recognize the importance of training and committing the necessary
resources and time for staff to attend purchase card training.
Ideas for Keeping Animal Researchers Safe

AIS editors

Federally funded animal research at universities and elsewhere is increasingly under attack by extremists and those who believe animals should enjoy some civil rights. According to the Society for Neuroscience, for example, nearly twice as many attacks were reported by members in 2007 — eleven — as in the entire five-year period 1999–2003 — six. The attacks have also become “more violent and brazen,” according to the group. But the National Institutes of Health (NIH) is not cowering — and it wants to ensure that researchers can continue their important work. “Threats to research with animals threaten the health of the nation,” according to Norka Ruiz Bravo, head of NIH’s Office of Extramural Research (OER).

On OER’s “Animals in Research” Web site (http://grants.nih.gov/grants/policy/air/index.htm), as a “first line of defense against incidents ranging from harassment and threats to break-ins and acts of domestic terrorism,” NIH strongly encourages its grantees to do the following:

◆ Operate an impeccable program of animal care and use and maintain their animal research facilities in optimal conditions at all time.

◆ Review their research portfolios to determine what activities might be targeted.

◆ Make certain that their institutional security group develops relationships with local and state law enforcement before an event happens to ensure that responses to illegal activities are prompt and adequate.

◆ Develop a crisis management plan that

  • safeguards people, animals, and institutions;

  • prepares the institution to respond with openness about the research being conducted; and

  • educates employees on how to protect their families and their personal property.

If an incident occurs involving NIH-funded animal research, NIH recommends that an institution

◆ immediately contact the appropriate officials at your institution (e.g., your Institutional Official, laboratory veterinarian, security office, etc.);

◆ immediately contact OLAW if the health or well-being of animals is jeopardized or harmed; and

◆ notify the project officer(s) of the NIH funding component(s) of the incident.

NIH has also developed a number of new resources in this area including, among other items, an outline of a preparedness program called “Be Prepared” (see Figure 3330.3-1), a Fact Sheet on the benefits of animals in research, and Media Releases about animals in research.
Figure 3330.3-1: Advice From NIH on How to ‘Be Prepared’

NIH’s “Be Prepared” program describes four key elements of an effective preparedness program, which are reprinted from the ARENA/OLAW Institutional Animal Care and Use Committee Guidebook. According to the Guidebook an institution should have in place —

1. An animal program of impeccable integrity. Each institution that receives PHS support for activities involving vertebrate animals or is subject to the authority of the Animal Welfare Act must operate an animal care and use program with clear lines of authority and responsibility. The program must include
   • a properly constituted and functioning Institutional Animal Care and use Committee (IACUC);
   • procedures for self monitoring;
   • an adequate veterinary care program;
   • an occupational health and safety program (not required under the AWA);
   • a personnel training program;
   • an environment, housing and management program for animals; and
   • appropriately maintained facilities for housing and support.

2. A security program based on risk assessment. The first step in developing a security program is to conduct a risk assessment of the institution’s facilities and an evaluation of the existing security system. Organization of a security and communication plan then follow. Some key points include
   • Determine facility vulnerability
   • Evaluate the security system
   • Check storage of research data
   • Organize a security plan
   • Organize a communication plan in the event of an incident during the day, after hours, weekends and holidays

3. An integrated communication plan with descriptions of research projects in lay terminology, spokespersons, and a telephone tree. The IACUC Chair and members can interact with institutional public information officers, researchers, veterinarians, technicians and the research administration to identify spokespersons to address animal research issues. These spokespersons should be provided adequate training. Fact sheets should be readily available about the institution’s policies and commitment to humane and appropriate animal care and use, the quality of its animal care and use program (including accreditation), and brief summaries of the value and importance of any specific animal use under scrutiny. Written materials need to be written in language understandable to nonscientists. Institutions must be prepared to respond to allegations honestly.

A phone tree should be implemented in order to quickly mobilize the individuals and entities needed to respond to an unexpected event. A phone tree is a pyramid-shaped system where each person calls between one to five other people in case of an emergency. Reliable volunteers are located towards the top of the tree, as they have to call the largest numbers of people. A phone tree for crises might include: institutional leaders, communications officers, animal program leaders, local law enforcement, etc.
Additional Resources from OLAW

NIH’s Office of Laboratory Animal Welfare has begun a series of online educational seminars. The first such seminar, “Preparing for Animal Rights Extremist Organizations,” was held in June 2008. ” For information on upcoming seminars or to access archived copies, go to www.grants.nih.gov/grants/olaw/e-seminars.htm.

A few tips that were noted in the June program include the following:

◆ **Provide Researchers ‘At Home’ Help.** One institution developed a “protestor toolkit” for researchers to keep at home that contains a camera to photograph any suspicious activities, “No Trespassing” signs to post, a “legal notice” to give to any protestors who might come to the door that explains the protestors are breaking the law by their presence, and a sheet listing actions researchers should take.

◆ **Recommends ‘Openness.’** One speaker recommended maintaining good relationships with reporters and believes it is vital to be responsive to every press call — and to be prepared to counteract all claims activists make about animal care or research. When an attack occurs, invite the press to come to the researcher’s home to see the damage for themselves, while explaining what the researcher’s work is really all about. Speak at community events. Conduct tours of your research center/facility and allow students, teachers, and others to participate in programs based there.

◆ **Carefully Screen New Employees.** One university has a “fairly extensive interview process” that includes asking “leading questions” of job candidates and does background checks on prospective employees. Screening procedures for new employees should include asking them how they became interested in working with animals and probing their past job experience. Hiring managers should also be on the lookout for new employees who request schedules that would cause them to work alone, such as on nights, weekends, and holidays.
Protecting Work Is Everyone’s Duty

Sooner or later, opponents of animal research will come for every researcher who works with animals, no matter how noncontroversial the work, or how well cared for the animals. As such, it is the duty of all scientists and their institutions to support animal investigators regardless of whether they are personally affected by threats against biomedical researchers. That was the sentiment expressed by J. David Jentsch, a professor of psychology and psychiatry at the University of California-Los Angeles who uses monkeys to study “genetic and neurochemical mechanisms that influence cognition, impulse control, and decision-making.”

“Our colleagues are under attack and they deserve our support. When the research is threatened or criticized, we have to work together as a community of scientists and academics to oppose those threats,” he said. Jentsch has long been a target of violent attacks by animal extremists; in a recent incident, the Animal Liberation Front said it had sent AIDS-tainted razor blades to Jentsch, who was described in a Los Angeles Times article as living with round-the-clock security.

He made his remarks as part of the closing panel at the three-day conference, “Animal Welfare and Scientific Research: 1985 to 2010,” held in October 2010 to discuss the history, current practices, and future of research animal care (see http://grants.nih.gov/grants/olaw/seminar/index.html). It was sponsored by the Office of Laboratory Animal Welfare, part of the National Institutes of Health, and the U.S. Department of Agriculture, as well as by private organizations.

Media Office Can Help. Jentsch laid out a number of avenues of response to such threats. In 2009, Jentsch and others formed Pro-Test for Science, modeled after a group in the United Kingdom that advocates for animal research. He also serves on the board of directors of Americans for Medical Progress (www.amprogress) and is a member of the executive committee of Speaking of Research (http://speakingofresearch.com).

“First and foremost, the leaders of our academic institutions should, without hesitation, support the research programs at the university and the investigators who do them,” he said, urging investigators at the meeting to “go home today and talk with the members of your campus administration about what they’re going to do to promote the research agenda of their university.”

Yet this is a shared responsibility, Jentsch said. “You shouldn’t leave this task to them…you should take on the role because you are the scientist; it’s your work…. [A]bsent all these other issues, the public supports the work that we do [through] a very large investment in the National Science Foundation, National Institutes of Health…and have a right to understand what we do and why.”

Remember that journalists have an important role to play, in helping to explain to the public where their tax dollars are going, Jentsch said. “Work with the media offices and make sure they know of scientists who will openly discuss research,”

---

Jentsch said. “Use these methods to coordinate effective public outreach about the research that’s being carried out at your university. Collaborate with the media relations office at your university. Ask them for help and advice, but don’t shy away from speaking for yourself. Use the mechanisms the campus has to describe what’s going on, describe what the benefits are, and describe how you have actually adjusted and refined your research to actually attend to things like animal welfare. You can take a visible role yourself. Speak openly about what you do, given the chance.” Researchers uncomfortable talking directly to the media can express themselves in other ways, including by issuing “controlled messages,” such as opinion pieces to run in daily newspapers or on blogs, Jentsch suggested.

Ultimately, the battle must be waged, he said. “We have to be forceful, we have to be persistent, organized, and thoughtful, and most importantly, we need to take the messages we’ve heard here home and spread them as widely as possible,” Jentsch said. “It’s up to scientists and people who work in the scientific enterprise to do this.”

Where to Go for Help

The following is a list of some organizations, both in the United States and abroad, that support animal research. The brief descriptions are from the organizations’ websites.

◆ Pro-Test, www.pro-test.org.uk. “We are an Oxford-based group campaigning in favour of continued animal testing and in support of scientific research. We aim to dispel the irrational myths promoted by antivivisectionists and to encourage people to stand up for science and human progress.”

◆ Pro-Test for Science, www.ucla-pro-test.org. “Following in the footsteps of the Pro-Test Group in Oxford, U.K., students and scientists at UCLA have pledged to stand up against the lies and misinformation of animal rights groups, and the violence of extremist organizations. They have formed the group Pro-Test for Science (formerly UCLA Pro-Test), which stands for science, reasoned discourse, and the belief that life-saving medical research must continue without violence and harassment.”

◆ Americans for Medical Progress, www.amprogress.org. “We focus on public outreach that builds understanding and appreciation for necessary and humane animal research. We also provide vital news, information and analysis to biomedical research stakeholders to ensure they have the resources they need to deflect campaigns that threaten the future of medical progress.”

◆ Society for Neuroscience, www.sfn.org/animals. “SfN supports the responsible use of animals in research and provides various resources for members who use animals for research purposes. In addition, SfN participates in various outreach efforts and educational initiatives to help explain to the public the positive impact of the use of animals in research.”

◆ Speaking of Research, http://speakingofresearch.com. “Speaking of Research is a campus-oriented group in the United States that seeks to provide university
students and faculty with accurate information and resources about the importance of animal research in medical science.”

♦ National Association for Biomedical Research, www.nabr.org. “Founded in 1979,… NABR provides the unified voice for the scientific community on legislative and regulatory matters affecting laboratory animal research. NABR works to safeguard the future of biomedical research on behalf of its more than 300 public and private universities, medical and veterinary schools, teaching hospitals, voluntary health agencies, professional societies, pharmaceutical and biotech industries, and other animal research-related firms.”

♦ Foundation for Biomedical Research, www.fbresearch.org. “Established in 1981,… FBR is the nation’s oldest and largest organization dedicated to improving human and veterinary health by promoting public understanding and support for humane and responsible animal research. Through its innovative educational programs, FBR works to inform the news media, teachers, students and parents, pet owners, and other groups about the essential need for lab animals in medical and scientific research and discovery.”

♦ Pennsylvania Society of Biomedical Research, www.psbr.org. “PSBR was established by universities, medical schools, pharmaceutical firms, and professional societies in the Commonwealth to foster a better understanding of the benefits of biomedical research to human and animal health, as well as the necessity for the humane treatment of animals in such research. The society supports the responsible use of animals for essential medical research and education in the prevention and treatment of human and animal diseases.”

♦ Basel Declaration, www.basel-declaration.org. “During a two-day conference in Basel, around 80 life sciences researchers from Switzerland, Germany, Sweden, France, and Great Britain addressed the problems of animal research. The outcome of this meeting was the Basel Declaration, in which the conference scientists commit to a responsible approach to the handling of animals in animal research, acknowledge the 3R principles (Replace, Reduce, Refine) and also apply these principles at all times. At the same time, the signatories of the declaration emphasize that necessary research involving animals remain[s] allowed now and in the future.”
3330.4 **Tips for Internal Controls for Use of Travel Cards**

AIS editors

The Department of Health and Human Services (HHS) Office of Inspector General (OIG) recently looked at the travel card practices of HHS employees to determine the extent to which the travel card transactions that employees made in 2007 constitute misuse and whether travel card internal controls, such as guidance, training, transaction reviews, and follow-up actions, work as intended to prevent or address misuse.1 Perhaps the OIG’s findings and suggestions could serve as useful advice for research administrators who oversee use of travel cards at their institutions.

Types of internal controls for travel cards include the following:
- Written policies and procedures for the appropriate use
- Training frequency and content for program coordinators/administrators, approving officials (typically cardholder supervisors), and cardholders
- Risk management controls ranging from general (e.g., ensuring that practices to mitigate risks associated with the charge card program are carried out) to specific (e.g., reviewing transactions to detect instances of misuse)
- Administrative and disciplinary actions that may be imposed to address misuse

**Suggestions to Improve Internal Controls**

◆ Review travel card program guidance. (The guidance could include specific examples of unallowable purchases with the travel card, a discussion of the actions that will be taken (and penalties imposed, if appropriate) for specific travel card misuses; and instructions for reporting travel card misuse. Consider developing a “Travel Card Do’s & Don’ts.”)

◆ Beef up travel card program training. (Training should be provided for users and supervisors/administrators who are responsible for reviewing and monitoring cardholder activities,

<table>

including flagging occurrences of misuse. Determine what training frequency and
documentation is most appropriate. Be sure the training meets each group’s needs.
For example, supervisors may need advice on how to spot and respond to misuse.)

◆ Examine whether your methods used to identify misuse are appropriate. (For
example, are transaction dates being matched against travel dates? Automating
this practice could prove helpful.)

◆ Be sure to follow-up with staff members when misuse is identified.

◆ Remember that efforts to detect atypical purchases may not identify all misuse.
(For example, are program administrators looking to identify unusual merchants
or personal or suspicious or atypical purchases? Sometimes misuse at typical
travel merchants, such as airlines and hotels, may go undetected if you are looking
only for atypical merchants.)
§3330.5  **Flowchart for Submitting NSF’s Project Outcomes Report**

AIS editors

Section 7010 of the America COMPETES Act of 2007 (Public Law No. 110-69) requires that all final project reports and citations of published research documents resulting from research funded, in whole or in part, by the National Science Foundation, be made available to the public in a timely manner and in electronic form through a website.

NSF’s implementation of Section 7100 requires principal investigators to submit a brief (200–800 words) report within 90 days following expiration of the grant. A PI has the option to upload images. This report is in addition to, not in lieu of, the final project report. This report is a summary, prepared specifically for the public, of the nature and outcomes of the project. This report will be posted in the “Research Spending and Results” section of www.research.gov.

NSF notes that the report, which it calls the “project outcomes report,” will be uploaded and publicly available — exactly as it is submitted. It will carry the following disclaimer: “The Project Outcomes Report for the General Public is displayed verbatim as submitted by the Principle Investigator (PI) for this award. Any opinions, findings, and conclusions or recommendations expressed in this Report are those of the PI and do not necessarily reflect the views of the National Science Foundation; NSF has not approved or endorsed its content.”

PIs are permitted to modify a submitted report for up to 30 days after submission. After 30 days, modifications to reports can be made by adding an unlimited number of addenda to the original report.

**Report Contents**

NSF’s *Proposal and Award Policies & Procedures Guide* outlines the requirement for PIs (see www.nsf.gov/pubs/policydocs/pappguide/nsf11001/index.jsp). The report should contain the following content:

- Outcomes/findings that address the intellectual merit and broader impacts of the NSF-funded activity as defined in the NSF merit review criteria. This description should be a brief (generally, two to three paragraphs) summary of the project’s results that is written for the lay reader. PIs are strongly encouraged to avoid use of jargon, terms of art, or acronyms.

- Products that have resulted from the award (collections, data sets, software, educational material, etc.). (NSF will automatically include all publications that are provided regarding the award in the FastLane project reporting system.)

- Additional information. Information regarding anticipated publication of project results, as well as any other information that would be of interest to the public also may be included in this section.
Report should not contain the following types of information:

- Confidential, proprietary business information
- Unpublished conclusions or data that could compromise ability to publish results
- Invention disclosures that might adversely affect patent rights
- Private personally identifiable information such as home contact information, individual demographic data or individually identifiable information collected from human research participants.

A flowchart of the process provided by NSF for submitting the project outcomes report is included at Figure 3330.5-1.

**Figure 3330.5-1: How to Submit an NSF Project Outcomes Report**
Statistics and Survey Results

This section includes statistics and survey results relating to the spectrum of post-award services. These materials are culled from a variety of authoritative sources.

Snapshot of Faculty Burden Survey Results

AIS editors

The Federal Demonstration Project (FDP) undertook a first of its kind “Faculty Workload Survey” — or faculty burden survey — to gauge how much time faculty researchers spend on activities relating to research administration. According to the final survey report’s Executive Summary,

The most striking aspect of the survey’s results was the general uniformity of responses that pointed to a high level of administrative burden and low level of research-project assistance. Multiple discrete activities linked to federal research-grant management appear to create a cumulative burden that in turn reduces the amount of time available to faculty to actively engage in research. … The data clearly show that the level of administrative burden is high enough to routinely take our nation’s most qualified scientists away from their research for significant amounts of time.

Research administrators may be interested in the survey results in that they likely share many of the same administrative challenges and frustrations, and of course assisting principal investigators in furthering their research is one of the primary duties of research administration.

A few of the survey findings follow. (See Figure 3360.1-1.) For a copy of the final survey report, which includes suggestions for steps to address the problems identified both within institutions and federal sponsoring agencies, go to at www.thefdp.org/Faculty_Committee.html#P11_2305. (The report is divided into five separate documents: the report itself and four appendices.)

---

Figure 3360.1-1: Key Results of FDP Faculty Burden Survey

Overview of Survey Respondents

◆ Fall 2005: survey yielded 6,081 valid responses from faculty at FDP institutions
◆ 90% of faculty were principal investigators (PIs); 10% co-PIs only
◆ Mostly white, male, scientists from large research institutions, often with affiliated medical schools
◆ Respondents spend a substantial amount of time on administrative tasks directly linked to their federal research projects
Figure 3360.1-1: Key Results of FDP Faculty Burden Survey (continued)

Faculty Time
◆ Respondents spent 58% of their time on research, with an additional 9% devoted to research service
◆ 65% of research time was spent on federally funded research projects. Of this time
  ▷ 42% is divided almost equally between pre- and post-award activities
  ▷ Active research consumed 58%
◆ 95% of respondents believed more time could be spent on active research if more assistance with research-related administrative tasks was available
◆ 76% of respondents indicated a willingness to re-allocate direct costs to provide for research-related administrative support

Top Burdens Overall
◆ No single dominant burden, but the top burdens identified were
  ▷ Grant progress report submission
  ▷ Personnel hiring
  ▷ Project revenue management
  ▷ Equipment/supply purchases
  ▷ IRB protocols and training
  ▷ Training personnel and students
  ▷ Personnel evaluations
◆ Noted was the “cumulative” effect of the burdens

Sources of Administration Burdens
◆ No single “culprit”; burdens come from many sources including
  ▷ Federal regulations
  ▷ Agency implementations of regulations
  ▷ Institutional implementations of regulations
  ▷ Fear of audits; lack of consistency
  ▷ Inherent part of doing research
  ▷ Lack of project-specific research administration support

Determining Best Practices in Effort-Reporting Compliance
Ashley E. Whitaker, Nova Southeastern University

Abstract
Effort-reporting compliance at higher education institutions was examined to discern best practices from those that would recommend their effort-reporting process. Data were derived from a survey of effort administrators—the research administrators responsible for the effort-reporting compliance program at their respective higher education institutions. The research was conducted in the fall of 2012, before the implementation of the OMB (2013) Uniform Guidance. Data were separated into two focus groups for greater applicability: Doctoral/Research Universities (DRUs) and Predominantly Undergraduate Institutions (PUIs). These effort administrators were generally confident about their institution’s compliance with current effort-reporting regulations and believed that, even aside from the regulations, they properly documented compensation costs charged to sponsoring agencies. These data provide information on best practices in effort-reporting compliance for these two types of higher education institutions and expand the body of knowledge in the field of research administration. Data derived from this study can also be used as a baseline from which to compare future studies on effort-reporting compliance after the implementation of the OMB (2013) Uniform Guidance.

Introduction
Effort reporting is one of the most challenging compliance areas faced by research administrators. Effort reporting, or documenting compensation for personnel services, is a federal requirement mandating institutions to verify that personnel costs on sponsored projects are reasonable when taking into account the actual work performed on the project (Anthony & Gindhart, 2009; Council on Government Relations, 2007). The process of reporting effort also verifies that time commitments made to a sponsoring agency are met. Personnel charges typically represent a large portion of sponsored project costs. Auditors have always focused on effort reporting, but there has been a recent increase in auditor oversight due to federal audit findings and multimillion dollar settlements, institutional disclosures, and whistleblower lawsuits brought under the False Claims Act (1863); these have created concerns that the policies and procedures in place at universities are inadequate or out of compliance (Blevens, 2013; Council on Governmental Relations, 2007; Fife, 2006). An examination of the Summary of University Audits, Settlements and Investigations Related to Federal Programs (Blevens, 2013) shows that effort-reporting findings represent the largest proportion, constituting over 25% of all compliance areas. Effort-reporting findings in annual A-133 audits, high-profile large settlements, and false-claims whistleblower lawsuits have motivated continued auditor oversight of universities (Fife, 2006; Stanley & McCartney, 2009). These circumstances demonstrate the need for universities to have a sound effort reporting compliance program.

1 This article is reprinted from the Research Management Review, Volume 20, No 2. (2015). It is used with permission of the publisher.
At the time of this study, the federal requirements governing compensation for personnel services were found in the U.S. Office of Management and Budget (OMB) Circular A-21, section J.10, *Cost Principles for Educational Institutions* (OMB, 2004). The federal regulations for compensation costs have since changed to the OMB (2013) *Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards*, “Uniform Guidance,” section 200.430. Based on either set of requirements, a sound effort-reporting compliance program should have a policy, procedure, and system that address the federal requirements. Continued from Circular A-21 (2004) to the OMB (2013) Uniform Guidance, is a required “after-the-fact” review process of personnel costs, versus relying on budget estimates to document costs. Further, it is expressed in both documents that costs must be reasonable, accurate, and based on all activities represented in an employee’s institutional-based salary. With the new focus on stringent internal controls in OMB (2013) Uniform Guidance, institutions should continue vigilance to ensure they have a strong effort-reporting compliance program.

External monitoring programs cannot be solely relied upon to ensure compliance (Fedor, Yaussy, & Cola, 2008). Compliance programs should be implemented into daily operations and the policies and procedures put in place to foster compliance should be followed (Saputelli & Smith, 2010). An effective compliance program serves to protect an institution from liability, mitigate risk, and foster the proper stewardship of external funds and institutional resources (Erickson & Tangredi-Hannon, 2006). The assessment of compliance programs at an institution must be a constant priority and continually monitored (Erickson & Tangredi-Hannon, 2006). Effective programs should ultimately lessen administrative burdens while allowing for the early identification and prevention of issues (Fedor et al., 2008). The increase in compliance costs is a large component of research and development expenses for higher education institutions; streamlining regulations is a way to decrease these costs for all higher education institutions (National Science Board, 2012). Rockwell (2009) noted that universities “go beyond the regulations” (p. 36) because they experience an audit, fear they will be audited, or have different interpretations by auditors, thus further exacerbating administrative burdens. Developing and utilizing best practices are one way that institutions can work together to lessen administrative burdens (National Science Board, 2014).

Institutions can point to multiple resources for developing sound compliance programs. For example, the Draft OIG Compliance Program (2005) for recipients of Public Health Service awards offered the following guidance for a good compliance program as a means to promote strong internal controls:

1. Implementing written policies and procedures,
2. Designating a compliance officer and compliance committee,
3. Conducting effective training and education,
4. Developing effective lines of communication,
5. Conducting internal monitoring and auditing,
6. Enforcing standards through well-publicized disciplinary guidelines,  
7. Responding promptly to detected problems and undertaking corrective action, and  
8. Defining roles and responsibilities and assigning oversight responsibility (p. 71313).

The two internal control documents cited in the OMB (2013) Uniform Guidance, Internal Control Integrated Framework, issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO), and Standards for Internal Control in the Federal Government, issued by the Comptroller General of the United States, are provided for best-practice guidance and can also be used to design a sound effort-reporting compliance program (Committee of Sponsoring Organizations, 2013; Comptroller General of the United States, 2014; Office of Management and Budget, 2014). Internal control is defined as “a process effected by an entity’s oversight body, management, and other personnel that provides reasonable assurance that the objectives of an entity will be achieved” (Comptroller General of the United States, 2014, p. 5). Strong internal controls ultimately allow institutions to quickly respond to change, such as the changes in regulation that the research community is now experiencing (Committee of Sponsoring Organizations, 2013).

Although the above examples are straightforward, achieving compliance is not. Research administrators still rely on their colleagues through listservs and conferences for assistance due to the ever-changing compliance environment and with specific areas of interest, such as effort reporting (Saputelli & Smith, 2010). The regulatory environment has evolved to have “strict” and “reactive” requirements that come with little guidance or time to implement (Saputelli & Smith, 2010, p. 23). Further, since the guidance is not always clear, institutions are responsible for clarifying some information in their policies (Saputelli & Smith, 2010). Due to this ambiguity, best practices are essential to developing or evaluating a compliance program. Best practices have changed over the past ten years due to new competitors, pressures from the government on “cost containment,” increased regulatory oversight by sponsors, and the technology age (Kirby & Waugaman, 2005, p. 5).

A goal of this study was to assist in identifying best practices by examining some of the common issues that institutions must address when designing an effort reporting compliance program. Further, since institutions are unique in their size and culture, there is no one best compliance program (Draft OIG Compliance, 2005). As such, this paper summarizes the effort-reporting characteristics of a sampling of Doctoral/Research Universities (DRUs) and Predominantly Undergraduate Institutions (PUI) that would recommend their effort-reporting process as a means of identifying best practices in effort-reporting compliance for these types of institutions. A DRU is defined as a higher education institution that awards at least 20 research doctoral degrees (adapted from Carnegie Foundation for the Advancement of Teaching, n.d.). A PUI is defined by the National Council of University Research Administrators (NCURA, 2013) as follows:

The PUI Neighborhood members provide research administration information to our colleagues at “predominantly undergraduate institutions”—two-year, four-year, masters-level, and small doctoral
colleges and universities that grant baccalaureate degrees, or provide programs of instruction for students pursuing such degrees with institutional transfers (e.g., two-year schools), where undergraduate enrollment exceeds graduate enrollment, and no more than 10 Ph.D. or D.Sc. degrees are awarded per year (adapted from the National Science Foundation’s description of PUIs) (para. 12).

**Methods**

Study participants were research administrators responsible for the effort-reporting compliance program at their respective higher education institutions (i.e., effort administrators). Participants were recruited from both the REASADM-L Research Administration Discussion List listserv and three of NCURA’s Collaborate membership communities (Predominantly Undergraduate Institutions, Compliance, and Financial Research) in order to access the largest number of eligible respondents from the population. To further expand the number of participants, listserv and community members were encouraged to send the survey communication on to the appropriate person at their institution. The sample was drawn from this proportion of the population of effort administrators and was composed of those individuals who completed the web-based survey. Nonprobability sampling was utilized since the groups described above were used to collect the sample and it was not known if all universities subject to effort-reporting requirements were represented in these groups. A random sampling method was used because the respondents were only sought out via the groups and not individually selected to participate in the study. The survey was anonymous; no identifying information was collected on the participants or their institutions. The number of participants was not limited in this study.

Demographic information was collected on both the institutions and individual respondents. The institutional information collected included institutional classification (Doctoral/Research University, Master’s College or University, Predominantly Undergraduate Institution, Associate’s or Technical College, or Other), public versus private status, total amount of annual sponsored funding expenditures, and the office that oversaw effort reporting. Respondent information collected was the respondent’s position title and years of experience working in effort administration. Institutions were grouped by their institutional classification in order to compare types of institutions.

The instrument was a web-based questionnaire using the Survey Gizmo software program and consisted of predominantly closed-ended questions, with a small number of semi-closed-ended questions and one open-ended question. The instrument was separated into four sections consisting of demographic data, current data on the institution’s effort-reporting compliance program, data on past audit influences, and perceptions of future changes to the effort-reporting regulations. The survey was preceded by a participant letter that included a participant rights statement and statement of consent. The survey adhered to Nova Southeastern University Institutional Review Board consent compliance requirements, and all applicable information was included in the e-mail invitation and survey introduction.
A cross-sectional survey design was used in this study. On September 25, 2012, an e-mail invitation to participate in the research study was sent to the REASADM-L listserv and posted in the three NCURA Collaborate communities. In order to prevent multiple individuals from responding to the survey from the same institution, the invitation to participate in the study specified that only the person responsible for effort-reporting compliance for the institution was eligible to take the survey. Users were limited from responding to the survey more than once by using software features. The invitation directed eligible participants to a link to the survey instrument. To reduce nonresponse error and ensure a high response rate was received, a follow-up invitation was sent one week following the initial invitation on October 2, 2012. A final request was sent two weeks following the initial invitation on October 9, 2012.

Each of the survey question response choices was coded prior to the data being collected. Once collected, the data were exported to the IBM Corporation’s SPSS (Versions 20 and 21) software for analysis. The response rate was not calculated because the number of eligible respondents could not be calculated since the number of eligible potential respondents was not known. To determine best-practice characteristics of effort-reporting compliance programs by type of institution, the data from respondents who indicated that they would recommend their effort-reporting process were separated from the master data set and then further divided into two groups, Doctoral Research Universities (DRU) and Predominantly Undergraduate Institutions (PUI). All variables were covered individually by the survey questions and percentages were calculated based on the strength of the responses to the variables. Descriptive statistics were also used to analyze the variables; frequencies on the responses were calculated.

A total of 114 responses were received. Of these, eight responses (six complete and two partial) were ineligible for the survey because they were not self-classified as institutions of higher education; these responses were omitted from data analysis. Of the 106 remaining responses, 38 were partial responses for which not enough data were collected and thus were discarded from the final analysis. The analyzed responses resulted in 67 or 68, depending on the variable. Two classifications of higher education institutions (DRUs and PUIs) represented the majority of institutions in this study (91.1% or 62 institutions). Of the 68 total institutions represented in the analysis, only 30 or 44.1% of respondents would recommend their effort-reporting process to others (variable: pREC). Of these 30 institutions, 28 were DRUs and PUIs with an equal number representing each group. A higher percentage of DRU respondents (14 of 19 institutions or 73.6%) would recommend their effort-reporting process than PUIs (14 of 43 institutions or 32.5%). The results presented here on DRUs and PUIs are specific to only those respondents who would recommend their institution’s effort-reporting process.

Results
Results are designed to shed light on best practices among DRUs and PUIs that can be adopted by other institutions looking to update their effort-reporting compliance
program. This analysis was conducted separately for both DRUs and PUIs to identify best practices for each type of institution. Throughout this section, variable labels are listed in parentheses.

The first section of the survey instrument collected demographic data on the types of respondents (position title), their institutions (public versus private status and research expenditures), and the respondent institution’s effort-reporting compliance program (office that oversaw effort reporting, effort-reporting system, OMB Circular A-21 method, frequency of certification, number of effort certifications per reporting period, and source of funding reported on). Most DRU respondents were public institutions (78.6%; d3). As expected, they reported higher research expenditures and effort certifications for their institution than PUIs (d5, d11). They expended more than $10 million in research expenditures for the last fiscal year, with most over $50 million (d5). This correlates with a higher number of effort certifications; they all reported above 500 certifications per the institutionally specified certification period, and the majority reported over 1,000 (78.6%; d11). Further, effort-reporting compliance programs were most often administered at DRUs by a central effort administrator (42.9%) with the next highest response being a central post-award research administrator (21.4%; d1). They were divided by which office oversaw effort reporting, with the sponsored accounting offices a slight majority (57.1%; d6) over sponsored programs offices (42.9%; d6). Most DRU respondents indicated that their institution used a software system to report effort; an equal number of institutions chose off-the-shelf software and institutionally developed software (85.8%; d8). The majority (64.3%; d9) of DRU respondents indicated an after-the-fact method for reporting effort. DRU respondents were divided on the frequency of certification at their institutions. The most common response was semiannually (42.9%; d10). Finally, almost all DRU respondents indicated that their institution reported effort for all sponsored funding (versus only federal funding or federal and state funding; 92.9%; d12).

Most PUI respondents were public institutions (64.3%; d3). As expected, PUI respondents reported lower research expenditures and effort certifications for their institutions than DRU respondents (d5, d11). Most PUI respondents indicated that their institutions expended less than $50 million in funds for research in the last fiscal year, with half of these respondents reporting under $5 million (d5). This correlates with a lower number of effort certifications, with 85.7% having fewer than 1,000 certifications per certification period and 71.4% having even fewer than 500 (d11). A clear trend was not observed on who administered effort-reporting compliance programs at these PUIs, although the most common positions included a central effort administrator, noneffort specific post-award research administrator, and generalist research administrator with varying functions (d1). PUI respondents were also divided about which office oversaw effort reporting at their institutions—sponsored programs offices were the majority, at 64.3%, followed by sponsored accounting offices at 28.6% (d6). In contrast to the DRU respondents, only half of PUI respondents used a software system at their institution, and the others utilized paper (both 42.9%; d8). The majority (85.7%) of PUI respondents used an after-the-
fact method for reporting effort at their institutions (d9), although they were mixed on the frequency of certification (d10). Finally, PUI respondents differed from DRU respondents in regard to types of sponsored funding reported—64.3% reported effort for all sponsored funding, 14.3% reported on federal and state funding only, and 21.4% reported on federal funding only (d12).

The second aspect of the survey collected current data on institutions’ effort-reporting compliance programs. Factors included: having an effort policy (c1), defining who can attest to effort or “suitable means of verification” (c2), allowance of certification by administrators (c3), training (c4), consequences in place for those that do not certify (c5), process in place to track late or overdue statements (c6), commitment management (c7), maximum effort policy (c8), minimum policy for principal investigators (c9), defining significant change per OMB Circular A-21 (c10), are sponsors charged correctly (c11), conducts independent internal evaluations (c12), timeliness of certification (c13), and allowance of recertification of effort (c14). In addition, the following self-analysis questions were examined: overall OMB Circular A-21 compliance (c15), having no federal audit findings (c16), having accurate certification (c17), and having an effective compliance program (c18). DRU respondents who would recommend their effort-reporting process demonstrated best practices on which other institutions could model their effort-reporting compliance programs (Figure 3360.2-1). All of these respondents reported having an effort-reporting policy and conducted independent internal evaluations (c1, c12). The majority defined in their policy who could attest to effort or, who had suitable means of verification (78.6%; c2), and what constituted a significant change per OMB Circular A-21 requirements (71.4%; c10). DRU policies did not let administrators certify another individual’s effort for which they did not have suitable means of verification (71.4%) or they allowed it only with supporting documentation (21.4%; c3). A formal training program on effort reporting was also common at DRUs (85.7%) although the trend was towards a non-mandatory program (64.3% versus 21.4%; c4). A slight majority reported that their institution had consequences in place for those who failed to certify effort (57.1%; c5). Almost all respondents said they tracked down late or overdue statements to achieve compliance (92.9%; c6). DRU respondents also managed commitments of effort (85.7%; c7) with the majority having a policy on minimum effort (specific to Principal Investigators; 64.3%; c9) and maximum effort (78.6%; c8) charged to sponsored projects. The majority of effort certifications at their institutions were completed on time (71.4%; c13). However, responses were mixed regarding the allowance of recertification, indicating no clear trend (c14).

PUI respondents who would recommend their effort-reporting process also demonstrated best practices for that process (Figure 3360.2-2). Similar to DRU respondents, almost all reported that their institution had an effort-reporting policy and conducted independent internal evaluations (both 92.9%; c1, c12) although there were mixed results about providing a definition of suitable means of verification in that policy or who has suitable means of verification to certify effort (c2, d15). The majority of PUI respondents indicated that their institution defined what constituted a significant change (71.4%; c10). They also did not let administrators certify another

individual’s effort for which they did not have suitable means of verification (85.7%, 14.3% allowed only with supporting documentation; c3). No trends were observed with regard to a formal effort-reporting training program (c4) or having consequences in place for those who did not certify effort (c5). All respondents indicated that their institution tracked down late or overdue statements to achieve compliance (c6). Like DRU respondents, the majority of PUIs formally managed commitments at their institutions (84.6%; c7), but in contrast to the DRU respondents, PUIs did not have policies on minimum or maximum effort (57.1% and 78.6%, respectively; c9, c8). They were positive with regard to timely completion of effort certifications at their institutions (71.4%; c13). However, responses were mixed regarding the allowance of recertification, indicating no clear trend (c14).

The next set of variables analyzed represented self-analysis questions (Figure 3360.2-3). Most DRU respondents indicated that the salary compensation charged to sponsors was an accurate reflection of the effort certified at their institution (78.6%; c11), with the rest indicating a neutral response. Almost all agreed that their institution’s effort-reporting compliance program met the requirements in OMB (2004) Circular A-21 (92.9%; c15) and almost all were neutral or positive in response to “my institution’s effort reporting compliance program would have no significant findings in a federal audit” (57.1% positive and 35.7% neutral; c16). Overall, these answers reflected confidence by DRU respondents in their institution’s compliance program. These respondents agreed or strongly agreed that effort was certified accurately at their institutions (78.6%; c17) and their effort-reporting compliance program was effective in documenting personnel expenses on sponsored projects aside from the federal effort-reporting regulations (100%; c18).

Most of the PUI respondents indicated that the salary compensation charged to sponsors was an accurate reflection of the effort certified at their institutions (78.6%) with the rest of the institutions indicating a neutral response (c11). All PUI respondents agreed or strongly agreed that their institution’s effort-reporting compliance program met the requirements in OMB (2004) Circular A-21 (c15). Most agreed or strongly agreed that their institution would have no significant findings in a federal

Note: DRU = doctoral research university; PUI = predominantly undergraduate university. For all PUI variables, the rest of the responses were neutral (no respondents disagreed with the statement). This same statement applies to variable c11 of the DRU responses. For variable c16 of the DRU responses, 35.7% indicated a neutral response.
audit (78.6%), with the rest indicating a neutral response (c16). Similar to the DRU respondents, the PUIs who would recommend their institution’s effort-reporting process were confident in their compliance program. These PUI respondents agreed or strongly agreed that effort was certified accurately at their institutions (85.7%), with the rest indicating a neutral response (c17). Similarly, PUI respondents agreed or strongly agreed that their institution’s effort-reporting compliance program was effective in documenting personnel expenses on sponsored projects aside from the federal effort-reporting regulations (85.7%), with all others indicating a neutral response (c18).

To put the above practices into context, the third aspect of the survey collected data on past audit influences. Factors included: audit findings (aFIND), change made to their compliance program due to an audit finding (aCHANGE), change due to fear of future audit (aFEAR); and change to an adopted electronic system (aELEC). The variables were weighted equally, ranging from 0 (no finding; no change) to 1 (finding; change). No further statistical tests were needed as each variable served as a separate indicator of audit influence. About half of DRU respondents reported having significant findings at their institution related to effort reporting in the past (aFIND). Most DRU respondents changed their effort-reporting compliance program in the past ten years due to the fear of being audited in the future (85.7%; aFEAR). Further, most DRU respondents noted a change in their institution’s effort-reporting compliance program in the past ten years to adopt an electronic system (85.7%; aELEC).

In contrast to DRUs, the majority of PUI respondents indicated that their institution had not had a significant finding related to effort reporting (92.3%; aFIND). This result was not surprising as it was assumed most PUI institutions, due to the level of funding, did not have a high audit risk. Only about half of PUI respondents indicated that their institution had changed their effort-reporting compliance program in the past ten years due to the fear of being audited in the future, with most others indicating a neutral response (aFEAR). Interestingly, these respondents were divided at opposite ends of the spectrum about whether their institution changed its effort-reporting compliance program in the past ten years to adopt an electronic system; 35.7% answered definitely false and 42.9% answered definitely true (aELEC).

The final section of the survey instrument collected data on perceptions of effort administrators on future changes to the effort-reporting regulations, since the data collected predated publication of the OMB (2013) Uniform Guidance. Factors included: satisfaction with current process (pSAT), concern regarding investment in a new system (pINVEST), and stay with current process (pSTAY). The variable, “would you recommend your institution’s effort reporting process to others” (pREC), was also included in this section. The questions were scored with equal weight from 0 to 1 with a higher score indicating a more positive response towards the variable. No further statistical tests were needed as each variable served as a separate indicator on perceptions of effort administrators on future changes to the effort-reporting regulations.

All DRU respondents reported being satisfied with their institution’s effort-re-
porting process (somewhat to very satisfied; pSAT). Given their institutional leadership, all except one of DRU respondents (who did not know) would likely stay with their institution’s current effort-reporting process if the regulations changed (pSTAY). Most of these respondents indicated at least some level of concern about the investment in resources and costs of implementing a new effort-reporting system (92.9%; pINVEST).

Similarly, almost all PUI respondents reported being satisfied with their current effort-reporting process (92.9% somewhat to very satisfied; pSAT). Given their institutional leadership, 85.7% of PUI respondents indicated that it was very likely that they would stay with their current effort-reporting process if the regulations changed, with the rest indicating that they were unsure (pSTAY). Most of these respondents (85.7%) noted at least some level of concern about the investment in resources and costs of implementing a new effort-reporting system (pINVEST).

Overall, these results demonstrate the vast difference between DRUs and PUIs, but also indicate some notable similarities between the two types of institutions. The DRU and PUI respondents who would recommend their effort-reporting process were understandably confident in their effort-reporting compliance programs’ basis on self-analysis questions (Table 3). The differences between the effort-reporting practices at these DRU and PUIs can most likely be explained by the varying resources and emphasis placed on research at these institutions. Further, given the lower amount of research expenditures reported at the PUIs than the DRUs, it makes sense that the PUIs would be less likely to have a significant audit finding related to effort. This is possibly another reason for the risk-assessment approach taken at a DRU versus a PUI.

Limitations
Since the data were self-reported, there is a possibility that participants could inflate their responses. It was assumed that the respondents responded honestly and accurately, which cannot be verified. Also, it was assumed that only one individual from an institution responded to the survey. By using research administration groups and a listserv to distribute the survey, there could be an association, although assumed to be minimal, of the membership of compliance-focused groups or subscription to a listserv as an indication of a high level of personal or institutional compliance. In addition, the analysis of data from those who would recommend their effort-reporting process to others was based on a small sample size and was subjective in that it only identified trends in these data as only one of many possible analyses to determine best practices in effort-reporting compliance.

Conclusion
This study expanded the body of knowledge in the field of research administration by examining effort-reporting compliance programs at both Doctoral Research Universities and Predominantly Undergraduate Institutions that would recommend their effort-reporting process. These effort administrators were generally confident that their institutions complied with the current regulations and, that their institution’s effort-reporting compliance programs properly documented personnel costs
to sponsored projects. Many institutions’ compliance programs reflected changes due to an audit finding or a fear of a future finding. No matter what the level of funding, all institutions that accept federal funds must ensure that they exercise proper stewardship of those funds and comply with the same set of regulations that govern research. Compliance programs are expensive; they require both financial and nonfinancial resources to operate in addition to an immense culture change. Institutions that accept federal funding must prioritize where their resources are best placed to ensure they are operating in the most efficient way possible. For example, tracking down late or overdue statements is an efficient way of ensuring compliance given the resources available. Institutions looking to update or enhance their effort-reporting compliance programs in light of the OMB (2013) Uniform Guidance can use these results as one set of best practices for developing or enhancing an effort-reporting compliance program.

**Recommendations for Further Study**

Future studies can be conducted to measure the impact of the OMB (2013) Uniform Guidance on effort-reporting compliance programs at higher education institutions in order to determine whether the regulatory changes result in more effective documentation of personnel costs charged to sponsored projects with fewer burdens on institutions. This research can also be carried into other compliance areas to determine best practices.

**Acknowledgments**

This paper was derived from findings from the author’s doctoral dissertation research. This research was presented at the annual meeting of the National Council of University Research Administrators (NCURA), Washington, DC, August 4–7, 2013, and the annual meeting of the NCURA Financial Research Administration Conference, San Francisco, CA, March 15–17, 2014. About the Author
Ashley E. Whitaker, M.S., CRA, currently serves as Assistant Director, Office of Sponsored Programs, Nova Southeastern University (NSU), Fort Lauderdale, Florida. She also serves as the Central Effort Administrator for NSU and has worked
with effort-reporting compliance since 2008. This study came about as part of her applied dissertation research for a Doctor of Education degree with an expected completion date of May 2015.
Knowledge Check

The Q&As at §3390.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 3300 has been understood. Note: For the answer key for §3390.1, see §3390.3, which appears on a separate page (page 3390:5) for testing purposes.

Discussion topics at §3390.2 are designed to engender dialogue among staff on general issues of importance in the field.

1. Which statement is generally NOT true about post-award administration?
   (a) There is no one correct way to organize the post-award functions of project administration.
   (b) Each institution must decide for itself what works best in its organizational structure and culture.
   (c) Organizational structure is particularly important in organizing the post-award function.
   (d) Post-award administration functions independent of pre-award in the most effective institutional set ups.

2. Prior approvals are necessary for
   (a) Some types of project or budgetary changes
   (b) Submitting closeout reports
   (c) Filing project reports
   (d) Subrecipient monitoring

3. In which of the following would you find the key requirements for post-award administration?
   (a) OMB Circular A-110
   (b) OMB Circular A-21
   (c) OMB Circular A-133
   (d) OMB Circular A-122

4. Program income can come in many forms including all of the following EXCEPT:
   (a) Fees for services performed
   (b) Sale of research materials
(c) Tuition remission
(d) Monies from participants at conferences

5. **In general, should an institution accept transferred awards?**
   (a) No and create established policies to state the reasons why.
   (b) Yes and create established policies to do so efficiently.
   (c) Yes, for first-time investigators only.
   (d) No, as they are not allowed under OMB Circular A-133.

6. **According to ¶3305, release time for faculty involved in research is often of particular concern to**
   (a) Institutions receiving primarily funding from NIH
   (b) Institutions receiving primarily funding from NSF
   (c) Primarily undergraduate institutions
   (d) Geographically isolated institutions

7. **An “Internal Notification of Award”**
   (a) Typically would be issued at closeout
   (b) Typically sets forth key information about the award
   (c) Typically provides instructions on navigating NIH Commons
   (d) Typically is signed by the sponsor

8. **Which of the following topics typically is NOT considered part of post-award administration?**
   (a) Award terms and conditions
   (b) Allowable costs and prior approvals
   (c) Effort certification and cost transfers
   (d) Training for application submissions

9. **What is fabricated equipment?**
   (a) An item of equipment that is built or assembled from individual parts by an investigator or other sponsored project personnel.
   (b) Equipment valued at greater than $10,000 and donated to a sponsored project.
   (c) An item of equipment not originally included on a project budget, but which is later added as an allowable expense under the award.
   (d) A piece of equipment with a set cost that includes shipping and handling.
13390.2 Discussion Topics

1. Concern about effort certification and cost transfers have been the subject of federal audits in recent years. What are the auditors looking for, what raises “red flags,” and how can an institution ensure that its policies in these areas are being followed properly?

2. Does your institution set a maximum percent of committed effort for a PI on a sponsored research project? How do you handle changes to effort commitments on existing projects?

3. What are some components of good “cash management” practices with respect to sponsored awards?

4. How might (or does) the increased use of more multidisciplinary, multiple PI awards impact post-award?

5. What information would you ideally want to receive from pre-award staff to make your job easier? How can you help ensure that this information is routinely shared with post-award administration?

6. What are your procedures in the event of a PI transfer? Under what circumstances would your institution not transfer an award in the event of a PI transfer?

7. How often do you review and update your grant closeout procedures?

8. How do you stay abreast of the Fly America Act, Open Skies Agreement, and other such legislation that may impact how you can charge travel costs under a federal award?

9. What role does your office play in the monitoring of subrecipients or subcontractors under a federal research award?

10. How do your management practices differ for a federal award versus an award from a private sponsor or a non-federal sponsor?

11. What kind of electronic system are you using to manage your awards? Is this system adequate, in your opinion? If not, what additional functionality would you like to see added to the system?

12. How do you handle PIs who are consistently late in submitting progress and final reports to sponsors? What impact on your operations do these type of actions by PIs have?

13. What role does the pre-award staff play in fulfilling the institution’s reporting requirements under the American Recovery and Reinvestment Act and the Federal Funding Accountability and Transparency Act?

14. How do you monitor your unit’s workload so as to best accommodate “spikes” and “lulls” in activity?
\section*{13390.3 \textit{Answer Key}}

Following are the correct answers to the questions included at \[13390.1.\]

1. (d) Post-award administration functions independent of pre-award in the most effective institutional set ups.

2. (a) Some types of project or budgetary changes

3. (a) OMB Circular A-110

4. (c) Tuition remission

5. (b) Yes and create established policies to do so efficiently.

6. (c) Primarily undergraduate institutions

7. (b) Typically sets forth key information about the award

8. (d) Training for application submissions

9. (a) An item of equipment that is built or assembled from individual parts by an investigator or other sponsored project personnel.

Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter provides general descriptions of the requirements surrounding export controls and strategies for managing compliance.

Universities are generally thought to be places where open inquiry, discovery, and dissemination of information are essential characteristics of the environment. Most people who work in universities, research administrators included, do not believe that they are involved in “export” activities that need to be “controlled.” In this chapter, Susan Wyatt Sedwick of The University of Texas at Austin makes it quite clear that through the creation and dissemination of knowledge and information, universities may, indeed, be involved in “export” activities for which the government has a complex system of export control regulations in place that must be understood and followed.

Sedwick’s chapter provides an introduction into the world of the Commerce Department’s Export Administration Act, the Department of State’s International Traffic in Arms Regulations, and the Treasury Department’s Office of Foreign Assets Control. While all of these regulations have been in place for many years, it is only in the time after September 11, 2001, that they have begun to have a major impact on the university research enterprise. We can no longer assume that everything done on a university campus qualifies as “fundamental research” and, therefore, is exempt from the regulations.

Sedwick provides an explanation of the more complex and arcane aspects of export control regulations. The chapter includes a useful set of Web sites where additional information is available.

Chapter 3400 will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶3405, over time as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶3420), practical tools (at ¶3430), case studies (¶3440), statistics and survey results (at ¶3460) and a knowledge check (¶3490). A “knowledge check” containing Q&As and discussion topics is included at ¶3490.
Export Controls
Susan Wyatt Sedwick and David Ivey, The University of Texas at Austin

This chapter provides an overview of the requirements and federal agencies involved in implementing export control regulations. Also discussed are strategies for sponsored research offices to provide oversight or coordination with other offices to achieve compliance.

Although export controls, embargoes, and sanctions in the United States have been in place since the 1800s, the terrorist attacks in the United States on September 11, 2001, created a heightened awareness of the potential for the occurrence of violations associated with university research and other scholarly activities, especially in the area of sponsored projects and technology development.

While effective research administration offices have historically included export controls as a part of their compliance oversight activities, additional resources and staffing have been added on most campuses since 9/11 to ensure documentation of compliance efforts and minimize the risk of violations in response to increased scrutiny and enforcement by federal agencies.

Regulatory Framework

The goal of export control regulations is to help protect national security and play a role in preventing terrorist attacks and other illicit activities, such as proliferation of weapons of mass destruction. International obligations such as treaties and other agreements are fulfilled, in part, by export controls and sanctions. Enforcement of these restrictions on the export and import of goods and technologies that have the potential to contribute to the military vitality of our adversaries furthers national security goals.

The regulations have numerous implications for universities and their faculties. Compliance with export controls, embargoes, and sanctions may impact or restrict:

◆ Collaborations and discussions with foreign colleagues and students both in the United States and abroad
◆ Activities of visiting foreign scientists
◆ The sharing of data, software, and materials — such as biological materials through material transfer agreements
◆ Peer review of publications for foreign persons
◆ Travel to and research and fieldwork conducted in foreign countries
◆ The involvement of foreign students in research

Perhaps of greatest concern to institutions is the last item listed above, the implications the export controls have for foreign students involved in research.

While peer review of articles submitted to refereed journals may be provided as an exception to certain sanctions, in other circumstances the provision of anything of value, including professional feedback, is controlled for certain sanctioned countries. Fieldwork and other travel to and in foreign countries that requires transfer-
ring controlled items or technologies or performing defense-related services require licenses to avoid violations.

**Regulatory Oversight**

**Reminder**
What is an export? Under the EAR, any actual transmission or shipment of items out of the U.S. is an export. “Items” include equipment, material, software, and associated technology.

There are multiple laws, regulations, embargoes, and sanctions that could potentially apply to sponsored projects on university campuses. While it is important to recognize these terms as representing distinct and separate actions, collectively these are often referenced under the general rubric of export controls and a detailed discussion of the subtle nuances is not germane to this document.

The three sources of export controls that are most directly relevant for sponsored research administrators are the Export Administration Regulations (EAR), the International Traffic in Arms Regulations (ITAR), and the sanctions administered by the Office of Foreign Assets Control (OFAC). Figure 3405.1-1 illustrates the enabling legislation, responsible federal agency, specific Code of Federal Regulations (CFR) cite, and enumerating document for each. (A list of Web sites for the federal agencies and other sources is included as Figure 4, page 3405:16.)

¶3405.2 **Safeguarding Exclusions Specific to Universities**

During the Reagan Administration questions arose about access by foreign persons to controlled technologies, especially persons from countries that were Cold War adversaries. In response, several major research universities united and worked with the federal government to establish a national policy for controlling the flow and transfer of scientific, technical, and engineering information produced in federally funded “fundamental research” at colleges, universities, and laboratories.

**NSDD 189 and Fundamental Research**

This national policy is embodied in National Security Decision Directive (NSDD)
189, which defines fundamental research and provides a qualified exclusion from the export control regulations. NSDD 189 went virtually unquestioned until after 9/11, but it was reaffirmed by the George W. Bush Administration in a letter in November 2001 from Condoleezza Rice who was then the assistant to the president for national security affairs.

**As defined in NSDD 189, fundamental research is**

Basic and applied research in science and engineering, the results of which ordinarily are published and shared broadly within the scientific community, as distinguished from proprietary research and from industrial development, design, production and product utilization, the results of which ordinarily are restricted for proprietary or national security reasons.

Research conducted by university researchers and students normally will be considered fundamental research when the research is conducted “from scratch” from technologies and information available in the public domain, as long as there is the full intent to publish openly the results of the research. However, if a university accepts restrictions on the publication of results or use of foreign persons, the research does not qualify as “fundamental.” Researchers should be cautioned that “side deals” or verbal agreements to withhold publication of certain aspects of the research nullify the fundamental research exclusion.

**Reminder**

If restrictions on the publication of results or use of foreign persons are accepted under the terms of the research, the research does not qualify for exclusion as **fundamental research**.

Research requiring access to proprietary technology/information, source code, design specifications, and/or schematics may not qualify under the fundamental research exclusion, and it is imperative that a thorough review be conducted to determine if the information that is proprietary is controlled. However, it is possible to compartmentalize the fundamental aspect of the research that does not require such access and allow foreign persons to participate in that aspect of a project.

**Example**

A principal investigator may have access to controlled information or technology that would allow she or he to conduct additional analysis or interpretation of results based upon fundamental research conducted by foreign students. However, it would be important to have the principal investigator sign a certification of compliance with export controls acknowledging his or her willingness and ability to segregate those activities in compliance with regulatory requirements.

**Educational Information**

While subtle differences in the definitions of fundamental research as contained in the EAR and ITAR do exist, the exclusion of fundamental research from the jurisdiction of export controls applies to basic and applied research at an institution of higher education in the United States on which no restrictions on the publication of the results or use of foreign persons has been imposed. Educational information con-
veyed in catalog courses and their associated teaching labs (as defined in the EAR) and general science, math, and engineering commonly taught at accredited institutions of higher education (as defined in the ITAR) are excluded from export controls.

§3405.3 **Deemed Exports and Encryption Code**

The transfer of or access to technology controlled under the EAR to a foreign person even while in the United States is “deemed” to be an export. Under the ITAR disclosing controlled technology to a foreign national in the United States is included in the definition of an export and does not have to be treated as a “deemed” export though is often referred to as such. Deemed export controls do not apply to U.S. citizens, permanent residents, and foreign persons with asylum protection living in the United States. However, the controls are applicable to U.S. citizens visiting or working in a foreign country. Deemed export controls do apply to foreign faculty, research assistants and students, and visiting scientists in the United States.

Under the EAR, when a foreign person needs access to controlled information, the criteria for determining whether a license is needed for such “deemed export” is much the same as if a physical export of a piece of controlled equipment were to be exported to that country. (For further discussion of licensing, see §3405.7.) Under EAR, encryption source and object code may be “exported” if posted to a website where it is available for download outside of the U.S.

**Public Domain Information**

Technical information (excluding controlled encryption software) available in the public domain is not subject to export controls and this exclusion is the broadest exclusion available under either regulation (the EAR or ITAR). Software available on public Web sites must be available for download without any restrictions on access to qualify under the public domain definition.

Materials transferred under material transfer agreements that impose publication or other access restrictions must be scrutinized for applicability of controls. When information or technology is protected under a nondisclosure or confidentiality agreement, it is critically important to determine if controls apply and if the protections afforded in the agreement and procedures in place are adequate to ensure compliance.

**Proprietary or Controlled Information**

Many institutions will not accept proprietary information or allow such to be stored on their campus. When controlled information/technology is required for the conduct of a research project, a thorough risk assessment should be conducted. In many instances, sponsors may seek to impose restrictions on the use of foreign nationals unnecessarily and universities that do not believe such restrictions are appropriate given the statement of work, should “push back.” Many institutions have been successful in such negotiations but many have also walked away from projects where the risk outweighs the benefits, especially when students are involved.
Overview of Commerce’s Export Administration Regulations

The ten statutory prohibitions under the Export Administration Regulations (EAR), implemented by the Bureau of Industry and Security (BIS) at the U.S. Department of Commerce, are promulgated in 15 CFR Part 774—The Commerce Control List of the EAR. Violations of any of these prohibitions can lead to the loss of exporting privileges and both civil and criminal penalties. Perhaps of equal concern to universities is the public admonition and bad publicity generated as a result of such noncompliance.

The ten “general prohibitions” articulated in the EAR are:

1. Export or “re-export” of controlled items or technology to a controlled country, inclusive of deemed exports
2. Export of de minimis amounts of U.S. content incorporated into a foreign product (de minimis thresholds are 10 percent for terrorist-supporting countries and 25 percent for all other countries)
3. Re-export of foreign-produced direct product of U.S. technology or software
4. Transfer of items or technology to a denied entity or person
5. Failure to consider the end use/end user
6. Exports to embargoed destinations
7. Support of proliferation activities
8. In-transit shipments (applicable when a shipment will be unloaded “in transit” in a country for which the item being shipped is controlled)
9. Failure to adhere to the terms and conditions of an export license
10. Failure to report known violations including failure to self-report

International Arrangements

The United States belongs to four multilateral regimes that influence the Export Administration Regulations (EAR). The Wassanaar Arrangement (controlling the flow of conventional arms and “dual use” technologies), the Australia Group (addressing chemical weapons, specifically those that can be used in weapons of mass destruction), the Nuclear Suppliers Group, and Missile Technology Control Regime. While the EAR has been updated to bring its controlled items into closer alignment with the Wassanaar controls, the focus remains on items associated with conventional weapons from the Cold War era.

EAR Country Groups

The countries that belong to each regime are illustrated in Supplement No. 1 to 15 CFR Part 740—Country Groups of the EAR. For example, “Group A” countries include Australia, Japan, and Great Britain. An exception may exist in the listed exceptions of an Export Control Classification Number category for countries included in “Group B” — those countries closely aligned to the United States, but who are not members of any of the multilateral regimes, which includes many South and Central American countries. (For a discussion of Export Control Classification Number, see
Countries cited as terrorist-supporting are listed in “Group E.” Countries listed in “Group D” will have a greater number of controls than those in “Group B” but fewer controls than do terrorist-supporting countries.

In a recent Federal Register notice, the Bureau of Industry and Security has indicated the intention to use the presently reserved “Group C” for countries that pose a risk of diversion if approved for export receipt. Future updates will address changes to the country groups. In summary, the country groups serve as a general indication of the level of concern and controls.

**Commerce Control List**

While the primary commercial use or purpose for a commodity or technology may not be military in nature, when there exists a substantial military use application, the item is deemed to be “dual use” (military and commercial) and likely to be controlled under the EAR. The Commerce Control List (CCL) describes items subject to the EAR. (For the CCL, see www.access.gpo.gov/bis/ear/ear_data.html.) The 10 categories of classification under the EAR listed in the CCL begin with category “0.” They are:

- 0 Nuclear materials, facilities, and equipment
- 1 Materials, chemicals, microorganisms, and toxins
- 2 Materials processing
- 3 Electronics design, development, and production
- 4 Computers
- 5 Telecommunications and information security
- 6 Sensors and lasers
- 7 Navigation and avionics
- 8 Marine
- 9 Propulsion systems and space vehicles

**Export Control Classification Number**

Items, technology, and software are identified in the CCL categories and assigned a five-digit Export Control Classification Number (ECCN). The first digit refers to the specific category as listed above (0 through 9). The second digit is a letter and references the product group as follows:

- A – Equipment, assemblies, and components
- B – Test, inspection, and production equipment
- C – Materials
- D – Software
- E – Technology*

At this point, it is important to consider the definitions contained in the EAR. When a word is set in quotations in the EAR, there is an articulated definition in Part 772 of the EAR. For example, “use” and “technology,” among other terms, are specifically defined in the EAR. For a technology defined as “specific information
necessary for the ‘development,’ ‘production,’ or ‘use’ of a product,” to be controlled, there must be a Technology* control specifically listed for the commodity associated with the Technology*. For technology to be controlled for “use,” it must provide information not available publicly that would allow the user to operate, install, maintain, repair, overhaul, and refurbish the commodity. Therefore, the concern for foreign students utilizing and operating controlled equipment in U.S. university laboratories arises primarily when controlled technology that is not available publicly is required. Not all items on the CCL are controlled for “use”; thus, just because an item may be controlled for physical export does not mean that the “technology” allowing for the operation, installation, maintenance, repair, overhaul, and refurbishing as defined is also controlled.

**Reminder**
Definitions in the EAR. When a word is set in “quotation marks” in the EAR, it is defined in Part 772 of the EAR.

The *third* and *fourth* digits of the ECCN refer to the reasons for control and the *fifth* number is used for sequential numbering. An example is provided below.

**Example**
ECCN 2B352 would indicate materials processing (2) test inspection and production equipment (B). The remaining digits represent a particular item. Generally, the smaller the number represented in the last three digits, the greater the number of controls, i.e., 2B001 would be subject to a much larger number of controls than 2B999.

Reasons for controls include classification as
- chemical and biological weapons (CB),
- missile technology (MT)
- national security (NS), and
- regional stability (RS).

Items controlled for antiterrorism (AT) are only controlled for those countries specifically sanctioned as terrorist-supporting countries.

Each ECCN articulates the reasons for control and certain listed exceptions. The Commerce Country Chart found in Supplement No. 1 to 15 CFR Part 738–Commerce Country Chart of the EAR must be utilized to determine which countries are controlled for a specific ECCN. The countries controlled for each ECCN are subject to change and when making a determination on whether a commodity, technology, or software is controlled for a specific country, it is wise to consult the most recent issuance of the CCL found on the Internet.

**Commercial Search Tools**
The process of making determinations as to whether or not a license may be required for a specific activity is somewhat complex and aided by the use of a
commercial search tool. These tools are available by subscription and require a substantial financial investment. However, they do provide an efficient means of conducting this complex search that usually requires technical expertise and legal interpretation. Also commercial search tools should provide links to the most recent regulations including listed exceptions.

**Exceptions**

Exceptions under each ECCN might include listed exceptions. Other exceptions available include the “Temporary” (TMP) exception that can be utilized for shipments to controlled countries of commodities for exhibit or demonstration and for “tools of the trade,” such as research equipment utilized in research fieldwork or laptop computers. Laptop computers are not a primary concern; it is the software and information stored on the laptop that may be controlled and thus must be protected.

When using the temporary exception, it is incumbent that the controlled item remains in the “reasonable” control of the U.S. party responsible for the item. It is not adequate control to leave the item locked in a hotel room or hotel room safe, and researchers utilizing this exception are advised to keep the item with them at all times. When this is not feasible, a license should be sought.

**When to Seek a License**

In summary, when a research project or other activity does not qualify as fundamental research, the institution may need to obtain an export license. The process for determining whether or not an export license should be sought for an export of an item, technology, or software controlled under the EAR to a foreign country or entity or to a foreign person in the United States as a deemed export is to:

1. determine the end-use and end-user;
2. determine the applicable ECCN;
3. identify the reason(s) for control and listed exceptions;
4. review the Country Chart for specific controls;
5. consider whether pertinent exceptions are available; and
6. review the General Prohibitions to determine if a license is required.

*Note:* When a foreign person has dual citizenship, only the most recent citizenship is considered in making licensing determinations under the EAR.

**Example**

*Scenario:* A foreign visiting scientist from China needs access to proprietary technology that is controlled under the EAR for China. There are no applicable exemptions. Publications require prior “review” by the sponsor to ensure no proprietary information including relevant source code or technology is controlled. Does this qualify under the fundamental research exclusion?

*Answer:* A license is required if the foreign person will access technology enabling “use” as defined in the EAR (operation, installation, maintenance, repair, overhaul, and refurbishing) or encrypted source code that is (1) controlled; and (2) protected as proprietary and not available in the public domain. Generally, “use” is characterized by providing the know-how to replicate a piece of equipment.
Overview of State’s International Traffic in Arms Regulations

The International Traffic in Arms Regulations (ITAR), implemented by the Department of Defense Trade Controls (DDTC) under the U.S. Department of State, control items listed on the U.S. Munitions List found in 22 CFR §121.1. (For the U.S. Munitions List, see www.access.gpo.gov/nara/cfr/waisidx_99/22cfr121_99.html.) The ITAR covers both research on defense articles and training or assistance related to the manufacture or production of defense articles.

Most satellite-related technologies are controlled under Category XV of the USML, and under this category technical assistance agreements may be necessary even when defense services provide only information that is available in the public domain and is otherwise exempt from licensing requirements (see 22 CFR §124.1).

Anything having a significant military application can be of concern for the ITAR. The countries comprehensively prohibited for exports under the ITAR are listed in 22 CFR §126.1 of the regulations. Additionally, the Embargo Reference Chart outlines the most up-to-date embargoes subject to ITAR controls. https://www.pmddtc.state.gov/embargoed – countries/index.html.

Technical data as defined in 22 CFR §120.10 of the ITAR focuses on the design, development, and production of defense articles and is controlled.

Fundamental Research and Public Domain Information

Under the ITAR, fundamental research is a subset of the definition of information published or generally available in the “public domain” (see 22 CFR §120.11). While the NSDD 189 definition of fundamental research includes the resulting information that is “ordinarily published and shared broadly in the scientific community” (see discussion above), the ITAR caveat if literally interpreted, can imply that the fundamental research exclusion is not available until the research results are actually published.

Included under the definition of public domain are

◆ information disclosed at conferences and meetings generally open in consideration of a reasonable fee and where attendees may take notes;
◆ information available in libraries open to the public; and
◆ patent information published once the patent has been issued.

Foreign Persons

Foreign persons in the United States who may have access to information controlled under the ITAR must be “bona fide” employees. As defined, a bona fide employee must be a full-time, regular employee of a U.S. institution of higher education with a permanent abode in the United States throughout employment. Foreign persons employed part-time, including students, do not qualify as bona fide employees under the ITAR definition.

Foreign persons from prohibited countries, currently including China, may not have access to ITAR-controlled information without a specific license, and it is the general policy of the Department of State to deny licenses. (Prohibited countries are
listed in 22 CFR §126.1 of the ITAR.)

Foreign persons from other countries must be informed about and agree, in writing, not to transfer controlled technology to another foreign person without a license. For these reasons, the conduct of research that requires access to and use of ITAR controlled information is particularly challenging and incongruent with most university policies.

Reminder
A bona fide employee under the ITAR is a regular, full-time employee of a U.S. institution of higher education with a permanent abode in the United States throughout employment.

3405.6 Overview of Treasury’s Office of Foreign Assets Control

Most transfers of assets or anything of value including cash, payments, and services to countries listed on the Office of Foreign Assets Control (OFAC) list of sanctioned countries may be prohibited. For some countries, such as Cuba, travel to and from the sanctioned country may be prohibited without a license from OFAC, part of the U.S. Department of the Treasury. Sanctions under OFAC are specific to each sanctioned country. (For details, see the “OFAC Sanctions Programs and Country Information” at http://www.treasury.gov/about/organizational-structure/offices/Pages/Office-of-Foreign-Assets-Control.aspx.

Peer Review Exception

While there is an exception for peer review by researchers of manuscripts considered for publication in peer-reviewed professional journals, researchers should be cautioned about providing feedback or other professional guidance to colleagues from sanctioned countries, as such assistance is viewed as having value that would be controlled and require an OFAC license.

Comprehensive sanctions apply to certain countries and prohibit any activity or transaction that would provide something of value. Research and educational activities in a country to which comprehensive sanctions apply require a license and a timely review of the most recently imposed sanctions. Licensing requirements for student study or research projects may be different from the licensing requirements for research or collaborative interactions by faculty researchers.

A list of compliance “case studies” is included as Figure 3405.6-1 below.

Figure 3405.6-1. Case Studies — Application of the Export Control Regulations

A principal investigator contemplates the appointment of a foreign student on an industry-sponsored project involving proprietary information from the industry sponsor that is controlled under the EAR. The sponsored research agreement allows for dissemination of the results pending review, not approval of the publication, by the sponsor to allow for protection of any resulting intellectual property and to ensure that no proprietary information is disclosed in the proposed publication.
Scenario 1: You have determined that the foreign student will not have access to the proprietary information. In this scenario, does the project qualify as fundamental research under the EAR?

Answer: Yes, as provided in NSDD 189, this research would qualify as fundamental research. Prior review by the sponsor for these purposes does not disqualify the institution from the fundamental research exclusion as long as the delay does not exceed a reasonable amount of time, usually 60–90 days. However, a “technology control plan” should be articulated and acknowledged in writing by all parties with access to the proprietary information describing the procedures that will be followed to limit access to the controlled information/technology.

Scenario 2: The foreign student must have access to the proprietary/controlled information, but the technology is not controlled for the student’s country of citizenship. Is any documentation regarding access to the information needed?

Answer: Normal safeguards for the protection of proprietary information should be adequate. However, acknowledgement of those obligations in writing should be incorporated in the award file.

Scenario 3: The information is controlled under the ITAR and the foreign student is from Germany. Does that change the procedures you would follow?

Answer: The bona fide employee exception under the ITAR does not apply to students including graduate research assistants working a full .50 FTE, and a license would be required for the student to have access to the controlled technology. This applies to graduate and undergraduate students.

Scenario 4: The information is controlled under the ITAR and the co-PI is a faculty member who is a citizen of China. Does the bona fide employee exception apply?

Answer: The bona fide employee exception does not apply to citizens from prohibited countries and China is a prohibited country under the general prohibitions in 22 CFR §126.1. A license would be required, but there is a policy of denying licenses to a prohibited country.

Scenario 5: A co-PI from China has applied for permanent residency, and her application is pending. Would this make any difference as to whether or not the bona fide employee exception applies?

Answer: Though unwritten, a license would still be required, but the fact that the co-PI is pursuing permanent residency would be taken into consideration by the Directorate of Defense Trade Controls in making a licensing determination. The Bureau of Industry and Security would offer the same consideration.

Scenario 1: You have determined that the foreign student will not have access to the proprietary information. In this scenario, does the project qualify as fundamental research under the EAR?

Answer: Yes, as provided in NSDD 189, this research would qualify as fundamental research. Prior review by the sponsor for these purposes does not disqualify the institution from the fundamental research exclusion as long as the delay does not exceed a reasonable amount of time, usually 60–90 days. However, a “technology control plan” should be articulated and acknowledged in writing by all parties with access to the proprietary information describing the procedures that will be followed to limit access to the controlled information/technology.

Scenario 2: The foreign student must have access to the proprietary/controlled information, but the technology is not controlled for the student’s country of citizenship. Is any documentation regarding access to the information needed?

Answer: Normal safeguards for the protection of proprietary information should be adequate. However, acknowledgement of those obligations in writing should be incorporated in the award file.
Scenario 3: The information is controlled under the ITAR and the foreign student is from Germany. Does that change the procedures you would follow?

*Answer:* The bona fide employee exception under the ITAR does not apply to students including graduate research assistants working a full .50 FTE, and a license would be required for the student to have access to the controlled technology. This applies to graduate and undergraduate students.

Scenario 4: The information is controlled under the ITAR and the co-PI is a faculty member who is a citizen of China. Does the bona fide employee exception apply?

*Answer:* The bona fide employee exception does not apply to citizens from prohibited countries and China is a prohibited country under the general prohibitions in 22 CFR §126.1. A license would be required, but there is a policy of denying licenses to a prohibited country.

Scenario 5: A co-PI from China has applied for permanent residency, and her application is pending. Would this make any difference as to whether or not the bona fide employee exception applies?

*Answer:* Though unwritten, a license would still be required, but the fact that the co-PI is pursuing permanent residency would be taken into consideration by the Directorate of Defense Trade Controls in making a licensing determination. The Bureau of Industry and Security would offer the same consideration.

### 3405.7 Licensing Issues

The conduct of sponsored research often triggers licensing requirements. Licensing procedures for each federal agency implementing export controls differ. Further, licenses under multiple regulations might be required in instances where research being conducted in a sanctioned country requires travel under an OFAC license and the physical export of equipment or services may require a license under either the EAR or ITAR.

**SNAP-R System and the EAR**

Paper copies of license applications and “commodity classifications” (see below) are no longer accepted, instead use of the Web-based Simplified Network Application Process Redesign (SNAP-R) system is required for licensing under the EAR. When submitting applications through the SNAP system, one must adhere to strict limitations on the number of characters that can be entered into individual fields.

It is generally advisable to include with the SNAP-R submission a letter of explanation, “white paper,” drawings, technical description, or other explanatory information to assist the licensing officer. The supplemental materials must be saved in PDF format and uploaded in the SNAP system. If supplemental materials are required for either paper or electronic applications, each item/page must be submitted in hard copy form and should be clearly marked with the “Application Control Number.” For deemed export licensing, proof of the intention of the foreign person to permanently reside in the United States will be taken into consideration when the licensing decision is made.

**‘Commodity Classification’ and ‘Commodity Jurisdiction’ Determinations**

The EAR and ITAR are discrete sets of regulations, however, ambiguity may exist as
to whether an item or technology is controlled under the CCL (EAR) or the USML (ITAR). The State Department has primary and superior jurisdiction to the Commerce Department. Ideally, there should be no overlap but it may be unclear as to any particular item or technology which agency has jurisdiction. When it is known or believed that an item or technology is subject to the EAR but the ECCN cannot be determined with certainty a request for a “Commodity Classification” may be submitted to the Commerce Department via the SNAP-R system. or When a question exists whether an item or technology is controlled under the EAR or ITAR a determination of controlling jurisdiction is required and may be obtained by submitting a “Commodity Jurisdiction Determination request” to the State Department. Only the State Department can make a jurisdiction determination thus a Commodity Classification is not a binding jurisdiction determination and is only binding on the Commerce Department as to the Commodity Classification (i.e., the ECCN). The procedures for requesting a Commodity Classification are outlined in 15 CFR Part 748 of the EAR and for seeking a Commodity Jurisdiction in 22 CFR §120.4 of the ITAR.

**Licenses Under ITAR**

Licensing for either physical export or release of technical data or technology to a foreign national in the United States under the ITAR requires registration and payment of a fee as outlined in 22 CFR §122.3 of the ITAR. An “empowered official” must be designated and, at most universities, this is usually the chief research officer or his/her designee. A “technical assistance agreement” (TAA) should be sought for the provision of defense-related services. Physical exports of items controlled under the ITAR require other agreements, as outlined in the regulations.

**Licenses Under OFAC**

Requests for licenses under OFAC require a letter describing the purpose of the travel or transaction in detail as described in “Licensing Questions” found at http://www.treasury.gov/resource-center/faqs/Sanctions/Pages/ques_index.aspx#license. The export of equipment associated with an OFAC license may require a separate license under the EAR or ITAR. Because licenses must be renewed annually and can take, on average, 60 to 90 days to acquire, institutions are advised to request the license for a full year.

Figure 3405.7-1 outlines the validity period for licenses obtained under each regulation. Reviewing agencies have 30 days to initiate action and comment on the application but agency processing of a license application may take months. Licenses most often include provisos, limitations, and caveats that require compliance, and such compliance may make the license unworkable. For example, deployment of controlled equipment for fieldwork in a controlled country may require 24/7 security by U.S. citizens, making adherence infeasible and/or cost prohibitive.

Under ITAR, an empowered official must be designated, often this is the chief research officer or his or her designee.

§3405.8 Role of Technology Control Plans
A “technology control plan” (TCP) describes the safeguards for protecting export-controlled technology and is a required element for licensing applications for the transfer of controlled technologies. Additionally, a TCP is an important element of compliance documentation.

Each technology control plan should outline the procedures employed in protecting access to controlled items and technology and represents the commitment of all involved parties to compliance. A physical security plan that utilizes badging and other access controls may be required as part of the TCP. For data stored electronically, an information security plan specifies how access to controlled information/technology will be assured.

A technology control plan begins with an institutional commitment to compliance in the form of policies and procedures. A technology control plan is specific to a particular project, not a general compliance program. The plan must be articulated in written form and signed by all parties involved. A sample template for certification appropriate for these purposes can be found at www.utexas.edu/research/osp/ (search under “Forms”).

§3405.9 Recommended Practices for Compliance
The bedrock underpinning any effective compliance program, including one addressing export controls, requires first and foremost a commitment from the institution’s highest levels in the form of (1) a policy statement that is widely disseminated and (2) the allocation of adequate resources. Identification of a responsible official, clearly articulated procedures, awareness training, and ongoing oversight all contribute to effective compliance and document due diligence. For institutions required to register under the ITAR, an empowered official must be named. (See discussion of “empowered official” above.)

Importance of Educating Constituents
Awareness training is an essential component of any export management system and because export controls can apply to activities outside of the research realm — such as foreign travel — should be provided widely. Faculty, staff, and students in
both academic and administrative units and executive officers should be briefed in order to have a basic understanding of the types of issues and transactions that may be controlled under export controls, embargoes, and sanctions. Individuals also need to readily know whom to contact for ongoing information and assistance.

Institutions committed to effective compliance programs must identify a responsible official and, thus, the office primarily responsible for export controls compliance. While some institutions have placed that organizational responsibility in research offices, others have separate compliance units that fulfill that role. Even if a research administration office does not have full responsibility for the compliance program, because of the unique role and perspective of the research administration unit(s), effective compliance programs rely heavily on the unit(s).

Most licensing requirements arise for an institution of higher education from research, which is often sponsored research.

**Record Keeping**

Record-keeping requirements under the EAR, ITAR, and OFAC basically require a five-year commitment. However, the enacting event for each is slightly different. The five-year requirement begins:

- For EAR: on the date of the last export/re-export transaction (see 15 CFR §762.6)
- For ITAR: on the expiration of the ITAR license
- For OFAC: on the date of the OFAC transaction

Electronic archival is permitted under the EAR (see 15 CFR §721.1(d)(2)) and the ITAR (see 22 CFR §122.5). Even in those cases where no license is required, retention of the documentation relating to the review process, technology control plan, and other compliance activities also should be retained. Because the regulations and countries of concern are subject to change, a central database that tracks the specific foreign concerns or categories can assist an institution with respect to ongoing and updated compliance activities.

Invocation of certain exemptions under the ITAR carry specific record-keeping and reporting requirements. Once licenses or technical assistance agreements are no longer required, it is advisable to terminate the agreement or license to minimize the period of record retention.

Periodic assessment and review of the institution’s research activities and of the efforts to ensure proper practice and adherence to procedures is a hallmark of any effective compliance program. The federal government is beginning to assess university compliance programs and undertake random document reviews of projects that have the potential for export controls, such as projects sponsored by defense agencies, those involving foreign fieldwork or other research activities, and those projects that employ foreign persons from regulated countries.

**Reporting Violations**

In spite of the most rigorous compliance program, a violation may occur. If a faculty
member or other university employee suspects a violation has or might occur he or she must know whom to contact for guidance, and the appropriate action must be taken. While the empowered or responsible official bears the responsibility and authority for making the ultimate decision on whether or not a reportable violation has occurred and requires disclosure, that decision should not be made without consultation with legal counsel and appropriate executive officers. The EAR, ITAR, and OFAC guidelines explicitly offer that voluntary self-reporting of violations will be taken into consideration when assessing penalties and fines, and it may mitigate the decision on penalties.

**Reminder**

Penalties under the EAR, ITAR, and OFAC can be severe and include criminal and civil monetary penalties.

Institutions with robust compliance systems that include education programs will fare better in general. Individuals involved with any infractions related to export controls are individually accountable.

### Conclusion

Export controls are the law of the land and will continue to be scrutinized by federal agencies and officials including members of Congress.¹ Violations of the regulations can lead to significant civil and criminal penalties. Academia continues to push back when attempts are made to further tighten controls that would impede fundamental research on U.S. college and university campuses. Figure 3405.10-1 provides a list of Web resources to help an institution stay updated.

¹ For example, a December 2006 Government Accountability Office (GAO) report, “Export Controls: Agencies Should Assess Vulnerabilities and Improve Guidance for Protecting Export-Controlled Information at Universities” (GAO-07-70) seems to commend higher education efforts to comply with confusing and sometimes conflicting rules. However, the report also recommends that the State Department and Commerce Department conduct “threat assessments” to see whether universities are truly vulnerable to violations of the rules. This section includes expanded coverage of topics related to export controls.

Export Control Reform and Higher Education
Kelly Hochstetler, University of Virginia

The current laws and regulations controlling technology exports have their foundation in the cold war era and are out of step with the current global nature of commerce and science. Recognizing this disconnect President Obama initiated an interagency review of the US export control system in August 2009. The intent of the interagency review was to identify ways to strengthen national security, increase the competitiveness of the US industrial base, and adapt the US export control system to today’s economic and technological landscape. The White House issued a press release (http://www.whitehouse.gov/the-press-office/2010/08/30/president-obama-lays-foundation-a-new-export-control-system-strengthen-n) summarizing the findings of the interagency review in August 2010 and these findings form the framework for the administration’s ongoing export control reform initiative which includes four major areas of focus:

◆ Update and restructure the current export control lists, with the ultimate goal of creating a single control list, to make it easier for exporters to determine the jurisdiction and control status of their items.

◆ Create a clear and consistent licensing policy and building a single licensing agency.

◆ Move to a single modernized information technology system to handle the intake, routing and review of export applications by all involved agencies.

◆ Create a single agency to coordinate and deconflict export control enforcement activities.

The International Traffic in Arms Regulations (ITAR) (22 CFR 120-130) administered by the Directorate of Defense Trade Controls (DDTC), the Export Administration Regulation (EAR) (15 CFR 730-774) administered and enforced by the Bureau of Industry and Security (BIS), and the trade sanction regulations (31 CFR 500-599) administered and enforced by the Office of Foreign Assets Control (OFAC) are the principle export control regulations of the United States (U.S.). Additional regulations governing various types of international trade fall under the jurisdiction of other U.S. Government agencies (e.g. nuclear materials and technologies, endangered species, and drugs and pharmaceuticals under the jurisdiction of the Nuclear Regulatory Commission and Department of Energy, Department of the Interior, and the Food & Drug Administration, respectively).

Although the primary focus of the ongoing export control reform initiative has been on revision and modernization of the ITAR and EAR, other actions take as part of the reform initiative have had broader applicability, including the creation of the Export Enforcement Coordination Center (E2C2) by Executive Order 13558
on November 9, 2010. The purpose of the E2C2 is to coordinate and enhance the efforts of the enforcement agencies “to detect, prevent, disrupt, investigate, and prosecute violations of U.S. export control laws” by sharing “intelligence and law enforcement information related to these efforts to the maximum extent possible, consistent with national security and applicable law.” The modernization of the IT infrastructure supporting export license submission and interagency review is underway, but those changes will continue to be largely invisible to the regulated community. DDTC, BIS and OFAC are also developing a single export application form which is expected to be released for public comment in late 2013 or early 2014. Initially the D-Trade2 and SNAP-R electronic submission systems for DDTC and BIS, respectively, will be maintained; however, these will become portals to a single U.S. Government export control IT system that will be accessible by everyone with review authority.

The regulated community has generally welcomed and supported all aspects of the export control reform initiative. Support has been particularly strong for the administration’s attempts to creating a “bright line” between technologies (e.g. items, software and proprietary technical information) subject to control under the ITAR and those controlled under the EAR; the establishment of positive criteria to describe technologies identified on the control lists; and the transfer of less critical technologies from the U.S. Munitions List (USML) (ITAR § 121.1) to the Commerce Control List (CCL) (EAR § 774). While many of the changes will provide greater clarity and certainty for university researchers and administrators other aspects of the export control reform initiative, particularly with regard to emerging and developmental technologies, are likely to result in an increase in the frequency with which university research programs and the technologies they produce being subject to control under the ITAR.

The DDTC and BIS have been and will continue to work closely to coordinate release of Federal Register notices relating to the revision to the control lists to ensure that there is no lapse in regulatory coverage for technologies moving from the ITAR to the EAR. The first pair of final rules implementing export control reform was issued on April 16, 2013, (Federal Register Vol. 78, No. 73, pp. 22740-22759) with the changes to take effect on October 15, 2013. The revisions to CCL are largely clarifications and the addition of new Export Control Classification Numbers (ECCN) to accommodate those technologies moving from the ITAR to the EAR. In contrast, the USML is being restructured into a positive list similar to the CCL; this adds clarity for exporters and will make it possible to merge the two lists into a single consolidated list of export controlled technologies should congress act on this recommendation of the administration. The proposed and final rule changes on or after April 16, 2013, provide a clear indication of the future structure of the USML and allow us to begin to assess the impact the reform of the control lists is likely to have on institutions of higher education.

Beginning with the first final rule implementing export control reform (Federal Register Vol. 78, No. 73, pp. 22740-22759), DDTC has begun to explicitly claim that developmental technologies funded by the DoD are subject to the ITAR. This language is first found in paragraph (f) of Category VIII Aircraft and Related Ar-
articles are subject to the ITAR which reads “[D]evelopmental aircraft and specially
designed parts, components, accessories, and attachments therefor funded by the
Department of Defense.”

A note to the paragraph identifies two mechanisms by which a developmental
technology may be excluded from control by the paragraph. The first is if the tech-
nology has been determined to be subject to the EAR via a commodity jurisdiction
determination. While this option may be reasonable for defense companies who
routinely deal with the development and manufacture of defense articles to meet
specific technical requirements or performance criteria; it is not generally feasible
for institutions of higher education who are typically developing new technolo-
gies based on broad general objectives through the use of best efforts and where
the specific technology may be developed to address a fundamental research ques-
tion rather to fulfill a specific deliverable required by the terms of the DoD funding
award. The level of technical specificity required for a commodity jurisdiction is
simply not typically available prior to the start of the research when decisions must
be made about the inclusion or exclusion of foreign nationals.

The second way that a technology may be excluded from control under para-
graph VIII(f) is if it is identified in the relevant DoD contract as being developed for
both civil and military applications. This mechanism is potentially useful for institu-
tions of higher education because it can be accomplished prior to the initiation of
the research project. The concern, however, is that DoD contracting officers are often
not technically qualified to make such determinations and are therefore likely to
reject requests for inclusion of the required language in university contracts. While
institutions of higher education may interpret the use of the term “contract” to ex-
clude applicability to other types of DoD funding awards, e.g. grants and coopera-
tive agreements, this restrictive interpretation is not required. Given that “contract”
is not defined in the ITAR the common language definition of “a binding agreement
between two or more persons or parties” (Merriam-Webster.com) should be used;
based on this definition, the term “contract” would include grants and cooperative
agreements. This has been further clarified by DDTC in later proposed and final
rules where the language of the note has been changed to read “identified in the
relevant Department of Defense contract or other funding authorization as being
developed for both civil and military applications.” However, this applicability to
grants creates an additional issues as the terms of grants are not typically subject
to negotiation and do not require a formal (signed) acceptance of the terms by the
recipient.

The July 8, 2013, final rule (Federal Register (FR) Vol. 78, No. 130, pp. 40922-
40933) issued by DDTC included in similar controls on DoD funded developmental
vessels and specially designed parts, components, accessories, and attachments
(Category VI(c)). This final rule also specifically added controls on developmental
armor in Category XIII(e)(7) and developmental [submersible] vessels in Category
45018-45025) issued by DDTC includes controls on DoD funded developmental
electronic equipment or systems in Category XI(a)(7); there is no reason to believe that
this language will be removed in the final rule. Similar controls on developmental technologies are anticipated in other USML categories, but were not identified in the final rules for Category VII Ground Vehicles; Category XVII Classified Articles, Technical Data, and Defense Services Not Otherwise Enumerated; Category XIX Gas Turbine Engines and Associated Equipment; and Category XXI Articles, Technical Data, and Defense Services Not Otherwise Enumerated. No controls on developmental technologies are identified in the May 24, 2013, proposed rule (Federal Register Vol. 78, No. 101, pp. 31444-31451) issued by DDTC for Category XV Spacecraft Systems and Related Articles but they may change in the eventual final rule. Control of developmental technologies is expected in most if not all of the coming final rules revising USML categories.

As if the staggered release and implementation of the final rules implementing changes to the USML categories was not challenging enough for universities, the July 8, 2013, final rule (Federal Register (FR) Vol. 78, No. 130, pp. 40922-40933) issued by DDTC included an additional note to the paragraphs controlling DoD funded developmental technologies. This note specifies that the first note, which identifies the ways in which technologies may be excluded from control under the paragraph, “is applicable to those contracts and funding authorizations that are dated one year or later following the publication of the rule.” This note was not included in the first final rule implementing export control reform (Federal Register Vol. 78, No. 73, pp. 22740-22759) but DDTC has indicated (personal communication) that conforming changes will be made to Category VII(f) prior to the effective date of the final rule (October 15, 2013); however, those changes had not been issued at the time of this writing.

One positive proposed change to control lists is the move of commercial satellite technology from the ITAR to the EAR. This transfer was made possible by the December 21, 2012, passage of the National Defense Authorization Act for Fiscal Year 2013 which included language overturning the requirements of Section 1513 of the Strom Thurmond National Defense Authorization Act of 1999 which mandated that satellites and related items be included on the USML. This action returned full authority to the President to designate those technologies and services subject to control under the ITAR.

Although the majority of the impacts to higher education from changes to the control lists are likely to come from new additions and clarifications to the USML categories, there are also CCL changes worth noting. In particular, BIS is adding two new series of ECCNs to accommodate technologies that are moving from the USML to the CCL. The first of these is the 600 series that is will be used to receive military commodities while the second, the 500 series, will be used for commercial satellite or space technologies. The most significant difference between the new ECCN series is that the prohibition on exports to destinations subject to a U.S. arms embargo (i.e. those countries listed in ITAR § 126.1) will be maintained once the commodities are moved to the CCL.

"Technology" is defined term in the EAR (EAR § 772) and refers to information related to the "development," "production," or "use," of a controlled commodity.
“Use” is also a defined term in the EAR and refers to information on the installation, modification, operation, repair, maintenance and refurbishment of a commodity; BIS has always interpreted that all six elements must be present for the “technology” to be subject to control. Due to the nature of the technologies being transferred to the CCL, BIS will, as deemed necessary, be controlling the components of “use” independently for the 600 series. Control of “use” “technology” for 500 series commodities will be consistent with its use in current ECCNs because these technologies are commercial rather than military.

The export reform initiative is ongoing and final rules have not yet been released for many USML categories. In addition to changes to the control lists, DDTC and to a lesser extent BIS are considering changes to the definitions of certain key terms used in the ITAR and EAR, respectively. New definitions for key terms may greatly impact how changes to the control lists and other parts of the export control regulations may affect university research and the training of the next generation of scientists and engineers; until they are released it is impossible to guess what their impact will ultimately be.

In the meantime, institutions of higher education must deal with the impact of the final rules that have been issued. Those changes will be felt most strongly in DoD-funded research programs in emerging technology areas such as applied engineering and computer science. Researcher administrators will need to carefully review all types of DoD-funded awards (e.g. grants, contracts and cooperative agreements) to determine whether or not the award is likely to result in technology advances and to ensure that appropriate terms are provided when those advances are intended to have both civil and military applications; this applies to situations in which the institution of higher learning is the prime recipient or a subcontract recipient on an industry prime contract. Determining whether or not the developmental items are subject to control under the ITAR is only the first step; once ITAR jurisdiction has been established institutions will have to determine whether or not foreign nationals may participate, whether or not the results may be published without formal approval from DDTC, and ultimately whether or not to accept this type of restricted research activity.

As the export reform initiative progresses it is critical that institutions of higher education monitor proposed changes, make the agencies aware of the potential impact changes may have on academia, and continue to adapt internal export control compliance policies and programs to implement changes as final rules are issued.

About the Author

Kelly Hochstetler is the Director of the Office of Export Controls at the University of Virginia. Upon accepting this newly created position in 2010, Kelly was charged with developing and implementing an institutional export compliance program for the university. Kelly continues to serve as the primary institutional official responsible for the day-to-day management of the university’s export controlled activities. Her duties include institutional export control risk assessment; performing reviews of proposals, award documents, non-disclosure documents, and other sponsorship
or partnering agreements to identify potential export issues; providing training and guidance to university researchers and support staff; and preparing license applications and other correspondence to regulatory agencies. These activities require close coordination with various university executive, administrative, academic and research academic offices, as well as outside counsel. Kelly received her doctorate in biological sciences from the University of Alaska Fairbanks.
\textbf{13430} \hspace{1em} \textbf{Practical Tools}

This section includes practical tools — flowcharts, checklists, etc. — relating to managing compliance with export controls. These materials are culled from a variety of authoritative sources.

\textbf{13430.1} \hspace{1em} \textbf{Outline of a Export Compliance Program}

AIS editors

The following outline or checklist is based on a presentation that discussed export compliance involving the International Traffic in Arms Regulations (ITAR), implemented by the Department of Defense Trade Controls (DDTC) at the U.S. Department of State (see §3405.5). The outline, however, also may be of general help to research administrators in reviewing their institution’s overall export compliance program.

\textbf{Compliance Program}\textsuperscript{1}

\textit{Why do you need a compliance program?}

\begin{itemize}
  \item The export control regulations are comprehensive and detailed.
  \item Penalties for violations are significant and include serious monetary and nonmonetary penalties.
  \item The regulatory system reflects the importance of defense trade to U.S. national security and foreign policy interests. Good universities, institutions, and laboratories must protect themselves and our country’s interests with strong internal controls.
  \item There are sophisticated procurement networks trying to fool you and the government to get this technology.
\end{itemize}

\textit{In developing the program, remember …}

\begin{itemize}
  \item There is no “magic formula.”
  \item One size does not fit all.
  \item A sound program starts with written direction issued by senior management.
  \item An effective program continues with ongoing senior management support, oversight, and training.
\end{itemize}

\textit{A compliance program should …}

\begin{itemize}
  \item Establish responsibilities and procedures
  \item Inform employees
  \item Establish comprehensive records
  \item Provide for timely reporting
\end{itemize}

\textsuperscript{1} This outline/checklist is based on a presentation by David Trimble, Director, Defense Trade Controls Compliance, May 2007, at the “Symposium on Export Controls.” The presentation is available on the Federal Demonstration Partnership Web site at www.thefdp.org/exp_controls_presentations.html.
Be proactive, not reactive
Conduct training regularly
Report violations promptly
Have senior-level management support — a must

Be sure your program allows you to …
Screen for proscribed countries/ineligible parties
Review for restrictions in contracts/subcontracts
Monitor publications that may rely on or include restricted data
Review staffing and participation of foreign person employees and students
Monitor international and local visitors to discuss projects that may contain or disclose restricted technical data
Validate exemption or license criteria satisfied
Review hardware and technical data (including instruments) needed to be used in order to obtain desired fundamental research results
Maintain physical and IT security
Monitor “defense services” to remain within scope of license or exemption

Final thoughts …
Again, be proactive, not reactive.
Maximize training opportunities.
Don’t hesitate to seek government guidance.
13430.2  Deemed Exports and the EAR

AIS editors

Transferring or providing access to technology controlled under the Export Administration Regulations (EAR) to a foreign person even while in the United States is “deemed” to be an export (to the foreign national’s country of origin) (see ¶3405.3). The EAR are implemented by the Department of Commerce’s Bureau of Industry and Security (BIS). To comply with the deemed export requirement, it is important that research administrators understand exactly who is a foreign national. A review of the definition follows.

Under the EAR, when a foreign person needs access to controlled information, the criteria for determining whether a license is needed for such “deemed export” is much the same as if a physical export of a piece of controlled equipment would be exported to that person’s country of origin. (For a discussion of export licensing, see ¶3405.7.)

According to BIS,¹ any foreign national is subject to the “deemed export” rule except a foreign national who

1. is granted permanent residence, as demonstrated by the issuance of a permanent resident visa (i.e., “Green Card”); or

2. is granted U.S. citizenship; or

3. is granted status as a “protected person” under 8 U.S.C. 1324b(a)(3).

It is BIS policy to recognize an individual’s most recent country of citizenship or permanent residency as his or her home country for licensing purposes and BIS offers the following examples:

◆ In the case of dual citizenship: If an individual is a citizen of China, but most recently became a Canadian citizen, then under the BIS deemed export licensing policy, BIS would recognize this individual as a Canadian for licensing purposes. In this example, export control licensing requirements for Canada would apply to this individual.

◆ When citizenship and permanent residency differ: If an individual is a citizen of India, but has obtained permanent residency in the United Kingdom (U.K.), then this individual would be recognized as a U.K. permanent resident for licensing purposes. In this example, that means that this individual would be required to obtain a license only for technology which is export controlled to the United Kingdom.

If this same Indian foreign national traveled to visit facilities in a third country, say Germany, the Indian national’s U.K. permanent residency status still drives the licensing requirements and releases of technology to him or her would be considered as transfers to the United Kingdom.

---

¹ This information is excerpted from material available at www.bis.doc.gov/deemedexports/deemedexportsfaqs.html and www.bis.doc.gov/DeemedExports/DeemedExportsSupplementQA.html.
Even if that same Indian foreign national comes to the United States, as long as the Indian foreign national maintains his or her permanent residency status in the United Kingdom, transfers of technology to that individual would be deemed as transfers to the United Kingdom.

◆ **When citizenship or residency cannot be determined:** If an institution is uncertain which country of origin should be used for deemed export license purposes, the exporter should contact BIS for further guidance and resolution (see below).

Institutions are reminded that although the deemed export rule may be “triggered” by the presence of a foreign national, this does not necessarily mean that an export license is required. Also to be considered is whether the technology is controlled under the EAR (see ¶3405.4).

**Resources**

Research administrators are reminded that the BIS Web site includes a variety of regulatory information, including the EAR regulations, the Commerce Control List, etc. (see Figure 4, page 3405:16), as well as an assortment of FAQs and export guides.

BIS provides two additional methods of assisting research administrators understand the basics of export controls:

◆ **Seminars:** Attendance at an export controls seminar may be a good place to start to learn about export licensing requirements and the Export Administration Regulations (EAR). A list of seminars is posted on the BIS Web site at www.bis.doc.gov/SeminarsAndTraining/webinars.htm, and you can register to

---

**Worth Noting**

“This today’s guilty verdict should serve as a warning to anyone who knowingly discloses restricted U.S. military data to foreign nationals,” said Patrick Rowan, Acting Assistant Attorney General for National Security. This statement appeared in a press release issued by the Justice Department after a federal jury convicted a professor emeritus of the University of Tennessee of conspiring with a Knoxville, Tenn., technology company to unlawfully export fifteen different “defense articles” to a citizen of the People’s Republic of China in violation of the Arms Export Control Act. This law prohibits the export of defense-related materials, including technical data, to a foreign national or a foreign nation. The illegal exports related to technical data and information developed through a U.S. Air Force research and development contract. Link: http://knoxville.fbi.gov/dojpressrel/2008/kxillegalexports090308.htm.

---

**Reminder**

If it is determined that a license is required because the technology does not qualify for treatment under EAR99 (EAR99 technology generally does not require a license) and no license exception is available, you must apply for an export license under the “deemed export” rule when both of the following conditions are met: (1) you intend to transfer controlled technologies to foreign nationals in the United States; and (2) transfer of the same technology to the foreign national’s home country would require an export license.
receive email notifications of upcoming seminars (at www.bis.doc.gov/Forms/NotificationForm.htm).

◆ Counseling: BIS export counselors can be contacted by phone at (202) 482-4811 (Washington, DC) or (408) 291-4212 (Northern California) or (949) 660-0144 (Southern California); e-mail them in Washington (www.bis.doc.gov/Forms/AskaCounselor.html) or California (www.bis.doc.gov/Forms/biswestinquiry.html).

Deemed Export Advisory Committee

The Deemed Export Advisory Committee (DEAC) is a federal advisory committee established in 2006 to conduct a comprehensive, “top-down” review of deemed export policy and deliver a set of recommendations. The DEAC consisted of 12 business and academic leaders. The DEAC held quarterly open meetings in 2007 and solicited input from stakeholders.

Final Report. The DEAC released its final report in late December 2007 (http://tac.bis.doc.gov/2007/deacreport.pdf). In it, the committee recommends an overhaul in the U.S. approach to deemed export controls. The transmittal letter accompanying the report states:

It is the Committee’s principal conclusion that the existing Deemed Export Regulatory Regime no longer effectively serves its intended purpose and should be replaced with an approach that better reflects the realities of today’s national security needs and global economy. The obsolescence of the current regime has been brought about by profound developments in science and technology, the free-flow of massive amounts of information, the mobility of the world’s populace, the burgeoning economies of other nations, and the change in the character of threats to America’s security.

Contained herein is a proposed approach to the management of Deemed Exports that the Committee believes is better suited to America’s needs in the Twenty-First Century.

BIS Proposed Rulemaking. It is too soon to know whether the DEAC report will bring any real changes in export control policy. However, the Bureau of Industry and Security (BIS) has recently closed an extended period for public comments on two Deemed Export Advisory Committee recommendations. BIS published a notice in the May 19 Federal Register seeking input on (1) whether the scope of technologies on the Commerce Control List subject to deemed export licensing requirements should be narrowed, and if so, which technologies should be subject to the requirements, and (2) whether a more comprehensive set of criteria should be used to assess country affiliation for foreign nationals with respect to deemed exports.

BIS Listserv

The BIS has an “Email Notification Service” that provides updates about regulatory changes and export training seminars. Link to sign up: www.bis.doc.gov/forms/emailnotification.htm.
Guidelines for a Compliance Program

The Directorate of Defense Trade Controls has developed a set of guidelines to assist organizations create and implement internal export control compliance programs for DDTC-regulated requirements (under the Arms Export Control Act and the International Traffic in Arms Regulations). Although technically written for commercial organizations, the guidelines may be of help to a research administrator in reviewing or developing an export compliance program for its college or university. They are included at Figure 3430.3-1.

Figure 3430.3-1 Compliance Program Guidelines

Comprehensive operational compliance programs include manuals that articulate the processes to be followed in implementing the company [Institutional] program. Important elements of effective manuals and programs include:

Organization Structure
◆ Organizational charts.
◆ Description (and flow charts, if appropriate) of company’s defense trade functions.
◆ Description of any management and control structures for implementing and tracking compliance with U.S. export controls (including names, titles, and principal responsibilities of key officers).

Corporate [Institutional] Commitment and Policy
◆ Directive by senior company management to comply with Arms Export Control Act (AECA) and the International Traffic in Arms Regulations (ITAR).
◆ Knowledge and understanding of when and how the AECA and ITAR affect the company with ITAR controlled items/technical data.
◆ Knowledge of corporate [institutional] internal controls that have been established and implemented to ensure compliance with the AECA and ITAR.

Examples of detail:
◆ Citation of basic authorities (AECA, ITAR).

Figure 3430.3-1, continued

- Identification of authorized U.S. Government control body (Directorate of Defense Trade Controls or DDTC).
- Corporate [institutional] policy to comply fully with all applicable U.S. export control laws and regulations.
- Compliance as a matter for top management attention that needs adequate resources.
- Identification, duties, and authority of key persons (senior executives, empowered officials) for day-to-day export/import operations and compliance oversight.
- Corporate [institutional] export administration organization chart.
- Operating division export administration flow chart.

Identification, Receipt and Tracking of ITAR Controlled Items/Technical Data

Methodology used, specifically tailored to corporate [institutional] structure, organization, and functions, to identify and account for ITAR controlled items/technical data the company handles (trace processing steps of ITAR controlled transactions from the time the company manufactures/receives the item to the time an item is shipped from the company – or in the case of a defense service, when provided).

Examples of questions to be addressed:

- Are appropriate employees familiar with the AECA and ITAR and related requirements, including handling export approvals with certain provisos and limitations?
- Are company [institutional] employees notified of changes in U.S. export control restrictions, and are they provided accurate, reliable interpretation of U.S. export control restrictions?
- What U.S. origin defense articles are manufactured/received by the firm and from whom? How identified and “tagged”?
- What U.S. origin technical data related to defense articles are produced/received by the firm and from whom? How identified and “tagged”?
- What items are manufactured by the firm using U.S. origin technical data? How identified and “tagged”?
- What items or articles are manufactured by the firm that incorporates U.S. origin defense articles (components)? How identified and “tagged”?
- What kind of recordkeeping system does the company maintain that would allow for control of, and for retrieval of information on, U.S. origin technical data and/or defense articles exported to the company?

Re-Exports/Retransfers

Procedures utilized to (a) obtain written State Department approval prior to the retransfer to a party not included in a State Department authorization of an item/technical data transferred or exported originally to the company, and (b) track the re-export or re-transfer (including placing parties on notice that the proposed transfers involve US origin products and labeling such products appropriately).

continued
Figure 3430.3-1, continued

- Procedure when an ITAR controlled item/technical data is transferred by the company to a foreign national employed at the company.
- Procedure when an ITAR controlled item/technical data is transferred by the company to a foreign person within the U.S.
- Procedure when ITAR controlled technical data or defense articles are transferred from the company to a foreign person outside of the U.S.
- Procedure when an ITAR controlled item/technical data is to be used or transferred for an end-use not included in the State Department authorization.

Restricted/Prohibited Exports and Transfers

- Procedure for screening customers, carriers, and countries.
- Screening procedure for high-risk transactions to combat illegal exports/retransfers.
- Procedures to investigate any evidence of diversion or unauthorized use of U.S. origin products.

Recordkeeping

- Description of record systems concerning U.S. origin products.
- Procedures for maintaining records relating to U.S. origin products for five years from the expiration of the State Department license or other approval.
- Regular internal review of files to ensure proper practices and procedures by persons reporting to top management.
- Perform audits periodically to ensure integrity of compliance program.
- Emphasis on validation of full export compliance, including adherence to license and other approval conditions.
- Measurement of effectiveness of day-to-day operations.
- Adopt procedure for highlighting any compliance areas that needs more attention.
- Report known or suspected violations to corporate [institutional] export administration office.
- Effective liaison and coordination with ombudsman.

Examples of detail:

- Specific description of procedures (examination of organizational structure, reporting relationships, and individuals assigned to export/import controls process.
- Random document review and tracing of processes.
- Review of internal recordkeeping, communications, document transfer, maintenance and retention.
- Conclusion and report of violations to corporate [institutional] export administrator.
- Coordination with ombudsman.

continued
Figure 3430.3-1, continued

Training
◆ Explanation of company training program on U. S. export control laws and regulations.
◆ Process to ensure education, training, and provision of guidance to all employees involved on exports (including those in departments such as Traffic, Marketing, Contracts, Security, Legal, Public Relations, Engineering, Executive Office).

Violations and Penalties
◆ Procedures for notification of potential violations, including use of voluntary disclosure and Ombudsman to report any violation of the company’s internal control program or U.S. export controls.
◆ Emphasis on importance of compliance (to avoid jeopardizing corporate [institutional] business and severe sanctions against the corporation [institutional] and responsible individuals).
◆ Description of AECA/ITAR penalties.
◆ Written statements and procedures to foster employee discipline (e.g., keying certain types of advancement to compliance understanding and implementation, and establishment of internal disciplinary measures).
¶3430.4 Export Controls Program Technical Assistance

AIS editors

The following are the nine key elements identified by the Bureau of Industry and Security (BIS) for any effective compliance program for an exporter of U.S.-origin dual-use items. The following elements provide a foundation for the basic structure of an export management and compliance program (EMCP), according to BIS, but they do not constitute an exhaustive list:

- Management commitment
- Continuous risk assessment of the export program
- Formal written EMCP
- Ongoing compliance training and awareness
- Export compliance security and screening throughout the export life-cycle
- Adherence to recordkeeping regulatory requirements
- Compliance monitoring and periodic audits/assessments
- Internal program for handling compliance problems, including reporting and escalating export violations
- Completing appropriate corrective actions in response to export violations

Implementing an EMCP is voluntary. According to BIS in its publication, Compliance Guidelines: How to Develop an Effective Export Management and Compliance Program and Manual (www.bis.doc.gov/complianceandenforcement/emcp_guidelines.pdf), the major benefit of implementing an effective EMCP is that it can “minimize the risk of noncompliance with export regulations and can be considered a mitigating factor, with great weight, in determining administrative penalties in case of an export violation.”

Characteristics of an EMCP

According to BIS, an export management and compliance program answers …

… your export control policies and procedures are to be implemented.

Benefits of a Compliance Program

BIS further presents the following as “benefits” of an EMCP:

- Reinforce senior management commitment to compliance with U.S. export laws and regulations to all parties within the institution.
- Provide management structure and organization for the processing of export transactions.
◆ Enhance accountability for export control tasks by identifying who is responsible for performing each part of the process and who is responsible for overall effectiveness of the EMCP.

◆ Provide compliance safeguards throughout a company’s supply chain to ensure order processing due diligence checks and screenings produce consistent export decisions.

◆ Provide written instructions for employees to blend into their daily responsibilities to “screen” export transactions against general prohibitions of exports, re-exports, and selected transfers to certain end-uses and end-users.

◆ Serve as a vehicle to communicate red flag indicators that raise questions about the legitimacy of a customer or transaction.

◆ Provide personnel with tools to help them ensure they are performing their export control functions accurately and consistently in all nine of the key elements.

◆ Identify transactions that could normally be exported without a license, but because of the end-use or end-user, require a license.

◆ Streamline the process and reduce time spent on compliance activities when employees have written instructions, tools and on-going training.

◆ Protect employees through training and awareness programs from inadvertently violating the EAR.

Seminars and Online Training

BIS also offers a variety of export compliance seminars and training at www.bis.doc.gov/seminarsandtraining/elsem.htm. Be sure to consult this site for details, especially on subjects covered by the program. BIS also offers a variety of online training modules and videos at www.bis.doc.gov/seminarsandtraining/seminar-training.htm.
Strategic Due Diligence: The Export Control Management and Compliance Program

M. Robin Witherspoon, The University of Tennessee at Knoxville

When I implemented our Export Control Management and Compliance Program at the University of Tennessee, Knoxville, six years ago, we were among the few U.S. universities with an established Export Control compliance program in place. However, in the last five years, research universities have been especially impacted by an even closer scrutiny of research activities and increasingly aggressive enforcement of export controls by U.S. government agencies.

Failure to comply with U.S. export controls can result in severe civil and criminal penalties (which can be assessed against both the institution and/or chargeable individuals). In addition to serious administrative, civil, and criminal consequences for violations of the export control laws, penalties may include the denial of research funding by federal agencies and negative publicity for the institution. Although many research institutions have now developed export control compliance programs, the challenge remains for other colleges and universities to establish strong programs that will not only guide and educate the institutions, but also manage export-related decisions and transactions to ensure compliance (May and MacNally, 2010).

What Are the Elements of a Good Export Control Compliance Program?

1. Senior Management Commitment: Securing the commitment of institutional leadership is critical by providing a cogent, high-level briefing on potential exposure and enforcement penalties. Focus on what export control issues and procedures are particularly relevant, the level of risk, how to manage compliance proactively, and internal resources (Commerce, 2010).

2. Centralize Export Control Compliance: Designate a centralized Export Control compliance officer tasked with the development of a compliance plan that ensures application of a uniform policy. It is important that this person have a good general knowledge of the three regulatory bodies of law: ITAR, EAR and OFAC and have experience communicating with all levels of faculty, staff, and government officials.

3. Export Control Risk Assessment: A high-level export risk assessment and resulting report enables the Export Control Officer to:
   - Methodically evaluate key points of exposure throughout the university,
   - Develop the level of procedural safeguards appropriate to the circumstances, and
   - Make recommendations for best practices to upper management.

---

1 This article is reprinted from the NCURA Magazine, Vol. XLII, No. 7, December 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
4. Written Manual: A manual of policies and procedures with a sufficient level of operational detail to ensure effective implementation and day-to-day compliance.

5. Ongoing Campus-wide Compliance Training and Awareness:
   - Emphasize what faculty and staff can know without being export experts:
     ~ How to qualify for exclusions
     ~ When to get advice from the central office
     ~ The risks and penalties of noncompliance
   - Tailor presentations to departments.

6. A Dedicated Web Site: The site should include general export control information, a short summary of the regulations, controlled technologies and sanctioned countries. On our website, we’ve included a Decision Tree, special sections for faculty and staff; and online training will be offered this year.

   The purpose of an Export Management Compliance Program is to ensure that the right export decisions are consistently being made, that employees know their export control responsibilities, that the right procedures are being followed, and that the right questions are being asked (May and MacNally, 2010). The existence of an effective internal compliance program not only is a factor in preventing export violations, but also enables university staff to identify potential problems and take the necessary remedial action. In addition, internal compliance programs may also serve as a great mitigating factor when violations do occur. In view of the potentially severe consequences of export noncompliance, it is critical that U.S. institutions of higher education that do not have an export control compliance program closely examine their possible vulnerabilities and consider implementing export control compliance policies and procedures.

About the Author

Robin Witherspoon is the Export Control Officer and Facility Security Officer at The University of Tennessee at Knoxville. She holds a Bachelor of Arts in English and a Master’s degree in Education from the University of Tennessee. Ms. Witherspoon has been with the University for eleven years. Prior to joining UT, she served as a Paralegal in law firms in North Carolina and Tennessee. As Export Control Officer, Ms. Witherspoon implemented the first export control compliance program at UT, is the point of contact for all export control issues, and is a delegated empowered official.
Controlled Unclassified Information: An Emerging Problem

David Brady, Virginia Polytechnic Institute and State University (Virginia Tech)

Introduction

In 2008, the President of the United States introduced a new term of art for United States Government use: “Controlled Unclassified Information” (CUI). Ostensibly arising from the government’s interest in controlling classified and unclassified information related to combating global terrorism, under the aegis of several subsequent Presidential Memoranda, the executive branch of the federal government is now taking steps to implement a standardized framework for controlling unclassified information across all federal agencies. Proposed changes would extend government-wide controls on information beyond those statutorily authorized requirements to protect “national security”, and would restrict information pertinent to the national interests or policy of the United States or to the important interests of entities outside the Federal Government. The risk for the proliferation of CUI’s restricting university research is profound and likely to grow.

What is Controlled Unclassified Information?

Government control on unclassified information is not new. Over many decades, the federal government has controlled unclassified information in many disparate ways, under the umbrella headings of Sensitive Information and Sensitive But Unclassified (SBU) Information, among others (Figure 3430.6-1). However, as defined in the President’s May 7, 2008 Memorandum Designation and Sharing of Controlled Unclassified Information (CUI):

“Controlled Unclassified Information” is a categorical designation that refers to unclassified information that does not meet the standards for National Security Classification under Executive Order 12958, as amended, but is (i) pertinent to the national interests of the United States or to the important interests of entities outside the Federal Government, and (ii) under law or policy requires protection from unauthorized disclosure, special handling safeguards, or prescribed limits on exchange or dissemination. Henceforth, the designation CUI replaces “Sensitive But Unclassified” (SBU).

Since 2008, the process for developing a government wide framework and standard for CUI has continued under the current administration. The target for implementation of the CUI framework is 2013. In his May 29, 2009, Memorandum on Classified Information and Controlled Unclassified Information, President Obama called for the establishment of an Interagency Task Force on CUI, which formed and met in 2009 and distributed its Report and Recommendations of the President’s Task Force on Controlled Unclassified Information in December, 2009. Outside of the Federation of American Scientists, no organization related to higher education was con-
sulted by the Task Force.

The Report identified 107 distinct SBU regimes currently in use by federal agencies, and 117 distinct existing SBU markings. In the interest of standardizing application of CUI throughout the federal government, the Task Force, recommended a revised definition: “All unclassified information for which, pursuant to statute, regulation, or departmental or agency policy, there is a compelling requirement for safeguarding and/or dissemination controls.” (Task Force, 2009)

The Task Force also called for a Presidential moratorium on definition or development of new SBU categories outside of the CUI Framework, which at the time of this article has not been enacted. In the absence of a moratorium, at least one new sweeping category of SBU—“DoD Information,” has been defined in an Advanced Notice of Proposed Rulemaking by the Department of Defense (DFAR, 2010).

Protected Critical Infrastructure Information (PCII) – a CUI Case Study

Though the origins and purposes of CUI vary widely by agency, some categories of information are authorized by statute for control. Setting aside the better known export control regimes of Export Administration Regulation (EAR), International Traffic in Arms Regulations (ITAR), and Export and Import of Nuclear Equipment and Materials Regulations, there are at least seven other regimes of CUI with statutory designation.

Many colleges and universities have already encountered three of these regimes of controlled unclassified information,1 established in the wake of 9/11, which have potential for government-imposed civil and criminal penalties for misuse of their information, including:

Protected Critical Infrastructure Information (PCII), under the jurisdiction of the Department of Homeland Security (DHS), Critical Energy Infrastructure Information (CEII), under the jurisdiction of the Federal Energy Regulatory Commission (FERC), and Sensitive Security Information (SSI) under joint regulation by the Transportation Security Administration (TSA) and Department of Transportation (DOT).

Rules for access, control, and dissemination of CUI under these regimes are not standardized. The most rigorously controlled of these regimes appears to be Homeland Security’s PCII. The PCII control regime is illustrative of the extent to which the federal government can now procedurally restrict unclassified information. PCI Information includes information regarding the security of critical infrastructure and protected systems, analysis, warning, interdependency study, recovery, reconstitution, or other informational purpose. PCI includes information generated by nonfederal agencies (e.g., municipalities, power and communication utilities, computer and internet companies, and energy distribution systems). Some examples of PCI might include gas pipeline roving security schedules, and power grid safety device or critical internet node locations. This information becomes PCI only when designated by DHS.

It is worth reviewing the extent to which DHS has developed procedures for controlling PCI in some detail, as the President’s Task Force was “impressed” with
the DHS guidelines for PCII control, and further opined that the PCII safeguarding standards “can be achieved with reasonable and appropriate efforts by non-federal partners” - e.g., colleges and universities. PCII controls may well become the government’s model for securing more types of CUI in the future.

From the perspective of an institution of higher education, the formalization of control on access and dissemination of information required in the PCII Procedures Manual is eye-opening, to say the least. There is more than a passing similarity to controls required for information classified for national security (Confidential, Secret, and Top Secret) under the National Security Policy Operating Manual (NI-SPOM). Yet, this DHS PCII manual represents the agency-authorized controls for unclassified information.

To bring PCII to your campus, your institution or state must first be accredited with DHS to have access to PCII, and must have a designated PCII Coordinator. FBI background checks are required for employees and nonemployees (e.g., students) with access to such information. Nondisclosure agreements, with terms objectionable to many universities, are required. Government training is mandatory for anyone with access to PCII.

Document marking and control procedures imitate regulations governing classified material requirements for packaging (double wrapping required), coversheets, and rules governing derivative marking, and document marking requirements-the latter with portion (paragraph by paragraph) marking of any document containing PCII. There are document destruction procedures, and requirements to report lost or misuse to the federal government.

Even universities well versed in dealing with export restricted information may find the procedural requirements of PCII to be challenging and administratively burdensome. The other post 9/11 security regimes of CUI, CEII and SSI, do not have the same level of procedural security restrictions (yet). CEII is controlled
through a web of FERC orders, issued in no apparent order.

TSA’s SSI is reportedly controlled through DHS Instruction for Safeguarding and control IAW DHS MD 2810.1 SSI Program and the TSA SSI Policy and Procedure Manual; however, the TSA SSI Manual does not appear to be published yet.

**CUI and University Research**

Academic researchers have already encountered PCII, CEII, and SSI in their sponsored research activities. The Department of Homeland Security issues block grants to state homeland security departments and some of these monies are being used to fund research at colleges and universities. Power utilities have been restricting information relating to their facilities since 2002. DHS and TSA have been restricting their information since 2004. As the framework for CUI continues to be developed by the executive branch of the government, and applied across more federal agencies, more government furnished unclassified information will be controlled, at worst case for universities, using procedures patterned along the lines of DHS’ PCII Manual.

Research Administrators will find CUI terms and conditions creeping into many different research instruments, including memoranda of understanding, nondisclosure agreements, grants, cooperative agreements, and contracts. Some interdepartmental coordination will likely to be necessary to accommodate the more sophisticated controls required by federal agencies such as DHS (e.g., research compliance, sponsored programs, and academic units). When accepting CUI, each institution should develop a clear understanding of the administrative burden associated with security restrictions required for custody of the information, and how those responsibilities are allocated among academic and administrative units. Faculty will need to understand the effect CUI can have on peer review, publishing, and student participation, particularly those projects involving CUI in thesis research. As the federal government continues down its path to develop a CUI framework across all executive agencies, the problem of Controlled Unclassified Information will be a growing one for higher education, and one that is unlikely to go away.

About the Author

David Brady is the Director of the Office of Export and Secure Research Compliance at Virginia Polytechnic Institute and State University (Virginia Tech). David is the university’s Empowered Official and is responsible for ensuring university-wide export and trade sanctions compliance in both classified and unclassified research at the university. He has also served as Virginia Tech’s senior contract negotiator for the Office of Sponsored Programs. David is a graduate of the United States Naval Academy, a former Navy nuclear propulsion engineer and consultant to DARPA on advanced submarine technologies. He is the past chair of the Association of University Export Control Officers (AUECO).
Understanding U.S. Sanctions Regulations in the University Setting

Jessa Albertson, University of Oklahoma

As universities continue to expand their global presence and operate in an international setting, it is important for the higher education community to be aware of economic sanctions administered by the U.S. Treasury Department’s Office of Foreign Assets Control (OFAC). Sanctions regulate transactions involving targeted individuals, property, and governments and can impact a much wider scope of academic activity beyond the traditional export control focus on sponsored research. Regulated transactions can include imports, exports, financial transactions, investments, donations, and services of value involving targeted property or governments. In contrast to the Export Administration Regulations (EAR) and the International Traffic in Arms Regulations (ITAR) (whose applicability depends largely upon items and technologies involved), it is possible to encounter activity subject to sanctions while conducting a wide range of common university activities, including those regularly exempted as “educational information” (EAR § 734.9) or “fundamental research.” (EAR § 734.8) This article is intended to be a brief introduction of how the Foreign Assets Control Regulations (FACR) administered by OFAC apply to university activity.

Targeted People, Property, and Governments

OFAC administers sanctions programs that target foreign governments, individuals, and practices. The majority of these programs are regime or list-based, meaning that the targets can be found on a list or fit a certain criteria such as Specially Designated Nationals (SDNs). Screening transactions for restricted parties can be an efficient way to reduce your institution’s risk of violating list-based sanctions.

In addition to regime and list-based sanctions programs, OFAC administers comprehensive sanctions against Cuba, Iran, and Sudan. Comprehensive sanctions are the most stringent programs and contain broad prohibitions and narrow licensing opportunities. Prohibitions, exemptions, and licensing policies vary from program to program. However, there are general consistencies among the programs that can lead to a greater understanding of the regulations.

Prohibitions

As one might assume, physical exports to sanctioned countries are heavily regulated and a license is generally required (FACR §§ 515.201, 560.204, 538.205). OFAC and BIS may share licensing responsibility for physical exports and depending on the country; a license may be required from BIS, OFAC, or in the case of Sudan, both. OFAC licenses all exports, including EAR99 items while BIS licenses items that are found on the Commerce Control List (CCL); therefore, proposed exports may need authorization from both BIS and OFAC.

The restrictions on physical exports also regulate the exportation of services to...
Cuba, Iran, and Sudan and the exportation of financial services to Burma (Myanmar) (FACR § 537.202). A professor’s giving a guest lecture at a university in Tehran, a faculty member’s corresponding via e-mail with a student located in Cuba regarding a recent publication, or a department’s providing distance learning services to a student located in southern Sudan may be considered “services of value” and prohibited without a license. Even though these activities would fit the definitions of “educational information,” or “fundamental research” found in other export control regulations, the services associated with them is beyond the “information and information materials” (FACR §§ 515.206(a), 560.210(a), 538.212(c)) exemption in FACR comprehensive sanctions and would be prohibited without authorization.

Comprehensive sanctions programs also regulate imports. OFAC prohibits the importation of Burmese-origin goods (FACR, § 537.203) and the importation of goods and services from Cuba, Iran, and Sudan (FACR, §§ 515.201 & 204, 560.201, 538.204). In general, OFAC regulations do not apply to individuals from sanctioned countries who are located in the U.S. on valid visas and are engaging in activities for which their visas were issued (FACR, §§ 515.571(a)(5), 560.505, 538.312(c)). The Iranian Transaction Regulations stipulate that immigrant visa categories and individuals who qualify for E-2, H, and L visas and are authorized to engage in activities for which their visas were granted as long as they are not agents, employees, or contractors of the Government of Iran or a business entity or other organization in Iran (FACR, § 560.505(c)). Now that many universities have instituted review processes to comply with the recent required export control certification on Form I-129 for H-1B, H-1B1, L-1, or O1A petitioners, it is easier to screen for this issue.

A prohibition that is unique to Cuba is the extensive ban on engaging in transactions in which Cuba or a Cuban national has interest (FACR, § 515.201). One result of this broad prohibition is that travel to Cuba is prohibited without a license, even if the travel is paid for by a third-country national or entity. However, several categories of academic travel are authorized pursuant to general licenses (FACR, §§ 515.564, 565). Recent regulatory changes allow for more educational travel pursuant to either a general or specific license (CACR).

**Exempt Transactions**

Exemptions contained in comprehensive sanctions programs differ from those contained in the EAR and the ITAR. “Fundamental research” and “educational information” are concepts not found in sanctions exemptions. Instead, categories of activities such as personal communications, humanitarian donations, and information and informational materials are exempt from regulations (FACR, §§ 515.206, 560.210, 538.212). The information and informational materials exemption is not as encompassing as may be expected. Only information and informational materials (books, films, etc.) that are “fully created and in existence” at the time of the transactions are exempted. This caveat precludes revisions, collaboration, and co-authorship related transactions with individuals located in the comprehensively sanctioned countries of Cuba, Iran, and Sudan. Transactions not included in the exemption may be authorized pursuant to a general license discussed in more detail.
later in this article.

The Sudanese Sanctions Regulations contain a provision exempting certain areas of Sudan, referred to as Specified Areas of Sudan or SAS, from most prohibitions. In general, imports from, and exports to the SAS are not prohibited. However, the transshipment of goods or financial services through the SAS, transactions involving blocked property and transactions involving the petroleum or petrochemical industries in Sudan are prohibited regardless of whether or not they occur in the SAS (FACR, § 538.212(g)). It is also important to remember that the SAS exemption is unique to OFAC regulations and is not applicable to BIS regulations. Thus, any physical export to Sudan, regardless of whether the destination is in a SAS, requires approval from BIS or must qualify for one of the few BIS license exceptions available for Sudan.

In addition to the exemptions above, transactions incident to travel are exempted from regulation—except in the case of Cuba. This includes accompanied baggage for personal use, payment of living expenses in-country, and purchasing goods or services for personal use in-country (FACR, §§ 560.210(d), 538.212(d)). Personnel traveling to sanctioned countries with university equipment should be aware that the commonly relied upon BIS license exception for the temporary export of “tools of the trade” are limited (EAR, § 740.9), or in the case Iran not available at all (EAR, § 746.7(c)).

**Licenses and Country-Specific Provisions**

One constant throughout OFAC’s regulations is the concept of two license types: general licenses and specific licenses. A general license is blanket authorization for an otherwise prohibited transaction if certain criteria are met. The applicability of the general license is self-determined, meaning no official written authorization or other involvement from OFAC is required (FACR, § 501.801(a)). Several general licenses are particularly useful to universities and will be covered in more detail later in this article. A specific license is official written authorization from OFAC to engage in a regulated activity. A written application and subsequent approval are required (FACR, § 501.801(b)). Each sanctions program identifies several specific licenses that OFAC will consider.

Several categories of travel-related transactions involving Cuba and academic institutions are authorized pursuant to general licenses. If travel to Cuba is authorized by a general license or by a specific license, then transportation-related transactions and transactions incident to living expenses are also authorized (FACR, § 515.560(c)). One general license is for professional research and professional meetings in Cuba (FACR, § 515.564(a)(1)). To qualify for this general license, the traveler must be a full-time research professional who will be conducting professional research in his or her professional area. The research must be academic with a “substantial likelihood” of being published. The research must encompass a full work schedule and cannot include any tourist activities.

Another general license authorizes travel transactions that are directly related to professional meetings that are organized by an international professional organiza-
tion. To qualify, the sponsoring organization cannot be headquartered in the U.S.
unless the organization has received a specific license from OFAC to host the meet-
ing. The purpose of the meeting cannot be the promotion of tourism to Cuba, or to
encourage production of biotechnical products (FACR, § 515.564(a)(2)).

Since January, university faculty, staff and students have been able to engage in
the following transactions pursuant to a general license:

- Activities related to an educational program (sponsored by the American
  institution or a formal course of study at a Cuban academic institution) in
  Cuba as long as the coursework will be accepted for credit towards the trav-
eler’s degree
- Graduate student academic research related to Cuba
- Teaching sponsored by the home institution to teach at a Cuban academic
  institution, as long as the teaching assignment lasts 10 weeks or longer
- Sponsoring a Cuban scholar to teach or conduct research.

Travelers must carry a letter from the sponsoring institution attesting to the
applicability of the general license and signed by a “designated representative of
the sponsoring U.S. academic institution” which is defined as “a person designated
by the relevant dean or the academic vice-president, provost, or president of the
institution as the official responsible for overseeing the institution’s Cuba travel
program” (FACR, § 515.565(d)). Adjunct professors and part-time staff are eligible
for the general licenses, and students may be sponsored by an academic institution
other than their own to engage in academic activities in Cuba.

Once authorized to travel to Cuba, travelers must make reservations through
a Travel Service Provider (TSP) that has been authorized by OFAC to make such
arrangements. The TSP will require certification that a general license applies or, if
required, a copy of the specific license.

Perhaps most helpful for universities is the general license authorizing activities
related to publishing. It authorizes transactions “necessary and ordinarily incident
to” the publishing process, including collaboration, editing, and augmenting pub-
lications with graphics, explanatory texts, or translations that are not exempted as
information and informational materials. The general license does not authorize any
physical exports, the involvement of the Governments of Burma (Myanmar), Cuba,
Iran, or Sudan or any other transaction that is not necessary and ordinarily associ-
ated with publishing and marketing activities (FACR, §§ 537.526, 515.577, 560.538,
538.529).

As a result of the Iranian civil protests of June 2009, OFAC implemented a
general license authorizing the exportation of services to promote the exchange
of personal communications over the internet such as instant messaging, e-mail,
social networking, and blogging. Services must be free and publically available
and software must be EAR99, Mass Market 5D992, or not subject to the EAR. The
general license does not authorize any exports to the Governments of Cuba, Iran, or
Sudan and does not authorize commercial web-hosting (FACR, §§ 515.578, 560.540,
538.533). Universities that conduct U.S. Government-sponsored research or other
activities in Sudan may find that their work is authorized via a general license that authorizes official activities of the U.S. Government and their contractors or grantees (FACR, § 538.531).

OFAC identifies several situations in which they may issue a specific license for activity that goes beyond what is covered in a general license. Most transactions incident to a licensed transaction (general or specific) are authorized (FACR, §§ 560.405, 538.405). Cuba, in particular, has several specific licenses available that are helpful to universities. Specific licenses may be authorized for the importation of research samples from Cuba (FACR, § 515.547). Travel-related transactions not covered by a general license may be available pursuant a specific license. For example, specific licenses may be authorized for multiple trips to Cuba by a research professional (FACR, § 515.564(b)), educational exchanges not involving academic coursework toward a degree, or sponsorship of academic meetings related to Cuba (FACR, § 515.565(b)(2) and (3)).

Applying for a license from OFAC is less formalized than other export licensing agencies. An exception is travel to Cuba pursuant to a general license or specific license. Guidance and forms relating to Cuban travel can be found on OFAC’s website (OFAC). For most other license applications relevant information may be supplied in letter format (FACR, § 501.801(b)(2)). If granted, licenses may include provisos and can be amended, modified or revoked by OFAC at any time (FACR, § 501.803). Regardless of whether or not an activity required a license (general or specific), complete records must be kept for a period of five years after the date of any transaction subject to sanctions regulations (FACR, § 501.601).

Assessing Risk
Identifying activities subject to sanctions regulations can be a challenge in the university setting because the transactions may not get flagged in the same way that other export control issues do. For example, the transaction may not be an export and it may not be tied to a written agreement. It may even be considered fundamental research. OFAC will consider the presence and scope of an institution’s risk-based compliance program when determining a response to a potential violation (FACR, App. § 501 at III.E). Appendix A to Part 501 contains the Economic Sanctions Enforcement Guidelines and is an excellent resource for institutions developing or auditing the OFAC compliance section of their export control management systems. When developing institutional practices to address OFAC issues, it is essential to begin with identifying the institution’s most risk-prone areas. Once the risks are identified, written policies and procedures can be developed to address the issues.

Conclusion
The information contained in this article is intended to be a brief overview of the mechanics of economic sanctions and to identify regulatory requirements, exemptions, and authorizations that are relevant to universities. Sanctions regulations and policies change quickly in response to world events. Every situation is unique, and there is no substitute for a thorough reading of the regulations. As universities become more global and the world becomes more connected, a comprehensive under-
standing of OFAC regulations is essential for compliance.

13430.8   **NARA Issues Final Rule on Controlled Unclassified Information**

Tina Reynolds, Morrison & Foerster LLP

A year and four months after its proposed rule, and nearly six years after the Executive Order that called for the standardization of handling requirements for Controlled Unclassified Information (CUI), the National Archives and Record Administration (NARA) issued its final rule on CUI last week (81 FR 63324, September 14, 2016).

The final rule is the outgrowth of Executive Order 13556, Controlled Unclassified Information, 75 FR 68675 (November 4, 2010). This Executive Order gave NARA the authority to “establish an open and uniform program for managing [unclassified] information that requires safeguarding or dissemination controls” to replace the ad hoc, patchwork approach used by federal agencies in the absence of uniform guidance. NARA issued a proposed rule on May 5, 2015 (80 FR 26501). We addressed the proposed rule and the maze of regulations relating to the safeguarding of non-classified government information in a previous article.

With this final rule, NARA seeks to clarify and make uniform the treatment of CUI across the federal government. In addition to specifying requirements within the final rule itself, NARA is also establishing and maintaining a CUI Registry, which will be the central repository for all guidance, policy, instructions, and information pertaining to CUI.

While the final rule directly applies only to federal agencies, the requirements indirectly extend to government contractors and grantees by virtue of the directive that agencies include the CUI protection requirements in all federal agreements that may involve CUI. A pending FAR case and anticipated forthcoming regulation will further implement this directive for federal contractors.

In accepting and rejecting comments on the proposed rule for purposes of the final rule, NARA recognized the tension between the dual federal government goals of protecting and sharing information. NARA’s revisions were designed “to more clearly explain how the different levels of CUI interact, the basis for CUI controls, what levels of controls agencies may impose,” as well as to establish rules pertaining to agency agreements, and marking, destruction, and dissemination of CUI.

After this final rule, information provided by or developed for the government falls into one of four categories, as described below:

◆ **Classified Information:** This refers to information required by Executive Order 13526, “Classified National Security Information,” or predecessor or successor orders, or the Atomic Energy Act of 1954, to be marked with a classification designation to protect it from unauthorized disclosure.

◆ **CUI Basic:** CUI is information created or possessed by or for the government for which a law, regulation, or policy requires or permits safeguarding or dissemination controls. CUI Basic is the subset of CUI for which no particular controls are specified. This final rule provides uniform handling controls to be used for CUI Basic, which requires protection at no less than a “moderate”
confidentiality standard under the Federal Information Systems Modernization Act (FISMA), 44 U.S.C. 3541, et seq. CUI Basic documents can be marked simply as “CUI” or “Controlled.”

◆ **CUI Specified**: CUI Specified is that subset of CUI for which applicable law, regulation, or policy provides specific handling controls that differ from the controls that apply to CUI Basic. Under the final rule, the specified controls are to continue to be used for this subset of CUI and the markings prescribed for these particular categories of information should continue to be used. Examples of CUI Specified information are information that is export controlled or source selection information.

◆ **Uncontrolled Unclassified Information**: All remaining information that is neither classified nor CUI. Although not controlled or classified, this information must still be handled as required by FISMA.

The final rule incorporates by reference various Federal Information Processing Standards (FIPS) and National Institute of Standards and Technology (NIST) Special Publications (SP), namely:

◆ FIPS Publication 199, Standards for Security Categorization of Federal Information and Information Systems;

◆ FIPS Publication 200, Minimum Security Requirements for Federal Information and Information Systems;

◆ NIST SP 800-53, Security and Privacy Controls for Federal Information Systems and Organizations;

◆ NIST SP 800-88, Guidelines for Media Sanitation; and

◆ NIST SP 800-171, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations.

These standards must be applied to systems that involve CUI in conjunction with the framework established by FISMA.

The final rule is effective November 14, 2016. It is not known when the proposed companion FAR clause will be released. Until that time, agencies will need to address CUI handling requirements in contracts and grants through use of their own language.

Although the final rule specifies that agencies must include in agreements directions to comply with the final rule and the CUI Registry when handling CUI, the absence of uniform agreement language at this point in time may create the same sort of confusion and inconsistency that the final rule is designed to address. We will carefully monitor release of the proposed FAR rule and any comments thereto in order to provide the most current information to our client federal contractors.

Communicating a Constructive Compliance Message

Aurali Dade, George Mason University, and Suzan DiBella, University of Nevada, Las Vegas

Presentations on export control often start with examples of serious ramifications of violations, from large institutional fines to prison time for researchers. While this tactic may serve some useful purposes, the practice creates an air of fear and a certain degree of loathing of the topic among university researchers. What can export control experts do to communicate more constructively about the topic?

If you have worked in research administration for some time, chances are that you have attended a presentation or had a discussion related to the topic of export compliance. Chances are also good that someone mentioned the word “prison” during this discussion or presentation.

It might have been part of a rhetorical question, as in, “Did you know that an export control violation could lead to prison time?” Or, the statement might have been more specific, as in, “One researcher actually went to prison for an export control violation.”

It’s quite common for presenters on the subject of export control to open training sessions with discussion of the most extreme consequences of violations. This practice may have developed, at least initially, because there was a widespread lack of awareness of new and evolving regulations in the area. There may have also been a degree of disbelief among faculty and staff that such consequences could apply to academic researchers; presenters frequently face incredulity about implementation of regulations that seemingly run counter to the mission of the research university. Given this environment, some rhetorical “scare tactics” may have previously seemed warranted to bring attention to these regulations, which have very serious institutional and individual consequences if violated.

Why Export Control Compliance Is Difficult To Discuss

Universities embrace the fundamental mission of advancing knowledge through basic research and creative activities, extending knowledge through provision of a liberal education of students that allows them to think creatively and understand broad topics, and disseminating knowledge through publication and civic engagement (Rosenstone, 2003). Within this mission are the implicit themes of openness and academic freedom. Research administrators with responsibilities for implementing compliance programs can find themselves accused of trampling on or not understanding these values. This is especially true when universities work to implement or improve export compliance programs.

Export compliance laws have received increased attention from universities over the past decade. The central goal of these laws is protect and control information and materials that are crucial to the United States for reasons of national or

---

economic security. (For a more detailed discussion of export control laws and the related risks that universities face, see Brady, Peloso, and Rowold, 2015.)

As described by Epley (2013), these laws apply not only to the transfer of information and materials out of the country, but also to the transfer of these materials to foreign nationals within the U.S. Universities enjoy specific exceptions to these controls through the fundamental research exclusion, public information exclusion, and other mechanisms. However, most universities still must have a program that brings attention to and guides compliance with export control regulations, especially with regard to sponsored projects, research teams’ travel to foreign countries, and/or the activities of visiting students and other individuals from sanctioned countries. Faculty who learn of export control restrictions for the first time may find the controls not only burdensome, but also somewhat objectionable; they may take exception to the very idea of the government having a say in what information they can share. This is where a strong communication plan is especially critical for the compliance program.

Use of Rhetorical Scare Tactics

Using scare tactics may work for grabbing attention, but, according to Walton (2000), social scientists have mixed views on their effectiveness. Appeals to fear can be powerful tools, but when the threat of fear is seen as unsubstantiated, such an appeal is considered a fallacious argument (Walton, 2000). In the context of export control training, use of this rhetorical device may negatively impact audience trust in the presenter and his/her information if audience members feel the threat is not realistic or is not applicable to them.

In all fairness to presenters using this tactic, they’re just doing what they’ve been told: In public speaking 101, students are instructed to gain audience attention in their introductions. Techniques for doing so vary, but one standard method is providing a shocking fact or statistic. The practice of opening a training session with the story about the faculty member who went to prison for export control violations certainly fits the bill; it is indeed shocking. Frankly, the thought of any university researcher being held personally responsible – and possibly even sentenced to jail time – is surprising to most people previously unaware of the regulations.

And, given the typical density and detail involved in the sea of federal regulations applicable in research, the threat of prison time seems, well, newsworthy. It’s exciting to discuss federal regulations where there are such palpable, even gritty, consequences of a violation. Reading most federal regulations, as the joke goes, is a sure-fire cure for insomnia. Export control, on the other hand, actually garners the interest of FBI agents, who regularly visit college campuses to learn about research activity with export control implications.

Yet, use of attention-grabbing headlines goes only so far in the export control training context. A well-reasoned methodical approach is a better choice, and certain basic tenets must be communicated. Most presenters discussing export compliance wish to convey the following information:

◆ These laws exist, apply to the university setting, and have serious consequences
if violated;
◆ Universities enjoy several important exceptions for work occurring on their campuses;
◆ Some grants and contracts specify controls, and, if the award is accepted, these controls must be put in place;
◆ Travel and shipping materials outside of the U.S. can trigger export controls (but there are also some exceptions); and
◆ Most importantly, researchers should contact the export compliance office with questions and for assistance.

Presentations that focus too heavily on consequences of noncompliance have the strong potential to distract and detract from the real messages presenters wish to convey. Employing a few key principles will help presenters develop a constructive approach to discussing export control.

**Key Principles for Communicating about Export Control**

**Consider your audience.** For mixed audiences with individuals unfamiliar with export control, avoid extensive discussion of extreme scenarios involving jail time. Remember that the first reaction to discussion of export control-related prison sentences will be one of alarm. Because export control issues are not relevant to most university research, many individuals will likely be relieved to learn that they will not be impacted. Others may just want to hear about the instances in which export control regulations are applicable to their research. For those with research or equipment with probable export control implications, the reaction to discussing prison sentences may be more concerned, perhaps even angry; they may react negatively to the suggestion that they could be lumped in with those who have violated the regulations.

**Prepare well-defined solutions to share.** Come prepared with examples of how to resolve export control issues. Be familiar with the areas of research of the person or persons involved in the discussion, and provide specific examples of technology and information that are controlled as well as management plans used within the discipline. Seek examples and guidance on successful solutions from colleagues at other universities if you are unfamiliar with a given area.

**Focus on support.** Make the focus of the discussion the support that your office is able to provide in this complex area. Highlight the steps you have already taken to enhance the institutional program and provide examples of real-world situations in which you have assisted researchers with compliance. Point the audience to information and resources and any pertinent forms that you have developed (all of which are provided on your website, ideally). Give examples of your office’s activities that support and assist researchers in complying with the rules, and emphasize your institution’s commitment to compliance.

**Tell them what’s in it for them.** Highlight the fact that these laws apply whether or not faculty and staff previously knew about them. Emphasize that the support
being provided by the institution enables them to be secure in the knowledge that they are complying with the law, thereby reducing their personal liability. Convey that you are able to provide the expertise in this area so that they can focus on the research that is important to them.

Taking a constructive approach sends a message to faculty and staff that you are their partner in addressing export control issues. It also reinforces the service orientation that research administrators seek to convey. In the end, using the above techniques rather than shocking stories is more likely to enable you to meet your goals of education and partnership in building a culture of compliance.

About the Authors

Aurali Dade, PhD, is Assistant Vice President for Research Integrity and Assurance at George Mason University. She is responsible for research compliance, including serving as the IO for export compliance. She is a co-editor of the book Implementing a Comprehensive Research Compliance Program: A Handbook for Research Officers (2015). Aurali can be reached at ADade3@gmu.edu

Suzan DiBella, M.A., is Executive Director of Communication and Planning at the University of Nevada, Las Vegas. Her scholarly interests include scientists and the media and research administration communication. She is a co-editor of the book Implementing a Comprehensive Research Compliance Program: A Handbook for Research Officers (2015). Suzan can be reached at sue.dibella@unlv.edu
¶3490  Knowledge Check
AIS editors

The Q&As at ¶3490.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 3400 has been understood. Note: For the answer key for ¶3490.1, see ¶3490.3, which appears on a separate page (page 3490:5) for testing purposes.

Discussion topics at ¶3490.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶3490.1  Q&As

1. What is a deemed export?
   (a) The electronic transfer of financial assets controlled under the OFAC
   (b) The transfer of or access to technology controlled under the EAR or ITAR while a U.S. citizen is residing in a foreign country
   (c) The transfer of or access to technology controlled under the EAR or ITAR to a foreign person while in the United States
   (d) The electronic transfer of financial assets controlled under the OFAC to a U.S. citizen employed by a foreign government

2. To qualify under the public domain definition, software available on public Web sites must be
   (a) Available for download without any restrictions on access
   (b) Encrypted for proprietary use
   (c) Developed under specific protocols
   (d) Only available under limited circumstances

3. Dual use research is defined as research that could have both
   (a) Domestic and international use
   (b) Military and commercial value
   (c) Public-sector and private-sector use
   (d) Tax-exempt and taxable consequences

4. Items subject to the EAR are found on the
   (a) Specially Designated Nationals List
   (b) U.S. Munitions List
(c) Central Contractor Clearinghouse
(d) Commerce Control List

5. Department of Defense Trade Controls is located within which federal agency or department?
(a) U.S. Department of Defense
(b) U.S. Department of State
(c) U.S. Department of Commerce
(d) Army Research Office

6. The Simplified Network Application Process (SNAP) system is used for licensing under
(a) MTA
(b) OFAC
(c) ITAR
(d) EAR

7. As used in §3405, what does TCP mean?
(a) Technology Control Protocol
(b) Technology Certification Platform
(c) Technology Control Plan
(d) Temporary Certification Plan

8. The five-year recordkeeping requirement begins for OFAC
(a) On the date of the covered transaction
(b) On the date of the last export/re-export transaction
(c) On the expiration of the license
(d) On the date the award is accepted
13490.2 Discussion Topics

1. Why does the United States (and other countries) impose export controls?

2. A thorough review should be conducted to determine if information that is "proprietary" is "controlled." What does this mean and what are the best practices in this area?

3. In many universities, sponsored programs offices do not have exclusive control over export control policies and practices. If this is the case at your institution, what then is the proper role for the office of sponsored research at your institution and how can you effectively interact with those who do have oversight?

4. As the types of sponsored research activity at your institution might change over time, how can you help ensure that any new activities that could trigger export controls are considered?
\subsection*{3490.3 Answer Key}
Following are the correct answers to the questions included at \textsection{3490.1}.
\begin{enumerate}
\item (c) The transfer of or access to technology controlled under the EAR or ITAR to a foreign person while in the United States
\item (a) Available for download without any restrictions on access
\item (b) Military and commercial value
\item (d) Commerce Control List
\item (b) U.S. Department of State
\item (d) EAR
\item (c) Technology Control Plan
\item (a) On the date of the covered transaction
\end{enumerate}

Introduction

Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter covers international research collaborations, a topic of ever-greater interest because of the increasingly global activities of many institutions. This chapter provides a valuable starting place on topics relating to international collaborations and ways to manage such activities.

The 21st century is rapidly becoming the “age of globalization” where we are discovering just what New York Times columnist Thomas Friedman was talking about in his assertion that “the world is flat.” Most practitioners of research administration in the United States have grown up believing that research administration is a uniquely American profession that is generally unknown outside our borders. The belief is that even where some aspects of research administration may be practiced in other countries, it is primitive and underdeveloped when compared to the practice in the United States. Denise Wallen of the University of New Mexico and John Carfora of Loyola Marymount challenge these ethnocentric assumptions and open our eyes to the fact that there is a big wide world out there where research administrators from different countries and cultures are working together to develop successful international research collaborations.

Wallen and Carfora have provided a veritable treasure of resources in the form of an extensive bibliography and a directory of organizations concerned with international research collaboration. This “catalogue” includes professional societies, institutional consortia, government agencies, and more. There is no question that international research collaborations are increasing and there is every reason to believe that this aspect of our activity will continue to grow. In this chapter, a research administrator can avail himself or herself of a “Fodor’s Guide to International Research Collaborations.” Bon voyage!

Chapter 3500 will continue to respond to the information needs of research administrators over time through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶3505, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at ¶3520), practical tools (at ¶3530), case studies (at ¶3540), and statistics and survey results (at ¶3560). A “knowledge check” containing Q&As and discussion topics is included at ¶3590.
Building Toward Successful International Research Collaborations

John M. Carfora
Executive Director, Office for Sponsored Programs
Loyola Marymount University

Denise Wallen
Director, Research Development and Initiatives, Research Development Services, Office of the Vice President for Research & Economic Development
The University of New Mexico

This chapter discusses how offices of sponsored programs (OSPs) — a term also referring to offices for research administration or offices for grants and contract management — can draw upon a number of effective strategies and recommended practices as they build toward successful international collaborations. “Successful international collaboration” means the cooperation of two or more international entities working together to develop, implement, and monitor meaningful agreements and related procedures for assuring a project moves forward — from conception to closeout — with maximum communication and professional cooperation on one hand, and with minimal administrative burden on the other hand.

It is recognized that many colleagues have both thematic and topical “how-to” questions pertinent to the practical conduct of international research administration. That said, the sheer depth and breadth of this topic will not, given the scope of this chapter, permit an in-depth discussion of many of those questions. Instead, readers should view this chapter as a “starting point” for many colleagues, both new and senior, who are just beginning to introduce the concept of international research administration to campus stakeholders. With this in mind, this chapter is a good portal to enter the conversation, and a first rate tool for facilitating meaningful discussions at one’s institution and with fellow research administrators in both the United States and abroad. Already the profession is taking a proactive approach, and the National Council of University Research Administrators (NCURA) fully supports this effort through its various professional development opportunities and training and education venues.

Note: A bibliography of selected sources, many of which are referred to in the text, and a list of international resources are included at the end of the chapter (see Figure 2, page 3505:17 and Figure 3, page 3505:19, respectively).

Developing Confidence in the Area of International Sponsored Research Administration

In addition to becoming familiar with the material in other chapters of this Guide, it is recommended that research administrators in the United States and abroad continuously stay abreast of developments within the profession, and conscientiously work to enhance their understanding and expertise across the many functional and managerial
areas that constitute sponsored research administration. This is essential for two rea-
sons as discussed below.

First, having a solid command of the workings and nuances of sponsored programs
administration in one’s own institution and country allows the research administrator
to answer international colleagues’ questions about research administration. Such
queries pertain to topics including the following:

◆ Recommendations of top-notch translational services, as well as guidance on
cultural questions about a particular country’s culture and professional customs
◆ Contractual and policy-related guidance on full economic costing
◆ Allowability of costs and documentation of in-country transactions
◆ Payment terms and required flow downs
◆ Appropriate certifications and assurances
◆ Publication rights
◆ Intellectual property
◆ Technology transfer
◆ Material transfer agreements
◆ Taxation
◆ Insurance
◆ Ownership and disposition of equipment
◆ General accounting and auditing issues
◆ Use of independent contractors
◆ Subrecipient monitoring
◆ Confidentiality agreements
◆ Human subject protection and animal care/use
◆ Governing law, dispute resolution, and use of arbitration
◆ Personal safety and security concerns
◆ Export controls

This rather broad list — though far from being collectively exhaustive — provides
an example of the topical and thematic concerns behind the growing interest in interna-
tional research administration. (See also the discussion at ¶3520.1.) In addition to the
above, non-Americans often ask for specific guidance involving language in proposed
agreements — particularly seeking clarification related to indemnification, intellectual
property, and publication rights (again to name but a few). Likewise, many non-
Americans are anxious to learn more about research administration in the United States
-especially with an eye toward offices providing both pre- and post-award services), so
they can better understand operational nuances of American research administration.
Queries from American and international colleagues — particularly from senior research managers — often seek guidance on how to best provide training and education to staff, as well as how to appreciably assure best practices and maintain institutional knowledge related to international research administration.

Second, that same command of the workings and nuances of sponsored programs administration in one’s own institution and country allows the research administrator to ask questions regarding how research administrators from another culture might approach a particular issue. At a minimum, the goal should be a desire to provide a highly proficient level of service and collaboration that develops a rapport and confidence between international colleagues.

The “body of knowledge” referred to in North America when speaking about the role, function, and place of sponsored research administration at U.S. and Canadian institutions is vast, and a comprehensive overview of its many purposeful areas can be found in the mainstay of publications that have come to define the standard by which North American-based research administration is understood and evaluated. It is thus recommended that all research administrators and managers work to maintain a solid understanding of the growing “body of knowledge” — the lingua franca if you will — that has come into print over the years.1

Perspectives on Research Administration

In support of the above, there are a number of national and international perspectives or views of research administration, and works by Johnson (1997), Nybacka-Willner (1997), and Zimmerman, Mackler, and Pe’er (2002), to name just a few, demonstrate how similar the experiences, visions, and practices are among research administrators and managers at sponsored research offices around the world. Familiarity with such writings can help us appreciate the professional environment research administrators globally share.² However, as a South African colleague once remarked: “Not everything in our work as research administrators is or even should be the same from culture to culture, and that is precisely what makes international research administration and management so interesting.”

In many respects the professional research administrator, whether she or he works in the international domain or in any of the other functional areas common to offices of sponsored programs, is best viewed by what in French is described as a bricoleur (Levi-Strauss, 1966; Denzin and Lincoln, 1994). Though a simple definition is somewhat lost in translation, the international research administrator-as-bricoleur is someone — generally comfortable in the domains of self-directed learning, collaborative aptitude, reflective practice, and noteworthy experience — who is proficient at performing diverse tasks and working betwixt and between convergent perspectives, paradigms, and experiences. With this perspective, international research administration can be viewed as a globally comparable profession united by a variety of practices, applied solutions, and meaningful goals.

¶3505.3 Most Valuable Pathway: Developing Learning and Professional Development Strategies

Beth Mora’s chapter on “Organizational Models” contains valuable information on office structures and purposeful roles and responsibilities; it also includes a good discussion of the range of skill sets needed for sponsored programs professionals (see ¶305). It is wise for the modern-day OSP also to have a cadre of staff with discerning, professional interests in international research administration.

² Professional, organizational, and functional similarities also resonate in such widely read works as E.C. Kulakowski and L.U. Chronister, eds., Research Administration and Management (Sudbury, MA: Jones and Bartlett Publishers, 2006); K.L. Beasley, M.R. Dingerson, O.D. Hensley, L.G. Hess, and J.A. Rodman, The Administration of Sponsored Programs (San Francisco: Jossey-Bass, 1982); R.J. Woodrow, Management for Research in U.S. Universities (Washington, D.C.: National Association of College and University Business Officers, 1978); and J.D. Sites in Kulakowski and Chronister, eds., Research Administration and Management (Sudbury, MA: Jones and Bartlett Publishers, 2006). Likewise, electronic “site visits” to many organizations and associations that service the international research administration community — such as those included in the international resources section at the end of this chapter — will provide further perspectives and similarities.
Since this chapter is being written with both American and non-American audiences from institutions of various sizes in mind, it is understood that not every sponsored programs office will have the requisite financial resources to send staff to international professional conferences and workshops entailing costly travel, accommodation, and per diem expenses. Given this limitation, the authors have spent a considerable amount of time speaking with colleagues from around the world about ways to develop learning and professional development strategies that would attract and retain the interest of colleagues and simultaneously satisfy differing levels of institutionally-financial support for training, education, and professional development. Outlined below are several such strategies for making professional development interesting and relevant for today’s professional research administrators keen to develop their skill sets in the area of international research administration.

The first step in developing optimal learning and professional development strategies is for senior institutional leaders to recognize that learning among adult professionals — and especially among research administrators — largely takes place through formal, informal, and incidental learning experiences. Among the best discussions of these three types of learning is that offered by Marsick and Watkins (1990; 2001) as follows:

Formal learning is typically institutionally sponsored, classroom-based, and highly structured. Informal learning, a category that includes incidental learning, may occur in institutions, but it is not typically classroom-based or highly structured, and control of learning rests primarily in the hands of the learner. Incidental learning is defined as a byproduct of some other activity, such as task accomplishment, interpersonal interaction, sensing the organizational culture, trial-and-error experimentation, or even formal learning. Informal learning can be deliberately encouraged by an organization or it can take place despite an environment not highly conducive to learning. Incidental learning, on the other hand, is almost always taking place, although people are not always conscious of it. (p. 12, 1990; p. 25, 2001)
Creating a substantive role and meaningful place for institutional learning, “andragogy,” and knowledge management are not new, and are of enormous value to forward-looking managers in search of ways to help shape collaborative learning environments that support a full range of formal, informal, and collaborative learning strategies.

Most Valuable Learning: Knowledge-Based Resources

There are four important avenues available to the research administrator-as-bricoleur in search of training, education, and professional development opportunities in the area of international collaborations.

U.S. and International Associations

First, many formal learning opportunities are available through international-based associations for research administrators, such as the National Council of University Research Administrators (NCURA), the Society of Research Administrators (SRA), the Canadian Association of University Research Administrators (CAURA), the European Association of Research Managers and Administrators (EARMA), the Australian Research Management Society (ARMS), the Swiss Association of Research Managers and Administrators (SARMA), and the Southern African Research and Innovation Management Association (SARIMA). (For contact information for these organizations, see Figure 3, page 3505:19.)

EARMA, for example, offers a range of professional development opportunities throughout Europe, such as workshops on Intellectual Property Rights and Contract Management and a training course on Advanced International Project Management. Likewise, EARMA has adopted a set of guidelines for effective training (www.earma.org/files/Training_Guidelines_Feb05.pdf) — and broadly endorses courses, workshops and events organized by other organizations such as Bluebell Research (www.bluebellres.co.uk/), Hyperion, Ltd (www.hyperion.ie); Forschungszentrum Karlsruhe and its

3 The concept of “andragogy” can easily be summarized in four general postulates: (1) adults should be involved, as much as possible, in the planning and evaluation of their instruction and learning; (2) experiences (both positive and disappointing) provide an optimal basis for learning activity; (3) adults are generally most interested in learning about subjects/topics/processes that have immediate and direct relevance to their work or personal life; and (4) adult learning is generally more “problem-centered” than “content-oriented,” though each concept should complement the other whenever possible. Additional information about this timely and fascinating theme can be found via the following sources: M.S. Knowles, The Modern Practice of Adult Education: From Pedagogy to Andragogy (Englewood Cliffs, NJ: Cambridge Adult Education, 1980); M.S. Knowles, Andragogy in Action (San Francisco: Jossey-Bass, 1984); S.B. Merriam, “Andragogy and Self-Directed Learning: Pillars of Adult Learning Theory” in S.B. Merriam, ed., “The ‘New’ Update on Adult Learning Theory,” New Directions for Higher Education, No. 89 (Spring 2001): 3-13.

4 See for example works by Knowles (1980; 1984); Brookfield (1985); Davenport and Prusak (1997); Merriam and Brockett (1997); Hansen, Nohria, and Tierney (1999); Merriam (2001); Yorks and Kasl (2002); Wlodkowski and Kasworm (2003); and Kezar (2005).
highly regarded Center for Advanced Technological and Environmental Training (http://fortbildung.fzk.de/Englisch/Index_e.html), and Yellow Research (www.yellowresearch.nl/index_yr.php).

Likewise, NCURA has several “traveling” workshops and seminars such as the “Export Controls and Embargoes Seminar.” Throughout the year, NCURA also offers special topical conferences, including those addressing topics relevant to international research collaborations. NCURA has created a range of online communities (known as “neighborhoods”) with topic-specific listservs and a range of other online offerings and video workshops. NCURA also offers a variety of publications. For details on NCURA publications and ever-expanding professional development offerings, see www.ncura.edu.

**Online Resources**

The second avenue for obtaining information on international collaborations involves a more self-directed approach, and calls for regular examination and professional understanding of international resources, essentially online materials available from organizations and associations that service the community of international research administrators. Figure 3, page 3505:19, includes an annotated listing of websites that is perhaps one of the most comprehensive resources of its kind available to research administrators to date, and much can be learned from making regular site visits to these globally based resources. For example, an electronic site visit to EUROPA — the European Union’s portal website (http://europa.eu.int/) — contains information made available by the institutions and bodies of the European Union (EU), including the European Parliament, the Council of the Union, the Commission, the Court of Justice, the Court of Auditors, the Economic and Social Committee, the Committee of the Regions, the European Central Bank, and the European Investment Bank. EUROPA also provides a vast array of information on European integration, particularly concerning the European Union’s objectives, policies, and emerging “Frameworks.”

The EUROPA site (http://europa.eu/geninfo/info/guide/index_en.htm#term) further maintains 20 separate public glossaries that contain over a thousand terms relating to European integration and the institutions and activities of the European Union. International glossaries are particularly useful, especially when the meanings and nuances of terms and phrases can differ in translation. Indeed, these glossaries are another example of the vast cache of resources available to international research administrators via the Web.

---

5 For example, the European Union’s “Sixth Framework Programme covers (EU) community activities in the field of research, technology, and development and demonstration for the period 2002-2006. For more information, please see: http://ec.europa.eu/research/fp6/pdf/ fp6-in-brief_en.pdf.
In-House Libraries

The third avenue research administrators can use for obtaining information on international collaborations encompasses development of an office library of books, articles, White Papers, documents, and pertinent government and nongovernmental items available in print. For example, no sponsored research administrator’s international library would be complete without copies of two articles by John B. Richey: “Crafting Contracts for International Projects” (1993) and “Budgeting for International Projects: In-Country Operations and Long-Term Residential Assignments” (1994). Though both articles are today somewhat dated and originally intended to draw attention to issues related to projects in newly industrializing and so-called less-developed nations — and often involving long-term residential assignments — Richey’s complementary works nevertheless provide a worthy conceptual framework through which research administrators can view and assess the terms and conditions of international contractual agreements. For example, Richey’s article contains a comprehensive, though as Richey correctly notes “not exhaustive” checklist against which research administrators can review and appraise contracts and international projects.

Research administrators wishing to enhance their skills for drafting, negotiating, and administering international agreements should become familiar with the thinking included in several chapters of the Guide, including Erickson and Tangredi-Hannon’s chapter on “Research Compliance,” Mayo’s work on “Administering Research Contracts,” Irwin’s contribution on “Legal Considerations,” and Killoren’s piece on “Subawards.” (See ¶1505, ¶2705, ¶2905, and ¶3705, respectively). These works — when considered individually and collectively — provide rich insight for the research administrator wishing to extend her or his domestic expertise in the international domain. Similar themes to those noted above, written by American and non-American experts in the field, are readily available in print or by electronically visiting organizations and associations included in the International Resources section at the end of this chapter.6 (See Figure 3, page 3505:19.)

---

6 One example of other works in print would include relevant sections and chapters in a variety of publications such as the section on “Research in the International Setting” in NACUA’s Legal Issues in Sponsored Programs: From Contracting to Compliance (2005) (www.nacua.org), that includes key chapters on “Export Control Regulations and Participation by Foreign Nationals” (James K. Kearney), “Fundamental Research and the International Traffic in Arms Regulations” (Rachel Claus), “Export Controls Compliance Programs: How Colleges and Universities Can Cope with the Complexity, Comply and Foster the Best Research and Teaching” (Jamie Lewis Keith), “Revision and Clarification of Deemed Export Related Regulatory Requirements” (U.S. Department of Commerce), and “Creative Structures for International and Joint Research and Education Transactions: The Sublimely Simple to the Unavoidably Complex” (Jamie Lewis Keith, et al.). One example of a very useful online resource is Restrictions on Research Awards: Troublesome Clauses, A Report of the AAU/COGR Taskforce, by Julie T. Norris, that is available from the Association of American Universities (www.aau.edu) or the Council on Governmental Relations (www.cogr.edu). See also works previously cited in footnotes 1 and 2, as well as those included in Figure 2: Selected Bibliography.
Collection of Contracts and Agreements. Consonant with the above it is also recommended that such in-house “international libraries” contain an ongoing collection of international contracts and research agreements — whenever possible maintaining copies in both the host language and in English — so that research administrators can, if linguistic abilities permit or translation services are available, check agreements for contextual and translational accuracy. For example, one of the authors was once asked to review an international contract (translated into English by the host nation), and being familiar with the host language decided to also read it in the original for linguistic, contextual, and contractual accuracies. The translation was quite good, but in one critical instance involving the appointment of a neutral arbitrator to resolve contractual disputes, the host-country’s translation used the word “possibility” when the author would have used the word “opportunity” given the particular context in which it was used; clearly, the two concepts are different and should be used appropriately. The author contacted the host institution, and after a proportionally appropriate amount of time was spent negotiating linguistic nuance (with potentially legal implications), at the author’s insistence the wording was changed in a way that outlined an actual process (and not the “possibility” or “opportunity”) for appointing a mutually agreeable arbitrator.

This example should not be unfamiliar to the experienced contract negotiator with domestic and/or international experience. The point here is simple: linguistic differences, as well as possible variations in a translator’s style and vocabulary, can potentially result in nonlegal misunderstandings or formal legal disputes. In the above case, the author reconciled a translational variance to improve a contractual agreement in a way that (hopefully) would avoid a potential legal dispute.

Budget Template. It is helpful to develop a budget template that is effective for focusing the attention of domestic and international collaborators on drafting budgetary parameters all parties can agree upon, operate within, and enhance trust by utilizing. To begin developing a template at your institution, it is recommended — after reading John Richey’s two articles — that colleagues work collaboratively to develop such a template. (See Figure 2, page 3505:17.) Whenever possible, such tools should be initially developed “in house” so as to identify particular institutional concerns.

Northwestern University’s Operating Guidelines for International Sponsored Activities is an effective resource for those institutions looking for examples of applicable policies and operational guidelines for guiding their (“in-house”) thinking. (See Figure 1, page 3505:15.) Such tools — intentionally developed to get the job done effectively and with minimal confusion to all parties — can be invaluable resources that facilitate discussion, collaboration, and agreement.

Networking with Colleagues

The fourth and final avenue for obtaining information on international collaborations addresses the cultivation of an international network of fellow professional research administrators who can provide invaluable perspectives and experientially based opinions on a variety of international themes. For example, over the years the authors
have developed meaningful friendships with research administrators from a variety of
nations, and correspondence regularly is exchanged concerning contractual language,
training and education programs, regulatory and compliance matters, and national and
transnational research trends that could impact the conduct of international research
administration.

Getting “connected” is easier than one might expect. For example, NCURA main-
tains an international listserv via its international neighborhood website
(www.ncura.edu/members/Neighborhoods). It is highly recommended that anyone
interested in communicating and exchanging information, perspectives, and “best
practices” with domestic and international colleagues sign-up for this professional
service. Similar tools for connecting with international colleagues are available through
the organizations listed in the International Resources section of this chapter. (See
Figure 3, page 3505:19.)

**Example**

On one such research administration listserv, there has been a recent
discussion regarding the hiring of an international post-doc on a spon-
sored project and visa requests. In this instance the PI wanted to charge
the $1,000 expedited visa processing fee to the project. The American
research administrator was concerned that this was not a reasonable
charge for the project to bear. E-conversations ensued and advice was
shared about visa processing — and why expedited processing may
sometimes be necessary and appropriate.

In instances when the visa application cannot allow the more than three months
processing time for regular approval now required by the government, expedited
processing fees (called Premium Processing), while considerable, allow processing in a
matter of weeks instead of months. If the timing is critical to the grant, then it could be
deemed a reasonable and allowable expense. Further information can be found at the
The visa processing time in a region may provide a justification for charging the addi-
tional fee to the grant.

It was recommended that an internal memo to the grant file be added to protect the
institution in the event of an audit.

Such timely and accessible discussion as included in the example above provides
the community of research administrators with sage advice, critical information, and
sound policy resources.

As our research environment continues to expand globally, international partner-
ships become more the norm than the exception. As such, it becomes critical for spon-
sored projects offices to have staff skilled and informed not only in the business and
nuances of international research administration such as rules, regulations, policies,
and procedures, but also in the cultural sensitivities that impact the negotiations and
details of an award. Providing adequate, accessible resources and training to research
administrators — along with opportunities for dialogue with international colleagues
— expedite and enrich the collaborative efforts of all stakeholders. In an environment of limited budgets, it is important that “management” understand the value of committing resources required by research administrators to develop and maintain those complex skills sets demanded by international research administration.

13505.5 Special Themes and Issues

Based upon conversations with American and international research administrators, a number of special themes emerge that today appear to be of importance when thinking about successful international collaborations. Rather than focusing upon specific in-depth topical discussions, which are beyond the scope of this chapter, this section instead focuses upon thematic foci and practical recommendations.

Human Subjects Research

The first theme of import to many research administrations around the world pertains to those challenges that arise when researchers from differing international organizations are involved in research involving human participants. Not surprisingly, the most commonly asked question that arises in this context is: Which nation’s legislation, regulations, or guidelines have precedence when collaborative research involves human subjects?

To answer this question, among the first places to consult is the International Compilation of Human Subject Research Protections developed by the U.S. Department of Health and Human Services Office for Human Research Protections. This exceptional resource — developed specifically for Institutional Review Boards (IRBs), ethics committees, researchers, funding agencies, and indeed anyone involved in international research — lists those countries for which laws, regulations, and guidelines relevant to human subjects research could be identified. The Compilation organizes information according to four categories:

1. **Key organizations** — including those groups that issue regulations or guidelines, or serve in a national oversight role for human subjects research

2. **Legislation** — including statutes, statutory instruments, legislative decrees, and constitutional provisions, if any, that relate to human subject protections

3. **Regulations** — meaning instruments that are created and issued under the name of governmental administrative bodies

4. **Guidelines** — meaning nonbinding instruments

Likewise, the 2008 edition of the Compilation listings cover 84 countries organized into six regions:

1. Africa

---

7 Institutional Review Boards can also be referred to as Committees for the Protection of Human Subjects, Committees for the Protection of Human Participants in Research, Research Ethics Boards, Research Ethics Committees, and Ethics Research Committees.
(2) Asia/Pacific/Middle East;
(3) Europe;
(4) International;
(5) Latin America/Caribbean; and
(6) North America.

Accessible online (www.hhs.gov/ohrp/international/HSPCompilation.pdf), the Compilation in effect identifies (with Internet links) an international grid of legislation, regulations, and guidelines, all of which share a common concern for modern research ethics in support of human dignity.8

Monitoring International Collaborations

The second theme that generates the most questions, especially from American research administrators (but increasingly from colleagues in Europe as well) pertains to the monitoring of international projects. In sum, the question is: How can foreign entities be appropriately monitored?

The current literature on monitoring foreign projects is not particularly strong, and this may indeed be because American-based institutions regularly define an “international project” as one sponsored by a foreign government, or perhaps by a private entity based in another country, irrespective of where the research/work is to be performed.

---

8 See for example NIH’s website entitled “Bioethics Resources on the Web,” http://bioethics.od.nih.gov/international/bioethics.html#guidelines, which includes links to (1) International Ethical Guidelines, Codes, and Declarations; (2) Educational Resources on International Research Ethics; (3) International Organizations; (4) International Bioethics Journals; (5) Tutorials, Case Studies, and Courses; (6) Short Educational and Training Courses; (7) Academic Centers and Programs; and (8) Educational Sites and Resources. Likewise, the Fogarty International Center — in partnership with several NIH institutes and a variety of federal centers and agencies — “supports domestic and international educational and research institutions to develop or expand current graduate curricula and training opportunities in international bioethics related to performing research on acute and chronic diseases in low- and middle-income nations.” For a full overview, see www.fic.nih.gov/programs/training_grants/bioethics/index.htm.

Similar online resources are available for research involving animals. Recommended resources include (1) the Swedish Research Council’s gateway to various research ethics guidelines — called CODEX (www.codex.vr.se/codex_eng/codex_eng.html) — that is run in collaboration with The Centre for Bioethics at Karolinska Institutet and Uppsala University; (2) the European Convention for the Protection of Vertebrate Animals Used for Experimental and other Scientific Purposes (www.codex.vr.se/codex_eng/codex_eng.html); (3) the European Consensus-Platform for Alternatives (www.ecopa.eu); (4) The Johns Hopkins Center for Alternatives to Animal Testing (http://caat.jhsph.edu/); and (5) the International Society for Applied Ethology’s Guidelines for Ethical Treatment of Animals in Applied Animal Behavior and Welfare Research (www.applied-ethology.org/index.htm).
When a group of veteran international research administrators from a variety of countries (including the United States, Canada, and nations in Africa, Asia, and Europe) were polled, the majority cited The International Development Research Centre (IDRC) as the primary online site (www.idrc.ca/en/ev-57172-201-1-DO_TOPIC.html) they consult, in the first instance, for information involving monitoring international entities and research agreements. The IDRC site is recommended as an easy-to-use and relatively trustworthy resource on monitoring.

In brief, IDRC’s “Grant Monitoring” site contains useful sections on
• Tracking
• Administration and funding
• Project reporting/reports
• Guidelines for preparing interim and final technical reports
• Financial reporting
• Audit considerations
• Feedback to recipients

The IDRC site also contains useful “checklists” (1) for monitoring and evaluating projects; (2) for evaluating incoming financial reports; and (3) for developing financial reports.

Evolving Issues. The special themes research administrators involved in international collaborations are faced with today will no doubt continue to evolve — and more issues and concerns will emerge. As research administrators become more sophisticated in this arena, and as partnerships mature, the possibility of shared resources will become a reality. Looking to the future, the global need of research administrators — such as for measuring OSP performance, accessing data and generating reports, responding to policy questions and interpreting rules and regulations vis-à-vis international projects — will be a driver for multinational research administration collaborations. As a result, research administrators will be in a better position to inform themselves and others, thereby contributing to the body of knowledge that many hope emerges into a culture of international research administration.

¶3505.6 Conclusion

This chapter presents an overview of methods offices of sponsored programs can use to develop effective strategies, practices, and resources in support of successful international collaborations. The complexities of international research administration can be challenging, and depending on the structure and staffing of these offices for sponsored programs, the burden can vary based upon the size and knowledge base of personnel. The current and anticipated increase in the complexity of the regulatory environment will only add further demands on these projects and staff. Coping with this will require
more strategies, efficiencies and mechanisms for sharing best practices within and among institutions.

**Importance of Communication**

Communication becomes one of the critical keys to a successful partnership and in spite of differing languages and cultural expectations this can be effectively accomplished. As noted in Kim Moreland’s chapter on “Communications in Research Administration,” communication skills require effort but the results can be profound (see ¶505). International communication skills are also a contributing factor to success, and these skills can be cultivated, regardless of language and cross-cultural differences. Here too the results can be profound.

Indeed, as international projects continue to become more commonplace, it is essential that research administrators and managers understand and be conversant in the issues affecting international grants and contracts. Even so, lying just beyond the rules, regulations, procedures, and policies is a need for cultural sensitivities and open communication among all parties — essentially allowing the research administrator the opportunity to play the role of the international envoy.
Recognizing Northwestern’s growing interest in international projects and the importance of such projects for achieving institutional goals, yet needing to respond to the complex issues that arise, new policies and guiding principles have been devised. For purposes of this policy statement, an international project is one that is sponsored by a foreign government or by a private entity based in a foreign nation, irrespective of where the work is to be performed.

As it does for other sponsored projects, the Office for Sponsored Research (OSR) serves as the point of contact for faculty interested in submitting a proposal to an international sponsor. OSR’s initial role is to determine the feasibility of moving ahead with proposal development. Risk Management, the Office of General Counsel, the Controller, and other University offices may be asked to participate in this process. Sufficient time should be provided to allow for the necessary internal analysis. OSR should be provided with a rationale for the activity and a budget outline.

OSR will then prepare a project assessment for the Vice President for Research. The Vice President may gather such other information as is deemed relevant to protect the originating unit, individual interests, or the University. Once approved, the proposal will be processed through OSR in accordance with established procedures and should include the written endorsement of the chairperson and dean or center director on the OSR-1 form, Statement of Commitments and Endorsement of a Proposal for a Sponsored Project. OSR will provide guidance on the preparation of the budget. The nonfederal indirect cost rate should be used. If an off-campus component is contemplated, the budget should clearly identify the on- and off-campus costs, and the correct indirect cost rate should be applied to each. If it emerges that a foreign sponsor declines to pay full overhead on this basis, any shortfall should normally be included as a direct cost to the sponsor in the form of rent, services, or project administration and will be recovered internally in the same manner as indirect cost. An authorized institutional signature by a designated OSR official or the Vice President for Research must be obtained before the proposal is submitted to the sponsor.

OSR is the only institutional office authorized to negotiate with the foreign sponsor on behalf of the University. The following terms will be included in agreements with foreign sponsors:

◆ English is the operative language.
◆ Payment is in U.S. dollars by wire transfer or by check drawn against a US bank or foreign bank with a US branch.
◆ An escrow deposit and/or advance payments, equal to no less than the anticipated quarterly expenses, are required.
◆ Invoicing instructions specifying the form, content, and required timing of invoice submission must be stated, along with sponsor contact and transmission instructions.
◆ Financial reporting requirements and fund reversion conditions must be identified.
◆ Language must allow for early termination by Northwestern and assure payment of actual expenses and noncancellable commitments through the date of termination.
◆ Dispute resolution should be by arbitration through the International Chamber of Commerce.

When an international agreement is negotiated successfully, a University account will be established with the following conditions:

◆ Funds will be appropriated to individual accounts as payments are received and have “cleared” the bank.

continued
Figure 1: Sample Operating Guidelines for International Sponsored Activities (continued)

◆ When available funds are insufficient to cover expenses and commitments, the account will be deactivated pending receipt of additional funds from the sponsor or a departmental or a valid center guarantee.

◆ The Office of Accounting Services for Research and Sponsored Programs (ASRSP) is responsible for invoicing in accordance with the payment schedule designated in the agreement. When possible, invoices will be faxed to the sponsor. Originals will follow, via express mail. ASRSP will notify the project director if delays or other problems are encountered in the invoicing/payment process. Where the project expenditures exceed awarded amounts, the University’s Policy on Fiscal Responsibility for Projects Sponsored by Industry and Business will govern the resolution of any overdraft condition.

Proposals involving projects to be completed outside the United States should be developed with a clear understanding of the cultural setting of the country in which the project is to be undertaken. Because the financial and legal exposures in undertaking international projects may be significant, OSR will make every effort to assist the project director in understanding and reducing the financial and other risks that may be identified.

Figure 2: Selected Bibliography

continued
Figure 2: Selected Bibliography (continued)

Academia Sinica, the most preeminent academic institution in the Republic of China, was founded in 1928 to promote scholarly research in China and to undertake academic research in the sciences and humanities. After the government moved to Taiwan in 1949, Academia Sinica was re-established in Taipei. The growth of Academia Sinica during the transition period was slow due to political instability and meager budgets.

In recent years, under the leadership of President Yuan T. Lee, Academia Sinica has been transformed into a modern research institute. Many of the 24 research institutes and 6 research centers are now headed by world-class scholars and staffed by highly-trained, motivated, and creative young researchers. Major strides have also been made toward raising the standards of academic research, and Academia Sinica is presently positioning itself to move its research activities to the international level. Aside from placing greater emphasis on opening up new areas of intellectual endeavors, Academia Sinica is also taking a leading role in the launch of new initiatives in applied areas to meet a broad spectrum of societal needs within Taiwan.

Towards fulfilling these goals, Academia Sinica has adopted various measures to promote internal integration of research activities in the three research disciplines — mathematics and physical sciences; life sciences; and the humanities and social sciences — to help with the planning, implementation, and evaluation of long-term projects in order to enhance the impact of research activities; to deploy basic research results in applications and technology transfers; to engage the academic and research community within Taiwan toward a modern, forward-looking and collective academic vision; to cultivate an intellectual environment that is conducive to the nurturing of young scholars and the recognition of outstanding scholarship in Taiwan; and to promote international cooperation and scholarly exchanges that will accelerate the overall development of academic research in Academia Sinica and the Republic of China.

Academy of Science of South Africa (ASSAF)
(South Africa)
www.assaf.co.za

Like democratic South Africa in general, ASSAF aspires to play both a national and an international role, particularly with respect to the African continent. ASSAF views the Academy as usefully at arms length from Government and other organised sections of the state, comprising an assembly of excellent scholars from many disciplines who are well-networked both nationally and internationally, and have shown their interest in and capacity for promoting the development of a prosperous and a fully enabled society. Membership of the Academy (by election) is both an honour and an obligation to work individually and collectively (as the Academy) to ensure that decision making requiring scholarly scrutiny and analysis is based on the best and most integrated understandings and insights available to the country. The Academicians thus represent an organised, independent but responsive scholarly voice to help guide the development of the country and its people.

The mission of ASSAF is to (1) become increasingly associated in the mind of the nation with the highest levels of scholarly achievement and excellence in the application of scientific thinking for the benefit of society; (2) consolidate its infrastructure and capacity, and to expand and mobilise the
membership to ensure that scholars from a full disciplinary spectrum are available for its work, and that these are indeed both thinkers and doers, willing to put significant effort into the Academy’s activities; (3) embark on a programme of systematic studies of evidence-based issues of national importance, some proposed by government or other sectors, and some identified by the Academy itself; (4) develop a sound and robust methodology for constituting study panels, organising their work, including conferences and workshops, and producing authoritative reports that are well-disseminated and have significant impact; (5) publish science-focused periodicals, especially a multidisciplinary journal of high quality (the South African Journal of Science) and a science magazine that will showcase the best of South African research to a wide national (and international) audience (QUEST — Science for South Africa); and to promote the development in South Africa of an indigenous system of research journals of internationally recognised quality and usefulness; (6) develop productive partnerships with other organisations, especially (but not only) the Departments of Science and Technology, Education, Health and Agriculture; the National Advisory Council on Innovation; science councils; higher education institutions, etc., with a view to the building of capacity in science and its applications within the National System of Innovation (NSI); (7) create new and diversified sources of funding for the sustainable functioning of an independent Academy; (8) communicate effectively with the general and specific publics, as well as with partners and sponsors; (9) develop a plan for the expansion of the activities of ASSAF in partnership with the national science academies of other countries, including contracted partnership with the US National Academies; and (10) play a significant role in the international science system, particularly in Africa, through organisations such as the InterAcademy Panel (IAP) and the InterAcademy Council (IAC), the Academy of Sciences of the Developing World (TWAS), the International Council on Science (ICSU), as well as the Network of African Science Academies (NASAC), all in the context of the New Partnership for Africa’s Development (NEPAD).

Academy of Sciences of the Islamic Republic of Iran
(Iran)
www.interacademies.net/CMS/2950/4251.aspx
The Supreme Council of Cultural Revolution sanctioned the establishment of the Academy of Sciences of the Islamic Republic of Iran in 1987. The main bodies of the Academy are: president of the Islamic Republic of Iran in his capacity as the presidency, general body, president of the Academy, scientific council and secretary of the Academy. The Academy has three types of members: fellows, associates and honorary. At present, the academy has 38 fellows, 74 associates and 3 honorary members.

Asia Pacific Research Online
(Asia – Pacific)
www.ciolek.com/
Online research and publications about Asia’s traditional and modern communication networks, and religions. The site, with over 50,000 visitors each month, is designed for swift access to data, and for good transmission speed and interoperability, not for fancy looks. Also, see the page about www.ciolek.com.

Association of African Universities
(Africa)
www.aau.org
The Association of African Universities (AAU) is an international non-governmental organisation set up by the universities in Africa to promote cooperation among themselves and between them and the international Academic community. The AAU, whose headquarters is in Accra, Ghana, was formed in November 1967 at a founding conference in Rabat, Morocco, attended by representatives of 34 universities who adopted the constitution of the Association. This followed earlier consultations
Figure 3: Selected Resources (continued)

Association of Universities and Colleges of Canada / Association des universités et collèges du Canada
(Canada)
www.aucc.ca

The Association of Universities and Colleges of Canada (AUCC) is the voice of Canada’s universities, and represents 90 Canadian public and private not-for-profit universities and university-degree level colleges. Since 1911, AUCC has provided strong and effective representation for its members, in Canada and abroad. AUCC’s mandate is to facilitate the development of public policy on higher education and to encourage cooperation among universities and governments, industry, communities, and institutions in other countries. AUCC provides services to member universities in three main areas: (1) public policy and advocacy; (2) communications, research and information-sharing; and (3) scholarships and international programs.

Association of Commonwealth Universities
(United Kingdom – International)
www.acu.ac.uk

The Association of Commonwealth Universities (ACU) is a global network of outstanding human and scientific resources that serves its member institutions by advancing international co-operation and understanding in higher education, and by providing a broad range of services and facilities. Membership comprises nearly 500 universities drawn from the Commonwealth countries of Africa and Asia, Australasia and the South Pacific, Canada and the Caribbean, the United Kingdom, Cyprus and Malta. These institutions come together voluntarily under the umbrella of the ACU to build on their historical links, shared traditions and common purposes in order to further international understanding and collaboration.

Association of European Science and Technology Transfer Professionals
(Europe)
www.astp.net

With the field of technology transfer growing rapidly, European Professionals in Transfer of Science & Technology have had an increasing need for a platform to meet and share experiences on a regular basis. The initiative of a multinational group of professionals resulted in the establishment of the non-profit Association of European Science & Technology Transfer Professionals on 31 December 1999. The mission of ASTP is to professionalise and promote technology and knowledge transfer between the European science base and industry. The Association is growing rapidly, and within five years has welcomed more than 500 members, covering 35 countries.

Association of Independent Research Institutes
(United States)
www.airi.org

The Association of Independent Research Institutes (AIRI) is a nationwide association of independent, not-for-profit research institutes conducting peer-reviewed basic and applied research in the biomedical and behavioral sciences.

continued
Figure 3: Selected Resources (continued)

Association of Research Managers and Administrators UK
(United Kingdom)
www.arma.ac.uk

ARMA is the professional association for research managers and administrators in the United Kingdom (UK). ARMA members work in a variety of organisations, including universities, funding bodies, the NHS and independent research organisations, as well as organisations providing services to research support offices. ARMA activities are focused on encouraging professional development and networking amongst research managers and administrators. To keep members up to date with developments in the field, ARMA provides a series of training and information events, including an annual Spring Conference, a series of one-day seminars, a structured programme of training courses, and short Study Tours. ARMA also support the exchange of knowledge and best practice through focused Discussion Groups and a number of email lists. ARMA publish a series of Occasional Papers to which members are encouraged to contribute and offer a small number of bursaries to support individual professional development activities. ARMA also collaborates actively with peer associations overseas.

Association of University Technology Managers
(United States)
www.autm.net/index.cfm

AUTM’s global network of members represent more than 350 universities, research institutions, teaching hospitals and government agencies as well as hundreds of companies involved with managing and licensing innovations derived from academic and nonprofit research. The association was founded in 1974 as the Society of University Patent Administrators with the objective of addressing a concern that inventions funded by the U.S. government were not being commercialized effectively. Through the years AUTM has grown beyond this single objective and now provides professional development and networking opportunities for technology transfer professionals at all career levels and from established and newly forming organizations worldwide. AUTM provides numerous resources for members including survey reports, professional development courses, a comprehensive training manual, peer-reviewed journal and a worldwide community of peers with expertise in all areas of intellectual property management.

Australian Academy of Science
(Australia)
www.science.org.au

The Academy was founded in 1954 by Australian Fellows of the Royal Society of London, and was granted a Royal Charter establishing the Academy as an independent body but with government endorsement. The Academy’s Constitution was modeled on that of the Royal Society of London. It receives government grants towards its activities but has no statutory obligation to government. The objectives of the Academy are to promote science through a range of activities. It has defined four major program areas: (1) recognition of outstanding contributions to science; (2) education and public awareness; (3) science policy; and (5) international relations.

Australian Research Council
(Australia)
www.arc.gov.au/default.htm

The Australian Research Council (ARC) plays a key role in the Australian Government’s investment in the future prosperity and well-being of the Australian community. ARC’s mission is to advance Australia’s capacity to undertake quality research that brings economic, social and cultural benefit to the Australian community. Likewise, ARC fosters excellence, partnerships and the highest ethical standards in research and research training in all fields of science, social sciences and the humanities.
ARMS is a professional association for research managers and administrators designed to enhance and build the networks of research professionals across the research enterprise spectrum, as well as to exchange knowledge and expertise on issues to do with the management and commercialisation of research. Currently ARMS has over 540 registered members under corporate or individual membership categories.

ARMS has grown significantly from its beginnings in 1999 and is now moving towards a partially supported professional society. The ARMS Executive volunteer their time with part-time support of a small secretariat. Primary activities centre on an annual conference, specialist interest workshops, and training and information events organised through local Chapters. ARMS also has a regular newsletter entitled “Up in ARMS” and e-newsletter updates to keep membership informed.

ARMS is dedicated to the professional development of members and currently offers travel grants to support middle-level research managers to participate in an appropriate national or international research management activity or study tour. ARMS also encourages and supports formal mentoring relationships through a mentoring scheme. ARMS is a member of the International Network of Research Management Societies (INORMS), and collaborates actively with sister societies overseas.

Bangladesh Academy of Sciences
(Bangladesh)

www.interacademies.net/CMS/2950/4262.aspx

The Bangladesh Academy of Sciences, established in 1973, is a national, non-governmental organization, recognized and financially supported by the government and considered as the apex body in science and technology in Bangladesh. Fellows, eminent for their original contribution to science and technology, are elected by the Academy. There are currently 58 fellows. The main objective of the Academy is to enhance science and technology in Bangladesh. In this context the Academy recognizes and promotes high caliber scientific research done by scientists, facilitates their mutual contacts, strengthens scientific and technological work and fosters it for social and economic development for the welfare of the people. The Academy also advises the government on scientific and technological matters of vital national interest. The Academy has established links with leading science academies worldwide, and was a founding member of the Federation of Asian Scientific Academies and Societies (FASAS) in 1984. The Academy also became a National Associate of ICSU in 1986.

Bolivian National Academy of Sciences – academia nacional de ciencias de bolivia
(Bolivia)

www.aciencias.org.bo

The National Academy of Sciences, founded in 1960, is a public self-governing autonomous learned society established under a presidential decree. Its mission is to create an appropriate environment for the development of science, technology and innovation in the country. Its present by-laws allow for 56 members, of which at present 53 are appointed. The Academy encourages scientific research by supporting members of the scientific community of Bolivia and carries out research activities and studies through its own institutes, at present: the Energy Institute, the National Astronomical Observatory, the National Museum of Natural History, the Biomedical Institute, the Centre for the Conservation and Sustainable use of Biodiversity and the Centre for the Study of Science, Technology and Innovation.
Figure 3: Selected Resources (continued)

The Academy also acts as an advisory body to government and the private sector, hosting conferences, meetings and lectures. At the same time it promotes public understanding of science through intensive policy dialogues.

**Brazilian Academy of Sciences (ABC)**
(Brazil)

www.abc.org.br/english/index.asp

The Brazilian Academy of Science was founded on May 3rd, 1916, in Rio de Janeiro, as the Brazilian Science Society. In 1921 the name was changed to the one in use today. The Academy focuses on promotion of high scientific standards and the advancement of science and technology in Brazil, encouraging efforts to diffuse education at all levels and contributing to the social well-being of its people. The Academy currently has 536 members including 283 full members, 114 associate members and 136 corresponding members. New members are elected annually by the General Assembly. ABC is frequently requested by the Brazilian government to provide advice on policy and technical issues of interest to the country. Due to the relevance of its affairs, the government has been a major financier of the Academy’s activities, respecting the independence and autonomous character of the Academy.

**Cameroon Academy of Sciences**
(Cameroon)

www.interacademies.net/CMS/2950/4265.aspx

The Academy was founded in 1990 with the goal of promoting the progress of science and technology for the economic, social and cultural development of Cameroon. Specific objectives include promoting research and technological training at the highest level, advising the national government and other national/international policy makers on issues related to science and technology. Membership, is non-discriminatory on the basis of ethnic group or gender and are distributed among the colleges of biological sciences, social sciences and mathematical and physical sciences. Main activities include organizing conferences, seminars, workshops and lectures on issues of scientific interest, awarding prizes to young scholars and researchers, publishing the Academy Journal, contracted research projects with partners, and the awarding of scholarship grants to encourage and motivate students in the sciences.

**Canadian Association of University Research Administrators**
(Canada)

www.caura-acaru.ca

Founded in 1971, the Canadian Association of University Research Administrators is a national association of individuals committed to advancing the profession; to improving the efficiency and effectiveness of research administration at post-secondary institutions, hospitals, and other research institutes; to maintaining a strong presence and coherent voice on key issues relevant to research and to fostering co-operation and links with other organizations active in the management and administration of research.

**Centre National de la Recherche Scientifique/French National Center for Scientific Research**
(France)

www.cnrs.fr/index.html

The French National Center for Scientific Research (CNRS) is a publicly-funded research organization that defines its mission as producing knowledge and making it available to society. CNRS has 26,000 employees (among which 11,600 are researchers and 14,400 are engineers and technical and administrative staff). The CNRS budget was about 2.214 billion euros for the year 2004. CNRS maintains 1,260 service and research units spread throughout the country that cover all fields of research.
Figure 3: Selected Resources (continued)

Chinese Academy of Sciences (CAS)
(China)
www.interacademies.net/CMS/2950/4266.aspx

Founded in 1949, the Chinese Academy of Sciences is the country’s highest academic institution in natural sciences, its supreme scientific and technological advisory body, and a comprehensive national research and development center in natural sciences and advanced technology. It has 90 research institutes, one research-oriented university, and one graduate school located in 13 major cities across the country: Beijing, Shanghai, Nanjing, Hefei, Changchun, Shenyang, Wuhan, Guangzhou, Chengdu, Kunming, Xi’an, Lanzhou, Urumqi (Xinjiang) and Hainan, with more than 43,000 professional staff and 38,000 graduate students. The Academy Divisions of CAS consists of six divisions, with 702 CAS Members and 53 foreign Members.

Columbian Academy of Exact, Physical and Natural Sciences
(Columbia)
www.accefyn.org.co

The Colombian Academy of Sciences was founded in 1929, and in 1933 was recognized as a consultative body of the Colombian government. The Academy is a non-governmental organization with 3 groups of membership: corresponding, full (40 members) and honorary (7 members). It promotes scientific research, and in particular, programs oriented towards enhancing knowledge of the Colombian natural environment and its resources. The improvement of science teaching, at all levels of the Colombian educational system, is another main task. These activities are considered of the highest priority for scientific capacity building in the country. Shortly after its establishment, the Revista was published and each year, the academy delivers two prizes: “The Colombian Academy of Sciences Prize” and “Twas Prizes for Young Scientists in Colombia.”

Community Research and Development Information Service
(Europe)
www.cordis.lu/en/home.html

CORDIS is the information service that keeps you up-to-date with European Community activities and initiatives in the field of Research & Development (R&D) and Innovation. CORDIS is free of charge and offers a wide range of information about EU research and innovation policies, EU funding programmes, initiatives, potential partners, and previous and on-going projects. This service is a powerful knowledge and funding resource for both small and medium sized enterprises and big companies across Europe that wish to increase their innovative potential. CORDIS is part of the Office for Official Publications of the European Communities, the publishing house of the European Union.

Cuban Academy of Sciences
(Cuba)
www.academiaciencias.cu/English/indexen.as

The Academy of Sciences of Cuba, is an official institution of the Cuban State with a national scope, independent and consultative in the area of science, and a continuer of the former Royal Academy of Medical, Physical and Natural Sciences of Havana, founded on May 19, 1861, which is attached to the Ministry of Science, Technology and the Environment.

For the accomplishment of the objective appointed to the Academy of Science of Cuba, it shall have the following powers and functions: (1) contribute to increase the role of science within the national culture and disseminate scientific methods in the society; (2) promote technical-scientific endeavors made by the scientific community with ideas that may contribute with specialized criticisms and provide alternative prospects to the problems of science and technique at home; (3) promote recognition of outstanding scientists and outstanding teams, and disseminate and stimulate
Figure 3: Selected Resources (continued)

observation of the principles of professional ethics by scientists; (4) contribute to increase scientific and technical level of the human potential in the country, particularly in the new generations; (5) contribute to the preservation of the history, traditions and patrimony of science in the country by issuing regulations and doing actions with respect thereof and disseminating the example of Cuban scientists; (6) develop different forms for the dissemination of advances of Cuban science at home and abroad and promote introduction of the said advances into general and people’s education through coordination with different bodies and organizations and also through the improvement of plans and programs of the national system of education; (7) promote activities which shall stimulate interdisciplinary relations and impulse potentials in the territories with less development, with the participation of scientific societies; (8) promote and strengthen inter-academic links with international organizations and the counterparts in other countries; (9) promote scientific sessions for the exchange among professionals working in similar areas and analyze and evaluate the performance of the scientific policy, issuing the relevant recommendations; (10) analyze and evaluate scientific journals published at home, issuing the relevant recommendations; (11) perform as a multi-branch consultative body for the cases of any relevant technical and scientific issue, issuing the pertinent recommendations; (12) create expert teams to evaluate projects or scientific topics upon request of organizations, bodies or institutions; (13) organize debates within the frame of the scientific community to discuss on current issues and disseminate the trends of current scientific thought in the main disciplines of knowledge; and (14) organize events in coordination with different scientific societies and promote participation of Cuban scientists in contests and international awards.

Delegation of the European Commission to the USA

(Europe – USA)

www.eurunion.org/partner/euusrelations/transcorpdocs.htm

This well-maintained and informative website contains important information on — and provides vital links to — a range of EU-US agreements of direct interest to research administrators.

Deutsche Forschungsgemeinschaft/German Research Foundation

(Germany)

www.dfg.de/en/index.html

The Deutsche Forschungsgemeinschaft (German Research Foundation) is the central, self-governing research organisation that promotes research at universities and other publicly financed research institutions in Germany. The DRF serves all branches of science and the humanities by funding research projects and facilitating cooperation among researchers.

Edinburgh Research and Innovation (The University of Edinburgh)

(Scotland)

www.research-innovation.ed.ac.uk

Edinburgh Research and Innovation (ERI) seeks to promote the University of Edinburgh’s research and commercialisation activities to potential research sponsors and collaborators, licensees or investors. These activities include: (1) research programs and centres seeking sponsored/collaboration research agreements; (2) new technologies available for licensing; (3) key research centres and academic experts engaging in consultancy and knowledge transfer; (4) new spin-out or start-up companies requiring investment; (5) supporting entrepreneurs seeking access to the university’s advanced facilities and expertise; (6) incubation centres providing early stage support to new companies; and (7) locating to the University of Edinburgh science & technology park.

European Association of Research Managers and Administrators  
(Europe)  
www.earma.org

EARMA is a not-for-profit organization with a mission to continually improve the quality of research management and administration; set high professional standards by effectively supporting its members; promote the interests of its members at all times; and influence relevant European policies by utilizing the invaluable experience of its members EARMA’s Strategic Objectives are to (1) promote the best interests of our members and influence EU policies; (2) provide coordinated Continued Professional Development (CPD) programmes for our members; (3) provide an effective system of networking and communication for our members; (4) identify, evaluate and disseminate information related to best practice in research management; (5) establish an effective and efficient organisational management infrastructure; and (6) enhance and maintain the financial stability of the association.

European Association for the Transfer of Technology, Innovation and Industrial Information  
(Europe)  
www.tii.org

The European Association for the Transfer of Technologies, Innovation and Industrial Information — or TII — is one of the longest-standing, voluntary, independent associations representing the innovation support and technology transfer professions in Europe. Its 300 members, based in some 30 countries, come from both the private and public sectors and are active in R&D exploitation, business incubation, IP negotiation, technology brokerage and licensing, prototype and new product development, technology audits and innovation management, company spin-off and start-up support. TII is a non-profit association governed by a Board of Management elected by and from the members.

European Industrial Research Management Association  
(Europe)  
www.eirma.org/f3/local_vbindex.php

The European Industrial Research Management Association (EIRMA) is an independent, not-for-profit organisation, and its aim is to enhance innovation through more effective market-oriented research and development. By being member-focused and by providing a platform for these members to discuss ideas and exchange practical experience, EIRMA stays current with the ways managers think about and address their jobs. EIRMA’s activities support companies in benchmarking and improving their innovation processes and in ensuring well-managed and well-organised research and development. These activities also establish EIRMA as a natural first point of contact for policy makers and others seeking the business community’s insight. Founded in 1966, today EIRMA has some 150 member companies. They are based in over twenty countries and they collectively fund the major proportion of business enterprise investment in R&D in Europe.

European Research Consortium for Informatics and Mathematics  
(Europe)  
www.ercim.org

The European Research Consortium for Informatics and Mathematics (ERCIM) aims to foster collaborative work within the European research community and to increase cooperation with European industry. Leading research institutes from seventeen European countries are members of ERCIM.

European Science Foundation
(Europe)
www.esf.org

The European Science Foundation (ESF) is an association of 77 member organisations devoted to scientific research in 30 European countries. Since ESF was established in 1974, it has coordinated a wide range of pan-European scientific initiatives, and its flexible organisation structure means ESF can respond quickly to new developments. In brief, ESF’s core purpose is to promote high quality science at a European level, and is committed to facilitating cooperation and collaboration in European science on behalf of its principal stakeholders (Member Organisations and Europe’s scientific community). This cross-border activity combines both “top-down” and “bottom-up” approaches in the long-term development of science. The Foundation is committed to providing scientific leadership through its networking expertise and by ensuring that there is a European added value to all of its initiatives and projects.

European Union Research
(Europe)
www.europa.eu.int/abouteuropa/faq/q01/index_en.htm

At the European Union’s portal web site — EUROPA — you will find all the information made available on the Internet by the institutions and bodies of the European Union, including the European Parliament, the Council of the Union, the Commission, the Court of Justice, the Court of Auditors, the Economic and Social Committee, the Committee of the Regions, the European Central Bank and the European Investment Bank. EUROPA provides a vast array of information on European integration, particularly concerning the European Union’s objectives, policies and institutional set-up. EUROPA is designed to be as user-friendly as possible in line with the EU institutions’ commitment to openness.

Federal Ministry of Education, Science, Research and Technology/Bundesministerium für Bildung, Wissenschaft, Forschung und Technologie
(Germany)

A source of valuable resources for information — in English or German — on efforts of Germany’s Federal Ministry of Education and Research to broaden participation in education, promote excellence and increase investments in research and development.

Georgian National Science Foundation
(Democratic Republic of Georgia)
www.eng.gnsf.ge

The Georgian National Science Foundation (GNSF) is a Public Legal Entity established by Presidential Decree # 653 in July 17, 2005 to promote the progress of science by funding state scientific grants. Governing Bodies of GNSF are represented by (1) Science Board, (2) Director, and (3) Staff. The Science Board includes scientific and public authorities; establishes the overall policies and oversees the activities, endorses the budget and the report of its implementation, distributes the scholarships, bonuses and fees; represents the results and recommendations of the activities of Foundation to the President of Georgia; publishes the detailed information of scientific and technological development. The mission of the Foundation is to allocate grants from the State Budget on the basis of open, transparent and free competitions.

Ghana Academy of Arts and Sciences  
(*Ghana*)

[www.interacademies.net/CMS/2950/4275.aspx](http://www.interacademies.net/CMS/2950/4275.aspx)

The Ghana Academy of Arts and Sciences (GAAS) was founded in 1959 to promote the study, extension and dissemination of the arts and sciences in Ghana and honour eminent scholars through their election as fellows. The Academy, whose membership currently totals 65, publishes the J.B. Danquah Memorial lectures and Academy proceedings, organizes symposia and meetings, bestows awards on citizens for their distinguished contributions in science, technology and the arts, and maintains contact with other academies in other countries.

Guatemalan Academy of Medical, Physical and Natural Sciences - academia de ciencias medicas, fisicas y naturales de Guatemala  
(*Guatemala*)

[www.interacademies.net/CMS/2950/4237.aspx](http://www.interacademies.net/CMS/2950/4237.aspx)

The Guatemalan Academy of Medical, Physical and Natural Sciences was established in 1945 with the purpose of dissemination of cultural studies, the advancement of science, support of scientific and technological research and incorporation of universal knowledge to human progress. The Academy is a member of the National Council of Science and Technology where it defends the interest of institutions of advanced education and of individual scientists. The Academy has 80 appointed members, 32 in the medical, human and animal health area, 20 in physics, mathematics and engineering, 20 in chemistry, biology, biochemistry and pharmaceutical sciences and 4 in agronomy.

Indian Academy of Sciences  
(*India*)

[www.ias.ac.in](http://www.ias.ac.in)

The Indian Academy of Sciences, founded in 1934, aims at promoting the progress and upholding the cause of science in pure and applied branches. Major activities include publication of scientific journals and special volumes, organizing meetings of the Fellowship and discussions on important topics, recognizing scientific talent, improvement of science education and taking up other issues of concern to the scientific community.

Indian Institute of Science  
(*India*)

[www.iisc.ernet.in](http://www.iisc.ernet.in)

Founded in 1909, the Indian Institute of Science (IISc) has grown into a premier institution of research and advanced instruction, with more than 2000 active researchers working in almost all frontier areas of science and technology. IISc is an institute of higher learning and is constantly in pursuit of excellence. It is one of the oldest and finest centres of its kind in India, and has a very high international standing in the academic world as well.

Indonesian Academy of Sciences  
(*Indonesia*)

[www.interacademies.net/CMS/2950/4278.aspx](http://www.interacademies.net/CMS/2950/4278.aspx)

The Indonesian Academy of Sciences was established in 1990. At present it has 41 members, of which 9 are honorary members. The academy currently has 5 scientific committees organized as follows: Committee on Basic Sciences; Committee on Engineering; Committee on Medical Sciences; Committee on Social Sciences; and Committee on Art and Culture.
Figure 3: Selected Resources (continued)

Institute of Nanotechnology
(United Kingdom)
www.nano.org.uk/ion.htm

The Institute of Nanotechnology (originally the Centre for Nanotechnology founded by Ottilia Saxl in 1994) was one of the world’s first nanotechnology information providers, and is now recognised as a global leader. IoN works closely with governments, universities, researchers, and companies worldwide on developing and promoting all aspects of nanotechnology. It also serves as a key organizer of international scientific events, conferences, and educational courses designed to encourage nanotechnology uptake by industry, as well as stimulating interest in less developed countries.

InterAcademy Council
(International)
www.interacademycouncil.net

The InterAcademy Council (IAC) was created by the world’s science academies to mobilize the best scientists and engineers worldwide to provide high quality advice to international bodies — such as the United Nations and the World Bank — as well as to other institutions. In a world where science and technology are fundamental to many critical issues — ranging from climate change to genetically modified organisms and the crucial challenge of achieving sustainability — making wise policy decisions has become increasingly dependent on good scientific advice. IAC is client-driven and works on a project-by-project basis. It has developed mechanisms and procedures to guarantee the scientific quality of its reports, the policy-relevance of its recommendations and the absence of regional or national bias.

International Association for Management of Technology
(International)
www.iamot.org

The International Association for Management of Technology (IAMOT) offers its members association with professionals in the field. There is particularly close interaction during the annual conference. IAMOT offers its members a discounted registration fee for the conference. Members have access to all information posted on our website and the ability to post announcements. IAMOT publishes a newsletter which contains current information on the field of Management of Technology from all over the world. IAMOT also offers its members discounts for certain professional journals, and offers priority status in receiving reports and publications sponsored by IAMOT. Finally, IAMOT offers its members the benefit of participating in an Association which supports research and application projects, world wide, in cooperation with government or private organizations or in its own initiative, an association which encourages education in the field of Management of Technology, and acts as an information resource center in the field.

International Association for Social Science Information Service and Technology
(US – International)
www.iassistdata.org

The International Association for Social Science Information Service and Technology (IASSIST) is an international organization of professionals working in and with information technology and data services to support research and teaching in the social sciences. Its 200 members are from a variety of workplaces, including data archives, statistical agencies, research centers, libraries, academic departments, government departments, and non-profit organizations.
Figure 3: Selected Resources (continued)

International Council for Science: Committee on Data for Science and Technology
(International)
www.codata.org/about/who.html

The Committee on Data for Science and Technology (CODATA) is an interdisciplinary Scientific Committee of the International Council for Science (ICSU) which works to improve the quality, reliability, management and accessibility of data of importance to all fields of science and technology. CODATA is a resource that provides scientists and engineers with access to international data activities for increased awareness, direct cooperation and new knowledge. CODATA was established 33 years ago by ICSU to promote and encourage, on a world-wide basis, the compilation, evaluation and dissemination of reliable numerical data of importance to science and technology. Today 23 countries are members, and 14 International Scientific Unions have assigned liaison delegates.

CODATA is concerned with all types of data resulting from experimental measurements, observations and calculations in every field of science and technology, including the physical sciences, biology, geology, astronomy, engineering, environmental science, ecology and others. Particular emphasis is given to data management problems common to different disciplines and to data used outside the field in which they were generated. CODATA’s objectives are: (1) The improvement of the quality and accessibility of data, as well as the methods by which data are acquired, managed, analysed and evaluated, with a particular emphasis on developing countries; (2) The facilitation of international cooperation among those collecting, organizing and using data; (3) The promotion of an increased awareness in the scientific and technical community of the importance of these activities; and (4) The consideration of data access and intellectual property issues. In short, the reason for CODATA is to help foster and advance science and technology through developing and sharing knowledge about data and the activities that work with data.

International Intellectual Property Institute
(USA – International)
www.iipi.org

The International Intellectual Property Institute (IIPI) is a not-for-profit 501(c)(3) corporation located in Washington, DC. As an international development organization and think tank, IIPI is dedicated to increasing awareness and understanding of the use of intellectual property as a tool for economic growth, particularly in developing countries. Since 1998 the Institute has been engaged in a wide range of activities both abroad and within the United States, including critical research, public education, policy and training workshops, technical assistance, institution building and consultative services.

The work of the Institute focuses on establishing constituencies of policymakers, business leaders and judicial stakeholders in the developing world who understand that effective, enforceable intellectual property rights can be a tool to promote economic development in their own countries, and not simply a nuisance or legal obligation. Because we live in a world where wealth generation is increasingly the result of ideas rather than products, it is critical to assist developing countries in moving away from commodities-based economies through the creation of thriving industries rooted in the intellectual assets of their citizens. The Institute seeks to increase awareness and understanding of the use of intellectual property — patents, copyrights and trademarks, trade secrets, industrial designs, etc. — as a tool for sustainable economic growth. With support from private corporations, the United States and foreign governments and other international development organizations, IIPI is working to increase the capacity of human intellectual assets and creativity to fuel economic growth and improve standards of living.
Figure 3: Selected Resources (continued)

International Network of Research Management Societies (INORMS)
(International)
www.inorms.org

INORMS was formed in 2001 to bring together research management societies and associations from across the globe. Its purpose is to enable interactions, sharing of good practice, and joint activities between the member societies, to the benefit of their individual memberships. Each member society has its own distinct remit, constitution, membership and geographical base, but we each face similar issues. The nature of research management and administration is changing, and it is becoming more professional. The economic and political imperatives and pressures are common across the globe. The network enables the officers of the member societies to compare their national or regional issues, and to learn from each other. Through INORMS, the network is able to transfer training course structure and content, adopt comparable support mechanisms, and jointly develop training materials. The objectives of INORMS are: (1) to internationalise the body of knowledge on research management; (2) to exchange best practice; and (3) to develop international approaches to supporting the research enterprise.

Israel Science Foundation
(Israel)
www.isf.org.il

The Israel Science Foundation (ISF) is now Israel’s predominant source of competitive grants funding for basic research. Its roughly $50 million annual budget funds 1,200 grants a year, providing two-thirds of all such funds. Every year, some 10,000 expert reviewers from Israel and abroad are involved in peer-reviewing the scientific merit of its proposals. The ISF awards grants in all fields of: Exact Sciences and Technology; Life Sciences and Medicine; Humanities and Social Sciences to researchers at Israeli universities, other centers of higher education, research centers and medical centers. Most funds (96%) are provided by the Government of Israel via the Planning and Budgeting Committee (PBC) of the Israel Council for Higher Education, under a long-term agreement.

Joint Research Councils
(United Kingdom)
www.rcuk.ac.uk

Research Councils UK (RCUK) is a strategic partnership through which the UK’s eight Research Councils work together to champion the research, training and innovation they support. The Research Councils are the main public investors in fundamental research in the UK with interests ranging from bio-medicine and particle physics to the environment, engineering and economic research. RCUK works alongside the Office of Science & Technology (OST) to support the UK’s finest academic researchers and to ensure the best investment of public money in research. The partnership is led by the RCUK Executive Group which comprises the eight Chief Executives of the Research Councils.

Jordanian Royal Scientific Society
(Jordan)
www.rss.gov.jo/index.html

The aims and functions of the Royal Scientific Society are to (1) support the development process in Jordan through R&D to strengthen the role of SMEs in Jordan’s economy; (2) promote itself as a reference technical institution in Jordan and the region; (3) expand its role as a certification body for both skilled manpower and industrial products; (4) strengthen co-operation with similar institutions to promote mutual interests; (5) develop human resources; (6) encourage and support the start-up, incubation and development of innovation-led knowledge-based businesses; (7) carry out studies and applied scientific research related to industry and environment, and to the various areas of development; (8) conduct economic and technical feasibility and analytical studies with regard to
development projects that fall within RSS scope of competence; (9) carry out joint research with scientific, production-oriented and service institutions at the national, regional and international levels; (10) offer technological consultations and services, calibration and conformity assessment of locally produced and imported products; (11) develop its laboratories, provide them with up-to-date equipment and orient them towards serving the objectives of scientific and technological research and the needs of public and private sectors; (12) co-operate with agencies concerned with setting national technical standards and specifications and provide technical services that facilitate their application and ensure proper quality control of goods and materials; (13) upgrade human capabilities and technical skills through the provision of distinctive training opportunities; (14) contribute to the transfer and adaptation of appropriate technologies to the benefit of industrial and socio-economic development in Jordan; (15) cooperating with local, regional and international organizations in science and technology for the purpose of networking and joint venturing; and (16) offer research facilities to entrepreneurs to enable them to start technological research, joint development and new businesses.

Kenya National Academy of Sciences
(Kenya)
www.knas.g3z.com

The objectives and purposes for which the Academy is constituted are to (1) promote the advancement of science and technology by establishing and enhancing standards of scientific and technological endeavour and achievement in Kenya, and to recognize outstanding contributions in the field of science and technology; (2) facilitate coordination among the different groups of scientists and the potential users of science and technology; (3) improve cooperation through international agreements and programmes between Kenyan scientists and the international scientific community. To promote the creation of scientific bodies in Kenya, provide professional guidance in their activities, and administer and improve resource utilization for purposes of research and projects; (4) provide the Government with scientific and technological information for policy formulation, execution and ways in which scientific projects may be instituted, carried out or revised; (5) synthesize and disseminate knowledge through publication of scientific and technological information; (6) cooperate with the National Council for Science and Technology [NCST] in the formulation of policies and programmes designed to encourage the development and application of science and technology for national development; and (7) organize, participate or collaborate in the organization of scientific meetings within and outside Kenya; to hold symposia, and to arrange visits for scientists from other countries to Kenya and vice versa.

Kingdom of Morroco – Hassan II Academy of Science and Technology
(Morroco)
www.academie.hassan2.sciences.ma/an/index.php

The Hassan-II Academy of Science and Technology is a dynamic organisation that seeks to achieve the general objectives set above and mainly the followings: (1) ensure that scientific and technical research ranks high among the values upheld by the nation; (2) propose to the authorities the relevant routes and means to kindle the scientific spirit within the Moroccan society; (3) provide local scientists and researchers with a special forum for debate and interaction; (4) foster high-level communication channels between national scientists and the international scientific elite; (5) work for the dissemination of science by organizing panels and scientific events, publishing relevant material, and opening science libraries; (6) review and evaluate the scientific findings and innovations submitted for its consideration; (7) ensure that the scientific and technical research exercises are made within the moral and ethical prescriptions; (8) contribute at setting the general orientations for the scientific and technological development; (9) put forward recommendations about priorities and how to achieve the nation’s targets in terms of research; (10) contribute to the elaboration of scientific human resources
Figure 3: Selected Resources (continued)

Policy capable of attracting high-profile scientists and, more importantly, promoting an adequate intellectual and material environment so as to provide talented Moroccan researchers who are sought or employed by foreign research laboratories and centers, with an efficient incentive to stay in their country; (11) monitor continuously the progress made in the field of technology for the benefit of the nation; (12) carry out studies, analyses and surveys in connection with research activities; (13) encourage the implementation of research programs which have been set in accordance with national priorities, determine their relevance and scientific value, and, when necessary, allocate them appropriate financial resources; (14) assess the implementation of research programs sponsored by the Academy, and to take all the relevant steps to enhance the resources of existing and projected research laboratories and other facilities; (15) propose to the relevant authorities the modalities on scientific and technical cooperation for participating in regional or international research programs; (16) provide advises on the evaluation of the activities carried out by the national research institutions involved in these programs; and (17) help to establish the adequate mechanisms for consultation, on a permanent basis, between the research and technical innovation community and its social and economic counterparts.

Korean National Academy of Sciences (KNAS)
(Korea)

The National Academy of Sciences, Republic of Korea, is the senior national organization of distinguished Korean scientists and scholars. Its primary objective is to promote learning and research in all areas of sciences by conferring membership and preferential treatment to those who have made outstanding contributions to the advancement of sciences and learning. The Academy consists of 150 Fellows who are selected by their peers for outstanding contributions to the sciences and education. The Academy is dedicated to (1) fostering the highest levels of learning and research in all areas of scholarship by conferring the National Academy of Sciences Award; (2) making available its members’ broad and varied knowledge to evaluate and advise on social, cultural, economic and scientific issues for the benefit of Korea; (3) promoting Korean scholarship and accomplishments internationally through active exchanges with other national academies; and (4) suggesting policy recommendations of the promotion of science to the national government.

Please visit the MAST website for complete information on the group’s activities.

Mexican Academy of Sciences – academia mexicana de ciencias  
(Mexico)  
www.amc.unam.mx

The Mexican Academy of Sciences was founded in 1959 as a non-governmental non-profit organization of distinguished scientists, in all fields of research. Since that date, the Academy has grown in membership and influence, and since 2003, has more than 1,900 members in exact, natural and social sciences. The Academy’s mission is to (1) serve as a spokesman for the scientific community; foster the development and consolidation of the Mexican scientific community; promote
scientific research, training and dissemination in Mexico; and (2) promote exchanges with scientific organizations and communities in other countries. The Academy’s main activities include: (1) science promotion and dissemination; (2) awards and incentives for scientific research; studies; (3) exchange programs; (4) meetings and symposia; (5) national and international relations; and (6) relations with the Mexican Legislative Congress.

Ministry of Education, Culture, Sports, Science and Technology
(Japan)
www.mext.go.jp/english

The best site for valuable information on Japan’s Ministry of Education, Culture, Sports, and Science and Technology (MEXT). Indeed, MEXT is the government agency primarily responsible for research and development. Based on the “Second Science and Technology Basic Plan,” the government’s basic policy on science and technology for the five year period from FY2001, MEXT promotes comprehensive research and development in order to accomplish the highest creative achievements in worldwide comparisons. The Plan epitomizes the ideal form of the nation from the viewpoint of cultivating new wisdom through science and technology, supporting national life and economic activity and realizing international contribution. Furthermore, in order to realize these objectives, the Plan outlines a planned approach to prioritized policy, centered upon the focused, strategic promotion of research and development, as well as reform in the science and technology system. Moreover, academic research conducted primarily in universities and other institutions aims to explore the truth in all academic fields, from the humanities and social sciences to the natural sciences. Endorsing the three desirable goals of “promoting research of the highest worldwide standards,” “creation of new academia in the 21st century” and “contribution to society,” and in view of the “Second Science and Technology Basic Plan” as well as deliberations at the Council for Science and Technology, MEXT is promoting diverse academic research in a wide spectrum of disciplines according to the following basic direction of promotion: (1) respect for the autonomy of researchers; (2) progress in all academic fields; and (3) integrated promotion of education and research.

Mongolian Academy of Sciences (MAS)
(Mongolia)
www.mas.ac.mn/en/index.php?option=com_frontpage&Itemid=1

Knowledge has always been of high regard and great value for Mongolians. It was in the 13th century, when Mongolians, in particular the Great Khaan Khubilai, established the first academic organization of the nation, “The Academy of Worthies.” Mongolia’s first center of modern sciences came into being in 1921 when the Government of newly independent Mongolia issued a resolution declaring the establishment of the “Institute of Literature and Scripts,” which was later upgraded into “Institute of Sciences” and then “Institute of Sciences and Higher Education.” In 1961, it was finally reorganized as “the Mongolian Academy of Sciences” (MAS). At present, under its direct supervision the MAS operates 16 research Institutes and Centers, the Ulaanbaatar University. Furthermore in joint operation it supervises 9 research and production corporations.

National Academy of Exact, Physical and Natural Sciences / Academia Nacional de Ciencias Exactas, Físicas y Naturales (ANCEFN)
(Argentina)
www.ancefn.org.ar/academia/english.html

The National Academy of Exact, Physical and Natural Sciences (Academia Nacional de Ciencias Exactas, Físicas y Naturales, ANCEFN) was established in 1874 to promote science in Argentina and honor scientists primarily through their election as full voting members. At present, the Academy has 33 full voting members, 29 corresponding national members, 59 corresponding foreign members, and 6 honorary members. The Academy bestows awards to scientists for their distinguished contributions.
Figure 3: Selected Resources (continued)

in diverse areas of science and technology and has exchange programs with academies, societies, and learned bodies in several countries. The Academy publishes journals and reports and recognizes young scientists through an awards scheme, and arranges seminars and symposia. The Academy also grants fellowships to university students.

National Academy of Sciences (NAS)
(United States)
www.nas.edu/

The National Academies bring together committees of experts in all areas of scientific and technological endeavor. These experts serve pro bono to address critical national issues and give advice to the federal government and the public. Four organizations comprise the Academies: (1) National Academy of Sciences, (2) National Academy of Engineering, (3) Institute of Medicine, and (4) National Research Council.

National Academy of Science and Technology (NAST)
(Philippines)
www.interacademies.net/CMS/2950/4291.aspx

The National Academy of Science and Technology (NAST) was created in 1976 to recognize outstanding achievements in science and technology and to serve as a reservoir of competent scientific and technological manpower for the country. In 1982 the Academy became the advisory body to the President of the Republic of the Philippines on policies concerning science and technology. Current membership is 51 academicians, grouped into the following divisions: Agricultural Sciences; Biological Sciences; Chemical, Mathematical, and Physical Sciences; Engineering Sciences and Technology; Health Sciences; and Social Sciences.

National Association of College and University Attorneys
(United States)
www.nacua.org

The mission of the National Association of College and University Attorneys (NACUA) is to advance the effective practice of higher education attorneys for the benefit of the colleges and universities they serve. NACUA is organized to assist higher education attorneys in representing and advising their client institutions. To achieve this purpose, NACUA and its member volunteers will: (1) Help member attorneys provide high quality and responsive legal services and information to institutions of higher education; (2) Deliver services that allow member attorneys to provide effective counsel to colleges and universities in the areas of administration, policy and ethics; (3) Support a learning environment for professional development of its member attorneys and help them to maintain the highest professional and ethical standards; and (4) Work to improve the understanding of legal issues and to enhance the role of NACUA and its member attorneys in the higher education community. NACUA and its members are committed to practicing and promoting the core values of quality, service, civility, collegiality, diversity, inclusiveness and respect.

National Research Council/Conseil national de recherches Canada
(Canada)
www.nrc-cnrc.gc.ca/main_e.html

NRC is a Government of Canada organization, and its mandate — set out in the National Research Council Act (NRC Act) — authorizes NRC is responsible for: Undertaking, assisting or promoting scientific and industrial research in different fields of importance to Canada; Establishing, operating and maintaining a national science library; Publishing and selling or otherwise distributing such scientific and technical information as the Council deems necessary; Investigating standards and methods of measurement; Working on the standardization and certification of scientific and technical
apparatus and instruments and materials used or usable by Canadian industry; Operating and administering any astronomical observatories established or maintained by the Government of Canada; Administering NRC’s research and development activities, including grants and contributions used to support a number of international activities; and Providing vital scientific and technological services to the research and industrial communities. This mandate is discharged to a great extent through the operation of the NRC Industrial Research Assistance Program, the NRC Canada Institute for Scientific and Technical Information, and the Canadian Technology Network. For more information, visit the Justice Canada website at www.laws.justice.gc.ca/en/N-15/index.html.

National Research Council/Consiglio Nazionale delle Ricerche
(Italy)
www.cnr.it/sitocnr/Englishversion/Englishversion.html

The National Research Council (CNR) is a public organization; its duty is to carry out, promote, spread, transfer and improve research activities in the main sectors of knowledge growth and of its applications for the scientific, technological, economic and social development of the Country. To this end, the activities of the organization are divided into macro areas of interdisciplinary scientific and technological research, concerning several sectors: biotechnology, medicine, materials, environment and land, information and communications, advanced systems of production, judicial and socio-economic sciences, classical studies and arts. CNR is distributed all over Italy through a network of institutes aiming at promoting a wide diffusion of its competences throughout the national territory and at facilitating contacts and cooperation with local firms and organizations. From the financial point of view, the main resources come from the State, but also from the market: even 30% of its balance sheet, an extraordinary result, is the result of revenues coming from external job orders for studies and activities of technical advice as well as from agreements with firms, contracts with the European Union and with the other international organizations.

Nepal Academy of Science and Technology
(Nepal)
www.nast.org.np/

Nepal Academy of Science and Technology (NAST) is an independent apex body established in 1982 to promote of science and technology in the country. The Academy is entrusted with four major objectives: advancement of science and technology for all-round development of the nation; preservation and further modernization of indigenous technologies; promotion of research in science and technology; and identification and facilitation of appropriate technology transfer.

Pakistan Academy of Sciences
(Pakistan)
www.paspk.org

The aims and objectives of the Pakistan Academy of Sciences is to (1) promote higher studies and research on pure and applied sciences in Pakistan and to disseminate scientific knowledge; (2) formulate standards of scientific effort and achievement in Pakistan and to recognize outstanding contributions to the advancements in science; (3) publish and assist in the publication of scientific Proceedings, Journals, Transactions, Monographs, Books and other scientific literature; (4) establish and maintain association and relations among Pakistani scientists and the international groups and unions of scientists and organize meetings including coordination of scientific activities of Pakistani and overseas scientists; (5) award grants, scholarships, fellowships, prizes and medals for scientific research; (6) undertake such scientific work of national or international importance as the Academy may be called upon to perform by the Government of Pakistan; and (7) have advisory and consultative status with the Ministries and Divisions of the Government dealing with scientific and technical matters, and to represent internationally the scientific work of Pakistan; (8) secure and 
administer funds, endowments and other grants for the promotion and development of scientific research or projects of a scientific nature, and for the attainment of the aims and objectives of the Academy. And (9) To do all other lawful things that the Academy may consider conducive to or necessary for the attainment of its aims and objectives.

Palestine Academy of Science and Technology
(Headquarters in Jerusalem and branches in Ramallah and Gaza)
www.palestineacademy.org/main.htm

The Academy aims at institutionalizing scientific and technological research in Palestine, promoting scientific discovery and innovative technological advances, in addition to fostering the use of science and technology in various domains. Furthermore, it aspires to obtain a fundamental role in coordinating scientific efforts between the private and the public sectors in order to encourage a strong national economy that is globally competitive through the support of the Palestinian science and technology base and through partnerships with governmental, non-governmental, local and international bodies.

Peruvian Academy of Exact, Physical and Natural Sciences
(Peru)
www.cerosis.org

The Academy of Exact, Physical and Natural Sciences was founded in Lima in 1938 by 37 founding fellows, under the auspices of the University of San Marcos. In 1939, the Government of Peru, considering that the academy was called to assume a guiding role in national activities, and the high scientific and cultural values it embodied, awarded official recognition. In 1966 the academy name was modified to National Academy of Sciences of Peru with the main role to perform advisory functions at the Government’s request, in matters related to its expertise. The NAS of Peru has a maximum of 40 fellows. Plans are underway to amend the statutes and introduce the category of senior academician.

Research-Africa.net
(Africa)
www.research-africa.net/getPage.cfm

Research Africa is for African government and institutional policy makers, researchers and research managers. Research Africa strengthens the African science and technology policy-making, and research community, and connects them with the world scientific community.

Research Promotion Bureau Ministry of Education, Culture, Sports, Science and Technology
(Japan)
www.mext.go.jp/english/shinkou/index.htm

The Research Promotion Bureau is responsible for the formulation of policies to promote cross-field research such as encouraging inventions, promoting the application of research results and cooperation among industries, academia and government, improving the research environment and R&D infrastructure by, for example, enhancing the research information infrastructure, and performing work relating to fundamental research. The Bureau also formulates policies to promote scientific study, including the establishment of scientific institutions and the provision of assistance for scientific research, and performs work relating to basic and fundamental research and development in such areas as IT, life science, and quantum and radiation research.

Nigerian National Academy of Sciences
(Nigeria)
www.interacademies.net/CMS/2950/4298.aspx

The Nigerian Academy of Sciences (NAS) was inaugurated in 1977 after five years of renewed effort by concerned Nigerian scientists under the auspices of the Science Association of Nigeria (SAN) to
Figure 3: Selected Resources (continued)

overcome the obstacles that plagued previous efforts of about 20 years to establish a formal Academy of Science. The academy membership is currently 100, and an average of 5 new members are elected each year. The main objectives of the academy are to (1) promote the growth, acquisition and dissemination of scientific knowledge; and (2) facilitate its use in the solution of major problems of national interest.

Royal Society of New Zealand
(New Zealand)
www.rsnz.org

The Royal Society of New Zealand is an independent, national academy of sciences, a federation of some 60 scientific and technological societies, and individual members. The Society promotes a critical awareness of science and technology in schools, in industry and in society. The Society invests in excellence in people and ideas, and puts them to work as an inspiration to New Zealanders. The Society administers several funds for science and technology, publishes 8 journals, offers science advice to government, and fosters international scientific contact and co-operation.

RSC: The Academies of Arts, Humanities and Sciences of Canada/
SRC : Les Académies des arts, des lettres et des sciences du Canada
(Canada)
www.rsc.ca/index.php?lang_id=1

RSC: The Academies of Arts, Humanities and Sciences of Canada, is the senior national body of distinguished Canadian scientists and scholars. Its primary objective is to promote learning and research in the arts and sciences. The Society consists of approximately 1,800 Fellows: men and women from across the country who are selected by their peers for outstanding contributions to the natural and social sciences and in the humanities. The RSC is a dedicated to (1) making available its members’ broad and varied knowledge to evaluate and advise on social, cultural, economic and scientific issues for the benefit of Canada, through projects, the organization of annual symposia and its publications; (2) assessing issues of importance to Canadians and providing independent expert advice, notably to government, on matters of public interest; (3) fostering the highest levels of learning and research in all areas of scholarship and recognizing outstanding achievements in research and innovation by electing new Fellows and awarding medals and prizes; and (4) promoting international collaboration and Canadian scholarship and accomplishments internationally through active exchanges with other national academies.

Russian Science News Agency
(Russia)
www.informnauka.ru/eng/index.shtml

Informnauka is a science news agency formed in September 1999. The aim of the agency is to keep journalists informing of science-related events and research progress in Russia. Information presented by Informnauka is used for publication by many Russian national newspapers, journals, and television and radio companies. Informnauka was established by Chemistry and Life, a magazine of popular science with thirty-five year history. Informnauka has connections with research groups in academic institutions, state research centers and universities all over the Russian Federation and CIS countries.

Science Council of Japan (SCJ)
(Japan)
www.scj.go.jp/en/

The Science Council of Japan was established in January 1949 as a “special organization” under the jurisdiction of the Prime Minister for the purpose of promoting and enhancing the field of science, and having science reflected in and permeated into administration, industries and people’s lives. Its two
functions are: (1) To deliberate on important issues concerning science and help solve such issues; and (2) To make coordination among scientific studies to achieve higher efficiency. The SCJ consists of 210 members and some 2,000 associate members. The SCJ organization comprises a General Assembly, an Executive Board, three Section Meetings (Humanities and Social Sciences, Life Sciences, and Physical Sciences and Engineering), 30 committees based on fields of specialties, five Administrative Committees for operation, and issue-oriented ad hoc committees.

**Scottish Funding Council**  
*(Scotland)*  
[www.sfc.ac.uk/](http://www.sfc.ac.uk/)

The Scottish Further and Higher Education Funding Council (SFC) was formally established on 3 October 2005. The new Council creates a single body providing a strategic overview of tertiary education in Scotland and will secure a more coherent system of high-quality learning and research. In promoting further and higher education in Scotland, the new Council will support colleges and universities in the: Delivery of high quality programmes for learners; Investment in modern facilities for learning and research; and Being flexible and responsive in allowing access to lifelong learning for all.

**Scottish Research Information System**  
*(Scotland)*  
[www.scottishresearch.com](http://www.scottishresearch.com)

The Scottish Research Information System (SRIS) is a starting point for finding out about Scotland’s vigorous research, development, consultancy and innovation resources, and keeping pace with innovation. SRIS brings together the powerful capabilities of universities and institutes in Scotland, and the vital interests of organizations across the world that can make good use of these resources.

**Senegalese Academy of Sciences/académie des sciences et techniques du sénégal**  
*(Senegal)*  
[www.interacademies.net/CMS/2950/4242.aspx](http://www.interacademies.net/CMS/2950/4242.aspx)

The Senegalese Academy of Sciences was set up in November 1999 to promote sciences and technology, and assist the government in defining its scientific and technological policy. Its annual assembly’s opening session is chaired by the Head of State, Grand Patron of the Academy, and 60 seats are available for the three sections: (1) medical sciences; (2) sciences and technology; and (3) agriculture and veterinary medicine. Current academy activities include the identification of expert scientists, promotion of science to the general public through symposia, lectures and prizes, and the use of regional and international networking.

**Singapore National Academy of Sciences (SNAS)**  
*(Singapore)*  
[www.interacademies.net/CMS/2950/4313.aspx](http://www.interacademies.net/CMS/2950/4313.aspx)

The Singapore National Academy of Science is an umbrella organization for the premier scientific societies in Singapore. Established in 1967, its principal mission objective is the promotion of science and technology in Singapore. The 9 scientific societies under the aegis of the Academy are: Institute of Physics Singapore; Singapore Association for the Advancement of Science; Singapore Institute of Biology; Singapore Mathematical Society; Singapore National Institute of Chemistry; Singapore Institute of Statistics; Singapore Society for Microbiology & Biotechnology; Singapore Society for Biochemistry & Molecular Biology; and the Science Teachers Association of Singapore.

Society of Research Administrators International
(USA – International)
www.srainternational.org/sra03/index.cfm

According to SRA’s Mission Statement: The society is an international organization dedicated to the education and professional development of research administrators, as well as the enhancement of public understanding of the importance of research and its administration.

Southern African Regional Universities Association
(Southern Africa)
www.sauvca.org.za/sarua/about_sarua

Excellence, growth and sustainability of university education, research and development will be a leading indicator of future growth of SADC regional economies and the quality of life of their people. The need for greater co-operation and collaboration within higher education in the SADC region has been a long-standing one. The Southern Africa Regional Universities Association (SARUA) brings together the leadership of 43 universities within the SADC region in order to achieve this reality. Launched in February 2005, SARUA will be the first association of its kind in Africa to simultaneously address the capacity and research needs of higher education institutions and the social, cultural and economic development priorities of the region.

Southern African Research and Innovation Management Association
(Southern Africa)
www.sarima.co.za

The objectives of the South African Research and Innovation Management Association (SARIMA) are: (1) Professional development and capacity building of those involved in managing research and innovation systems; (2) Promotion of best practice in the management and administration of research and innovation to create value for education, public benefit and economic development; (3) Creation of awareness in academic and public forums of the value of a stronger research and innovation system and the contribution it can make to economic and social development; (4) Advocacy of appropriate national and institutional policy in support of research and innovation and participation in the development and testing of policy; and (5) Advancement of science, technology and innovation, including addressing the asymmetries in access to, and diffusion of, knowledge between “North and South.” SARIMA operates at an institutional, national and international level, as well as across the research value chain, from research management to commercialization of research. SARIMA interacts and liaises with other organisations as required.

Sri Lanka National Academy of Science
(Sri Lanka)
www.interacademies.net/CMS/2950/4293.aspx

The National Academy of Sciences, Sri Lanka is a high-level, non-governmental scientific body, established in 1976. It is a body of eminent scientists who study fundamental issues relating to scientific developments in the country and issues of national importance, as well as the links between science and economic development. The main objectives of the Academy are to report on issues in which scientific and technological considerations are paramount to national interest; advise on activities related to the application of science and technology to national development; report on the management and rational utilization of the natural resources of Sri Lanka so as to ensure optimal productivity, consistent with the continued use of the biosphere. Currently, there are 105 fellows. The Academy has no permanent staff, but secretarial and other staff are recruited on an ad hoc basis.
Figure 3: Selected Resources (continued)

Sudanese National Academy of Sciences (SNAS)
(Sudan)
www.interacademies.net/CMS/2950/7823.aspx

The Sudanese National Academy of Sciences is a non-governmental organization currently located at the University of Khartoum. The main objectives of the Academy are to (1) raise the standard of and further develop theoretical and applied research in Sudan; (2) act as consultant and render advice to the Government and the private sector in the areas of science, education, technology and scientific research; (3) help in the dissemination of knowledge; (4) raise community awareness of the importance of science and technology for economic and social development; (5) collaborate with similar institutions in the developed and developing countries; and (6) offer scholarships, incentives and prizes in the area of scientific research.

Swiss Association of Research Managers and Administrators
(Switzerland)
www.sarma.ch/mission.htm

The Swiss Association of Research Managers and Administrators (SARMA) is a non-profit national network of professionals committed to improving the effectiveness, competitiveness and quality of research and innovation management in Switzerland. In today’s complex economic, social and political environment, R&D management and administration increasingly require professional competences that go way beyond scientific know-how. Ever since its foundation in 1999, SARMA’s principal objective has been to support capacity building in order to improve the R&D manager’s role as an interface between management and research, to foster professional skills and to eliminate barriers. With over 100 individual and 8 top ranking institutional members in both the public and the private sectors, SARMA has established itself as a well respected and widely known association for professionals in Switzerland who aspire to excel in their field. The Association is directed by the Board and the Programme Committee (PC), and governed by the General Assembly. The Board and the PC develop strategies and policies, and define priority topics, considering the best way to serve the membership in this complex professional area.

Tanzania Academy of Sciences (TAAS)
(Tanzania)
www.interacademies.net/CMS/2950/7061.aspx

Please visit the TAAS website for complete information about the organization.

Thai Academy of Science and Technology
(Thailand)
www.tast.or.th/index.html

The Thai Academy of Science and Technology (TAST) was established in 1997. It was organised by a group of scientists and technologist whose works have been continuously recognised and whose experiences and interests are vital to the development of the nation as a whole. TAST is a “non-government agency”. This is to ensure there is justice in giving recommendations to the government, organizations, and the public as a whole. TAST realises that the nation’s matters in science and technology have a profound impact on the nation as a whole. Therefore, TAST has made this its duty and priority to pick issues or matters that are currently in the eyes of the public and perform careful analyses by gathering additional information, doing research, and providing opportunities for discussion and criticism in order to bring to conclusion, further the study of, or formalise plans for the future. The Academy’s objectives are (1) to promote and be the driving force for S&T development in order to enhance the nation’s efficiency in the following areas: Environmental Management; competitiveness in the world market; quality of life, society and environment; and sustainable development of the nation; (2) study and analyse problems and barriers to S&T; (3) give science-related
Figure 3: Selected Resources (continued)

information, options and recommendations to the government and the public as a whole; (4) promote efficiency in managing and developing technology-related industry; (5) ensure that the works at Thai scientist and technologists are beneficial to the development of the nation; (6) promote harmony and integration between science & technology and other disciplines including the nation’s culture; (7) promote cooperation among associations, foundations and academic organisations in the development of human resources in the field of S&T; (8) create links with international organisations whose objectives are similar to TAST; and (9) NOT be involved in any political agenda.

**Trade Association of European Specialized Research and Technology Organizations (Europe)**

www.earto.org/home

The Trade Association of European Specialized Research and Technology Organizations (EARTO) is the trade association of Europe’s specialised research and technology organisations. Its members make a major contribution to strengthening Europe’s economic performance by supporting product and process innovation in all branches of industry and services, thereby raising the international competitiveness of European firms. EARTO represents the views of its members to European decision-makers. It publishes policy papers and organises briefing sessions. EARTO members sit on the European Union’s influential European Research Forum and Programme Advisory Committees. EARTO is a forum for exchange and co-operation between its members. It organises working groups, task forces, seminars and conferences. Members plan and perform major European R&D projects. Through NEXUS they pool their expertise to tackle major international multi-sectoral and multi-disciplinary assignments. EARTO provides its members with information about European policies and programmes, obtains official documents, and arranges meetings with European officials.

**Uganda National Council for Science and Technology (Uganda)**

www.uncst.go.ug/site/index.php

The UNCST mandate is to (1) develop and implement policies and strategies for integrating science and technology (S&T) into the national development policies; (2) advise the Government on policy matters for promoting S&T; and (3) coordinating and guiding national research and development in Uganda. The UNCST vision is “to be the centre of excellence for the management and integration of science and technology into the national development process.” UNCST’s mission is “to provide effective and innovative leadership in the development, promotion and application of science and technology and its integration in sustainable national development”. UNCST’s core values are: (1) commitment and hard work embracing team work to ensure efficient service/product delivery; (2) a high level of Integrity; and (3) excellence in the performance of duties and tasks.

**Western Norway Research Institute (Norway)**

www.vestforsk.no/english

The Western Norway Research Institute (WNRI) contributes to development and innovation in the public and industrial sectors by delivering relevant innovative ideas and knowledge of a high standard. Our work will contribute to increased insight, adaptability in terms of reorganisation, as well as innovation, particularly within the policy formulation, management, industrial development, and formation of value. WNRI is a non-profit foundation, established as an independent research institute in 1985. The institute is part of Norway’s national research system, and has a close co-operation with the Regional College of Sogn og Fjordane. Key research areas are in the fields of information technology, environmental research, and society and industry. The research staff represents various scientific areas such as social subjects, organisation subjects, technology subjects, the (liberal) arts, economics, and natural science.
Figure 3: Selected Resources (continued)

West African Research and Innovation Management Association
(West Africa)
www.warima.org
The West African Research and Innovation Management Association (WARIMA) is the professional body for research management in the West Africa region. WARIMA's objectives are: (1) Professional development and capacity building; (2) promotion of best practice; (3) increasing awareness of research and innovation issues in academic and public fora; (4) advocacy of appropriate national and institutional policy in support of research and innovation and participation in the development and testing of policy; (5) advancement of science, technology and innovation, including addressing the asymmetries in access to, and diffusion of, knowledge between “North” and “South;” (6) advancement of a code of professional standards through a framework of values and principles which members are expected to follow; and (7) enhancement of the profile of the profession.

World Intellectual Property Organization
(International)
www.wipo.int/portal/index.html.en
The World Intellectual Property Organization (WIPO) is an international organization dedicated to promoting the use and protection of works of the human spirit. These works — intellectual property — are expanding the bounds of science and technology and enriching the world of the arts. Through its work, WIPO plays an important role in enhancing the quality and enjoyment of life, as well as creating real wealth for nations. With headquarters in Geneva, Switzerland, WIPO is one of the 16 specialized agencies of the United Nations system of organizations. It administers 23 international treaties dealing with different aspects of intellectual property protection. The Organization counts 182 nations as member states.

Zimbabwe Academy of Sciences
(Zimbabwe)
www.interacademies.net/CMS/2950/4778.aspx
The Zimbabwe Academy of Sciences (ZAS) was established in 2005 and is a learned society which aims to promote national and international development by championing the acquisition and advancement of knowledge for application to sustainable development. The fellows of ZAS represent some of Zimbabwe’s accomplished scientists elected from among leading scholars in the life sciences, physical sciences and social sciences. ZAS is made up of three constituent colleges representing the main groups of scientific disciplines: College of Life Sciences; College of Physical Sciences; and College of Social Sciences.
Supplementary Material

This section includes expanded coverage of topics relating to international collaborations. These materials are culled from a variety of authoritative sources.

Compliance with Certain U.S. Laws that Affect Universities Engaged in Academic Activities Abroad

Amy Davine Kim, Associate
Patton Boggs LLP

Caroline J. O’Neill, Assistant General Counsel
The George Washington University

I. Introduction

University faculty and staff may engage in a variety of academic activities with foreign institutions or individuals that present new and significant opportunities for the U.S. university. When a U.S. university considers offering goods, teaching or research services, or expanding its own programs overseas, it should be aware of the requirements and consequences of a handful of complex U.S. laws. These laws are not commonly thought to apply to educational activities, but in many cases, they do apply to U.S. persons and organizations, including U.S. universities, their faculty, and staff. Most carry civil and criminal penalties that could be assessed against institutions and even their individual employees if violations occur.

In this basic discussion, we identify and describe select U.S. laws relevant to a university’s international activity and illustrate when they may apply. First, we describe briefly the range of international activities undertaken by colleges and universities that may implicate these laws. Second, we highlight four areas of U.S. laws affecting a university’s international activity: economic sanctions, boycotts, export controls, and corrupt practices. Third, we review special concerns in international contracting. Finally, we provide a short checklist of legal considerations when doing business abroad in Figure 4, page 3520:18; a hypothetical case study containing “issue spots” where the laws discussed herein could apply is presented in Figure 5, page 3520:19; and a list of federal Web sites for information referred to in this discussion is included in Figure 6, page 3520:21.

The laws we discuss are often complex, interconnected, and sometimes contradictory, requiring careful analysis for each and every type of international activity. A small change in circumstances can significantly change the analysis. Keep in mind that additional U.S. laws or international treaties may also apply to a university’s foreign

* This article is based on a June 2006 presentation at the National Association of College and University Attorneys annual conference in Chicago, Ill., and a November 2006 presentation at the National Association of College and University Research Administrators annual conference in Washington, D.C.
business activity, but they are beyond the scope of this discussion.\(^1\) By following the basic considerations discussed here, appropriate legal safeguards can begin to be put in place to help ensure the success of a U.S. university’s international activity.

II. Typical International Activities of Universities

Typical international academic activities may involve university faculty, staff, and students. Examples of international activity that may give rise to the laws described in this article include:

◆ Attendance by faculty at overseas conferences

◆ Academic agreements, often called MOUs (memoranda of understanding), entered into by the institution as a whole, or by a school or division of the university, with an entity or individual overseas to provide services or goods, which may involve payments to foreign nationals or institutions, for the purpose of, for example, faculty or student exchange, offering of certificate or degree programs at foreign universities, or short-term training in specific subject areas

◆ Research grants from public or private funding sources to conduct work overseas, or that require subcontracts or agreements with entities or individuals overseas

◆ Co-authoring or co-publishing scholarly articles or journals with faculty at foreign academic and research institutions

III. U.S. Laws Unique to Doing Business with Foreign Entities

Economic Sanctions

General Limitations. Economic sanctions maintained by the United States are generally known as “embargoes,” and prohibit most imports, exports, and transactions with certain countries absent a general or specific license from the Office of Foreign Assets Control (OFAC) within the Department of the Treasury.\(^2\) A general license is a provision contained in the regulations authorizing a transaction that meets certain specifications. No license application is needed for a general license so long as the activity meets the relevant requirements. A specific license, on the other hand, must be approved by OFAC (no particular application form is required) and should include all necessary information required by the application guidelines or the regulations pertaining to the particular embargo program.\(^3\) Specific licenses should be requested early, as a license approval (or denial) from OFAC can take months. (For a further discussion of OFAC, see ¶3405.)

Over the years, OFAC has moved away from broad embargoes and focused on what are now known as “targeted sanctions,” or sanctions that target the precise nature of the threat to the United States. For example, as of May 2007, the United States currently maintains only three comprehensive embargoes — those against Cuba, Iran, and Sudan — which prohibit almost all exports to, imports from, and transactions or

\(^1\) For example, U.S. laws or international treaties on labor, immigration, human rights, the environment, labor, trade, tax, and antitrust.

\(^2\) See 31 CFR Part 500 \emph{et seq}.

\(^3\) See OFAC’s guidance at www.ustreas.gov/offices/enforcement/ofac/faq/answer.shtml#60.
dealings with the targeted country. Even entering into an agreement for academic activities with these countries will likely require an OFAC license. OFAC also administers targeted sanctions programs against a host of other countries, including the Balkans, Belarus, Burma (Myanmar), Côte d’Ivoire, Liberia, North Korea, Syria, and Zimbabwe. Each of these sanctions programs contains unique prohibitions and is described briefly in Figure 1.

Figure 1: Specific Country Sanctions

The following are general descriptions of each sanctions program. OFAC’s Web site at www.ustreas.gov/offices/enforcement/ofac and the regulations for each sanctions program should be consulted if any activities or transactions are contemplated with an entity located in (or national of) any of these countries.

Balkans (Serbia)

The sanctions against Serbia are quite targeted and now prohibit transactions with a short list of persons identified on the Specially Designated Nationals (SDN) List (see page 3520:6 under “Lists of Restricted/Prohibited Persons”).

Belarus

The sanctions block the property of certain persons viewed as undermining democratic processes in Belarus.

Burma (Myanmar)

U.S. persons are prohibited from exporting financial services to, or approving or facilitating transactions in, Burma (Myanmar). Imports of Burmese-origin items are also prohibited, as is new investment in Burma. Finally, several Burmese entities are listed on the SDN List and the U.S. government has blocked their property.

Côte d’Ivoire

These sanctions generally block the property of persons contributing to the political and social unrest in Côte d’Ivoire, who are designated on the SDN List.

Cuba

Under one of the broadest embargo programs, U.S. persons may not import or export Cuban-origin goods or services, travel to Cuba (with some exceptions), or charter Cuban vessels. Several exceptions apply to the embargo of Cuba that affect universities. These include travel and related transactions directly incident to full-time professional research, certain educational activities, and publishing. These exceptions may still require a license from OFAC, for example, for educational activities, but will not be subject to OFAC’s general policy of denial.

Iran

The OFAC embargo of Iran is also quite broad. U.S. persons may not import or export goods, services, or technology to Iran or the Government of Iran without a license from OFAC. The embargo contains some limited exceptions that are generally not applicable to universities. However, U.S. persons may

---

4 Transactions or dealings are construed broadly and can include purchasing, selling, transporting, swapping, brokering, approving, financing, facilitating, or guaranteeing. See, e.g., 31 CFR
travel to Iran, and U.S. persons may undertake certain activities relating to publishing as described above. Note that even entering into an academic agreement or memorandum of understanding (MOU) with Iran or an individual in Iran (or Cuba or Sudan) may require a license from OFAC. Sponsorship by U.S. persons of conferences, or events at conferences, organized or co-organized by the Government of Iran or persons in Iran is prohibited.  

**Iraq**

The United States substantially lifted its embargo of Iraq effective May 23, 2003. U.S. persons may now do such things as invest in Iraq, import goods and services of Iraqi origin, travel to Iraq, and transfer funds to and from Iraq without a license from OFAC. OFAC has promulgated a general license authorizing such transactions with Iraq, subject to certain exceptions; however, the export of many items to Iraq still requires a license from the Bureau of Industry and Security (BIS) within the Department of Commerce.

**Liberia**

These sanctions generally block the property of certain persons and prohibit the importation of certain products from Liberia.

**Libya**

The United States substantially lifted its embargo of Libya in September 2004, enabling most commercial activities and financial transactions by U.S. persons.

**North Korea**

North Korean products can not be imported into the United States without a license. In response to North Korea’s test of a nuclear weapon, the U.N. Security Council adopted a resolution sanctioning North Korea on October 14, 2006. The resolution prohibits the purchase, supply, sale, or transfer to North Korea of military articles, technology and training, as well as “luxury goods.” It also freezes certain funds of the North Korean government related to their military and nuclear-related programs. In January 2007, the United States, through the Commerce Department, adopted restrictions on the export of luxury goods.

**Sudan**

U.S. persons may not import or export goods, services, or technology to Sudan. The embargo contains some limited exceptions that generally are not applicable to universities except for those related to the export of information and informational materials and the 2004 rule on publishing activities (see page 3520:5 under “Exceptions Important to Universities”).

**Syria**

The U.S. sanctions against Syria are primarily maintained by BIS and prohibit the export or re-export of any “product of the United States” or any good that is listed on the Commerce Control List. Excepted from this prohibition are food and medicines that are classified as “EAR99.” Several nationals of Syria have been designated on the SDN List, and thus no U.S. institution may do business with those persons.
Zimbabwe
The sanctions against Zimbabwe are quite targeted and focus on the designation of certain nationals of Zimbabwe. Those persons are identified on the SDN List and thus, in general, universities, like other U.S. organizations, may not engage in transactions with those persons.

Exceptions Important to Universities. The sanctions contain an important exclusion that affects universities; they expressly authorize the export of information and informational materials, in any format or medium. Information and informational materials includes publications, films, CD ROMS, and CDs, among others. This exclusion, however, only applies to information or informational materials fully created and in existence as of the date of the transaction. Exporting materials not fully created and in existence at the date of the transaction would generally require a specific license from OFAC.

In recent years, OFAC has relaxed its restrictions on publishing activities. In December 2004, OFAC published a rule providing for a general license for publishing activities in Cuba, Iran, and Sudan. With limited exceptions, the 2004 rule permits all activities with these countries incident to publishing, including among others, collaborating on the creation and enhancement of written publications, substantive editing of written text, and creating or undertaking a marketing campaign to promote written publications. The rule does not apply if the parties to the transaction include the governments of Cuba, Iran, or Sudan, or their agents or instrumentalities, or in other instances. Academic and research institutions and their personnel, however, are not considered part of these governments under the rule.

6 31 CFR 515.565.
7 Iranian Transactions Regulations, 31 CFR Part 560.
9 31 CFR 575.533.
Specific Country Sanctions and Penalties. General descriptions of specific country sanctions are outlined in Figure 1 (page 3520:3). It is important to consult OFAC’s Web site at www.ustreas.gov/offices1/enforcement/ofac and the regulations for each sanctions program if any educational activities or transactions are contemplated with an entity located in (or national of) any of these countries.

OFAC can impose both criminal and civil penalties for violations of these sanctions (penalties vary depending upon the sanction regime in question), and they can apply to individuals and institutions (meaning both faculty and the university can be charged civilly and criminally). In 2006, the maximum civil and criminal penalties for an OFAC violation were increased, respectively, to $50,000 per violation and 20 years of imprisonment.8

State Sponsors of Terrorism. Several of the countries included in Figure 1 (Cuba, Iran, North Korea, Sudan, and Syria) are also designated by the U.S. Department of State as state sponsors of terrorism. Such designation imposes the following additional restrictions on these countries: (1) a ban on arms-related exports and sales; (2) controls over the export of dual use items (see page 3520:10); (3) prohibitions on economic assistance; and (4) imposition of miscellaneous financial and other restrictions.9

Lists of Restricted/Prohibited Persons. Both OFAC (Treasury) and BIS (Commerce) maintain lists of persons with whom many, if not all, transactions (including the provision of services or training) are prohibited. The most well known of these is OFAC’s list of “Specially Designated Nationals” (SDNs), generally considered the most comprehensive international list of suspected or known terrorists, persons connected to terrorism, narcotics traffickers, and others.

However, the U.S. government maintains other lists, briefly described in Figure 2, that also should be checked before engaging in international activities. It is sound practice to check the names of the university’s foreign counterparts, especially the name of the foreign person who signs a contract or MOU, against each of these lists prior to engaging in discussions with the foreign party. Another sound practice is to

---

check the names of any foreign persons who will be paid, trained, or who will receive other services under the academic agreement. The lists can be accessed at www.bis.doc.gov/ComplianceAndEnforcement/ListsToCheck.htm. If any name or entity appears on the SDN or any other list, stop the transaction or discussion immediately and review the relevant list and nature of the listing before proceeding.

Figure 2: Lists to Check Before Engaging in International Activities

The following lists can be accessed at: www.bis.doc.gov/ComplianceAndEnforcement/ListsToCheck.htm.

1. Specially Designated Nationals (SDN). In general, if the person with whom the university wishes to do business is on OFAC’s SDN List, the university cannot deal with or transact business with the person. The list includes designated nationals of the countries sanctioned by OFAC, and it has expanded over the years beyond this simple designation to include foreign terrorist organizations, individual terrorists, narcotics traffickers, and others.

2. Denied Persons. BIS maintains a list of persons who are denied their privileges to export, most likely because they have violated U.S. export control laws.

3. Entities List. BIS also maintains an “Entities List” that includes individual foreign companies that are known or believed to be involved in weapons proliferation activities. As of June 2007, the Entities List includes companies located in China, India, Israel, Pakistan, Russia, Syria, and the United Arab Emirates. Generally, persons listed on the Entities List are ineligible to receive any items controlled by the Department of Commerce, although the specific restrictions applicable to each entity are identified on the list.

4. Unverified List. BIS also maintains an “Unverified List” that includes foreign persons who in the past were parties to a transaction with respect to which BIS could not conduct a pre-license check (PLC) or a post-shipment verification (PSV). Transactions with a person on the Unverified List raise a “red flag” with respect to the export.

5. Debarred Persons List. The Directorate of Defense Trade Controls (DDTC) within the Department of State maintains a list of “debarred persons” who are denied the privilege of participating directly or indirectly in the export of defense articles, technical data, or services.

7. General Order 3 to Part 736. This is a BIS general order imposing a license requirement for exports and re-exports of all items subject to the EAR where the transaction involves Mayrow General Trading or related entities located in Dubai, the United Arab Emirates, or Germany. It also prohibits the use of “License Exceptions” for exports or re-exports of any items subject to the EAR involving these entities.

IV. Anti-Boycott Laws

Two U.S. laws separately maintained by the Departments of Commerce and Treasury prohibit or penalize participation in, or cooperation with, foreign boycotts, which the United States does not sanction. For practical purposes, “unsanctioned foreign boycotts” means the Arab boycott of Israel, which is the focus here. These laws are extremely complex, and in some cases, are seemingly counterintuitive. Because this is a
basic discussion, we will only briefly present them here so that administrators are aware of the red flags signaling a potentially prohibited or reportable request (or both).

*Department of Commerce*¹⁰

Commerce maintains anti-boycott provisions that prohibit U.S. persons from refusing to do business with or in a boycotted country and from furnishing certain information about activities or operations with that country. Commerce regulations also require U.S. persons to report certain boycott-related requests.

**Prohibitions.** Boycott requests can come in a variety of forms. They may appear in the terms of letters of credit, in the actual contract or MOU, or may be verbal questions. They generally take the form of the following:

◆ Request from a boycotting country to *refuse to do business* with a “blacklisted” firm or in Israel; or

◆ Request to refuse to employ or to otherwise *discriminate* against persons on the basis of race, religion, or national origin; or

◆ Request to *furnish information* relating to your operations or business relationships with Israel or boycotted companies. In this case, responding “yes, we do business in Israel and will continue to do so” may be a violation.

**Reporting Requirement.** Certain boycott requests must be reported to Commerce on a form provided by the government — Form BIS 621-P or 6051P, available at www.bis.doc.gov/antiboycottcompliance/boycottrequestreportingform.htm. These reports are required on a quarterly basis. It is important to remember that even if you determine that a boycott request is actually permissible and not prohibited, it may still be reportable.

*Department of the Treasury*

Treasury maintains laws within the Internal Revenue Code that deny certain tax benefits

---

¹⁰ Export Administration Act of 1979, 50 App. USC §2401 et seq.
to persons who participate in or cooperate with an unsanctioned boycott and requires the reporting of requests to participate and the actual participation in such a boycott.\textsuperscript{11} Treasury also requires that U.S. taxpayers with “operations in or related to” a boycotting country report those operations in their annual income tax return on Form 5713, available at www.irs.gov/formspubs/lists/0,,id=97817,00.html.\textsuperscript{12} The term “operations” is very broadly defined and includes “educational services.”

Treasury quarterly publishes a list of countries that require participation in an unsanctioned boycott. Figure 3 contains a current listing of such countries.

\begin{figure}
\centering
\begin{tabular}{ll}
\textbf{Kuwait} & \textbf{Saudi Arabia} \\
\textbf{Lebanon} & \textbf{Syria} \\
\textbf{Libya} & \textbf{United Arab Emirates} \\
\textbf{Qatar} & \textbf{Republic of Yemen}
\end{tabular}
\caption{Countries that Require Participation In an Unsanctioned Boycott}
\end{figure}

Keep in mind that the two sets of laws are different — some actions allowed (permissible and not reportable) by one set of laws may be prohibited and/or reportable by the other. Also keep in mind that several technical exceptions to these rules exist, and they should be examined in the context of the unique facts of each request received. Words or phrases that should trigger scrutiny include references in documentation to Israel, boycotts, or blacklists.

\textbf{Penalties for Violations.} Penalties for willful violations of these laws can be severe and reach up to $250,000 and imprisonment for up to 10 years for individuals; and $1 million for corporations, the loss of certain tax benefits, and denial of export privileges.

\section*{V. Export Controls}
\textit{Export Administration Regulations (EAR)}

Commerce also controls the export of “dual use” (i.e., having both civilian and military applications) goods, technology, and services (including training and certain information related to these items). The Export Administration Regulations (EAR) control these

\textsuperscript{11} 26 USC 999.
\textsuperscript{12} Even though many universities are not-for-profit, they usually file tax returns on their unrelated business taxable income.
items when they are identified on the Commerce Control List (CCL). These regulations also follow U.S.-origin goods, so that a U.S.-origin good exported to France, for example, in general may not be re-exported to a prohibited country. These controls are generally based on two factors: (1) the sophistication of the item; and (2) the intended destination. For example, the more sophisticated the item, the greater the level of control regardless of the destination. Conversely, items of lesser sophistication will likely be controlled to high-risk destinations, and certainly to countries embargoed by the United States.

If an item appears on the CCL, its classification will indicate whether a license is required for export to a particular country. If a license is required, a license exception may apply. Most items are classified under a catch-all provision called EAR99 and do not require a license. The EAR also contain “end-use” and knowledge-based controls that prohibit exports by an exporter that has knowledge or reason to know that an end-use could contribute to nuclear, missile, or chemical and biological weapons proliferation. In addition, knowledge that a violation of the EAR will occur or is intended to occur, creates the obligation to ask more questions and even stop the transaction.

Exclusions Specific to the University Context. The EAR exclude from regulation technology that is “published,” that is, generally accessible to the interested public in any form. This would include information provided at an open conference, or published in books at a price that does not exceed the cost of reproduction and distribution. It also includes submission of papers to domestic or foreign editors of journals and organizers of open conferences.

Also excluded is “fundamental research” when the resulting information is published and shared broadly in a scientific community. In this regard, research conducted by scientists, engineers, or students at a university will normally be considered “fundamental research.” Some exceptions do apply to this rule, however, and should be consulted (for example, prepublication review by third parties, particularly corporate sponsors). Government-sponsored research covered by contractual controls may also be exempt.

---

13 15 CFR Part 774.
14 See 15 CFR Part 740 for license exceptions.

16 See the Department of Commerce’s “Know Your Customer” guidelines and “Red Flags” located at www.bis.doc.gov/ComplianceAndEnforcement/KnowYourCustomerGuidance.htm.
be restricted for export. Certain “educational information” released by instruction in catalog courses and teaching laboratories is also excluded.17

**Deemed Export Rule.** Under the “deemed export” rule, the release of technology to a foreign national (who is not a U.S. permanent resident) while in the United States is considered a “deemed export” to the home country of that national and is subject to any license requirements that would apply to an actual transfer to that country.18 In December 2005, the Commerce Department announced that it would no longer consider a rule change19 that would restrict foreign nationals’ access to sensitive technology based on their country of birth. Instead, it retains the current standard, which considers a foreign national’s most recent country of citizenship or residency.20

Nevertheless, in 2006 the Department of Commerce created the Deemed Export Advisory Committee (DEAC) with a mandate to review and provide recommendations to the Department of Commerce on deemed export policy. The role of the DEAC is to help ensure that the deemed export licensing policy of the United States most effectively protects national security while ensuring the United States continues to be at the leading edge of technological innovation.

‘Defense’ Services and Equipment (the ITAR)

The State Department controls the export of defense articles and services under the International Traffic in Arms Regulations (ITAR).21 The ITAR contain a list of the defense articles controlled by these regulations, called the U.S. Munitions List. A license is required from the State Department’s Directorate of Defense Trade Controls (DDTC) before any defense article or service may be exported and the exporter must be registered with the DDTC. The intended use of the item is not relevant to the ITAR controls; rather, the ITAR look to whether the item is “specifically designed, developed, configured, adapted or modified for a military application” among other considerations.22

---

17 15 CFR Part 734.
18 15 CFR 734.2(b).
21 22 CFR Parts 120 through 130.
22 22 CFR 120.3.
In the university context, for example, space technology will frequently be subject to ITAR limitations. Any research done for NASA could trigger the ITAR regulations, although certain considerations apply for services performed for U.S. government entities.

**Penalties.** Penalties for violations of the EAR vary, but ultimately may reach the greater of $1 million or five times the value of the exports for each willful violation. Individuals can be fined up to $250,000 and imprisoned for 10 years, or both, for each willful violation. Civil penalties can reach up to $50,000 per violation. Penalties for violations of the ITAR can reach up to $1 million per violation and 10 years imprisonment for willful violations, and civil fines up to $500,000 per violation. In addition, a university found violating the ITAR can be debarred from contracting with the government and lose its exporting privileges.

(For a full discussion of export controls, see Chapter 3400.)

**VI. Foreign Corrupt Practices Act**

The Foreign Corrupt Practices Act (FCPA) contains two sets of restrictions, one relating to anti-bribery and the other relating to accounting practices. For purposes of academic activities of U.S. institutions, we will discuss only the anti-bribery provisions.

The anti-bribery provisions\(^{23}\) apply to U.S. universities as follows:

1. “U.S. universities and their employees.” Applies to domestic concerns (such as a U.S. university) or any officer, director, employee (such as a faculty member), or agent thereof.
2. “That use the mail, telephone, or fax.” Any means or instrumentality of interstate commerce, although amendments to the FCPA virtually eliminate this barrier to finding a violation.
3. “Corruptly.”
4. “With a payment or giving anything of value.” In furtherance of an offer, payment, promise to pay, or authorization of the payment of money or anything of value.\(^ {24}\)
5. “To a foreign official.” This includes a foreign official, foreign political party or party official, or any candidate for foreign political office, or to any person while knowing that any portion of the thing of value will be given to such persons.

---

\(^{23}\) 15 USC 78dd-2.

(6) “For a business purpose.” For the purpose of influencing or inducing the official in order to secure an improper advantage to obtain or retain business.

Exception. The FCPA contains one exception and two affirmative defenses. Under the “grease payment” exception, a facilitating payment may be made to a foreign official if the purpose of the payment is to obtain the performance of a “routine governmental action.” A routine governmental action includes the issuance of permits, licenses, or other official documents or the processing of routine governmental papers such as visas.

The two affirmative defenses include the following:

(1) A payment that is lawful under the written laws and regulations of the foreign official’s country.

(2) A payment that is a reasonable and bona fide expenditure, such as travel and lodging expenses, directly related to either the promotion, explanation, or demonstration of a university’s services or to the execution or performance of a specific contract.

The first affirmative defense is extremely difficult to satisfy. The second defense occurs much more frequently. While the following examples will implicate the FCPA, a university incurs less risk under the reasonable and bona fide expenditure defense to the FCPA if it

◆ hosts a foreign official if the purpose is to demonstrate the capabilities of the university at its campus;
◆ honors a foreign country if the purpose is not to obtain or retain business;
◆ pays the reasonable travel and subsistence costs of a foreign official if the university is required by contract with the foreign government to pay these costs; or
◆ offers gifts of university memorabilia (i.e., mugs, caps, plaques, etc.) if the purpose is not to obtain or retain business but rather offered as a courtesy or token.

Note that these are general examples of “affirmative defenses” (meaning that the FCPA is implicated and any defense must be proved). FCPA jurisprudence generally considers more egregious conduct; however, gray areas such as these should be approached carefully. Each occasion should be reviewed independently against the particular overall circumstances of the university. For example, because of the risk that

a meal away from the university’s campus is not directly related to the promotion, demonstration, or explanation of products and services, a university should not pay for a meal for a foreign official in the foreign official’s home country.

**Penalties.** There has been a significant increase in FCPA investigations and enforcement over the last several years. Penalties for FCPA violations are severe. Corporations and other business entities are subject to a fine of up to $25,000,000 per violation. Individuals can be fined up to $5,000,000 per violation or imprisoned for a maximum of 20 years.25

**VII. Special Concerns in International Contracting**

Given that many university academic activities may occur pursuant to written grants, contracts, or other agreements, we address here concerns about immunity, choice of law, and arbitration clauses usually found in such agreements.

**Immunity and Consent to Jurisdiction**

Many foreign educational institutions are government-owned. If that is the case, the foreign institution itself may be entitled to sovereign immunity from enforcement of or performance under the contract.26 Claims of immunity are generally difficult to overcome.

Should the parties find themselves in a dispute where the foreign party claims immunity, the Foreign Sovereign Immunities Act (FSIA)27 provides the basis for obtaining jurisdiction over a foreign state (including their agents or instrumentalities) in U.S. courts. The ability to sue a foreign sovereign in the United States exists only when one of the exceptions of the FSIA applies. The most common exception is the “commercial activity” exception. Other exceptions include waiver of immunity or enforcement of an agreement to arbitrate or confirm an award to arbitrate (under certain circumstances).28 The commercial activity exception applies only where a sovereign acts in the manner of a private player in the market, or where it exercises only those powers that can also be exercised by private citizens as distinct from those powers particular to sovereigns.29

---

26 Additionally, many contracts arise from a U.S. university’s contacts with a foreign embassy. Embassies may be entitled to diplomatic immunity under the provisions of the Vienna Convention on Diplomatic Relations (Vienna Convention on Diplomatic Relations, opened for signature April 18, 1961, 23 U.S.T. 3227, 500 U.N.T.S. 95 (entered into force April 24, 1964)). This international treaty is beyond the scope of this paper; however, these issues of immunity should be considered when assessing an institution’s ability to enforce an arbitral award or to attempt to subject the foreign party to litigation in a U.S. court.
27 28 USC 1605, et seq.
28 28 USC 1605(a).
29 See, e.g., Janini v. Kuwait University, 43 F.3d 1534 (D.C. 1995) (finding that Kuwait University’s termination of university employee’s contracts pursuant to Kuwaiti Government decree was a commercial activity).
While it will be difficult to overcome claims of immunity, a U.S. university can take steps to protect itself in case the contract or MOU is breached (most likely, where the foreign institution decides not to go forward with the exchange and does not pay for work already performed). First, the university can structure the payments required of the sovereign in advance, as explained below. Second, the university could draft an express waiver of immunity into the contract or agreement. Such a waiver is not foolproof, however, as U.S. courts generally view explicit waivers of sovereign immunity narrowly in favor of the sovereign, and they generally do not enlarge upon the express language of the waiver. The waiver must also be clear and unambiguous and intended for enforcement in the United States. In addition, an express arbitration provision may operate to confer jurisdiction in U.S. courts under certain circumstances.

Choice of Law Clauses

An area of potential disagreement between parties to an international agreement is the choice of law governing the contract in the event of a dispute. Generally, a U.S. university should avoid subjecting itself to the uncertainty and cost of defending itself in a foreign jurisdiction for work that will occur in that jurisdiction. Options for choice of law, in order of preference, include governing the contract under

1. A particular state law, such as the law of the jurisdiction of the university;
2. New York or Delaware law, which are generally recognized as commercially developed and neutral; or
3. Laws of a neutral international jurisdiction, such as the United Kingdom, assuming the other party is not located there.

A less desirable alternative is to leave out the choice of law clause. Sometimes the foreign institution, or even the U.S. university’s faculty member negotiating with the foreign institution, will want to leave out the choice of law clause, preferring instead to insert a clause to state only that the parties will work out their disagreements amicably.

While the parties can agree to work disputes out amicably as a first course of action, including a choice of law clause is preferable to no clause at all. In the absence of such a clause, the university runs the risk of a court determining that the law of the foreign entity controls, even if a majority of the negotiations or activity will occur in the United States. Moreover, the location in which the contract is signed may influence the court’s decision. If a program is located abroad, it is particularly important to identify the governing law in the contract because the contract will be performed outside the United States.

32 Choice of court may also become a relevant clause in international contracts. The Hague Conference on Private International Law has drafted a proposed Convention on Choice of Court Agreements dated June 30, 2005. It has not yet entered into force.
Decisions on choice of law clauses should be made in concert with the selection of a dispute resolution method, such as resolution through courts, arbitration, or mediation. If the parties to a contract wish to pursue arbitration, for example, the parties will need to consider the locale for the arbitration, which arbitration rules apply, which jurisdiction’s law will govern the arbitration, and whether the parties to the contract are parties to the New York Convention on the Recognition and Enforcement of Foreign Arbitral Awards, discussed immediately below.

**Arbitration and Enforcement of Arbitral Awards**

The New York Convention on the Recognition and Enforcement of Foreign Arbitral Awards (NY Convention) was prepared by the United Nations and adopted in 1958. The NY Convention requires courts of contracting “states” to recognize an agreement to arbitrate and to recognize and enforce awards made in other states, with certain exceptions.

When contracting with a foreign institution for academic activities, it is sound practice to determine whether the location of the program or activity is in a country that is a signatory to the NY Convention. If it is, it is advisable to consider binding arbitration for resolution of any disputes arising out of the contract as an alternative to resolution through a foreign country’s courts. The NY Convention helps to ensure that any arbitral award received by a U.S. university will be recognized and enforced in the country in which the university is providing a service or otherwise doing business. Note, however, that if the NY Convention is relied on for enforcement, the contracting country’s declarations should also be reviewed. The NY Convention permits states to participate in the convention subject to certain declared conditions, such as requirements of reciprocal treatment and defining “commercial” disputes in accordance with domestic law.

**Financial Protections and Avoiding Disputes: Structure of Payments**

A university can protect itself financially by structuring the payments under the contract in such a way as to protect itself from breach. The best way to structure the payments is to require payments to be made in full before the actual work is performed, although payments may also be staggered throughout the term of the project. In this way, the university’s expenses are covered if the foreign institution gives notice of its

---

33 The contract may specify rules, for example, of the American Arbitration Association (AAA), International Chamber of Commerce (ICC), United Nations Commission on International Trade Law (UNCITRAL), or the Hong Kong International Arbitration Center (HKIAC).
intent to terminate. If the foreign institution misses a payment, the U.S. university is alerted to possible breach and may notify its partner or stop work. By requiring advance payment, the university can avoid the situation of having to request funds from a foreign institution after that institution has terminated the relationship.

**VIII. Conclusion**

U.S. universities active overseas need to be cognizant of at least four categories of U.S. laws: economic sanctions, anti-boycott, export controls, and corrupt practices. Addressing possible legal concerns early in the development of a program or project abroad will help the university, and its individual employees, avoid running afoul of governmental authorities or seeing a relationship with the foreign individual or entity end in dispute. Any given international activity may raise more than one legal concern. By analyzing the potential effects of the laws discussed here on a university’s specific international activities, a university can help ensure the success of its ventures abroad.
Figure 4: Checklist of U.S. Laws Related to Academic International Activities

This short checklist of questions to ask yourself may be used to identify potential legal issues with a university’s international activity. Legal counsel can then further explore with sponsored research personnel the impact of these laws, and others, on a specific international activity.

**Economic Sanctions**

1. Is the university — or its employees — transacting business with an individual or an entity on the Specially Designated Nationals List of the U.S. Department of the Treasury, or other U.S. government lists?

2. Is the university — or its employees — engaging in activities with an entity or individual in a country subject to U.S. sanctions (the Balkans, Belarus, Burma (Myanmar), Côte d’Ivoire, Cuba, Iran, Liberia, North Korea, Sudan, Syria, or Zimbabwe)?

**Export Controls**

1. Is the university — or its employees — exporting goods, technology, or services overseas?

2. Is the export a “deemed export” such that a license may be required?

3. Do any exclusions apply, such as for fundamental research?

**Anti-Boycott**

1. Is the university — or its employees — conducting business in countries that participate in the Arab boycott of Israel (Kuwait, Lebanon, Libya, Qatar, Saudi Arabia, Syria, the United Arab Emirates, or Yemen)?

2. Has the university, or its employees, been asked to participate in a boycott against Israel, for example, in letters of credit, in a contract or MOU, in verbal question form, or in any other boycott?

**Foreign Corrupt Practices Act, Anti-Bribery Provisions**

1. Is the university — or its employees — engaging in international activity with officials of a foreign government?

2. Has the university — or its employees — offered or given anything of value to the foreign official for the purpose of influencing or inducing the official in order to secure an improper advantage or obtain or retain business?

3. If the university — or its employees — has offered or given something of value to a foreign official, was it for the purpose of facilitating the performance of a routine governmental action (the “grease exception”), or was it otherwise permissible under an affirmative defense of the FCPA?
**Figure 5: Case Study**

You are employed by U.S. University (U) as a Research Administrator. The U.S. Government has awarded U a $2 million five-year contract (Contract) to collaborate with the Ministry of Health (MOH) of Al-Malik, a fictitious country in the Middle East, to train physicians and nurses in infectious disease survey methods. The PI on this contract, Professor Jones, has conducted extensive research on the subject and has published his findings among university and health care experts in the field. He will share his findings with the MOH colleagues as part of the training. You are responsible for Contract compliance. The Contract requires U to comply with U.S. laws and the laws of Al-Malik.

The Contract contains an Anti-Terrorism Certification which U has signed. It states that U agrees not to provide “material support” (which is not defined in the Contract) to any known or suspected terrorists or terrorist organizations, and it refers U to the Specially Designated Nationals (SDN) List. You are not certain what this phrase requires you to do. You do know that Al-Malik is not subject to U.S. government sanctions at this time.

You and certain faculty from U travel to Al-Malik to meet with MOH officials to sign a final Memorandum of Understanding (MOU) setting forth the terms of your relationship for this project. While you are there, U and the MOH hold a kick-off dinner at one of the best restaurants in Al-Malik, attended by senior government officials of Al-Malik, U’s representatives, and a representative of the local U.S. government mission. You have offered for U to pay for the dinner from the Contract (the Contract does not include the costs of dinner for this function, but nothing also appears to bar U from paying for the dinner).

While at the dinner, one of the senior government officials of Al-Malik asks you, “Didn’t U recently conduct an infectious disease survey in Africa in partnership with an Israeli hospital?” You think it is OK to respond, but you are not sure.

The next day, U and the MOH agree that U should subcontract with a local entity to handle on-the-ground logistics, for which the entity would be paid $200,000 over five years. The MOH shares with you draft proposals from two local private companies it has identified. U and the MOH agree that the company that looks the best for the job is Logi-Al-Malik, which happens to be owned by an official of the Al-Malik Ministry of Commerce. The draft proposal calls for binding arbitration in Al-Malik in the event of a dispute between U and Logi-Al-Malik. Alternatively, Logi-Al-Malik proposes that any disputes be resolved in the courts of Al-Malik.

**Potential Issues**

What are the potential legal concerns with this fictitious scenario? Five are discussed below.

1. **Is there an Office of Foreign Assets Control (OFAC) concern?**
   
   Yes. U.S. law prohibits dealings of any kind with persons or entities on the SDN List, absent a license from OFAC, which will likely be denied. Regardless of the Contract’s requirements, it would be sound practice to run against the SDN list the names of any person or entity in Al-Malik to whom U will provide payment, training, or any other services under the Contract, and to check the names of the persons signing the MOU with the MOH and the subcontract with any entity selected to handle local logistics.
2. Is there a Foreign Corrupt Practices Act (FCPA) concern?

Yes. U has probably already violated the FCPA because it has offered to give something of value (the dinner) to Al-Malik government officials. The FCPA makes it a crime to offer, promise, or pay anything of value to any foreign official, foreign political party, party official, or any candidate for foreign political office for the purpose of influencing an official in order to obtain or retain business or secure an improper advantage. You may think that there would not be an FCPA issue because U and the MOH are already “in business” together or because U doesn’t think it has a corrupt intent. However, U could be seen to be entertaining for the purpose of retaining business, or for the purpose of influencing an official to give U future business. If all the other elements of the FCPA are met, corrupt intent is usually inferred. It is better not to pay for the dinner. Also, for similar reasons, because Logi-Al-Malik is owned by a foreign government official, it is better not to subcontract with Logi-Al-Malik.

3. Is there a boycott concern?

Yes, if we assume Al-Malik participates in the Arab boycott of Israel and appears on the Treasury Department’s quarterly list. If so, when the MOH official asks about U’s prior collaborations with partners in Israel, you should not answer, but should instead ask him why he wants to know. If he replies, “I just remembered that our Ministry won’t let me sign an MOU with anyone who does business with Israelis,” then you cannot answer his question, and U may need to report the receipt of a boycott request to the Departments of Commerce and Treasury. You must also report your project in Al-Malik as “operations” on your annual tax return if Al-Malik is a listed boycott country. Finally, U should except from the Contract clause requiring compliance with the laws of Al-Malik that it will not abide by the boycott of Israel.

4. Is binding arbitration in Al-Malik advisable?

Probably not. U would be better off trying to get arbitration in a neutral locale (e.g., the United Kingdom), using neutral rules of arbitration (e.g., United Nations Commission on International Trade Law (UNCITRAL), London Court of International Arbitration (LCIA), International Chamber of Commerce (ICC), etc.). Also, you would want to know if Al-Malik is a signatory to the New York Convention. If it is, then if U wins in arbitration, there is a better chance that the award will be enforced (i.e., U will get its money) in Al-Malik. If it is not a signatory, the risk is greater that U will not see its award enforced. However, even if Al-Malik has not signed the NY Convention, arbitration would still be preferable to resolving the dispute in Al-Malik’s courts.

5. Must Professor Jones obtain a license in order to share his research with his MOH colleagues?

Probably not. The research likely qualifies as “fundamental research” because it was conducted by scientists, and possibly students, at a university. It has also been published and shared broadly within a particular scientific community.

Foreign Corrupt Practices Act, Anti-Bribery
International Efforts Toward Financial and Programmatic Accountability
Aliza I. Sacknovitz and Jill W. Schamberger

In the following article, the authors address some financial and programmatic risks in conducting international collaborations under sponsored awards. Although the authors are speaking to colleagues in the federal offices of inspectors general, their comments could readily apply to research administrators. The authors write that in addition to the increase in the amount of federal support now funding awards involving international collaborations and an increase in the international nature of science, “This increase in domestic and international R&D activities brings with it a growing need for ensuring financial and programmatic accountability in areas such as use of research funds, integrity in research, and achievement of research programs’ stated goals.” These words could easily apply to research administrators, who share these concerns and responsibilities. The authors further discuss the kinds of things the OIGs look at, when investigating allegations of financial and programmatic misconduct. Given the difficulties often encountered in ensuring accountability with respect to foreign collaborations, the authors’ comments may additionally prove helpful. Footnotes in this article appear as Endnotes, see page 3520:29 –Ed.

Funding for research and development is increasing around the world. Offices of Inspectors General at federal research agencies, whose very mission is to ensure agency accountability for tax-payer dollars, must be particularly aware of the increasingly international nature of research, the ensuing accountability challenges, and the actions being taken to address these challenges.

From 2002 to 2004, R&D activities in the 30 countries that comprise the Organization for Economic Co-operation and Development grew from $657 billion to $726 billion.1 The U.S. government provided over $55 billion for R&D funding in 2007,2 and the National Science Foundation alone spends $300-400 million annually on research awards involving international collaborations.3

Also increasing is the international nature of science, with multi-national, cross-disciplinary research, not only common, but desirable. For example, a February 2008 report issued by NSF’s National Science Board stated that international science and engineering partnerships play a crucial role in promoting global prosperity by building S&E capacity and expertise around the world, energizing U.S. innovation, strengthening diplomacy, and fostering capacity building in developing countries.4

This increase in domestic and international R&D activities brings with it a growing need for ensuring financial and programmatic accountability in areas such as use of research funds, integrity in research, and achievement of research programs’

stated goals. The U.S. and other international research and governmental bodies must address these financial and programmatic challenges in order to preserve the integrity of, and tax payer confidence in, the research enterprise. The recent NSB report also advises that funding agencies and researchers consider accountability issues: “Accountability must be an integral part of planning successful collaborations to assure supporters that research integrity is a priority and that funds are used appropriately.” OIGs must collaborate to transcend traditional agency boundaries in order to better address challenges presented by global R&D endeavors. OIGs cannot continue to work under the status quo, but rather must communicate and cooperate amongst themselves and others. As a European Science Foundation report states, “Global communication and cooperation among accountability professionals is necessary to gain efficiency and produce timely, useful accountability information.”

Financial and Programmatic Accountability Transcends Borders

Accountability for Research Funds

OIGs at federal research agencies are responsible for ensuring that their agencies hold research award recipients accountable for the federal dollars they receive. Audit work focused on financial accountability and internal controls can help mitigate the risks of fraud, waste, and abuse. However, as OIGs are only too aware, accountability for federal research dollars is often lacking. For example, a series of audits the NSF OIG is currently conducting on time and effort reporting at institutions receiving NSF funding is illustrative of this deficiency. Findings include missing, incomplete, or inadequate documentation to support the accuracy of labor effort costs; salaries charged in excess of limits; and salaries improperly charged because the work did not directly benefit NSF awards. Such findings bring into focus both weaknesses with effort reporting and payroll systems, as well as institutions’ lack of compliance with their own internal policies.

Institutions receiving federal research dollars from any federal agency must have adequate accounting and internal control systems to track and manage their research awards. However, NSF OIG findings raise questions about the extent to which these control systems are operating properly. NSF OIG audits have identified concerns with institutions not effectively overseeing federal monies passed through to subrecipients; not having support for claimed cost sharing; and not separately accounting for direct and indirect costs to prevent duplicate charges, all of which place federal research dollars at risk.

Challenges in financial accountability also exist when research is conducted in other countries using U.S. funds. For example, an NSF OIG audit found many issues regarding the operations of an organization created by an international treaty agreement to coordinate and promote scientific research related to global change in the Americas. The organization’s operations and research programs are funded by voluntary contributions by 19 countries: NSF awarded grants totaling $16.4 million on behalf of the U.S. The NSF OIG found that the organization did not adequately manage its subawards and that it was not familiar with, or did not understand, its responsibilities for subaward monitoring activities as required by the NSF grant...
agreements. As such, it did not place a priority on monitoring or improving its oversight of subawards. In addition, the audit identified other accountability problems such as the premature draw down of funds, excess educational allowance payments that could have been put towards better use, and unallowable costs charged to the NSF grant. Effecting change to protect NSF’s investment was made difficult by the involvement of multiple countries in the governance of the organization.

Other NSF OIG audits of international research activities have also identified concerns about award recipients’ internal controls as well as the adequacy of NSF’s policies and procedures to monitor compliance with award terms and conditions. U.S. research agencies and their OIGs, therefore, cannot assume that research conducted overseas will be done within the accountability structures expected and/or required of U.S. institutions.

**Integrity in Research**

Ensuring financial and programmatic accountability includes the need for OIGs to ensure scientific integrity and prevent and address issues of research misconduct, which the 2000 Federal policy defines as fabrication, falsification, and plagiarism. In so doing, OIGs not only protect the federal funds used to conduct research, but also maintain the trust of the American people in the research that their tax-dollars fund. Recent headlines and studies suggest that the research community is plagued with cases of RM, some of which receive high profile coverage. It is therefore even more crucial that U.S. research agencies and their OIGs take allegations of RM seriously and hold researchers accountable for maintaining integrity in their research.

However, ever increasing multinational, cross-disciplinary research presents unique challenges for investigating RM allegations. In such cases, RM investigators are often no longer dealing exclusively with U.S. researchers located at U.S. institutions. Rather, allegations may involve examining foreign researchers collaborating with U.S. researchers, but employed at a foreign site not governed by the federal policy. In such cases, RM investigators often must identify who to contact to coordinate an international investigation, which itself can be difficult. Next, RM investigators must determine whether the research entity has an RM policy and, if so, how that policy differs from the federal policy. Oftentimes, RM investigators quickly learn that, unlike the U.S., many other countries, including some major sponsors of research, do not have a formal RM policy. Or, RM investigators realize that the differences within and between national policies themselves create practical challenges.

NSF OIG, as well as other research funding agencies, have already faced some such challenges. In one case, NSF OIG received an allegation related to a project intended to facilitate collaboration between a U.S. and a non-U.S. researcher. The foreign researcher denied participating in the project and the U.S. researcher could not provide evidence of the collaboration. After initially assisting in the investigation, the foreign researcher suddenly stopped acknowledging NSF OIG emails and refused to cooperate further. NSF OIG was thus unable to pursue investigative action against the U.S. researcher.

As international collaborative research continues to thrive such scenarios are
bound to continue. While overall OIGs at federal research agencies are aware of the
need to ensure integrity in research,13 OIGs are only beginning to explore the need
for mechanisms for investigating international RM.

**Evaluation of Research**

Assurances regarding the integrity of the finances and the conduct of research
must also be accompanied by assurances that research programs have attained
their stated goals. Evaluations of research programs provide a means to obtain such
assurances and, in so doing, also inform funding agencies and stakeholders about
programmatic outcomes.

Evaluating basic research poses challenges recognized by funding agencies
around the world. One challenge is the difficulty in determining what programmatic
impacts and outcomes should be measured (e.g., economic, field of study, etc.).
Another challenge is that programmatic impacts and outcomes may not be known
until many years in the future. However, such challenges do not mean that evaluations
of basic research should be avoided.

U.S. and foreign funding agencies have approached these challenges differently.
NSF, for example, currently relies on a variety of activities to ensure that the best
science proposed is funded, and that this research contributes to the goals of the
scientific program and the agency overall. Most NSF awards are subject to merit
review, whereby panels of external experts review research proposals and recom-
mend to NSF which proposals should be funded. After individual awards are made,
NSF then relies on a variety of evaluation committees14 to provide a retrospective
assessment of whether the projects funded furthered the research program as well
as the agency’s goals. Nonetheless, NSF has not systematically built evaluations into
all of its programs, nor does it have a central office that can assist programs in plan-
ning and conducting evaluations. NSF instead relies on its various directorates and
programs to consider and commission evaluations at their own discretion.

In contrast, the Deutsche Forschungsgemeinschaf, Germany’s main funding
agency for basic research, has embarked on a more systematic approach to evalua-
tion. Until 1990, the DFG relied on its different departments to commission evalu-
ation studies for different programs whenever they were deemed necessary; there
was no single office for overseeing evaluations. In 1999, the DFG implemented a
more systemic and professional approach to evaluations. The organization began
placing emphasis on the concept that the results of evaluation studies would be
used in the development of research plans and research policy. The Information
Management Unit (IM Unit) is now mainly responsible for evaluation studies. Act-
ing as a service provider to other DFR units, the IM Unit offers advice on conceptu-
alizing the study, drafting a request for proposals, selecting a contractor, and assist-
ing with implementing the contract.15

OIGs need to be aware of how research funding agencies in different countries
are taking on the challenge of evaluating the outcomes and impacts of the research
they fund. Such knowledge can inform OIGs in assessing the effectiveness of their
own agency’s approaches to evaluating research programs. Audit work that consid-
ers how information about research results is collected and used internationally can help identify promising practices that can strengthen their own agency’s domestic operations.

**International Accountability Activities**

As the previous examples show, U.S. research agencies are not alone in facing multiple challenges to financial and programmatic accountability. A variety of recent international activities have brought together decision-makers and practitioners to address these challenges by exchanging strategies and experiences and building upon their collective knowledge.

**Accountability for Research Funds**

European research funding agencies, the European Science Foundation, and the NSF OIG have co-sponsored a series of annual workshops to address accountability in research activities. Beginning in 2003, these workshops have focused on issues such as audit practices and compliance monitoring, oversight strategies, and evaluating and managing risk. These workshops typically include about 40 participants from 15 countries. The participants are mainly those who are responsible for the administration and audit of government-funded S&E research programs. These meetings provide a forum for discussing individual countries’ practices for addressing various accountability challenges, and a starting point for developing international approaches to address them.

**Integrity in Research**

Research misconduct is also receiving international attention. The Global Science Forum of the Organization for Economic Co-operation and Development established the Co-ordinating Committee for Facilitating International Research Misconduct Investigations to focus on practical issues related to international RM investigations. This expert group was created in response to an OECD Report developed following a February 2007 meeting in Tokyo to address scientific integrity and misconduct. The document discussed the significance and impact of RM, the international diversity of principles and procedures for dealing with RM allegations, and the possible causes and contributing factors. Among other things, it recommended that “Interested countries … undertake an international dialog among national practitioners.” NSF IG, Dr. Christine Boesz, and Executive Vice-President of the Natural Sciences and Engineering Research Council of Canada, Dr. Nigel Lloyd, are co-chairing the expert group.

The committee has convened two times. At its inaugural meeting in December 2007 at NSF in Arlington, Virginia, 16 participants representing 14 countries and international bodies discussed various approaches for coordinating investigations of and resolving RM allegations. They agreed to develop principles regarding international RM investigations. They also discussed developing generic models of misconduct-related documents and agreements to be signed at the onset of international research collaborations. Lastly, the committee recommended broadening its membership in order to better reflect the diversity of international research and its systems. Overall,
the meeting served as a means of opening a dialogue between nations.20

These topics were advanced during the committee’s second meeting in April 2008 in Paris. At this meeting, 25 participants from 21 countries and international entities further discussed issues raised at the first meeting.

Specifically, participants reviewed draft documents of the principles for facilitating international RM investigations and generic templates of misconduct-related documents for inclusion in international agreements.

They also discussed the target groups for dissemination of these documents once finalized.

The committee’s next and last meeting will occur in September 2008 in Vienna. Participants are expected to finalize a document containing the principles of international RM investigations and the generic templates of misconduct-related documents. The committee will also discuss its communication strategy for disseminating its work, which will include a practical manual on how to approach misconduct cases in international research collaborations.

Other international integrity efforts show the broad nature of these concerns. The ESF and the U.S. Department of Health and Human Services Office of Research Integrity organized a World Conference on Research Integrity in September 2007 in Lisbon.21 According to the conference’s final report,22 this conference “was the first global forum convened to provide researchers, research administrators, research sponsors, journal editors, representatives from professional societies, policymakers, and others an opportunity to discuss strategies for harmonizing research misconduct policies and fostering responsible conduct in research.” The number of attendees — 275 participants from 47 countries — and their diverse professional backgrounds indicate the widespread interest in these issues.23

**Evaluation of Research**

Finally, evaluating research is also being discussed at the international level. The ESF is leading a forum for member organizations and others to develop and address approaches for evaluating research projects and programs. The forum’s focus is on post-award evaluations, such as whether the research project or program achieved its stated goals. To date the forum has sponsored two meetings, each attended by approximately 40 representatives from research funding agencies, research performing organizations, and learned societies from over 20 countries. The workshops have provided a platform for sharing current practices and experiences in evaluating research. Presentations have included evaluation approaches used by institutions that conduct research, case studies of quantitative indicators used in ex-post evaluations, the comparability of evaluations and indicators across disciplines and countries, and how progress and final project reports can be used in ex-post evaluations.

The forum’s next workshop will occur in October 2008 in Vienna. The objective of this meeting is to produce a set of documents that will describe state-of-the-art practices in ensuring quality in evaluations of research programs, as well as a set of common European indicators in evaluating organizations performing research.
Conclusion

The efforts described above are only a start in addressing the variety of financial and programmatic accountability challenges faced worldwide. In working together, nations will have to recognize that their financial systems, their national RM policies, and their approaches to evaluating research differ in many, often significant, ways. In creating internationally recognized policies and practices the cooperation and participation of funding agencies, institutions, and the researchers themselves is essential.

In this time of more complex international issues such as global climate change and public health, global research is more important than ever. As research becomes more international, OIGs at research agencies must be well-informed of the accountability efforts being undertaken around the world. Their oversight responsibilities for monitoring and evaluating research agency operations will confront additional challenges as the number of international collaborations grows. OIGs must therefore ensure that their agencies implement adequate controls to ensure the financial and programmatic risks associated with these international endeavors are considered and addressed.

9 Executive Office of the President, Office of Science and Technology Policy, 65 FR 76260-76264, Federal Policy on Research Misconduct, Washington, DC, December 6. 2000. The policy instructed federal agencies that support or conduct research to implement it within one year. NSF was one of the first agencies to implement the federal policy in 2002 (45 CFR
Part 689).

12 This case is similarly detailed in a nature article co-authored by NSF IG Dr. Christine Boesz, entitled “Investigating international misconduct,” April 10 2008.

13 The interest of OIGs in ensuring research integrity is evident, among other things, by IG membership from over 20 federal agencies in the PCIE/ECIE Misconduct in Research Working Group, which began in 2001. NSF IG Dr. Christine Boesz chairs this working group and can be contacted by those seeking additional information about its activities.

14 Committees of Visitors consist of a panel of external experts that evaluate the integrity and efficiency of the proposal review processes and provide a retrospective assessment of the quality of the results of the projects funded. NSF requires that its research programs receive such a review every 3–5 years. The Advisory Committee for GPRA Performance Assessment is comprised of external experts from the research fields NSF funds. The Committee meets annually to review the NSF-wide portfolio of projects to determine whether the agency has made progress towards meeting its strategic goals.

18 The OECD report can be found at http://www.oecd.org/dataoecd/37/17/40188303.pdf.

20 For further information regarding the expert group and its first meeting, see Drs.

23 In addition to multinational efforts, individual countries are also taking steps to ensure research integrity. In China, for example, these activities are being undertaken by multiple national organizations. The China Science Foundation now publicizes names of scientists who conduct RM; the Ministry of Science and Technology created an office in to handle RM cases; and the Chinese Academy of Sciences now requires all of its institutes to establish scientific ethics committees. (See “China Science Foundation Takes Action Against 60 Grantees,” *Science*, September 16, 2005; “China sets up rules to combat scientific misconduct,” SciDev.net, November 13, 2006; and “CAS takes aim at misconduct,” www.chinaview.cn, February 27, 2007).
Examining RCR Issues in International Collaborations
Sandra Titus, Ph.D., Office of Research Integrity

The Government-University-Industry Research Roundtable (GUIRR) of the National Academies of Sciences (NAS; Washington, DC) recently hosted a workshop on July 26-27 entitled “Examining Core Elements of International Research Collaboration.” The central aim of the workshop was to explore the role of government, industry, and academia in promoting better cross-border and interdisciplinary research collaborations.

Key speakers discussed issues relevant to understanding and enhancing cross-border and interdisciplinary research, including cross-cultural and ethical issues, research integrity, financial risk, export controls, the role of intellectual property, and diplomacy. One workshop session specifically focused on research integrity and the responsible conduct of research (RCR), highlighting key issues fundamental to promoting and ensuring data integrity in international research collaborations. This article is based on my interpretation and impressions of that session.

Researchers are increasingly involved in international collaborations. However, as Dr. John Kirkland, Deputy Secretary General, Association of Commonwealth Universities, London, pointed out, before that begins, one must know the infrastructure and consider the differences that are present in the culture, the ways research is conducted, the institutional structure that supports the researcher, and the economic incentives for researchers and institutions. There is a growing awareness from current international researchers that research standards for data collection and management may encounter serious problems that can impede and limit successful research efforts.

Researchers who worked with collaborators in other countries described their experiences and mechanisms for promoting data integrity. One key element stressed by attendees was the importance of taking the time to thoroughly train and then continually monitor team members.

While international collaborations may appear to open doors to additional research opportunities, many speakers stressed giving careful consideration to what one is trying to accomplish and evaluating what one’s potential collaborator is trying to accomplish. One must consider motivations and have a good rationale for why one plans to work with a certain individual or center.

Speakers also highlighted the need to have a clear understanding of the cultural context as well as a formal written agreement before beginning the research. Such agreements should happen long after trust has been established and individuals and institutions know and understand each other’s goals. The following lists of issues are a summary of the committee discussions and presentations made by Drs. David Resnick (National Institute of Environmental Health Sciences), William Blattner

---

Specifically, agreements should include the following objectives:

- To specify tasks
- To specify authorship and intellectual property
- To describe financial issues
- To describe a dispute resolution process and termination provision

The discussion focused on what might be done to enhance training and international collaborations in the United States. A course or courses could be developed to help domestic researchers who work on international collaborations understand and discuss the objectives listed above.

Moreover, since data integrity is one desired objective, many participants noted that there is a need for additional training and rules that offer an assurance of data integrity. Industry is often far ahead of academia in knowing how to assure data integrity, specifically in the pharmaceutical area, because they are required to follow the Food and Drug Administration’s (FDA’s) Good Clinical Practice rules (www.fda.gov/ScienceResearch/SpecialTopics/RunningClinicalTrials/default.htm).

Future discussions with representatives from various industries might also provide additional information on how to adapt and translate some of the data integrity standards from industry to academia and to researchers.

Finally, participants noted the need for the government to expand and alter their role in promoting and regulating data integrity in the international arena. These include the following guidelines:

- Regulatory approaches should be altered to be applicable to modern research operations.
- Online courses can be a valuable component of RCR education and training, but should not be the sole mechanisms used.
- Institutions and agencies should be required to invest real resources in monitoring and enforcing existing RCR requirements.
- Institutions should be directed to ensure that every researcher conducting international research receives RCR training that addresses international issues.
- Institutions and agencies should be required to develop better systems of data stewardship and transparency.

Participants also hoped that the ideas promoted through the presentations and discussions could lead the NAS GUIRR [National Academy Science Government-University-Industry Research Roundtable] to

---

**Help from NSF**

NSF has a dedicated research integrity Web page, www.nsf.gov/od/oise/intl-research-integrity.jsp. The agency has said it will continue to focus on international issues, as it develops further resources on responsible conduct of research.
convene a larger meeting to further explore and advance the issues involved in international research collaborations as well as provide an impetus for bringing about necessary changes.

Additional information about this particular project may also be viewed online on the GUIRR Web site at www.nas.edu/guirr.
International Agreements: What Makes Them Different and Not so Different

Pat Hawk, Oregon State University

Throughout my career, I’ve worked with international agreements from different perspectives. I’ve been a departmental administrator, a federal extramural projects specialist, and a contracting officer in a central administrator’s role. While my roles have been different, here are some of the lessons I’ve learned.

Budgeting Can Be Tricky
We may have to deal in foreign currency, so make sure you have your allowable/appropriate costs included and calculated for US dollars. There may be less “cushion” with changing exchange rates. Also be aware that there may be costs you should include, but do not normally see, in our everyday projects. Doctoral Dissertation Research Abroad projects are a perfect example of where I first saw those unusual budget items called “informant’s fees.” This budget item was used to describe translators, local guides, and sometimes gifts for those individuals the student might be meeting. Once I understood what that “gift” was, a very common way of saying “thank you for your time,” I didn’t see it much different from a McDonald’s gift card we might give to a human subject participant.

Negotiating Can Be Tricky
Negotiating any agreement can be challenging. Regardless of the sponsor, we have to make sure we follow our institutional policies and procedures; for public universities, state law may play a bigger part. In Oregon, our state law prevents us from accepting certain clauses such as binding arbitration (it creates contingent debt). We always check to make sure the entity/entity’s country of origin is not “on the bad side” of any Office of Foreign Assets Control (OFAC) lists. I dare say governing law is always interesting for all of us, but I think of time zones as my biggest challenge. When negotiating an agreement with someone in Vienna (Austria), I was coming into work at 5:30 in the morning so that I could reach them at the end of their work day. While e-mail is a great tool, I’ve found—just like with many industry agreements—a telephone call can sometimes be the best negotiating tool.

Award Management Can Be Tricky
As mentioned earlier, we may have to report and bill our costs in foreign currency. Exchange rates vary daily, so make sure you always check them. But just like any award, I know that if we have (1) budgeted correctly and proposed a clear description of work to be performed and (2) negotiated a good agreement (including payment terms), then award management goes much more smoothly. I would much rather get everything in the best possible shape before award set-up.

1 This article is reprinted from the NCURA Magazine, Vol. XLII, No. 1, January-February 2010, published by the National Council of University Research Administrators. It is used with permission of the publisher.
There are other aspects of award negotiation and management that can be confusing in our global economy. Just what is an international agreement in our world today? Is it an agreement with an organization located overseas, or is it more than that?

As a good example, we’re currently negotiating an agreement with a U.S.-based oil company that has global operations. While it’s very exciting to work with a global enterprise, it brings up a whole new set of questions. While our primary contact is located in the U.S., the branch providing the funding is not. The agreement is asking us to follow governing law in a foreign country because the particular branch is not in the U.S. Even though it’s a U.S.-based company, following the laws of another country makes it tricky. The logistics of negotiating is a challenge as well. Again, our contact is in the U.S., but permissions need to come from the legal counsel in the office that has a 14-hour time zone difference. Luckily, our time zone difference with our foreign counterpart is a mere fraction of that difference.

This project gets even more interesting because the project involves migrating whales. While our work this year will keep us within U.S. waters for the most part, we may have to go into Canadian waters. Just to be sure, we will get all of the proper permits; if our Principal Investigator has to continue his work during the winter months, he will also likely need permits from Mexico. Next year, our Principal Investigator may be heading west. Then I suppose we’re working in international waters.

What about a project funded by a U.S. organization, but the work takes place overseas? I have very fond memories of an award supporting an archeological dig in Italy from my days at the University of Virginia. It was fascinating, and our regulatory world was a lot simpler then; however, there were still many hurdles to face—travel advances, travel vouchers, bringing home soil samples. A lot of permissions were asked for and received in order to perform this project. Good planning was critical.

We currently have a very large project from the U.S. Agency for International Development. Our Principal Investigator leads a multimillion dollar, multi-institution effort to help improve aquaculture in developing countries. This project requires a lot of local assistance and we even write subawards to international governments. While it sounds a little scary, I think the project has gone very well. We have been able to successfully negotiate these subawards, and successfully manage the awards. Again, good planning was critical.

As a federal extramural projects specialist at the U.S. Environmental Protection Agency, I only dealt with a few international agreements. However, these agreements required additional approvals, some even going to the U.S. Department of State. Once again, good planning and good documentation was very important to obtaining the necessary approvals to get those awards made. My philosophy has always been to put a proposal, a funding package, or an agreement with the clearest information, the best justifications/ documentation possible. It takes the focus to the right place — the science — and makes approval/acceptance so much simpler.

After thinking about these issues—budgeting, negotiating, awarding and managing — I believe that international agreements are more similar to domestic agree-
ments than we commonly think. Keeping this in mind helps make international agreements a bit less intimidating.

About the Author

Patricia Hawk is the Director of the Office of Sponsored Programs at Oregon State University. Pat has been involved in research administration for more than 26 years. She began her career as a research administrator in the Office of the Associate Provost for Research at the University of Virginia. Pat has also worked at the U.S. Environmental Protection Agency’s Office of Research and Development, and returned to the university research community first at the University of Oregon and Oregon Health and Sciences University before her employment at Oregon State University.
3520.5 The Seventh European Framework Programme Comes to an End: What Was it About and Why Should U.S. Researchers Cooperate Now?¹
Elli Tzatzanis-Stepanovic, Austrian Research Promotion Agency (FFG)

Competition has been shown to be useful up to a certain point and no further, but cooperation, which is the thing we must strive for today, begins where competition leaves off.

Franklin D. Roosevelt

International relations between the U.S. and Europe have a long history and are backed by several Declarations and Agreements. After years of competition the U.S. is more than willing to cooperate with the rest of the world, especially with Europe. Half of the world’s GDP and one third of world’s trade are created by EU-US transatlantic cooperation. In order to tackle global societal challenges transatlantic S&T cooperation has to play a stronger role. The Seventh European Framework Programme (FP7), which will be replaced by ‘Horizon 2020’ in 2014, is encouraging transatlantic S&T teams to submit joint research proposals. European project consortia with U.S. participation have higher success rates and U.S. partners are provided partial funding for such proposals.

EU–U.S.: Competition or Cooperation?
The first formal cooperation between the EU and the U.S. in the area of S&T cooperation took place in 1990 with the Transatlantic Declaration. In 1995 the New Transatlantic Agenda provided the foundation for this relationship.

Cooperation in competition matters has been taking place for 20 years, regulated by the EU/US Competition Cooperation Agreement of 1991, which foresees, among other aspects, regular exchange of information on current enforcement activities and priorities, on policy regulations and other matters of mutual interest. The EU/U.S. Positive Comity Agreement followed in 1998 and the Administrative Arrangement on Attendance in 1999. In 2002 the EU and the United States agreed on best practices on cooperation in merger cases which were updated and revised in 2011.

As recognition that science and technology contribute significantly to economic growth and quality of life, the EU and the U.S. concluded a Science and Technology Cooperation Agreement in 1998 which was renewed in 2004 underlying the importance of the on-going transatlantic research dialogue. Transatlantic research cooperation is one piece of many within the Seventh Framework Programme for Research and Technological Development, the European Union’s main instrument for funding research. It is nevertheless an important one. Although FP7 will come to an end in 2013, the last round of Calls to be opened in July 2012 is said to become the most significant for bridging the gap to the next Framework Program for Research and Technological Development, Horizon 2020, which will start in 2014 and end in 2020.

¹ This article is reprinted from the NCURA Magazine, May/June 2012, Volume XLIV, No. 3, published by the National Council of University Research Administrators. It is used with permission of the publisher.
The ‘Cooperation’ Programme in FP7

The European Framework Programme represents only a small portion of total R&D investment in Europe, but it is a key element in providing a basis for strategic coordination and cooperation and therefore better utilization of resources. FP7 is structured into four so-called Specific Programmes which reflect the four major areas that are being funded by FP7. Cooperation among researchers is funded within the ‘Cooperation’ Programme and excellent ideas are funded in the ‘Ideas’ Programme from the European Research Council. Carrier development and mobility of researchers is funded in the ‘People’ Programme and the building of different research capacities is funded in the ‘Capacities’ Programme.

With more resources than in the previous Framework Programme (FP6) and more open to international cooperation, FP7 was and is open for U.S. partners throughout all research topics of the Specific Programme ‘Cooperation,’ supporting all types of research activities carried out by different research bodies in transnational cooperation. The ‘Cooperation’ Programme is sub-divided into ten distinct themes, reflecting the most important fields of knowledge and technology where research excellence is particularly important to improve the ability to address social, economic, public health, environmental and industrial challenges of the future.

**Figure 3520.5-1. Thematic Distribution of US Participants (in contracts signed)**

The ‘Cooperation’ Programme, together with the ‘People’ Programme, so far has been the most attractive for U.S. organisations joining research activities within FP7. U.S. participation in the Cooperation Programme was dominated by higher education institutions, totalling 61.4% of all proposals. From January 2007 to December 2010 a total number of 1,118 U.S. organisations have been included in the submission of 868 proposals, with a success rate of 19.2% involving 215 U.S. participants.

The thematic distribution of U.S. participation in FP7 shows that almost one third of EU-U.S. cooperation in FP7 takes place in health research. Since 2008, the U.S. National Institutes of Health (NIH) and FP7 have offered reciprocal opportunities

KBE = Knowledge Based Bio Economy; ICT = Information & Communications Technology; NMP = Nanotechnologies, Materials and new Production Technologies; SSH = Socio-economic Science and Humanities
for participation and funding aimed at fostering transatlantic research cooperation in health and smarter competition in science. Setting an example for research cooperation in other areas of research, pursuing mutual interests in S&T cooperation needs a strategic orientation and pragmatic steps.

**Transatlantic S&T Cooperation Wanted Now**

Although the international dimension of FP7 laid the groundwork for increasing U.S. participation, it is still low and there is a huge potential for improvement. An important structural difference that could be an obstacle to a complete understanding of Framework Programmes and their importance is that in the U.S. research is directed mainly by a principal investigator (PI). Cooperation is usually not a required component in U.S. funding, meaning that funding is mainly given to individuals and not to teams. This is very different compared to the Framework Programmes. Additional efforts are needed to create greater awareness in the U.S. of opportunities for EU-U.S. S&T cooperation within FP7.

There are many reasons why U.S. researchers should participate in the last round of FP7 Calls to be open as of July 2012, but the following seven would persuade most researchers:

1. **Funding Budget is High**
   The last round of FP7 Calls will become the largest ever with respect to available funds. In general, the EU budget for U.S. researchers is accessible if certain conditions are met.

2. **Transatlantic Cooperation is Stimulated**
   Collaborative research is encouraged within FP7 aiming at establishing excellent research projects and networks able to attract researchers and investments. Tackling global challenges and addressing more ambitious problems become easier through international cooperation where mutual interest exists. Clear provisions foreseeing the integration of entities established in the U.S. may be included in the work programme/call for proposals, such as the upcoming work programme in Health or Socio-economic Sciences and Humanities.

3. **Participation in FP7 is Simple**
   Participation for U.S. partners in FP7 research consortia is simple. The role of European research project coordinators is to guide partners, support them during the project proposal phase, and to manage the project during project life cycle. In addition, the Participant Portal has become the European Commission’s single authoritative website for the publication of FP7 calls, organisation registration, all project related services and all FP7 related legal and guidance documents.

4. **Timing is Good**
   Now is the best time to reactivate research networks, reshape research ideas and get started: the last round of FP7 Calls opens in July 2012. It offers a good opportunity
for U.S. researchers to secure partial funding of their research by FP7. The new Science, Technology and Innovation Programme, Horizon 2020, will start in January 2014 creating a gap between the two research funding programmes.

5. Re-submission is Encouraged
It is common that most research project proposals become successful when being submitted the second or third time! Re-submission of proposals is encouraged by the European Commission giving the research consortium enough time to complete, review and adapt the research project proposal to the current work programme. It is fact that project consortia with U.S. participation have a higher success rate!

6. Established European Networks are available
During the lifetime of FP7, numerous European Networks have been established and a number of research consortia have been dealing with research on European scale and several teams have been successful. Finding an existing research consortium is easier than ever! The European Commission also offers online partner search services.

7. BILAT-USA and Link2US are supportive
The projects BILAT-USA and Link2US, funded by the EC under FP7, support the enhancement and development of transatlantic S&T partnerships. All relevant services and information offered can be found under www.EuUsScienceTechnology.eu

One does not have to believe that transatlantic cooperation under FP7 per se is easy. One cannot deny the distance, and cooperation needs team spirit. One has to become very familiar with the participation rules and administrative procedures of FP7. Here the European research consortium plays an important role which gives support and guidance to U.S. partners. When asking U.S. partners in FP7 research consortia what the main reasons for their transatlantic cooperation are, they mostly cite the establishment of a wider cooperation network, access to specific expertise, and improvement of scientific excellence. This sounds worth an experiment!

◆ International Travel. The U.S. State Department maintains an extensive site providing official visa requirements for foreign destinations and per diems and travel warnings for various parts of the world. Link: www.state.gov/travelandbusiness.

◆ Time Converter. This is a good site for determining the current time for cities around the world. Link: www.timeanddate.com.

◆ Translators (online). This site provides straightforward, online translation of words, phrases, or sayings in multiple languages. Link: http://babelfish.altavista.com/translate.dyn.

Select Federal Funding Opportunities

◆ U.S. Agency for International Development (USAID) (www.usaid.gov). USAID is an independent agency that serves under the “direct authority and foreign policy guidance” of the Secretary of State. USAID is responsible for most bilateral development assistance — including economic growth, global health, and democracy programs — and food assistance programs. There are many opportunities for the involvement of institutions of higher education.

◆ Department of Health and Human Services (HHS)/National Institutes of Health (NIH). The NIH center or institute that exclusively promotes and fund international collaborations is the Fogarty International Center (www.fic.nih.gov). The center supports a variety of international research and related programs. HHS allows for the inclusion of a foreign component on NIH grants with prior approval. During the
proposal submission process, applicants are required to identify consortium partners as either domestic or foreign. If an application involving a foreign component is considered for funding, the requirement for approval of the foreign subrecipient will be addressed at that time. HHS defines a “foreign component” as performance of any significant element or segment of the project outside the United States either by the grantee or by a researcher employed by a foreign institution, whether or not grant funds are expended. HHS states that the justification for the inclusion of a foreign component must present special opportunities for furthering research programs through the use of unusual talents, resources, populations, or environmental characteristics that augment existing U.S.-based resources. An HHS Grants Policy Statement (www.hhs.gov/grantsnet/adminis/gpd) provides a summary of policy requirements applicable to domestic grants with a foreign component. With two exceptions — the American University of Beirut, which is not considered a foreign organization, and the World Health Organization — foreign indirect costs will not be reimbursed.

◆ **National Science Foundation (NSF)** (www.nsf.gov/funding/browse_all_funding.jsp). The NSF is an independent federal agency created “to promote the progress of science.” The basic mission of the NSF is to fund and advance independent research within the U.S. scientific and engineering community through competitive grant awards based on merit review of proposed projects. NSF normally does not fund foreign organizations directly; it does make awards to U.S. organizations that include in their projects foreign subawards. A foreign entity receiving NSF funds would only be eligible for direct costs, unless the foreign entity has a previously negotiated facilities and administrative rate agreement with a U.S. federal agency.

◆ **National Aeronautics and Space Administration (NASA)** (www.nasa.gov/about/research/index.html) NASA as a policy generally does not support research with foreign organizations conducted through grants or cooperative agreements. However, it does encourage undertaking collaborative projects involving international scientific efforts through an international agreement with NASA on a no-exchange-of-funds basis (see NASA FAR Supplement (NFS) 1835.016-70 (www.hq.nasa.gov/office/procurement/regs/nfstoc.htm)). The direct purchase of supplies and/or services, which does not constitute research, from non-U.S. sources by U.S. award recipients is permitted.

◆ **Department of Agriculture (USDA).** The USDA offers some limited programs that support international research partnerships through its International Science and Education Competitive Grants Program (ISE) competitive grants program and Foreign Agricultural Service (FAS). The ISE supports research, extension, and teaching activities that will enhance the capabilities of American colleges and universities to conduct international collaborative research, extension, and teaching. ISE projects are expected to enhance the international content of curricula; ensure that faculty work beyond the United States and bring lessons learned back home; promote international research partnerships; enhance the use and application of
foreign technologies in the United States; and strengthen the role that colleges and universities play in maintaining U.S. competitiveness. Link: www.csrees.usda.gov/fo/educationinternationalscience.cfm. FAS offers a range of technical assistance, education, and outreach programs for emerging markets and developing countries that are designed to support the development of science-based regulatory policies and promote food security. Link: http://www.fas.usda.gov/aboutfas.asp.

◆ Department of Energy (DOE). While DOE, through its Office of Science (www.sc.doe.gov), is supportive of large projects involving multiple countries collaboratively working toward the advancement of plasma science and nuclear energy, support for small-scale collaborative projects involving international partners is infrequent. The agency sponsors a research and technical support program, called the Work For Others (www.cio.energy.gov/documents/OthersCradas.pdf), that provides assistance to organizations for activities that are not associated with the U.S. federal government.

◆ Environmental Protection Agency (EPA). EPA allows for the inclusion of a foreign subrecipient award in EPA awards. EPA’s Office of International Affairs (www.epa.gov/international/index.html) is responsible for acting on requests and for granting EPA consent for subawards involving any work to be performed in a foreign country or any work to be performed in the United States by a foreign recipient or international organization.
Suggestions for General Terms for Foreign Subawards

AIS editors

The FDP has developed a “Checklist of Additional Terms and Conditions to Be Considered for Foreign Subawards” (www.thefdp.org/checklist_foreign_subaward.doc). It cautions institutions when using the checklist to “consult appropriate campus officials to make sure the subaward you prepare meets your institution’s and the project’s requirements, and any special terms & conditions specified by the sponsor in the prime award.”

The FDP terms and conditions are reproduced below:

- **Use of Name:** Neither party shall use the name of the other party, nor the name of any faculty member, employee, or student of the other party, in connection with any product, service, promotion, news release, or other publicity without the prior written permission of the other party and, if an individual’s name be concerned, of that individual.

- **Publications:** Collaborator agrees that all publications that result from work under this subaward will acknowledge that the project was supported by (Award #), (Sponsor Name).

- **Governing Language:** In the event that a translation of this Agreement is prepared and signed by the parties, this English language version shall be the official version and shall govern if there is a conflict between this English language version and the translation. All disputes [litigation and arbitration] under this Agreement shall be resolved and conducted, regardless of the means or authority, in the English language.

- **Governing Law:** This Agreement shall be governed, construed and enforced for all purposes in accordance with the laws of [specify], without regard to such laws governing choice of law. Notwithstanding the foregoing Collaborator acknowledges that University is subject to the laws of the United States and will not be obligated to take any action that is violative of such laws.

- **Patents:** Pursuant to Public Law 96-517, as amended by Public Law 98-620, title to any invention or discovery made or conceived under this subaward shall vest in the Collaborator. Collaborator shall promptly notify Principal Investigator (as shown in Attachment 3) in writing of any such inventions or discoveries. Collaborator hereby grants to University a royalty-free, non-exclusive license for internal research purposes to any Collaborator invention or discovery.

- **Anti-terrorist Compliance:** Collaborator hereby agrees that all funds, including sub-awards to subrecipients, will be used in compliance with all applicable United States anti-terrorist financing and asset control laws, regulations, rules and executive orders.

- **No Partnership/Joint Venture:** The relationship of the Parties under this Agreement is that of independent contractors and they are not agents, employees, partners or joint ventures of one another. No Party has the authority to bind any
other Party in contract or to incur any debts or obligations on behalf of any other Party, and no Party (including any employee or other representative of a Party with responsibility for [Program] matters) shall take any action that attempts or purports to bind any other Party in contract or to incur any debts or obligations on behalf of any other Party, without the affected Party’s prior written approval.

◆ Export Controls: It is understood that University is subject to United States laws and regulations controlling the export of technical data, computer software, laboratory prototypes and other commodities, and that its obligations hereunder are contingent on compliance with applicable U.S. export laws and regulations (including the Arms Export Control Act, as amended, and the Export Administration Act of 1979). The transfer of any such Technology and Items and the entering into and provision of such Transactions and Services that are subject to Restrictions may require a license or authorization from the cognizant agency of the United States Government, and/or may require written assurances by the receiving party that it shall not re-export such Technology and Items to certain foreign destinations and/or to certain recipients without prior approval of the cognizant government agency, and/or may require that the involved individuals and entities will comply with conditions on Transactions and Services. While University agrees to cooperate in securing any license which the cognizant agency deems necessary in connection with this Agreement, University cannot guarantee that such licenses will be granted.

The FDP also makes available at its Web site (www.thefdp.org/Subawards_Forms.html) the following subaward template from the National Institutes of Health, included as Figure 3530.3-1.

### Terms and Conditions

1) University hereby awards a (choose one): ☐ cost reimbursable ☐ firm-fixed-price subaward, as described above, to Collaborator. The statement of work and budget for this subaward are shown in Attachment 5. In its performance of subaward work, Collaborator shall be an independent entity and not an employee or agent of University.

2) University shall (choose one):
   - ☐ issue an advance payment of $___U.S. dollars upon execution of this Agreement. University shall thereafter reimburse Collaborator on a quarterly basis for allowable costs based on invoices submitted in accordance with sample invoice shown in Attachment 6.
   - ☐ pay Collaborator according to the payment schedule in Attachment 4.

Expenditures of Collaborator shall conform to budget in Attachment 5. All payments will be in U.S. dollars. Questions concerning payments should be directed to the appropriate party’s Financial Contact, as shown in Attachment 3.

3) A final statement of cumulative costs incurred, including cost sharing, marked “FINAL,” must be submitted to University’s Financial Contact NOT LATER THAN sixty (60) days after subaward end date. The final statement of costs shall constitute Collaborator’s final financial report.

4) All payments shall be considered provisional and subject to adjustment within the total estimated cost in the event such adjustment is necessary as a result of an adverse audit finding against Collaborator.

5) Matters concerning the technical performance of this subaward should be directed to the appropriate party’s Project Director, as shown in Attachment 3. Technical reports are required as shown above: “Reporting Requirements.”

6) Matters concerning the request or negotiation of any changes in the terms, conditions, or amounts cited in this subaward agreement, and any changes requiring prior approval, should be directed to the appropriate party’s Administrative Contact, as shown in Attachment 3. Any such changes made to this subaward agreement require the written approval of each party’s Authorized Official, as shown in Attachment 3.

7) Each party shall be responsible for its negligent acts or omissions and the negligent acts or omissions of its employees, officers, or directors, to the extent allowed by law.

8) Either party may terminate this agreement with thirty days written notice to the appropriate party’s Administrative Contact, as shown in Attachment 3. University shall pay Collaborator for termination costs as allowable under 45 CFR Part 74.61.

9) No-cost extensions require the approval of the University. Any requests for a no-cost extension should be addressed to and received by the Administrative Contact, as shown in Attachment 3, not less than thirty days prior to the desired effective date of the requested change.

10) The Subaward is subject to the terms and conditions of the Prime Award (Attachment 1) and other special terms and conditions, as identified in Attachment 2.

11) By signing below Collaborator makes the certifications and assurances shown in Attachment 2.

By an Authorized Official of COLLABORATOR: ____________________________

Name ____________________________ Date ____________
Recombinant DNA molecules and human gene transfer research.

1. **Research misconduct.** The research misconduct requirements included in "Public Policy Requirements and Objectives—Ethical and Safe Conduct in Science and Organizational Operations—Research Misconduct"

4. **Drug-free workplace.** Compliance with the Drug-Free Workplace Act of 1988 (Public Law 100-690, Title V, Subtitle D, as amended) requires that all organizations receiving grants from any federal agency agree to maintain a drug-free workplace. [http://grants2.nih.gov/grants/policy/nihgps_2003/NIHGPS_Part4.htm#_Toc54600073]

5. **Debarment and suspension.** Applicants/grantees that are foreign governments or governmental entities, public international organizations, or foreign-government-owned or -controlled (in whole or in part) entities ARE NOT subject to the debarment or suspension certification requirement or to debarment or suspension under 45 CFR Part 76 [http://www.access.gpo.gov/nara/cfr/waisidx_04/45cfr76_00.html]. ALL OTHER FOREIGN INSTITUTIONS AND INTERNATIONAL ORGANIZATIONS ARE SUBJECT TO THESE REQUIREMENTS.

8. **Research on Transplantation of Human Fetal Tissue.** The Requirements Affecting the Rights and Welfare of Individuals as Research Subjects, Patients, or Recipients of Services apply to this subaward. [http://grants2.nih.gov/grants/policy/nihgps_2003/NIHGPS_Part5.htm#_Toc54600080]

11. **Inclusion of children policy.** NIH Guidelines on the Inclusion of Children (i.e., individuals under the age of 21) as Subjects in Clinical Research. NIH has a separate policy on inclusion of children as subjects in clinical research that is similar to the policy regarding inclusion of women and minorities. The inclusion of children as subjects in research must comply with all applicable provisions of 45 CFR Part 46 and other pertinent Federal laws and regulations. [http://grants1.nih.gov/grants/policy/nihgps_2003/NIHGPS_Part5.htm#_Toc54600090]

**General terms and conditions:**

1. 45 CFR Part 74 [http://www.access.gpo.gov/nara/cfr/waisidx_00/45cfr74_00.html] applies to this subaward.
2. The NIH Grants Policy Statement, including addenda, in effect as of the beginning date of the period of performance and found at [https://grants.nih.gov/grants/policy/policy.htm], except for the payment mechanism and final reporting requirements, which are replaced with Reporting Requirements (Attachment 4) and Terms and Conditions on the front page of this agreement.
3. Any prior approvals are to be sought from the University and not the Federal Awarding Agency.
4. Collaborator assures, by signing this Subaward Agreement, that all Collaborator’s personnel who are responsible for the design and conduct of projects involving human research participants have successfully completed their institutional training in accordance with the NIH Guide, Notice OD-00-039 <http://grants1.nih.gov/grants/guide/notice-files/NOT-OD-00-039.html>.

5. Purchase of equipment costing more than $5,000 requires prior approval of University. Title to equipment costing $5,000 or more that is purchased or fabricated with research funds or Collaborator cost sharing funds, as direct costs of the project or program, shall unconditionally vest in the Collaborator upon acquisition without further obligation to the Federal Awarding Agency subject to the conditions specified in the NIH Grants Policy Statement.

6. Collaborator is subject to the audit requirements specified in 45 CFR 74.26(d) http://www.access.gpo.gov/nara/cfr/waisidx_00/45cfr74_00.html. Collaborator agrees that the Comptroller General of the United States, or a duly authorized representative, or University, shall, until the expiration of three (3) years after final payment under this Agreement, have access to and right to examine any directly pertinent books, documents, papers and records of the Collaborator involving transactions related to this Agreement. It is understood that, unless agreed to in writing by Collaborator, such examination shall be made during Collaborator’s regularly established business hours.

7. Fiscal Considerations: In addition to requirements per Terms and Conditions paragraph 2, costs must be expressed in U.S. dollars using an exchange rate applicable at the time the invoice is submitted. Facilities and Administrative Costs (F&A) are specifically limited to 8 percent of total direct costs less equipment under this Agreement to support the costs of compliance with NIH requirements including, but not limited to, protection of human subjects, animal welfare, and research misconduct. NIH will not support the acquisition of, or provide for depreciation on, any capital expenditures, or support the normal, general operations of foreign and international organizations. http://grants2.nih.gov/grants/policy/nihgps_2003/NIHGPS_Part12.htm#_Allowable_and_Unallowable_1

8. Customs and Import Duties are unallowable. This includes consular fees, customs surtax, value-added taxes, and other related charges.

9. Travel Regulations. Travel costs are limited to those allowed by formal organizational policy and, in the case of air travel, the lowest reasonable commercial airfares must be used. http://grants2.nih.gov/grants/policy/nihgps_2003/NIHGPS_Part6.htm#Travel

Special terms and conditions:

1. Copyrighted Material. Subject to its legal ability to do so, Collaborator shall grant to University an irrevocable, royalty-free, non-transferable, non-exclusive right and license to use, reproduce, make derivative works, display, publish, and perform any copyrights or copyrighted material (including any computer software and its documentation and/or databases) developed under this Subaward Agreement for the purpose of education and research or to the extent required to meet University’s obligations under its Prime Award.

2. Data Rights. Subject to its legal ability to do so, Collaborator shall grant to University the right to use data created in the performance of this Subaward Agreement for the purpose of education and research or to the extent required to meet University's obligations under its Prime Award.

3. Disputes: Resolution of disputes of a technical nature shall be resolved through good faith negotiations. Any dispute arising under or related to this Agreement shall be resolved to the maximum possible extent through negotiations and settlement. Failing settlement, despite good faith efforts by both parties, any such unresolved issues shall be arbitrated in accordance with the International Arbitration Rules of the American Arbitration Association.

Attachment 4
Subaward Agreement

Reporting Requirements
Quarterly expenditure reports are due within 30 days of the quarter end date. The reports should include current and cumulative costs, Subaward number, and certification as to truth and accuracy of the report [include this requirement for firm-fixed-price Subaward Agreement]. In accordance with 37 CFR 401.14, Collaborator shall notify University’s Administrative Contact, as stated in Attachment 3, within two months after Collaborator’s inventor discloses invention(s) in writing to Collaborator personnel responsible for patent matters.

Final Technical Report: To be submitted within sixty (60) days of the termination date of this Agreement to the University Principal Investigator as stated in Attachment 3.

Final Patent Report: To be submitted within sixty (60) days of the termination date of this Agreement to the University Administrative Contact as stated in Attachment 3. A negative report is required.

All reporting shall be in English and in U.S. dollars ($US).

Payment Schedule [include for firm-fixed-price Subaward Agreement]

University shall pay Collaborator according to the following schedule:

Payment 1) University will issue an advance payment of dollars U.S. ($U.S.) upon full execution of this Agreement.

Payment 2) Milestone/deliverable, etc.

Payment 3)

Payment 4)
Knowledge Check

AIS editors

The Q&As at §3590.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 3500 has been understood. Note: For the answer key for §3590.1, see §3590.3, which appears on a separate page (page 3590:5) for testing purposes.

Discussion topics at §3590.2 are designed to engender dialogue among staff on general issues of importance in the field.

Q&As

1. According to §3505, a particularly helpful site for information concerning monitoring international entities and research agreements is sponsored by which of the following:
   (a) The European Union portal
   (b) The International Development Research Centre (IDRC)
   (c) The Canadian Government Ministry of Trade
   (d) The International Business Improvement Group (IBIG)

2. The International Compilation of Human Subject Research Protections was developed by the
   (a) U.K. Human Subjects Protection Programme
   (b) European Association for the Protection of Human Research Participants
   (c) International Regime Governing Human Research Protections
   (d) U.S. Department of Health and Human Services Office for Human Research Protections

3. Which of the following organizations would you consult for various European training courses, such as workshops on intellectual property rights and contracting:
   (a) Institute of Medicine
   (b) European Association of Research Export Officers
   (c) International Society of Research Officers
   (d) European Association of Research Managers and Administrators

4. The concept of “andragogy” as discussed in §3505 can encompass all of the following EXCEPT:
   (a) Adults should be involved, as much as possible, in the planning and evaluation of their instruction and learning.
   (b) Experiences (both positive and disappointing) provide an optimal basis for learning.
   (c) Adults are generally most interested in learning about subjects/topics/processes that have immediate and direct relevance to their work or personal life.
   (d) Adult learning is generally more “content-oriented” than “problem-centered.”
5. The Swedish Research Council’s gateway to various research ethics guidelines is called
(a) CODEX
(b) The International Fogarty Center
(c) SARIMA
(d) SARMA

6. Before engaging in international activities, it is suggested that an institution check the following lists EXCEPT:
(a) Specially Designated Nationals (SDN) list
(b) Entities List
(c) Denied Persons list
(d) Proliferation of Sanctions list

7. The Foreign Corrupt Practices Act (FCPA) contains two sets of restrictions, relating to
(a) Anti-racketeering and sanctions practices
(b) Money laundering and accounting practices
(c) Anti-bribery and accounting practices
(d) Taxation and accounting practices

8. Two U.S. laws separately maintained by which two U.S. agencies prohibit or penalize participation in, or cooperation with, foreign boycotts that the United States does not sanction?
(a) Departments of Commerce and Defense
(b) Departments of Commerce and Treasury
(c) Departments of State and Treasury
(d) Departments of Defense and Treasury
13590.2 **Discussion Topics**

1. As it may not be possible to physically visit international institutions with which you are collaborating, one suggestion is to perform an “electronic site visit.” How would you do this and what would be involved?

2. Given the additional complexities that come with international collaborations, why would an institution ever engage in such collaboration?

3. What types of processes and policies need to be established especially — and organizationally who would be in charge of establishing these — at your institution to support your international research collaborations?

4. There may be cultural differences that need to be taken into consideration in the conduct of international collaborations? What does this term mean and how might these differences be identified and overcome or affectively addressed so that the collaboration can proceed?
13590.3  Answer Key
Following are the correct answers to the questions included at ¶3590.1.
1. (b) The International Development Research Centre (IDRC)
2. (d) U.S. Department of Health and Human Services Office for Human Research Protections
3. (d) European Association of Research Managers and Administrators (EARMA)
4. (d) Adult learning is generally more “content-oriented” than “problem-centered.”
5. (a) CODEX
6. (d) Proliferation of Sanctions list
7. (c) Anti-bribery and accounting practices
8. (b) Departments of Commerce and Treasury

Introduction

This chapter covers a topic of increasing concern to all research administrators—subawards to collaborating institutions—as interinstitutional research collaborations is one of the fastest-growing areas within the realm of sponsored programs at colleges and universities.

Jennifer Barron of Johns Hopkins University has updated information originally developed by Robert Killoren. With input from subject matter experts Mora Harris, JHU; Sandra Fink, JHU; Stephanie Scott, Columbia University; and Laura Register, Stanford University, this chapter provides a thorough yet highly accessible discussion of the world of subawards. It begins with a description of the financial assistance model under which subawards are clearly separated from “subcontracts,” “vendor agreements,” and “consulting agreements.” Once again, we are reminded that research administration has evolved its own highly specialized vocabulary. Understanding the terms is absolutely critical to being able to make sense of complex relationships such as those contemplated in a subaward.

The chapter provides a complete and useful description of the multitude of considerations necessary to effectively manage this key mechanism that supports collaborative research including the standard agreement template for research collaborations between colleges and universities that was developed and tested by the members of the Federal Demonstration Partnership (FDP). This model agreement was approved by the Office of Management and Budget (OMB) and has been used regularly throughout the higher education community.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to ¶3705, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related resources and practical tools.
This chapter examines the policies and procedures necessary to effectively and efficiently manage subawards on federal grants. It also includes information regarding the model subaward agreement form originally developed by the Federal Demonstration Partnership (FDP). In January 2005, the Office of Management and Budget (OMB) and the Office of Science and Technology Policy (OSTP) endorsed this form as a national standard for streamlining research collaborations with universities and not-for-profit organizations. This regularly updated form has been adopted nationally since, and annually saves hundreds of thousands of dollars in person-hours devoted to processing subaward agreements.

This chapter also discusses the important tasks surrounding subrecipient monitoring, which have become a focus of the new Uniform Guidance regulations (2 CFR 200). Over a decade ago, streamlined federal requirements allowed universities to rely on audit information found in the Federal Audit Clearinghouse (FAC) when conducting subrecipient monitoring. (See Figure 3705-1 for background on the FDP and the FAC.) Uniform Guidance builds on that foundation and provides further instruction on appropriate subrecipient monitoring.

This chapter focuses on the relationship between a “pass-through entity (PTE)” institution under a grant that issues “subawards” to “subrecipient” institutions. There are other ways that the PTE can involve multiple institutions not covered in this discussion, including:

◆ a purchasing agreement, which may be used when an organization is simply providing a service to the PTE, such as performing a routine sample analysis in which one of its labs excels, or when the lead institution is procuring the assistance of another organization’s survey center;

◆ a subcontract, which is used when the PTE is procuring sophisticated levels of research expertise to accomplish a segment of a project’s scope of work under a contract (rather than grant) award; and

◆ a consulting agreement, which is used to engage independent contractors rather than institutions.

Sometimes the terms “subaward” and “subcontract” are used interchangeably, but in the strictest sense they are distinct. Generally, a “subaward” is used when the originating award is a grant or cooperative agreement (the federal government refers to these as financial assistance awards), and a “subcontract” is used when the originating award is a contract. This chapter uses this basic differentiation when referring to subawards. (For a full discussion of administering research contracts, see Chapter 2700.)

Finally, coverage in the chapter is limited to federal funding granted by a pass-
through entity to subrecipients when both institutions are subject to Uniform Guidance. Even in situations where this is not the case, institutions will find that many of the procedures discussed below are appropriate to follow when an institution is dealing with other types of sponsors as well.

§3705.1 Research Collaborations

Research collaborations among researchers at different institutions are commonplace today. The increase in these types of arrangements is a result of several factors: the result of the increasing sophistication of science and the sheer magnitude of the research enterprise; the move towards multi-disciplinary, translational projects; and a move by the federal government to reduce the number of prime awards issued and reduce their administrative burden. While individual investigator-initiated research projects still make up the bulk of awards from most federal sponsors like the National Science Foundation (NSF) and the National Institutes of Health (NIH), big science increasingly demands big solutions to reveal the mysteries of nature and human interactions. Such solutions can only be unraveled by engaging scientists from a wide variety of disciplines, each bringing individual specialties to bear on a single

Figure 3705-1: What Are the FDP and FAC?

The Federal Demonstration Partnership

The Federal Demonstration Partnership (FDP) is a cooperative initiative among 10 federal agencies and 155 institutional recipients of federal funds; its purpose is to reduce the administrative burdens associated with research grants and contracts. The interaction between FDP’s 450 or so university and federal members takes place at three annual meetings and, more extensively, in the many collaborative working groups and task forces that meet often by conference calls in order to develop specific work products. The FDP is a unique forum for individuals from universities and nonprofits to work collaboratively with federal agency officials to improve the national research enterprise. More about the activities and member institutions of the FDP can be found at: www.thefdp.org

Federal Audit Clearinghouse

The Office of Management and Budget established the Federal Audit Clearinghouse (FAC) to serve as the repository for the data collection form, Form SF-SAC, and the single audit reporting packages. The FAC then compiles the data contained in the package and provides that information, along with other appropriate information about the auditee, its audit report, and federal programs to awarding agencies. Its primary purposes are to:

◆ Distribute single audit reporting packages to federal agencies.
◆ Support OMB oversight and assessment of federal award audit requirements.
◆ Maintain a public database of completed audits.
◆ Help auditors and auditees minimize the reporting burden of complying with Uniform Guidance audit requirements.

More about the FAC can be found at: http://harvester.census.gov/sac/
problem. Even the largest and best research institutions in America cannot fully staff the full breadth of expertise needed to work on some problems.

Because a finite amount of money is spent on research, federal agencies are also looking for ways to get the “biggest bang for the buck.” Agencies frequently encourage collaborations between institutions. They employ this team approach not only to find financial efficiencies, but also to encourage diversity. It is thought that such diversity can spark synergies, as well as have a positive long-term impact by increasing the overall scientific base upon which new knowledge is generated. The best scientists in the country may not be in the biggest schools or in particular regions of the country, nor is scientific expertise and dedication limited to gender, race, or ethnic background. Collaborations among large and small institutions, public and private institutions, institutions from different parts of the country, and predominantly minority institutions and those that are not, are necessary to meet the demands of science and society.

Collaborations between institutions are sometimes accomplished with collaborative research awards, where each institution submits its own proposal with a common project description but different budgets. NSF, for instance, accepts related proposals from different institutions and then combines them for review. Successful collaborative proposals yield separate awards to each institution. More often, however, one institution among the collaborators is selected as the lead institution, with the others serving as subrecipients. In this case, the lead institution submits a single proposal on behalf of all the collaborating institutions. If successful, a single grant award is made to the lead institution, and the lead institution makes subawards to the collaborators. This latter arrangement is the focus of this chapter.

### 3705.2 Key Terms

**Figure 3705-2-1: Who’s Who**

- **Recipient** receives financial assistance (an award) directly from a federal agency
  - Also called:
    - Awardee
    - Lead institution
    - University
    - Grantee or prime grantee
    - Pass-through entity
  - Subrecipient receives financial assistance (a subaward) from a recipient
    - Also called:
      - Subawardee
      - Collaborating Institution
      - Collaborator
      - Subgrantee

Uniform Guidance contains the formal definitions of terms used for federal awards. Understanding these definitions is extremely important to understanding the policies and procedures affecting subawards. Definitions of key terms associated with subawards are included below, followed by brief commentary on the terms’ relevancy for a college or university office of sponsored programs (OSP).

*Grant Agreement* means a legal instrument of financial assistance between a Fed-
eral awarding agency or pass-through entity and a non-Federal entity. (§200.51)

The first thing to note is a “grant agreement” means financial assistance; that is, the granting of a grant agreement is not considered a purchasing or procurement activity. The government is not buying something from a university when it gives the institution a grant agreement; rather, it is providing financial assistance necessary to help the institution fulfill its own mission. By using the word assistance, the implication is the funds are given to supplement the institution’s capacity to perform the project.

The concept of financial assistance also suggests that the institution assumes a binding obligation to perform in response to the federal government’s granting of support. However, a grant agreement is not exclusively meant to support an ongoing activity of an institution. Sometimes the grant is to stimulate new activities at the institution that may be of national interest and fall within the institution’s mission and purpose, but currently are not being undertaken. A grant agreement is always made “to accomplish a public purpose.” The government is awarding money derived from public support, e.g., taxes. Therefore awards may not be used for the private benefit or enrichment of persons or entities.

Recipient means a non-Federal entity that receives a Federal award directly from a Federal awarding agency to carry out an activity under a Federal program. The term recipient does not include subrecipients. (§200.86)

Under Uniform Guidance, awards are given to “recipients.” Often the term “grantee” is used, but the formal, technical term is recipient. When recipients share federal funds with subrecipients, they are referred to as “pass-through entities.” Organizations can be recipients but, in general, individuals cannot. Some grant agreements are made to individuals, such as those funded by the National Endowment for the Humanities. However, awards for individuals are administered under different administrative requirements than are awards to institutions. Uniform Guidance states specifically that recipients must be a non-Federal entity, which includes “a state, local government, Indian tribe, institution of higher education (IHE), or nonprofit organization.”

Recipients can receive funding directly from a Federal agency, or indirectly from a pass-through entity (PTE). When receiving funding from a pass-through entity, recipients are referred to as “subrecipients.” In accepting financial assistance, a recipient’s use of grant funds is restricted to carrying out the project or program that fulfills the public purpose supported by the award.

Pass-through entity means a non-Federal entity that provides a subaward to a subrecipient to carry out part of a Federal program. (§200.74)

Once a recipient gives a subaward to another organization, the recipient, as the pass-through entity, takes on the role of the federal government and assumes the responsibility to monitor a subrecipient’s technical and financial progress and compliance. Thus, subrecipients do not report directly to a federal agency, but to the pass-through entity. In some cases, a subrecipient can in turn award a subaward to a lower-tier subrecipient. In those cases, the subrecipient would also be considered a
pass-through entity.

Subaward means an award provided by a pass-through entity to a subrecipient for the subrecipient to carry out an intellectually significant portion of the scope of work of a federal award received by the pass-through entity. A subaward may be provided through any legal instrument type, including an agreement that the pass-through entity considers a contract. (§200.92) A subaward would not be used for payments to a contractor or payments to an individual beneficiary of a federal program.

A “subaward” is made to a subrecipient to carry out part of a federal award. The subaward “flows down” terms and conditions from the award issued to the pass-through entity to an eligible subrecipient, carrying along with it the requirement that it must support or stimulate the subrecipient to accomplish a public purpose. Federal assistance retains its identity as long as it flows down to eligible subrecipients, regardless of what the mechanism for moving the funds is called. According to Uniform Guidance, “a subaward may be provided through any legal agreement, including an agreement that the pass-through entity considers a contract.”

Subrecipient means a non-Federal entity that receives a subaward from a pass-through entity to carry out an intellectually significant portion of the scope of work of a Federal program; but does not include an individual that is a beneficiary of such program. (§200.93). A “subrecipient” must be a non-Federal organization, not an individual, as defined in 2 CFR §200.69.

\subsection{3705.3 Resources Required for Administering Subawards}

Subaward administration can be included as part of any number of research administration functions, including pre-award, post-award, financial, and departmental communications, either as a centralized function, a decentralized function, or a distributed or shared function. Whatever organizational model is used, however, the range of operations associated with subawards should be considered in assigning oversight responsibilities.

\subsubsection{Budget Review}

The same individual or team that reviews the overall budget for the originating proposal should also be responsible for reviewing and incorporating the budgets for any subawards. Subaward costs must be distinct from the costs of the pass-through entity in proposal budgets. Salaries and wages of subrecipients do not show up in the personnel line of the recipient’s budget, for example. Rather, salaries, fringe benefits, equipment, and other direct costs of a subrecipient’s component of the overall program are included in a single line item of the recipient’s budget, with details provided in budget notes or backup documentation. Thus, organizationally, approval of a detailed subrecipient budget should be assigned to the same pre-award unit that reviews budgets for proposals, whether the institution is the pass-through entity or a planned subrecipient. (See 3705.4 for more information.)
Post Award
The same logic applies for post-award operations associated with subawards. The technical progress of a subrecipient needs to be monitored by the principal investigator (PI), and the same PI and his or her department should review, and at most institutions approve and sign, all subrecipient invoices. This is most reasonable, since it is the PI and department staff who are most knowledgeable about the subrecipient’s performance.

Written Policy
Subawards are a favorite target of auditors, so it pays to ensure that the institution’s policy on subawards is in writing, addresses all aspects of subaward management, and is readily available to all project personnel. Be sure that anything included in your written policy is supported by actual practices, and not just an idealized document of what “should” be done. Specialized training for managing subawards is also a necessity for those involved in the process. It is extremely important to communicate to the PI the special responsibilities involved with subawards, particularly when a subrecipient is considered higher risk. If things go amiss in collaborations, it is often because faculty misunderstand their roles and responsibilities regarding subawards, resulting in failure to closely monitor the progress and performance of subrecipients. Failures of communication can readily spoil good scientific relationships and can lead to unsuccessful projects.

Communications
Communications among the sponsored programs office, departmental and college research administration offices, and research accounting operations are essential in administering every subaward. A kickoff meeting with PIs and their assistants who will be handling the accounting and other processes is an effective way to begin the collaboration. Communications among PIs and research administrators from both lead and collaborating institutions need to take place initially and on an ongoing basis to head off problems and resolve differences. Find avenues to remind all individuals involved in subaward management of the institutional subaward policy. This can be done via email communications at the issuance of a subaward, or as a reminder during a subaward modification. Initial and ongoing training programs for PIs, departmental staff, and central office personnel should be conducted on a regular basis to keep new and existing personnel up to date and to address any changes to process or policy.

Tracking System
In addition to a solid understanding of subaward requirements and an organizational structure that allows them to carry out their responsibilities effectively, research administrators across the institution optimally will have access to a subawards tracking database or some other kind of tracking system. Depending on the size of the institution and the number of subawards that need to be tracked, such a system could be created using relatively simple Excel™ spreadsheets, database programs like Access™, or a subaward information system that is integrated into an
institution’s financial or electronic research administration (eRA) systems. Whatever type of system selected, it should be capable of alerting staff about risk assessment, monitoring requirements, milestones, modifications, and deadlines. Subawarding is very much a date-driven process, often involving negotiations between institutions with back and forth communications. It is helpful to track the dates subawards are initially issued to subrecipients, dates when they respond, dates when the PTE needs to follow-up, fiscal year end dates, and the dates of partial and fully executed agreements. (For an in-depth discussion of information systems and eRA, see Chapters 700 and 900, respectively.)

Staffing
As discussed above, the staff member who prepares the award budget typically will handle the subaward budget as well. However, there are certain functions — such as the issuance, negotiation, and administration of subawards — that an institution could choose to handle in a unit dedicated to subawards management, so that there is a consistent treatment and handling of all subawards.

Depending on the volume and complexity of subawards issued by an institution, staffing requirements may vary greatly. Institutions that issue a large number of subawards may benefit from having a team that does nothing but manage subawards. Many such institutions have made managing subawards a specialty of research administration, with its own policies and procedures.

In OSPs that are organized around a customer-based management system (where individuals or teams manage grants from inception to closeout for specific academic units), it makes sense for a team to have oversight of any subawards made under their customers’ awards. Likewise, institutions that emphasize one-stop-shopping concepts may have subawards handled by the team that manages all related administration and financial management associated with a particular project, since the assigned staff is already familiar with that project. This approach provides continuity in administering the project, but can lead to workflow difficulties if the number of subawards is not distributed equally among all teams in the office, or if there are competing deadlines among proposals, awards, and subawards.

In smaller institutions or institutions that do not handle many subawards, it is important that staff working with subawards understand the unique requirements that apply to subawards.

Some institutions assign subawards management to the purchasing department because that office is already handling purchases of services and subcontracts. In most instances this is not the preferred location for managing subawards, because it presents, in a sense, a contradiction in terms. Since subawards by definition are not procurement, but federal assistance, they should not be managed in the same manner as the purchase of goods and services. There can also be contractual implications such as intellectual property or export control that procurement offices may not be prepared to negotiate.

If the institution prefers to create a stand-alone team to administer subawards, this team should have at least some part of an experienced research administrator’s
effort and a staff assistant who would be responsible for the entire subawards process from the award phase to closeout for all subawards.

Some institutions foster the creation of a staff subaward expert to provide help and advice to the entire OSP staff. The subaward expert may:

◆ be available as a resource to anyone in the office,
◆ keep tabs on new developments in national policies regarding subawards,
◆ oversee the institution’s subawards tracking system,
◆ perform various reporting functions, including FFATA reporting, and
◆ act as interface on subawards with auditors.

¶3705.4 Proposal Preparation and Submission

The first step in formally establishing a collaboration between research institutions is submission of a proposal to a funding agency. Although many aspects of proposal development are the same whether or not an institution proposes with collaborators, there are additional requirements imposed by Uniform Guidance. There are also often more complex logistics when submitting proposals with subrecipients.

Subrecipient Determination

Prior to proposal submission, the pass-through entity is required by Uniform Guidance in §200.330 to document its determination that a collaborator is correctly identified as a subrecipient rather than a contractor. This classification will determine the type of legal agreement required to document the relationship. Properly classifying the relationship is essential because it determines the allocation of responsibilities, influences the appropriate application of indirect cost rates, and ensures proper accounting for costs and compliance requirements. FDP has developed a form that can be used to document the determination of a subrecipient, which can be found on the Subaward Subcommittee page of the FDP website.

In order to properly make a determination of whether a collaborator is a subrecipient or a contractor, it is important to understand the distinction.

Characteristics of a subrecipient relationship include those where the subrecipient conducts some of the following types of activities:

1. Determines who is eligible to receive Federal assistance;
2. Has its performance measured in relation to whether objectives of the Federal program are met;
3. Has responsibility for programmatic decision making;
4. Has responsibility for adherence to applicable Federal program requirements specified in the Federal award; and
5. Uses the Federal funds to carry out a program for a public purpose specified in authorizing statute, as opposed to providing goods or services for the benefit of the pass-through entity.
On the other hand, a contract for goods and services occurs when the contractor performs any of the following kinds of activities:

1. Provides the goods and services within normal business operations;
2. Provides similar goods or services to many different purchasers;
3. Normally operates in a competitive environment;
4. Provides goods or services that are ancillary to the operation of the Federal program; and
5. Is not subject to compliance requirements of the Federal program as a result of the agreement, though similar requirements may apply for other reasons.

A non-Federal entity would typically enter into a contract for goods or services with a contractor for its own use through a procurement relationship.

It is important that the correct agreement determination is made early in the process of preparing a grant application, as Facilities and Administrative (F&A) treatment and monitoring requirements for these types of agreements vary and will impact the award budget and, in some cases, the statement of work. In addition, if specified in the award terms and conditions, sponsor approval may be required prior to executing a subaward.

At times, purchased services from an organizational entity do not involve substantive programmatic or scientific research, and a contract for goods and services may be appropriate. An example would be the performance of repetitive tests or activities requiring no discretionary judgment on the part of the provider, or activities which are related to the administrative support of the federal assistance program. In these cases, the pass-through entity must exercise judgment in determining whether an entity will serve as a subrecipient or contractor for the scope of work being performed. Misclassification may result in delays of subaward processing, and failure to include or exclude F&A costs will lead to significant errors in budget calculations.

**Proposal Package**

The following is the recommended minimum information needed from a subrecipient for inclusion in the proposal:

- A statement of the work to be performed under the subaward
- A budget prepared using the budget format and level of detail as required by the sponsoring agency
- Completed representations and certifications, including FCOI certifications, if required at the time of proposal submission
- The signature of an authorized official of the subrecipient, signifying the collaborator’s commitment to carrying out the project if funded.
- Additional institutional forms may be required if the proposal contains foreign subawards, or if the total dollar amount of subawards requested is more than the amount requested to cover the work of the pass-through entity.
The subaward material should be received well in advance of the proposal deadline to allow for a review for completeness and its incorporation into the proposal. It is important for the pass-through entity to carefully review the package to ensure that no material or necessary approvals from the collaborating university are missing.

Once the entire proposal package is assembled, the proposal is ready for submission. The submission process for a proposal containing subawards is the same as is required for submitting any other proposal to a particular sponsor. During the proposal review cycle, it is important for all participating parties to stay in regular communication, especially if there are changes to the budget and scope of work to negotiate during the approval process.

**Scope of Work**

PIs from the collaborating institutions are responsible for developing the proposal. There are multiple ways to approach the writing of a collaborative proposal, depending on the scope of the collaboration and the relative contributions of the parties. The method used most often is to split the proposal into its constituent parts, assigning parts of the proposal writing to the proper investigators who eventually will be responsible for their respective parts of the project. The lead institution’s PI then combines the various contributions into a convincing, comprehensive finished product.

During development of the proposal narrative, a joint project can begin to fall apart if the expectations embodied in each investigator’s contributions to the project are not clearly understood by the collaborators. It is not a good idea for a joint proposal to be written with the understanding that all parties are simply “doing everything together” or, for that matter, “doing their own thing.” Instead, one should make sure the proposal contains a statement of work clearly indicating for what the lead institution and each other party will be responsible.

When reviewing a statement of work, consider including the following items to ensure expectations are clear and well defined:

- A detailed description of the work to be performed
- Clearly state what you want the subrecipient to achieve and deliver
- Will travel be required to complete the work?
- Is there a specific number of times something needs to be “done” (i.e. interview 10 subjects)
- Period of Performance – when does this work start and end?
- Deliverables -- include a timeline of major deliverable due dates
- Include milestones as necessary so that the work can be monitored to ensure that progress is being made and the quality of the work is as expected
- Are there any special requirements?
- Include a definition of completion -- if a final product is submitted, what
constitutes acceptance?

◆ Payment terms
  ◆ Tied to milestones or acceptance of deliverables?
  ◆ Based on monthly invoices?
  ◆ Lump sum at the end of the project?

**Budget**

The budget is the fiscal expression of the project’s scope of work. It needs to accurately reflect the costs of the activities to be undertaken by each collaborator. The pass-through entity is responsible for submitting the overall project budget in the proposal. Subaward estimated costs are not to be interwoven with the pass-through entity’s costs throughout the budget, but included as a separate direct-cost line item in the proposal. If there are multiple subawards proposed, the total cost for each subaward should be provided in the budget along with the name of each collaborating institution, if space allows. The total of all subawards should be entered as the amount for that budget category.

Federal agency guidelines and budget forms often use a term like “subcontracts” instead of “subawards,” but as stated earlier, financial assistance keeps its identity no matter what the proposal calls it. If there is not enough space provided on the budget form to list each subaward separately, use the budget justification page to identify each subrecipient and its total costs.

On NIH modular grants, one must list separately the F&A (facilities and administrative) costs for the “consortium members” (NIH-speak for subrecipients) on the top of the budget justification form. In the justification narrative, each consortium institution’s estimated costs per year must be identified, showing how each sum is split between direct and F&A costs. It is important to note that when NIH establishes a ceiling on the amount of funds that can be requested on a grant, F&A costs related to consortium subawards usually are not factored into this budget limit. Be sure to check the program announcement carefully to confirm what costs may or may not be included under a cap.

The level of effort of the PI and project personnel must be shown, indicating the scope of work each will contribute to the overall project. Since many agencies require approval before including subrecipients in a project, it is important to list each subrecipient explicitly, as this will serve as agency approval. It is almost always a good idea to include a complete budget from the subrecipient as part of the documentation accompanying the proposal.

**F&A Recovery**

Because the pass-through entity is responsible for the management of all subrecipients, it is eligible for a certain amount of F&A costs to help cover the costs of that administrative burden. When calculating F&A based on modified total direct costs (MTDC) for instance, F&A is allowed to be charged on the first $25,000 of each subaward. That limit covers the competitive segment of the project. Thus for a three-
year grant, the pass-through entity only gets F&A on the first $25,000 of the total amount given to each subrecipient for the entire three-year grant period. When receiving a competitive renewal for another three years, the grant is given a “new life” and the F&A cycle begins again. Each subrecipient, on the other hand, is entitled to its full F&A recovery throughout the life of the award, unless there are limitations imposed on the entire proposal by the sponsoring agency.

It is improper to ask the subrecipient to lower its F&A request in order to make more direct costs available for a project. PIs from time to time have been known to attempt to force a reduced F&A recovery “requirement” on subrecipients as a prerequisite for participating in the project. Uniform Guidance prohibits this practice in §200.331(a), which requires the pass-through entity to provide the subrecipient “an approved federally recognized indirect cost rate negotiated between the subrecipient and the Federal Government or, if no such rate exists, either a rate negotiated between the pass-through entity and the subrecipient (in compliance with this part), or a de minimis indirect cost rate as defined in §200.414 Indirect (F&A) costs, paragraph (f)”.

One of the responsibilities of the OSP is to explain to PIs the appropriateness and importance of each subrecipient (and of course the prime) institution recovering its full allowed F&A reimbursement. (For more on F&A costs and recovery, see Chapter 1700.)

**Cost/Price Analysis**

The pass-through entity is responsible for determining the reasonableness of all costs associated with their federal award, including those costs incurred by subrecipients. One way to assess reasonableness is to conduct and document a cost or price analysis when selecting a subrecipient, both when competitively bidding and when using a sole or single source. Under a federal contract, a cost or price analysis is required by the Federal Acquisition Regulations (FAR) to be performed each time a subrecipient is proposed or selected. While not explicitly required by Uniform Guidance, a similar process is recommended for subawards issued under a federal assistance award to ensure compliance with §200.403.

Cost or Price Analysis should be done at the proposal stage, before a subaward is proposed.

<table>
<thead>
<tr>
<th>Questions to Ask in Performing a Cost or Price Analysis</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Have multiple quotes been received and compared for the work?</td>
</tr>
<tr>
<td>• Has cost/price been compared to similar work available in the marketplace/industry?</td>
</tr>
<tr>
<td>• Has the subrecipient provided a copy of their indirect cost rate agreement?</td>
</tr>
<tr>
<td>• Have costs been evaluated for reasonableness, allocability, and allowability?</td>
</tr>
<tr>
<td>• Have details been provided in response to the questions above?</td>
</tr>
</tbody>
</table>

**Cost Analysis** is the review of separate elements of cost and supporting data on a cost-reimbursement subaward. Such analysis may include:

◆ Review of each cost element and supporting information
◆ Determination of whether each cost is necessary and reasonable
Evaluation of cost trends and reasonableness of estimates

Comparison of the application of audited and negotiated F&A rates, labor rates, etc.

Comparison of proposed subrecipient costs with:

- Actual costs previously incurred by subrecipient;
- Previous cost estimates from the subrecipient or other subrecipients for similar items;
- Other cost estimates received in response to the solicitation; or
- Independent estimates by technical personnel

*Price Analysis* is the review of the entire contract price of a fixed-price subaward, without looking at individual items of cost. Characteristics include:

- Used to evaluate the total price under fixed-price awards
- The review of the full price of the subaward without evaluating the individual cost elements

Evaluation based on price comparisons:

- Competitive bids
- Published price lists
- Compare to cost estimates
- Market research
- Historical data/experience

Reviewing the reasonableness of the subrecipient’s costs is a good business practice to ensure the understanding and justification of costs proposed by the subrecipients. Although documenting such analyses is not explicitly required under federal assistance awards, doing so will ensure that an institution has access to any information that may be requested by auditors.

**Request for a Subaward**

After an award is made, the subaward documents must be prepared. The first step in this process is for the PI to initiate a request for OSP to issue subaward. It is important that the PI initiates this process, as an OSP might be unaware of changes that have occurred among the PIs between the time of proposal submission and grant award. For instance, the PI on the subaward may have changed institutions. The subaward request, as submitted by the PI, should include any budget revisions or changes to scopes of work that may have been negotiated between the PI and the agency’s program officer prior to the award. (It would have been preferable if the OSP had been notified of these negotiations, but this does not always happen.)

**Risk Assessment**

Uniform Guidance requires that each pass-through entity evaluate each subrecipient’s risk of noncompliance with Federal statutes, regulations, and the terms and
conditions of the subaward for purposes of determining the appropriate subrecipient monitoring. This assessment should be done prior to the issuance of a subaward and annually thereafter. (§200.331(b)) Such evaluation may include consideration of such factors as:

- The subrecipient’s prior experience with the same or similar subawards;
- The results of previous audits including whether or not the subrecipient receives a Single Audit in accordance with Subpart F—Audit Requirements, and the extent to which the same or similar subaward has been audited as a major program;
- Whether the subrecipient has new personnel or new or substantially changed systems; and
- The extent and results of Federal awarding agency monitoring (e.g., if the subrecipient also receives Federal awards directly from a Federal awarding agency).

In addition to the suggestions in Uniform Guidance listed above, other factors can be used to determine risk:

- Program complexity. Programs with complex compliance requirements have a higher risk of noncompliance.
- Percentage passed through. The larger the percentage of program awards passed through, the greater the need for subrecipient monitoring.
- Amount of awards. Large dollar awards are greater risks.

Subrecipients may be evaluated as higher risk or lower risk to determine the need for closer monitoring. The range used by institutions to identify risk varies, including high v. low risk, low, medium or high risk, or ratings on a scale of 1-10, for example. Generally, new subrecipients would require closer monitoring. For existing subrecipients, based on results of during-the-award monitoring and subrecipient audits, a subrecipient may warrant closer monitoring (for example, if the subrecipient has (1) a history of noncompliance as either a recipient or subrecipient, (2) new personnel, or (3) new or substantially changed systems).

The pass-through entity is responsible for developing its own procedures to be used and compliance areas to be tested, depending on the risk determined by using the above standards, and documenting the determination for each subrecipient accordingly. Based on the institution’s procedures, auditors would look to review specifics on the nature and extent of monitoring activities.

FDP has created a Risk Assessment Tool (RAQ) which can be utilized for this requirement, and can be found on the Subaward Agreement Forms page of the FDP website. The RAQ provides a good starting place for institutions to craft a risk assessment process and to document assessment of risk. It supports responsible stewardship of awarded funds and other institutional needs, as well as compliance with the Uniform Guidance and other sponsor requirements. The RAQ is not designed to be prescriptive in how an institution will determine or manage risk, nor does it represent every possible scenario. The RAQ focuses on Federal and Federal flow-
through funds, but could be used to assess risk of subrecipients regardless of funding source. It is a tool to assist a pass-through entity with determining the risk of a subrecipient, and should not be recycled as a questionnaire to send to a subrecipient to complete. Use of the RAQ does not guarantee a clean audit. FDP has also developed a companion Continuing Assessment Tool (CAT), which can be used annually or at time of a subaward modification to supplement the RAQ.

§3705.5 Subaward Agreements

Uniform Guidance (§200.331(a)(1)) is very clear on what data elements must be included in every subaward. The following items must be part of all subawards:

i. Subrecipient name (which must match the name associated with its unique entity identifier);

ii. Subrecipient’s unique entity identifier;

iii. Federal Award Identification Number (FAIN);

iv. Federal Award Date (see §200.39 Federal award date) of award to the recipient by the Federal agency;

v. Subaward Period of Performance Start and End Date;

vi. Amount of Federal Funds Obligated by this action by the pass-through entity to the subrecipient;

vii. Total Amount of Federal Funds Obligated to the subrecipient by the pass-through entity including the current obligation;

viii. Total Amount of the Federal Award committed to the subrecipient by the pass-through entity;

ix. Federal award project description, as required to be responsive to the Federal Funding Accountability and Transparency Act (FFATA);

x. Name of Federal awarding agency, pass-through entity, and contact information for awarding official of the Pass-through entity;

xi. CFDA Number and Name; the pass-through entity must identify the dollar amount made available under each Federal award and the CFDA number at time of disbursement;

xii. Identification of whether the award is R&D; and

xiii. Indirect cost rate for the Federal award (including if the de minimis rate is charged per §200.414 Indirect (F&A) costs.

The terms and conditions of the subaward need to address the following, in accordance with Uniform Guidance:

◆ The subaward is clearly identified to the subrecipient as a subaward;

◆ All requirements imposed by the pass-through entity on the subrecipient so that the Federal award is used in accordance with Federal statutes, regulations, and the terms and conditions of the Federal award;
Any additional requirements that the pass-through entity imposes on the subrecipient in order for the pass-through entity to meet its own responsibility to the Federal awarding agency including identification of any required financial and performance reports;

A requirement that the subrecipient permit the pass-through entity and auditors to have access to the subrecipient’s records and financial statements as necessary for the pass-through entity to meet the requirements of this part; and

Appropriate terms and conditions concerning closeout of the subaward. (See 2 CFR 200.331(a)(2)-(6))

Consider imposing specific subaward conditions upon a subrecipient if appropriate as described in §200.207 Specific conditions. (See 2 CFR 200.331(c))

Other terms and conditions that should be included, but are not required by Uniform Guidance, include:

Statement of subrecipient’s legal standing (e.g., independent entity and not an employee)

Reimbursement process (e.g., submission of invoices and billing cycles)

Submission of final invoices

Schedule of progress reports or deliverables due

Subaward modification process

Termination process

No-cost extension process

Liabilities of each party

Any special intellectual property, data rights, and publication arrangements

The pass-through entity may have other institution-specific requirements to follow, such as special state requirements that also need to be addressed in the subaward. Most importantly, subawards must be signed by the appropriate authorized officials of both the subrecipient and the pass-through entity.

**FDP Subaward Template Agreement Form**

There are many different ways that institutions can present the above-listed elements in a subaward. This variability in presenting the award terms and conditions can cause misunderstandings between parties to arise, which can lead to extended negotiations, delays in commencing the research, deteriorating relationships, and even an end to the project. Recognizing the need for some kind of standards for and streamlining of the subaward process, the Federal Demonstration Partnership (FDP) assembled a task force to craft a common set of terms and conditions that most institutions could accept. Such troublesome issues, such as limitations that some states put on indemnification, arbitration, and sovereign immunity, were addressed so that all parties to the agreement would be satisfied with the protections given.
The basic approach to standardizing and streamlining the subaward agreement was to defer most “contractual” issues to the general regulations that govern federal awards (originally OMB Circulars A-110, A-21, and A-133, now Uniform Guidance) and include the appropriate document by reference, rather than restating them in a litany of flow-down clauses within the subaward agreement.

Another goal of the subaward template form is the incorporation of common, compromise provisions that all parties can use without changing the language. This reduces the time needed to review and negotiate each contract, and streamlines the subaward process.

Acknowledging that awards can have special terms and conditions, or pass-through entities can be subject to specific state requirements that must be part of a subaward agreement, the FDP task force built flexibility into its model document by incorporating into it several different Attachments to address prime award specificity. By moving prime award specific provisions to a separate attachment, general agreement was reached among institutions on the standard terms and conditions.

The FDP templates offer institutions many benefits. The FDP Subaward Template has been developed and vetted for federal awards over many years by member institutions and agencies. The result is a streamlined, standard set of terms and conditions that have been widely accepted, comply with federal regulations and policies, and enable expedited review and negotiation of routine subawards between member institutions. Because of these widely recognized benefits, the FDP subaward templates are used by both member and non-member institutions.

Update for Uniform Guidance
In response to the implementation on December 26, 2014 of the OMB Uniform Guidance Final Rule (2 CFR part 200) “Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards,” the FDP has revised its subaward agreement templates. While these templates were designed for use by FDP member organizations in collaborating with each other, they may be used by any FDP or non-FDP member institution. It is the pass-through entity’s responsibility to ensure all required terms and conditions flow down from a prime award to a subrecipient. All templates are under continuous review, and attachments are updated as agency regulations are released.

Elements of the FDP Subaward Agreement Form
The current FDP forms can be found on the FDP website: www.thefdp.org  Institutions should check the website frequently to ensure use of the latest versions of the forms. All templates are updated annually through the efforts of a working group. Revised versions will be posted to the FDP Subaward Agreement Forms page in September, or as needed to address changes in Federal requirements. Please check there for the most recent versions before using the templates to develop any subaward agreement. The template consists of a facepage and several attachments. There are several guidance documents and Frequently Asked Questions available for the templates on the FDP website. FDP members can stay up to date by joining
the FDP Subawards Listserv. A listserv request form is also available on the website.

**Subaward Agreement Forms**

The facepage and Attachment 2 include all of the required Uniform Guidance data elements and other standard required information, including:

- identification of the parties and principal investigators;
- prime award information, including award number, FAIN, date, award amount, and *Catalog of Federal Domestic Assistance* (CFDA) number and title;
- awarding agency;
- subaward project title, period, total funding, and funding increment for this award action; and
- References to Attachments for reporting, FFATA, and cost sharing.

**Terms and Conditions**

The standard terms and conditions of the subaward are found on the facepage, and should not be modified from the original document. These terms have been extensively vetted by the FDP membership to be compliant with current federal regulations and to include just the minimum amount of oversight required for the subrecipient to understand its responsibilities and for the pass-through entity to manage the subaward. A discussion of the issues addressed in the agreement follows.

**Payment**

The payment mechanism of the subaward is not dependent upon the type of the prime award; but, rather, should be determined by the pass-through entity based on the activity type, ability of the subrecipient to manage a cost reimbursable agreement, and the approval of the Federal agency when required (see 2 CFR 200.332 and applicable agency regulations). The FDP has a separate fixed price facepage template, which should be used when issuing a fixed price subaward.

The PTE has the option of referencing the subrecipient’s proposal or attaching a scope of work in Attachment 5. If changes need to be made to either the scope of work or the budget, institutions might prefer to attach the revised statement of work and/or revised budget to the subaward. Some institutions simply feel more comfortable with these matters spelled out, so they use Attachment 5 all the time. Inclusion of these items within the four corners of the award document can clarify any potential confusion where revisions were necessary.

It is legally important to identify the collaborator as an independent entity, which clarifies the relationship for tax and workers’ compensation purposes. This also makes clear that each party is acting on its own authority only — neither speaks for the other nor can make any commitments on behalf of the other party.

A monthly invoice is a standard payment mechanism for a cost-reimbursable subaward. Monthly invoicing is common practice; however this clause allows for less frequent invoicing if both parties agree. Monthly invoicing allows the PTE to more closely monitor both the technical progress and spending, and allows the sub-
recipient to be paid more timely and maintain cash flow.

The subrecipient has flexibility in the format of the invoice they provide, as long as it includes invoice data elements as required in Uniform Guidance, including current and cumulative costs being billed for major budget categories. The subaward terms strictly require the subrecipient to provide the subaward number on the invoice, which allows the pass-through entity to track invoices back to the prime award. Subrecipients are also tasked with the responsibility to certify the truth and accuracy of each invoice.

The final invoicing process is addressed specifically in the facepage. The subrecipient must identify the final invoice as “final” and submit it to the PTE within 60 days of the end date of the subaward. Uniform Guidance requires that final invoices on prime awards must be submitted within 90 days of the end of the award, so the university must have the final subaward invoice in hand soon enough to give it time to prepare its final financial report to the agency. (See 2 CFR 200.343(a)) Some Federal agencies, including NIH, have extended the final invoice submission deadline to 120 days. The 60-day limit is a compromise arrangement that allows the subrecipient a reasonable time to complete its records, while also giving the pass-through entity enough time to prepare its final financial report including all subaward costs. For close-out purposes, the final invoice is considered the final financial report from the subrecipient.

While the prime grantee has overall responsibility for the project, it would be an onerous financial liability to the pass-through entity to assume financial risk for the entire project. The grantee requires the collaborator to be responsible for its proper stewardship of Federal funds. Thus, just as the Federal government reserves the right to be reimbursed for illegitimate expenses made on grants and discovered during audits, the PTE reserves such a right with respect to the subrecipient’s use of funds.

**Technical Reports**

The principal investigator/project director (PI/PD) is the individual who takes responsibility for measuring the technical progress of the project, and is responsible for reporting technical progress to the Federal awarding agency. This “measurement” takes into account the amount of work done relative to the time frame of the project, technical and financial progress towards achieving the proposed outcomes of the project, and the quality of contributions made to the project. Likewise, the PI/PD of the subaward reports technical developments to the grantee, and coordinates experimental design in accordance with the scope of work being conducted at his/her institution. Any additional reports are listed in Attachment 4, where the PTE can choose from a list of commonly required reports or include additional requirements.

The FDP Subaward Agreement provides a structure for effective communications and reporting. PI/PDs on both sides need to keep research administrators informed if a change in the scope of work is anticipated or if difficulties in working arrangements between investigators arise.
Changes
The two parties to the agreement must work together in making changes in the relationship or in the project’s scope. This clause prompts personnel at both institutions to alert the proper contacts when the terms and conditions of the agreement change. Severe damage can be done to projects and relationships when investigators initiate “stop-work orders,” changes to the scope of work and funding levels, or the like, without first involving their respective research administrators and following proper legal protocols.

Any changes to the subaward require the written approval of each party. Because of the large number of administrative modifications issued during the course of a project, the FDP has further reduced burden on each party by authorizing the use of unilateral modifications, if both parties agree. Unilateral modifications would be issued by the pass-through entity only for simple, non-substantive changes, including no-cost extensions, incremental funding, or administrative changes. By offering unilateral modifications, the parties can expedite the turnaround time for modification execution.

Indemnity
The issue of indemnity involved extensive negotiations by the task force working on the model agreement, in light of the wide variety of restrictions on and needs of different kinds of institutions. Many state institutions are prohibited by state law from indemnifying or agreeing to hold another party harmless in contracts. Yet institutions need some protection against wrongful acts by subrecipients.

The template includes a requirement for each party to be responsible for their own negligent acts or omissions. This compromise clause provides a reasonable solution to the needs and concerns of the parties; troublesome language like “indemnify” and “hold harmless” are avoided. The clause requires that each institution take responsibility for events within its control yet recognizes that there may be legal limits on the level of liability (such as sovereign immunity in the case of certain state institutions). This clause has proven to be well received by all types of institutions.

Termination
Sometimes projects unravel, investigator relationships sour, institutional capabilities change significantly, or key personnel become unavailable to work on the project. In these cases or other similar events, there must be a provision for either party to “gracefully” back out of the collaboration. The reference to Uniform Guidance in the provision is a good example of how the subaward agreement itself does not have to provide extensive coverage of every topic relating to a subaward. The subaward agreement references other documents as appropriate.

One expanded authority of the pass-through entity that does not automatically flow down to the subrecipient is granting time extensions. Requests for time extensions must be submitted by the subrecipient with enough lead time so that the request can be considered by the pass-through entity, who in turn can submit notification or a request within the time frame as required by the granting agency’s guidelines.
Official Signatures

Signature boxes for the pass-through entity and subrecipient appear on the bottom of the first page of the model subaward. The signatures should be those of the same persons who are identified in Attachments 3A and 3B as the authorized officials for each party.

Attachments

The remainder of the model subaward agreement form consists of five attachments, which are to be included in the subaward document as appropriate. The attachments are as follows:

◆ Attachment 1 contains special certifications and assurances that are required to be specifically spelled out verbatim in all subawards, the requirement for audit in accordance with Uniform Guidance, and a general use of name clause indicating that neither party will use the name of the other without prior approval.

◆ Attachment 2 lists agency-specific terms and special conditions. Attachment 2 is a “smart form,” and it changes based on which agency issued the prime award. Attachment 2 also includes other clauses that cover special topics, such as compliance issues like Institutional Review Board (IRB) and Institutional Animal Care and Use Committee (IACUC) approvals, Financial Conflicts of Interest (FCOI) requirements, and intellectual property terms. Special conditions that are required to be flowed down to the subrecipient can also be included in Attachment 2. Pass-through entities are cautioned to only include the minimum necessary special conditions in accordance with the prime award. Additional “institutional” terms and conditions, such as insurance or governing law, should not be added unless explicitly required by a state law. A pass-through entity may also use Attachment 2 to include a copy of their prime award to the subrecipient, properly redacted, although it is not a requirement to do so.

◆ Attachments 3A and 3B gives contact information for both institutions, and FFATA reporting information.

◆ Attachment 4 contains a list of optional reporting requirements. Any special reports that may be required may also be included.

◆ Attachment 5 contains the scope of work and budget, if the pass-through entity chooses to include them rather than to refer to them by date on the facepage. There are different versions for cost-reimbursement and fixed price subaward agreements.

Sample agreements designed specifically for use with international collaborators are available as well. Sample modification templates are also included, as are numerous guidance documents and frequently asked questions.

The FDP is continually working to improve the usability and efficiency of the template forms, as well as keep them updated with ever-changing regulations. Visit the FDP subawards form webpage often for updates.
Restricted Uses
The subaward agreement template should not be used for contracts or other procurement mechanisms. FDP has created a sample subcontract template, which was designed with much more flexibility in which clauses should be included. The clauses included in the subcontract have been reviewed and discussed by the FDP community, and although the language used in the suggested terms and conditions reflect general agreement, the pass-through entity is free to draft a subcontract consistent with the requirements of its prime contract as well as any institutional policies or state laws.

FDP members are required to use the templates as designed and approved by the community, without unnecessary changes. Although non-FDP member pass-through entities are welcome to use the templates, any changes made should be done sparingly, and such deviations should be justified to the subrecipient.

13705.7 Subrecipient Monitoring
Once the subaward agreement is signed, the most vital and complex subaward work begins. As a recipient of Federal funding, the pass-through entity takes on the responsibilities normally assigned to a Federal agency. As required by Uniform Guidance, recipient institutions need to have written policies and procedures to ensure that they are providing proper oversight of subrecipients and meeting monitoring requirements.

In addition to making a determination that a collaborator is considered a subrecipient, and assessing the subrecipient’s risk of noncompliance with Federal regulations, as discussed previously in this chapter, the pass-through entity is also required to monitor the activities of the subrecipient to ensure that the subaward is “used for authorized purposes, in compliance with Federal statutes, regulations and the terms and conditions of the subaward, and that subaward performance goals are achieved.” (See 2 CFR 200.331(d)) Such monitoring must include:

◆ Reviewing financial and performance reports required by the pass-through entity.

◆ Verifying that every subrecipient is audited as required by Subpart F of Uniform Guidance in accordance with §200.501.

◆ Issuing a management decision for audit findings pertaining to the Federal award provided to the subrecipient from the pass-through entity, as required by §200.521 Management decision.

◆ Following up and ensuring that the subrecipient takes timely and appropriate action on all deficiencies detected through audits, on-site reviews, and other means, as pertain to the Federal award provided to the subrecipient from the pass-through entity.

Uniform Guidance instructs institutions that it may be reasonable to perform different levels of monitoring depending on the risk assessment determination made by the pass-through entity (See §3705.4, Risk Assessment). Many institutions have a tiered monitoring system which includes different requirements for low
risk institutions (e.g. most FDP institutions) and high risk institutions (e.g. foreign organizations or small businesses). Depending upon the pass-through entity’s assessment of risk posed by the subrecipient, Uniform Guidance suggests a number of monitoring tools that may be useful for the pass-through entity to ensure proper accountability and compliance with program requirements and achievement of performance goals, including:

◆ Providing subrecipients with training and technical assistance on program-related matters

◆ Performing on-site reviews of the subrecipient’s program operations

◆ Considering whether the results of the subrecipient’s audits, on-site reviews, or other monitoring indicate conditions that necessitate adjustments to the pass-through entity’s own records.

◆ Considering taking enforcement action against noncompliant subrecipients as described in §200.338 Remedies for noncompliance of this part and in program regulations.

The extent to which a pass-through entity should use any of these techniques is determined by the level of risk each subrecipient presents. For instance, when dealing with other research institutions that regularly receive Federal awards and that have “clean” audit histories, site visits are probably not needed. However, if one is dealing with a small organization who has very little Federal funding or a newly established not-for-profit organization that has been set up specifically to respond to a particular need that the sponsored project addresses, a much higher level of inspection and monitoring is reasonable. See Uniform Guidance §200.425 for information on allowable costs for audit services for the pass-through entity.

**Federal Funding Accountability and Transparency Act (FFATA) Reporting**

The Federal Funding Accountability and Transparency Act (FFATA) was signed into law on September 26, 2006 by President George W. Bush as a way to hold the government accountable for spending allocations. It requires all entities and organizations receiving federal funds to disclose their funding via USASpending.gov. This is a publicly available, searchable website allowing individuals to drill down by entity, geographical region, award, or even individual transaction, to see where tax dollars are being spent.

Prime awardees of federal funds, whether in the form of federal assistance awards or contracts, are required to report on their first-tier subrecipients. Effective October 1, 2010, pass-through entities were required to submit FFATA reports via the FFATA Subaward Reporting System (FSRS). In turn, the data reported in FFATA reports are made publicly available in USASpending.gov.

New financial assistance awards issued on or after October 1, 2010 and awarded $25,000 or more are subject the FFATA reporting requirements. The pass-through entity is required to ensure the applicable subaward has been reported by the end of the following month in which the pass-through entity awards any subaward greater than or equal to $25,000. Federal contracts work in the same manner, however,
pass-through entities are required to file FFATA reports by the end of the month following the month in which the prime contractor awards any subcontract greater than $30,000. In addition, FFATA requires the names and total compensation of the five most highly compensated officers of the entity(ies) if in the preceding fiscal year received 80 percent or more of its annual gross revenues in federal awards; and $25,000,000 or more in annual gross revenues from federal awards; and the public does not have access to this information about the compensation of the senior executives of the entity through periodic reports filed under section 13(a) or 15(d) of the Securities Exchange Act of 1934 (15 U.S.C. §§ 78m(a), 78o(d)) or section 6104 of the Internal Revenue Code of 1986. See FFATA § 2(b)(1) Internal Revenue Code of 1986. All three conditions must be met in order to be required to report this information.

Prime awardees need to consider how they will track awards subject to the FFATA reporting requirements. The Notice of Award issued from the prime sponsor will indicate if the award is subject to FFATA reporting. Some institutions have developed tracking mechanisms using Excel spreadsheets, others have found ways to flag subawards and subcontracts issued subject to FFATA reporting in their grants management systems. Usually individuals who issue subawards are involved with FFATA reporting; however, your organization may choose to assign the responsibility to an individual to submit the reports through FSRS. Regardless of who is assigned to submit FFATA reports and how they are tracked, the reports must be submitted via FSRS in a timely manner. FFATA reporting has traditionally been audited during a Single Audit. Auditors may request a sample of FFATA reports corresponding to subawards and subcontracts issued, where auditors will verify the reports were submitted on time and accurately.

Many resources exist on the FSRS website to educate an institution about the FFATA reporting requirements. FAQs can be found on the home page at https://www.fsrs.gov/. Other resources exist at https://www.fsrs.gov/resources. The FDP has created a listserv for member institutions to share best practices in FFATA reporting. Members can request to be added to the listserv using the mailing list request form at http://sites.nationalacademies.org/PGA/fdp/PGA_055510.

**Audit Procedures**

Uniform Guidance makes clear in Subpart F what is expected of an institution’s policies and procedures with regards to subrecipient monitoring. Institutions should review Subpart F to ensure their subrecipient monitoring policies are sufficient to pass audit. The following topics give a good idea of what may be reviewed by auditors with respect to a pass-through entity’s subrecipient monitoring activities.

**Written Policies and Procedures**

An institution should have written policies and procedures dealing with subrecipient monitoring. If an institution does not have any such policies, developing a set of policies should be an immediate priority. Your institution’s internal auditing group may have suggestions, or institutions can review the policies of other institutions. A number of institutions present excellent models for developing policies and procedures. A comprehensive policy covers risk assessment of subrecipients, including
a number of factors to measure when assessing risk. The policy defines the different roles and responsibilities for each level of research administration involved in subaward management. It describes what is necessary for reviewing invoices, and when and how to make site visits, determine Uniform Guidance compliance, and request audits. An effective policy anticipates what the auditors will be looking for, and documents how the pass-through entity performs its monitoring tasks.

Even if you already have written polices, it would be wise to review them from time to time for currency and relevancy. It is not enough to have policies and procedures in place, however. Institutions must ensure that PIs and research administrators know what the policies are and for which duties each is responsible.

**Documentation of Monitoring Activities**

An institution should be aware of what documentation is being collected regarding the subrecipient’s current and past performance, both programmatically and financially. If such data is not being collected and maintained by the OSP, an institution should create a central database or repository to collect this information or know where such information can be found readily. This information can be decentralized and located with the PIs and departments, or held in a central research financial or accounting office. The documentation of monitoring activities should be clearly outlined in the institution’s subaward policies.

**Corrective Action**

Occasionally, research work at the subrecipient institution is not going as proposed or anticipated, and corrective action may be needed. PIs often will be the first to pick up on something that’s not quite right about a subrecipient’s conduct. For example, a PI might determine that travel is being charged for data collection during at-home interviews of research participants, but no reports of these interviews are coming in. A brief investigation might reveal that students conducting the interviews are failing to transcribe and report on their interviews, yet continue to make trips and charge for travel. The PI might then work with the investigator at the subrecipient institution to arrange to pay for some extra help to document the interviews in a more timely fashion. In cases where a problem arises and is addressed, there should be measures written into the lead institution’s policies and practices for monitoring that the “fix” is working. If red flags or discrepancies with the budget are found on the invoice, the PI may request additional information on how the expenses support the scope of work of the project or backup to support the invoice. Such corrective actions should be documented, including information about the problem, what determination was made for correction, and whether the corrective action has been followed and is successful.

**Ensure Subrecipient Compliance**

Institutions must make sure staff who are responsible for ensuring subrecipient compliance are well trained in using and understanding information in the Federal Audit Clearinghouse (FAC). To document that the subrecipient does not have any negative audit findings that would impact their ability to manage federal funding,
many institutions archive a copy of the subrecipient FAC information. If there is a finding, be sure to follow up with the institution to ensure corrective action is in place, and document the action.

An institution’s policies and procedures need to address specifics on both management decisions and subrecipient corrective action to demonstrate the institution’s timely response to negative findings concerning the subrecipient’s management of grant funds. Using the excuse that “well, the federal government will take care of that (or already has) because the other institution is still getting grants from the NSF” does not obviate the institution’s responsibilities in this area. Auditors will be looking for what the lead institution did to ensure that corrective steps were taken, not what NSF did or did not do. The pass-through entity also may have to impose sanctions when a subrecipient is unresponsive, even in cases where the federal agencies themselves have not followed up.

13705.8 Subaward Closeout

At the end of the subaward period, the institution must follow the same basic steps that Federal agencies use when closing out grants. The pass-through entity is required to close-out the subaward when it determines that all applicable administrative actions and all required work have been completed by the subrecipient. The subrecipient must submit a final financial statement (or final invoice), technical report, invention report, and property report according to the specifications in the terms and conditions of the subaward agreement. The pass-through entity is responsible to the sponsoring agency for sending in all the subaward closeout information with its closeout.

When using the FDP Subaward Agreement, all closeout matters should be addressed in Attachment 4, “Reporting Requirements.” It is the responsibility of the pass-through entity to inform the subrecipient of the proper report format for each required report selected on Attachment 4.

Once the materials are received, the pass-through entity PI and department review the final technical report and invoice. If satisfactory, the PI incorporates the subrecipient’s report on findings or performance into the final grant report. The invoice is sent to the appropriate institutional office to make the final payment. Most institutions require a certification of technical completion be provided by the PI to the proper institutional office prior to paying the subrecipient’s final invoice. If the subrecipient’s report is not satisfactory, then the PI needs to work with the subrecipient’s PI to make it so. If proper monitoring of technical performance has occurred throughout the life of the subaward, there should not be any surprises upon receipt of the subrecipient’s final technical report. If the final report is not satisfactory, the pass-through entity PI should put a hold on payment of the final invoice until the work (and report) is satisfactorily completed. The institution may request a time extension for submission of the final report if necessary.

The pass-through entity must ensure that the subrecipient performs the same closeout actions as are required of the pass-through entity. Uniform Guidance pro-
vides instructions in §200.343:

a. Submit, no later than 90 calendar days after the end date of the period of performance, all financial, performance, and other reports as required by the terms and conditions of the subaward.

b. Liquidate all obligations incurred under the subaward not later than 60 calendar days after the end date of the period of performance as specified in the terms and conditions of the subaward.

c. Pass-through entity must make prompt payments to the subrecipient for allowable reimbursable costs subaward being closed out.

d. Promptly refund any balances of unobligated cash that the pass-through entity paid in advance or paid and that are not authorized to be retained by the subrecipient for use in other projects. (See §200.345 Collection of amounts due, for requirements regarding unreturned amounts that become delinquent debts.)

e. Pass-through entity must make a settlement for any upward or downward adjustments to the Federal share of costs after closeout reports are received.

f. Account for any real and personal property acquired with Federal funds or received from the Federal Government.

g. Pass-through entity should complete all closeout actions for Federal awards no later than one year after receipt and acceptance of all required final reports.

In lieu of a closeout audit of a subaward, the pass-through entity can perform a desk review of all costs to determine allowability of expenditures and record this in a letter to the file called an “Administrative Closeout Memorandum.” depending on the level of risk assigned to the subrecipient, the nature of the program, or the results of a subrecipient’s audits, the pass-through entity may conduct a formal audit if it deems it appropriate.

13705.9 Conclusion

Although issuing subawards and performing subrecipient monitoring has always been a requirement under Federal regulations, the increased emphasis by auditors and agencies on ensuring proper stewardship of Federal funds has in many ways made the collaboration process more onerous. Uniform Guidance attempted to provide clarity as to what is and is not required by pass-through entities. Until we see the interpretations of OIG offices and independent auditors, the clarity of that guidance remains unknown. Efforts by organizations like FDP have worked to streamline the subaward process, and to bring universities together in order to discuss best practices, share policies, and unite in a common understanding of the changing regulatory landscape.
Supplementary Material

This section includes expanded coverage of topics relating to managing subawards. These materials are culled from a variety of authoritative sources.

Subrecipient Monitoring: Recent Audit Findings

Both the National Science Foundation (NSF) and Department of Health and Human Services (HHS) Offices of Inspector General (OIG) have audited prime grantees for their subrecipient monitoring policies and procedures, as well as the subrecipients themselves to determine whether they claim allowable costs in compliance with the terms and conditions of the award and federal regulations. Like their pass-through entity, subawardees must safeguard and properly expend federal funds according to A-133, but the prime recipient is ultimately responsible for the actions of its subrecipients.

A review of findings in the OIG audit reports involving subawards (see Figures 3720.1-1 and 3720.2-1) can be instructive in assisting institutions develop effective internal controls and policies in the area of subrecipient monitoring.

Requirements Flow from A-133. Among their responsibilities (see ¶3705.7), pass-through entities are required by Subpart D of Circular A-133 to do the following:

◆ Advise subrecipients of requirements imposed on them by federal laws, regulations, and the provisions of contracts or grant agreements as well as any supplemental requirements imposed by the pass-through entity.

◆ Monitor the activities of subrecipients as necessary to ensure that federal awards are used for authorized purposes in compliance with laws, regulations, and the provisions of contracts or grant agreements and that performance goals are achieved.

◆ Ensure that subrecipients expending $500,000 or more in federal awards during the subrecipient’s fiscal year have met the audit requirements of this part for that fiscal year.

◆ Issue a management decision on audit findings within six months after receipt of the subrecipient’s audit report and ensure that the subrecipient takes appropriate and timely corrective action.

◆ Consider whether subrecipient audits necessitate adjustment of the pass-through entity’s own records.

Audits of subrecipients have found many of the same problems that surface in audits of prime grantees — unsupported labor costs, unallowable cost transfers, direct costs without supporting documentation, unsubstantiated cost sharing, and late reports. In one audit, the HHS OIG recommended that the prime grantee be responsible for making the financial adjustment for the costs overstated by the subrecipients. In many audits, neither the pass-through entity’s nor the subrecipient’s policies and procedures were adequate to properly manage and monitor the subrecipient funds.
Documents/Reviews. In many of the subrecipient audits, auditors requested the following documents and conducted the following reviews:

◆ Requested subaward documents, and university policies and procedures for pertinent terms and conditions

◆ Requested detailed ledger transaction listings, labor distribution records, personnel records, and supporting documents on costs claimed

◆ Reconciled costs claimed by the university with accounting records

◆ Reviewed charges distributed through payroll distribution procedures and reconciled salary and wage charges with supporting records and semi-annual effort certification reports

◆ Reviewed proposed and actual levels of effort of a key employee for differences

◆ Ascertained the appropriateness of fringe benefit and indirect rates that the university used

◆ Reviewed subrecipient purchasing and recharge center procedures and tested and verified selected direct costs (i.e., for materials, supplies, equipment, and travel) to source documents
Reviewed report filing dates to determine timeliness

The NSF OIG auditors questioned costs in one audit because, while business managers compared invoices signed by a fiscally responsible person at the subawardee to the budget, they did not require supporting documentation with invoices, and NSF auditors determined that this invoice-to-budget methodology was not adequate to ensure accuracy of the costs. Auditors also faulted the university for not conducting on-location financial monitoring.

Internal Controls. Although the circular is not specific as to what actions a university needs to take to meet the monitoring requirement, auditors, at times, appear to require on-site visits and other specific tasks that universities contend are not mandated.

Both NSF and HHS OIG audits have been critical of the internal controls universities have in place to fulfill their pass-through obligations. Audits have found controls inadequate because subrecipient costs were not separately tracked for each subawardee, but were commingled with other types of service costs, or because the university did not have a centralized location for subawardee agreements, contact information, budget, invoices, and other cost information.

In a number of NSF audits of subrecipients, the OIG recommended that the university establish a risk-based system for monitoring and reporting subaward costs. It recommended that the university develop and implement written policies and procedures to assess and document each subawardee’s risk of claiming non-allocable or non-allowable costs, including cost sharing expenditures, and, based on these assessments, perform periodic reviews of each subawardee’s invoices.

HHS, in its audits, also looks for evidence of assessment of the subrecipient’s risk with regard to managing the federal funds. Finally, both NSF and HHS have faulted universities for not reviewing the subrecipients’ A-133 audits, even if the subrecipient has validated the results.

Risk Assessments. Routine, fiscal subaward oversight that includes risk-based evaluation and monitoring could prevent or identify unallowable claimed subaward costs, according to findings in several of the audit reports. Auditors cited one university for failing to conduct risk assessments prior to selecting subawardee institutions. (See also Figure 3720.1-2.) Several audit reports discussed the importance of having a formal process for ongoing risk assessments as part of effective subrecipient monitoring practices. For example, in one audit report, the auditors suggested that a plan could include “performing effective annual reviews of a subawardee’s A-133 audit report; obtaining supporting documentation; and performing desk reviews and site visits.” In another audit, it was recommended that a risk-based approach to subawardee monitoring be sued to determine which monitoring procedures are most appropriate for a particular awardee.

Relying on the controls and self-assessments made by the subawardees was insufficient, according to the report. Another report noted that a reliance on a subawardee’s Circular A-133 audit to provide “assurance that subawardees will comply
Background. The NSF OIG conducted an audit covering calendar years 2004 through 2008 and looked at five NSF awards totaling just under $15 million, about 13% of the university’s total NSF funding. Three of the five awards selected were collaborative in nature and included 11 subawards totaling $9.2 million, approximately 61% of the total costs charged to NSF for the period. (Link to the audit: www.nsf.gov/oig/10_1_006_UM.pdf.)

Risk Assessment Process Faulty. Auditors found problems with how the university’s controller’s office conducts the risk assessment. University policy requires the controller’s office to send a Subrecipient Confirmation Letter to each subrecipient to gather information in order to conduct a risk assessment of the subawardee. In the Subrecipient Confirmation Letter, the subawardee states whether or not it must have an A-133 single audit and certifies that the A-133 audit showed no material instances of noncompliance, material weaknesses, and/or reportable conditions “relating to federal awards provided by the University.” If there are findings relating to the university, the subawardee provides a copy of the audit.

The Subrecipient Questionnaire is used only if the subawardee is not subject to an A-133 single audit (i.e., receives less than $500,000 in federal funds), which is rare.

The audit found that when the controller’s office believes it can get the information it needs from alternative information sources, it does not require the subawardee to submit a Subrecipient Confirmation Letter or a copy of its A-133 audit. Instead, the controller routinely uses information from the subawardee’s A-133 Data Collection Form, which provides a summary of A-133 audit results but no details regarding specific findings (see http://harvester.census.gov/sac).

The controller’s office uses information from the Subrecipient Confirmation Letter or the Data Collection Form to complete a Risk Assessment Worksheet. The worksheet contains a series of questions, but the auditors noted that neither the confirmation letter nor the subrecipient questionnaire provided the information needed to answer the questions.

Without the confirmation letter, the auditors pointed out, there is “no representation from the subawardee that could validate the on-line Federal Audit Clearinghouse data form. Further, without the audit report, the nature of any findings, such as inadequate payroll, procurement or cash controls, or inaccurate financial reporting, cannot be determined. These findings, while not necessarily specific to a University award, nonetheless affect the risk of proper award management.”

Potential Internal Control Risks. The controller’s office had rated all subawardees tested in the audit as low-risk because none of the findings related to the university’s awards. But the auditors uncovered several instances of A-133 findings that while not related to university awards, represented potential internal control deficiencies in payroll, procurement, bank reconciliations, inadequate segregation of duties, and inability to prepare financial statements.

One of the subawardees was incorrectly rated as low-risk, even though a theft of $11,766 from an NSF award due to improper use of a procurement card had been reported on the A-133 audit. The audit of another subawardee reported an unreconciled bank balance that required a $3.6 million adjustment.

with significant award terms and conditions” is insufficient. In one report, the auditors said the results of risk assessments of potential subawardees should be better documented. It was also important, according to the auditors, to document the “rationale” to support the level of monitoring activities.
**Figure 3720.1-2: Subaward Audit Case Study — Risk Assessment, continued**

In another instance, one of the two Subrecipient Confirmation Letters that had been returned stated, “Material instances of noncompliance, material weaknesses and/or reportable conditions were found relating to federal awards provided by the university,” but that sentence had been manually crossed out, and the Risk Assessment Worksheet for the subawardee noted only that recurring prior findings, “were not related to funding provided by [the university].” No additional information supporting this determination was provided, and the subawardee was rated low-risk.

**Review Other Agency Audits.** Another problem with the risk assessment process, according to the audit, was that university policies and procedures require review of a subrecipient’s A-133 audits but do not address other audits that might be conducted by other agencies, such as OIGs, or by internal auditors. The auditors found that two subawardees had audits that identified material internal control weaknesses that could affect their ability to report costs accurately. These results, had they been reviewed during the risk assessment process, would likely have prompted the assignment of a higher risk category to these subawardees.

**OIG Recommendations.** The auditors emphasized how critical the risk assessment process was to designing a subaward monitoring plan and recommended that the university do the following:

- Send a Subrecipient Confirmation Letter and Subrecipient Questionnaire to all subawardees at least annually.
- Request and thoroughly review A-133 audit reports as well as other audit reports.
- Document the reason for the assigned risk assessment level on the Risk Assessment Worksheet.
- Require supervisory personnel to review the risk assessments.

**University Response.** Other than the supervisory review of risk assessments, the university did not concur with the audit conclusions on subrecipient monitoring. Its policies and procedures, the institution said, comply with A-133 and its A-133 auditors have found its subrecipient monitoring procedures adequate and in compliance with the circular.

The auditors responded that they do not agree with the university’s assessment. While the university’s written policy to send a Subrecipient Confirmation Letter to all subawardees and obtain copies of A-133 audits is acceptable, the controller’s office does not always follow this policy. Reliance solely on the information provided in the Data Collection Form is not sufficient, they said, because the information provided there is limited.
Disclosing Federal Subaward Information: FFATA Compliance

Understanding the Federal Funding Accountability and Transparency Act (FFATA) is important to research administrators because federal agencies require awardees to provide much of the needed data as a condition of receiving federal financial assistance, and awardees are responsible for updating the database with subaward and subcontractor information.

FFATA required establishment by January 1, 2008, of a single searchable website accessible by the public for free that includes for each federal award:

- The name of the entity receiving the award.
- The amount of the award.
- Information on the award including transaction type, funding agency, etc.
- The location of the entity receiving the award.
- A unique identifier of the entity receiving the award.

Implementation and Oversight. The Office of Management and Budget (OMB) heads the task force in charge of implementing FFATA, including issuing regulations to do so. OMB, in its oversight role implementing both the American Recovery & Reinvestment Act of 2009 (see ¶120.2) and FFATA, harmonized the subaward reporting as mandated under both statutes. (For a comparison of reporting requirements, see Figure 3720.2-1 on page 3720:11.)

Guidance on Reporting

OMB was unable to get a subaward reporting system in place by the deadline set down in FFATA, January 2009. Finally, OMB announced in April 2010, in a memorandum on “open government and transparency,” that beginning October 1, 2010, federal agencies will be required to initiate collection and reporting of information on subawards as required by FFATA.

In addition to containing the initial FFATA guidance, OMB’s memo requires federal agencies to improve the timeliness, completeness, and accuracy of the ongo-

### Reporting Overview

FFATA, signed into law in September 2006, requires “the full disclosure of entities or organizations receiving federal funds beginning in fiscal year 2007.” Specifically, the law requires the federal government to create and maintain a single searchable website that includes and makes downloadable specific data elements about most federal awards. The website containing prime award data is USAspending.gov. Subaward data is to be reported within 30 days of award and in the same format as primary award data. Subaward reporting is done using the FFATA Subaward Reporting System at www.fsrs.gov. The information will then be publically accessible at USAspending.gov.
ing reporting of direct federal awards at USAspending.gov. OMB also issued guidance containing specific instructions on the subaward reporting on August 27, 2010. Both guidance documents are available at the OMB Open Government site at www.whitehouse.gov/omb/open.

**FAR Rule.** The subcontract pilot program was implemented through the Federal Acquisition Regulation. The Department of Defense, the General Services Administration, and NASA published a rulemaking establishing the subcontractor data collection pilot in the September 6, 2007, Federal Register. These agencies published an interim rule on July 8, 2010, amending the FAR and containing FFATA reporting requirements for federal contracts (http://edocket.access.gpo.gov/2010/pdf/2010-16691.pdf). The rule essentially institutionalizes the OMB April 6, 2010, memo on FFATA reporting.

**Compliance Supplement Now Addresses FFATA Reporting**

The 2011 edition of the OMB Circular A-103 Compliance Supplement contains, for the first time, a discussion of auditing for reporting on subawards as required by the Transparency Act. Subrecipient reporting under the act represents a new area of concern for auditors, and the Reporting (Section L) and Subrecipient Monitoring (Section M) sections of Part 3 of the supplement have been revised to add requirements related to FFATA reporting.

A new L.5 titled “Subaward Reporting under the Transparency Act” was added to each program and cluster in Parts 4 and 5 of the supplement to indicate whether this reporting is applicable or not applicable. The compliance supplement notes that reporting might not be applicable for several reasons. If the program has no subawards, of course, there is no subaward reporting required. Programs that are funded by ARRA are exempt from the FFATA reporting because Sec. 1512 of ARRA requires similar reporting. If a program has ARRA and non-ARRA funding, the supplement notes, only the non-ARRA funds are subject to the FFATA reporting requirements.

**Demonstrating ‘Good Faith Effort’**

The American Institute of Certified Public Accountants was provided a “final draft” of the 2012 OMB A-133 Compliance Supplement, as the agency announced late in May that the clearance process is taking longer than expected. (Although it is unlikely
that the official compliance supplement will vary significantly from this version, auditors are cautioned to use the draft only for planning purposes. The final draft is publicly available on AICPA’s Government Accounting Quality Center website at http://tinyurl.com/7bwm4ph.)

Certain major changes in this year’s supplement deal with Federal Financial Accountability and Transparency Act subrecipient reporting. Because the FFATA requirements for reporting on payments to subrecipients are relatively new and complex, recipients have encountered problems in meeting the requirements, and auditors have encountered problems in testing for compliance, according to OMB. As such, the compliance supplement’s Part 3L, Reporting, has been revised to provide clearer guidance on FFATA reporting. For example, the chart showing when FFATA reporting is required has been expanded considerably (see Figure 3720.2-1).

A new Part 3L subsection on “Good Faith Effort” has been added instructing auditors to look at the circumstances if they determine that the recipient has failed to adequately comply with the reporting requirements in steps 10 and 11 of Part 3L, which address FFATA. If the recipient can demonstrate a “good faith effort” to comply, auditors are not required to report audit findings. Good faith effort must be demonstrated by proper documentation, such as emails or phone logs of communications with the awarding agency or the General Services Administration, or screen shots of attempts to upload the information into the FFATA Subaward Reporting System (www.fsrs.gov).

Auditors also can use a demonstration of good faith effort in determining low-risk status of programs or recipients. Auditors are not required to consider findings in previous audits based on steps 10 or 11 of Part 3L if they determine the recipients made a good faith effort to comply. Language in the new section emphasizes that despite these accommodations, recipients are still required to comply with the FFATA reporting requirements, and auditors are encouraged to remind recipients of their responsibilities under FFATA.

**Reporting Specifics**

Data on prime awards come from the federal agencies and departments that make the awards and are posted by them. Federal agencies have up to 30 days to enter award information. Institutions may want to periodically verify the accuracy of information on their programs included at USASpending.gov. Research administrators report finding inaccuracies in the data agencies are submitting on their institutions.

Federal prime awardees must report on subawards they make: a prime grant awardee is required to report on its subgrants and a prime contract awardee is required to report on its subcontracts. Subaward reporting is done using the FFATA Subaward Reporting System at www.fsrs.gov. The information will then be publically accessible at USAspending.gov. Federal contractors and prime grant recipients are required to register at www.fsrs.gov before reporting.

Subaward data is required for first-tier subawards (i.e., grants, cooperative agreements, or contracts made to others by entities that received the funds directly from the federal government) of grants, cooperative agreements, contracts, and task-
and-delivery orders. The OMB April 2010 guidance defines a subaward “as generally referring to a monetary award made as a result of a federal award to a grant recipient or contractor to a subrecipient or subcontractor, respectively.”

FFATA subaward reporting on assistance programs currently is required only for first-tier subawards under assistance provided from the federal government through grants or cooperative agreements, but in the future, other types of assistance, such as loans and loan guarantees, may also come under the requirements. (FFATA subrecipient reporting is also required for first-tier subawards under federal contracts.)

Grantees. In accordance with 2 CFR Chapter 1, Part 170 Reporting Sub-Award and Executive Compensation Information, prime grantees awarded a federal grant are required to file a FFATA subaward report by the end of the month following the month in which the prime awardee awards any subgrant equal to or greater than $25,000. The grantee reporting requirements are outlined at www.fsrs.gov as follows:

This requirement is for both mandatory and discretionary grants awarded on or after October 1, 2010.

All subaward information must be reported by the prime awardee.

For new federal grants as of October 1, 2010, if the initial award is equal to or over $25,000, reporting of subaward and executive compensation data is required.

If the initial award is below $25,000 but subsequent grant modifications result in a total award equal to or over $25,000, the award will be subject to the reporting requirements as of the date the award exceeds $25,000.

If the initial award equals or exceeds $25,000 but funding is subsequently de-obligated such that the total award amount falls below $25,000, the award continues to be subject to the reporting requirements of the Transparency Act.

According to an FAQ posted at www.fsrs.gov, “to facilitate transparency of federal funds awarded through grants, OMB will consider future additional guidance related to the collection of subaward data. These may include capturing information about: procurements under grants, grant awardees’ costs other than sub-awards and procurements, and sub-awards under other types of federal financial assistance awards.”

Worth Noting?

The following is taken from the FAQs appearing on www.fsrs.gov:

Question: Does the agency have a requirement to ensure FFATA subaward reports have been submitted by the prime for grants the agency has awarded?

Answer: No. ... However, federal agencies are strongly encouraged to ensure the accuracy and data quality of the award information they report.
Further, with some limited exceptions, the reporting requirements apply to all prime awardees of federal grants, including foreign prime recipients and foreign subawardees.

**Contractors.** In accordance with Federal Acquisition Regulation clause 52.204-10 (Reporting Executive Compensation and First-Tier Sub-Contract Awards), prime contractors awarded a federal contract or order are required to file a FFATA subaward report by the end of the month following the month in which the prime contractor awards any subcontract (as of March 1, 2011) greater than $25,000.

The 2011 A-133 Compliance Supplement includes the following table, which explains the one difference between the two sets of reporting requirements for grantees and contractors (www.whitehouse.gov/omb/circulars/a133_compliance_supplement_2011; page III-L-8). (Apart from this difference, the reporting requirements are comparable.)

| DUNS Number | Required for recipients (referred to as contractors under the FAR) and first-tier subrecipients (referred to as subcontractors under the FAR) | Required for recipients and first-tier subrecipients | Required for contractors and first-tier subcontractors (may be required for subrecipients for purposes of A-133 audits) |
| CCR Registration | Required for recipients and first-tier subrecipients; not required for first-tier subcontractors under the FAR | Required for recipients; not required for first-tier subrecipients | Required of recipients; not required for first-tier subcontractors |
| What is reported | As required by Sec. 1512 of ARRA | Each first-tier subaward or action of $25,000 or more in federal funds IF the prime award was made on or after 10/1/2010 with a new Federal Assistance Identification Number (FAIN); does not include vendor payments by recipients or subawards to individuals | Each first-tier subcontract with a value of $25,000 or more in federal funds and any modification to that amount made on or after 10/1/2010 |
| Who reports it | Recipient OR may delegate reporting to first-tier subrecipients | Recipient information at CCR (www.ccr.gov); first-tier subrecipient information at FSRS.gov | Recipient information at CCR; first-tier subcontract information at FSRS.gov |
| Where is it reported | FederalSpending.gov | Recipient information at CCR (www.ccr.gov); first-tier subrecipient information at FSRS.gov | Recipient information at CCR; first-tier subcontract information at FSRS.gov |
| When must it be reported | By the 10th day after the end of the calendar quarter in which the award was made and similarly thereafter | By the end of the month following the month in which the funding occurred | By the end of the month following the month in which the funding or modification occurred |
| Requirement | OMB M-09-21, Questions 2.1 – 2.11 (www.whitehouse.gov/omb/asset.aspx?AssetId=1412) | 2 CFR part 170 and 75 FR 55663, 75 FR 39414 | 75 FR 39414 |

Figure 3720.2-2: Reporting on Subawards Under FFATA

The 2012 Compliance Supplement final draft offers the following guidance on FFATA subrecipient reporting at www.fsrs.gov.

**SOURCE:** 2012 Compliance Supplement (Final Draft), Part 3-L-8, http://tinyurl.com/7bwm4ph

**Familiar Data to Be Reported.** Data items to be reported for subawards greater than $25,000 are the following:

1. Name of entity receiving award
2. Amount of award
3. Funding agency
4. North American Industry Classification System code for contracts/Catalog of Federal Domestic Assistance program number for grants
5. Program source
6. Award title descriptive of the purpose of the funding action
7. Location of the entity (including congressional district)
8. Place of performance (including congressional district)
9. Unique identifier of the entity and its parent; and

10. Total compensation and names of top five executives (same thresholds as for primes)

Total compensation and names of the top five executives must also be reported if (1) more than 80% of annual gross revenues from the federal government, and those revenues are greater than $25 million annually; and (2) compensation information is not already available through reporting to the Securities and Exchange Commission.

Classified information is exempt from the prime and subaward reporting requirement as are contracts with individuals.

User guides, FAQs, and online recordings are available at the FSRS website to assist users. FSRS uses www.zip-codes.com as the source of the congressional district for the location of the entity and primary place of performance.

According to an FAQ posted at www.fsrs.gov, FSRS “takes an ‘awardee-centric’ approach allowing the prime awardee to manage (using their Awardee Worklist) and report against multiple contracts and/or grants awarded to their registered DUNS number. The awardee can sort and filter their worklist by type (i.e., contract or grant), by awarding agency, and by other filter terms. They will be able to see, by award number, the FFATA sub-award reports filed against that particular contract and/or grant.”
The Devil Is in the Details: Subrecipient/Vendor Identification

AIS editors

Colleges and universities are paying more and more attention to the distinction between a subrecipient of federal assistance funds and a contractor acting as a vendor to a federal funds recipient because misidentification has a significant impact on two key areas: single audits under OMB Circular A-133 and reporting under the American Recovery and Reinvestment Act and the Federal Funding Accountability and Transparency Act. In a recent interview, Robert M. Lloyd, a grants consultant, confirmed that “This is one of the most common areas of confusion I am seeing right now.”

Lloyd cites several sources for the confusion. First, there is a widespread misuse of terminology, which stems from a lack of clarity in some applicable guidance, he says. Grantees, and, in fact, federal officials, often refer to all subawards as subcontracts or use the even more ambiguous phrase “partner relationships.”

Lloyd also says an “abundance of caution” can contribute to the problem. For example, some lawyers who may be unfamiliar with the OMB circulars and other requirements often get involved when subaward documents are prepared and have a tendency to add language that would cover any conceivable eventuality, even ones that would not be appropriate to an assistance award or a contract for goods or services. Once language covering both types of instruments is inserted into the award document, its overall purpose becomes muddied, and it is much harder to determine whether it is a subaward or a contract.

The public policy requirements attached to the award documents are one example of where this happens. When a federal funds recipient awards a contract to a vendor, it must include eight contract provisions (outlined in Attachment A to Circular A-110) that cover areas such as anti-kickback and equal employment opportunity.

Subawardees, on the other hand, must comply with the policies in the standard statement of assurances (Standard Form 424B that is part of the application process and available at grants.gov) addressing 18 public policy areas. There is very little overlap between the two, but sometimes subaward documents have been drawn up with all of the provisions included, both those for subawardees and for contractors under grants, which is unnecessary and confusing. Lloyd also says that independent auditors and federal inspectors general sometimes believe they must guard against the possibility of a grantee manipulating the facts of the award to get out of the administrative and audit requirements associated with a subaward. They believe that if the award is not auditable, accountability is lost.

---

Determination Affects Audit Scope

However, it is not the terminology or the public policy provisions, but the award itself, that determines what the funding instrument really is — what it is intended to do and how it is executed. Because different entities use different labels, it often is not clear what type of agreement is involved until multiple factors are examined.

A key determinant in deciding whether an award is a contract or a subaward, says Lloyd, is who benefits from the funds. The concept of who benefits is addressed in OMB Circular A-133 (covering single audits), in §__.210(b)(5), which states, “Characteristics indicative of a Federal award received by a subrecipient are when the organization … [u]ses the Federal funds to carry out a program of the organization as compared to providing goods or services for a program of the pass-through entity.”

The distinction between subawards (pass-through grants) and procurements under grants (contracts) has been an issue in single audits conducted under Circular A-133 as far back as 1997 when the circular was revised, according to Lloyd, because funds received as a recipient or subrecipient are subject to audit under A-133, while payments received as a vendor for goods and services are not. Similarly, subawards are subject to the same federal grants management requirements as the funds in the original award to the prime grantee, and the prime grantee is responsible for the subrecipient’s expenditure of the funds to the same extent as it is responsible for the funds it expends under the grant. Funds that a recipient awards to subrecipients are subject to the recipient’s A-133 audit to the extent that the auditor will examine how well the recipient monitors the subrecipient to ensure that it follows all federal expenditure requirements under the original grant. (Subawardees that expend more than $500,000 in the audit year also may be subject to their own A-133 audit.) However, funds expended by the recipient as subcontracts are examined in the recipient’s audit only to determine if they were allowable expenditures and awarded properly.

Focus Is on the SEFA

In A-133 audits, the problem is primarily associated with the Schedule of Expenditures of Federal Awards, which the grantee must prepare and the auditor uses to identify which funds to audit. Subawards listed on the SEFAs of colleges and universities are generally subject to the grant administration requirements of Circular A-110 and cost principles of Circular A-21, and those requirements pass down to the subrecipient as well.

On the other hand, contracts under grants are subject only to the rules for procurement under grants (Sections 40-48 of Circular A-110; 2 CFR 215.40-48), and once the funds are paid to the vendor, they are considered to be earned income and generally not subject to further audit. Thus, proper determination of awards of grant funds as subawards or contracts has a significant impact on the scope of the A-133 audit.

The auditor is required to render an opinion on the SEFA and, accordingly, will examine which awards are included on the SEFA and why each is there. If in the
course of conducting the audit the auditor identifies other subawards of assistance funds that are not reported on the SEFA, the auditor will qualify its opinion on the SEFA. The grantee would then be required to issue a restatement, adding the missing awards to the SEFA.

Lloyd points out that nothing in the regulations or circulars prevents a recipient from establishing a robust contract administration policy affecting vendors. For example, in a cost-reimbursable contract, a grantee might retain the right to review the contractor’s records to ensure compliance with the terms and conditions of the contract and performance. In other words, even though grant auditing requirements do not require auditing of contracts under grants, they can be auditable if the grantee so chooses.

**Transparency Reporting May Differ**

With implementation of both ARRA and FFATA reporting, the focus on the correct identification of subrecipient and vendors has intensified. Although ARRA requires recipients of ARRA funds to report expenditures of payments to subrecipients and vendors (contracts over $25,000), FFATA reporting specifically excludes reporting on payments to vendors. So the distinction between subawards and contracts has a significant impact on how the recipient satisfies these reporting requirements.

This reporting also has an impact on the single audit, because auditors are required to examine the ARRA reports as part of the A-133 audit. Recipients also must answer to the federal agencies that awarded the funds in the first place. The inspectors general at those agencies, as instructed by the Office of Management and Budget, have taken a particular interest in the reporting under ARRA, with numerous examinations focused on this. FFATA subrecipient reporting also is likely to engender heightened scrutiny at the IG level. So grantees may have to justify to independent auditors and IGs their determinations of which transactions were subawards and which were contracts for goods and/or services.

**The Determination Is a ‘Process’**

Both ARRA and FFATA regulations refer to §210 of Circular A-133 for the definition of a subaward, but Lloyd maintains that §210 captures only some of the general characteristics of a subaward, and that to truly understand the difference, one should go back to the underlying parameters in OMB’s administrative circulars (A-102 and A-110) on which portions of the A-133 definition are based.

“This is important,” he says, “because the determination should be made at the time the award is made — not at the point where its expenditures become subject to audit coverage.”

Subawards and contracts under grants have the same “life events” in common, says Lloyd, which is why making the subaward vs. contract determination can be so difficult. To make the determination, the grantee should look at all the relevant features of the award, which are actually more extensive than those identified in Circular A-133 (see Figure 3720.3-1, page 3720:22).
At each stage of the process, the grantee should ask the question, “Is this more like a contract to a vendor or more like a subaward?” The response may differ for each stage, but the ultimate decision must consider all of the features taken together.

Based on a review of the applicable regulations and circulars, Lloyd suggests there are about 15 relevant considerations in making the decision about whether an award is a subaward to an entity to further the purposes of the original grant or a contract with a vendor for goods and/or services.

Some of the characteristics presented below are so similar for both subawards and contracts that they do not weigh in on either side of the equation. For instance, both subawards and contracts can be awarded on either a cost-reimbursement basis or as a fixed obligation, and just because one approach is taken (say cost-reimbursement) does not automatically determine one type of instrument or the other.

Many of these “features” flesh out the concepts discussed in § 210 of A-133. No single feature or any special combination of features is determinative. Consequently, the determination should be made through the preponderance of features indicative of a subaward or contract.

**Stated Intent of the Awarding Agency.** Does the first paragraph of the award document say something like, “This is an award of federal financial assistance” or “This is a purchase of goods and/or services”?

**CFDA Number.** Does the agreement cite the source of the funding by CFDA number? There is no need to do this for a contract, but it is required information for a subaward.

**Competition and Solicitation.** Is there competition involved? Competition to the maximum extent practical is required for awarding contracts, but there is no governmentwide requirement for competition for subawards (although in practice competition is often involved).

**Number of Awards.** It is unlikely that there will be multiple contracts for the same goods and/or services, but it is quite common for a grantee to make several subawards to fund similar goals and activities.

**Criteria for Selection.** Contracts are most often awarded based on factors such as price and capability, whereas subawards are based on the need to further the goals of the main grant, often considering the most egregious problems that must be dealt with or the financial needs of the subawardee.

**Creation of the Statement of Work.** Who created the statement of work or scope of services? For contracts, these are always created by the awarding entity, and prospective contractors are precluded from involvement. It is quite common, however, for a subawardee to propose to the grantee what the work will be and how it will proceed.

**Timing of Payment.** Federal regulations require that grant recipients advance funds to their subrecipients when they receive advance payment themselves. This is why cash management of federal funds advanced is a type of compliance requirement that must be tested under A-133. On the other hand, normally
contracts with vendors do not involve advancing funds because to do so sacrifices a degree of leverage over contractor performance.

“Costing” of the Agreement. This is on the list because it is often (erroneously) thought to be dispositive — that all subawards are settled on a cost-reimbursement basis, whereas contracts can be fixed-price or cost-type. In fact, both types of instruments could be handled as cost-type or fixed-obligation.

Performance Criteria. Does the instrument contain performance criteria? These are common for subawards, whereas contracts tend to identify specific deliverables.

Special Conditions. Federal regulations affecting subawards permit special conditions in the award document for high-risk entities. However, contracts do not, either because high-risk organizations are generally precluded from being engaged to perform work or they simply fail to meet minimum qualifications.

Cost Participation. Subawardees are often required to commit some of their own resources to match or cost share on a project, whereas it is unusual for contractors to do so.

Risk to Awardee. Contractors nearly always assume a certain amount of risk — if the contractor does not perform adequately, there will be no payment, and the possibility of other adverse consequences exists. Subawardees, on the other hand, do not run the same risk, and awarded funds are claimed even when the quantity or quality of work falls short of expectations.

Property Purchased with Award Funds. Title to property purchased with subaward funds generally rests with the subawardee, with some residual financial interest for the pass-through entity. This means that after the subaward is finished, the pass-through entity could require return of the property or request appropriate settlement if the subawardee wants to keep it. Contractors, on the other hand, own the property they purchase and build the cost of any contemporaneous purchase into their contract pricing.

Applicable Federal Rules & Public Policy Provisions. A key distinction exists here. The applicable terms of the OMB administrative and cost circulars (A-110 and A-21) flow down to subawardees — but not to contractors. Instead, the grantee must flow down Section 48 (Contract Provisions) and Appendix A of A-110 to the contractor. Similarly, federal public policy provisions that apply to grantees because they receive federal funds flow down to subawardees — but not to contractors. These provisions are identified in the standard statement of assurances used in federal grant applications and awards (Standard Form 424B). Contractors, however, only must follow the eight contract provisions in Appendix A of A-110 that cover topics such as anti-kickback and equal employment opportunity.

Termination. Federal regulations permit grantees to terminate their contracts for cause or convenience, but they allow grantees to terminate subawards only for default.

Contact Lloyd at consultlloyd@aol.com.
**Figure 3720.3-1: Subrecipient/Vendor Distinction: Guidance From Circular A-133**

The Circular A-133 provision on subrecipient/vendor determinations serves as the definition of subaward for both ARRA and FFATA.

§ __.210 Subrecipient and vendor determinations. 

(a) General. An auditee may be a recipient, a subrecipient, and a vendor. Federal awards expended as a recipient or a subrecipient would be subject to audit under this part. The payments received for goods or services provided as a vendor would not be considered Federal awards. The guidance in paragraphs (b) and (c) of this section should be considered in determining whether payments constitute a Federal award or a payment for goods and services.

(b) Federal award. Characteristics indicative of a Federal award received by a subrecipient are when the organization:
- Determines who is eligible to receive what Federal financial assistance;
- Has its performance measured against whether the objectives of the Federal program are met;
- Has responsibility for programmatic decision making;
- Has responsibility for adherence to applicable Federal program compliance requirements; and
- Uses the Federal funds to carry out a program of the organization as compared to providing goods or services for a program of the pass-through entity.

(c) Payment for goods and services. Characteristics indicative of a payment for goods and services received by a vendor are when the organization:
- Provides the goods and services within normal business operations;
- Provides similar goods or services to many different purchasers;
- Operates in a competitive environment;
- Provides goods or services that are ancillary to the operation of the Federal program;
- Is not subject to compliance requirements of the Federal program.

(d) Use of judgment in making determination. There may be unusual circumstances or exceptions to the listed characteristics. In making the determination of whether a subrecipient or vendor relationship exists, the substance of the relationship is more important than the form of the agreement. It is not expected that all of the characteristics will be present and judgment should be used in determining whether an entity is a subrecipient or vendor.

(e) For-profit subrecipient. Since this part does not apply to for-profit subrecipients, the pass-through entity is responsible for establishing requirements, as necessary, to ensure compliance by for-profit subrecipients. The contract with the for-profit subrecipient should describe applicable compliance requirements and the for-profit subrecipient’s compliance responsibility. Methods to ensure compliance for Federal awards made to for-profit subrecipients may include pre-award audits, monitoring during the contract, and post-award audits.

(f) Compliance responsibility for vendors. In most cases, the auditee’s compliance responsibility for vendors is only to ensure that the procurement, receipt, and payment for goods and services comply with laws, regulations, and the provisions of contracts or grant agreements. Program compliance requirements normally do not pass through to vendors. However, the auditee is responsible for ensuring compliance for vendor transactions which are structured such that the vendor is responsible for program compliance or the vendor’s records must be reviewed to determine program compliance. Also, when these vendor transactions relate to a major program, the scope of the audit shall include determining whether these transactions are in compliance with laws, regulations, and the provisions of contracts or grant agreements.
13720.4 To Ensure Compliance, Treat Subawardees as Feds Treat You

AIS editors

In the recent spate of audits by the National Science Foundation’s Inspector General and in other audits by different agencies, the issue of deficient subawardee monitoring arises time and again. So just how big is the oversight job of a university, and how can you ensure compliance?

The extent and nature of the responsibilities that colleges and universities have with respect to providing funds to another entity depends on whether a subaward creates a “subcontract” or “subrecipient” relationship. If a subaward is issued to perform part of the programmatic work under a prime grant, both OMB Circulars A-110 and A-133 impose oversight responsibilities that tend to place the college or university in the same position as if it were a federal agency dealing with its own primary recipient.

In essence, under a subaward, the prime recipient becomes the funding agency with the same roles and responsibilities that the agency has to the prime grantee. It is important that colleges and universities understand that ultimate responsibility for any federal funds received rests solely with the recipient. Consequently, the federal government holds the recipient, not the subrecipient, responsible for compliance and may seek recovery from the pass-through entity, not the subrecipient, for any disallowed costs.

A-133 specifies not only subawardee monitoring requirements but also lists items that need to be included in any subaward. Specifically, §___400(d) of A-133 requires recipients to identify federal awards by informing each subrecipient of the CFDA title and number, award name and number, award year, whether the award is R&D and name of the federal agency. When some of this information is unavailable, the pass-through entity should provide the best information available to describe the award. The same section of A-133 also states that subrecipients must be advised of requirements imposed on them by federal laws, regulations and the provisions of contract or grant agreements, as well as any supplemental requirements imposed by the pass-through entity.

Subs Must Further Your Compliance

In addition to taking affirmative measures to monitor subrecipient compliance, the prime recipient institution should ensure that awards of federal funds to subrecipients contain provisions that require the subrecipient to take all of the steps necessary for the institution to comply with its own responsibilities as a pass-through entity under A-133.

This should include specific language that:

Requires the subrecipient to perform an A-133 audit or other audit, if applicable, and to submit reports or other communications promptly to the institution.

1This article is reprinted from the June 2011 issue of Federal Grants News. For more information or to order, visit www.managingfederalgrants.com.
Requires the subrecipient to take corrective action with respect to matters identified in the audit report involving noncompliance with federal laws and regulations within six months of receipt of the report. To avoid disputes as to what corrective action is necessary, the agreement should provide that the subrecipient will take corrective action “as deemed appropriate by the institution.”

Guarantees access by the institution and the institution’s independent auditor to the subrecipient’s records and financial statements as necessary for the institution to comply with its obligations as a direct recipient. Access also should be provided for federal agencies, the Comptroller General and their representatives.

Requires the subrecipient to maintain records, including audit work papers, or ensure that such records are maintained by its own auditors, for three years from the date of the audit report, subject to extension at the institution’s request, and to make the records available to federal auditors and the institution upon request.

Certifies that the subrecipient’s systems meet the standards set forth in relevant federal cost principles and administrative requirements. Circular A-110 states that the provisions of the circular apply to subrecipients performing substantive work under grants that are passed through or awarded by the primary recipient. For example, the requirements relating to cash depositories (§215.22), record keeping and retention (§215.53), and program income (§215.24), among many others, are also applicable to a subagreement.

Standard Terms, Templates for Subawards
Most organizations do not specifically spell out in their subawards all of the applicable provisions of the circulars. Instead, they incorporate the provisions of the prime award either by reference or by including the actual award. The prime award document will specify the agency regulations applicable to the award — these regulations typically include the specific agency adoption of the circular requirements. For example, the Department of Defense Grant Administration Regulations are the DoD’s implementation of A-110 and A-133 requirements. Likewise, 45 CFR Part 74, as referenced in NIH awards, is where NIH does the same.

Following the 2008 adoption by the Office of Science and Technology Policy of standard terms and conditions for research grants (in the January 25, 2008, Federal Register), federal research agencies, in turn, individually adopted the standard terms. A listing by agency of implementation of the standard terms, public policy requirements that must be followed and agency-specific terms and conditions is available at www.nsf.gov/awards/managing/rtc.jsp.

FDP Offers Universal Template
The standardization of the research terms and conditions also have allowed for universal use of the Federal Demonstration Partnership’s subaward templates. For several years, the FDP membership has been using these templates for subawards to other members. Now, the FDP, with the OSTP’s blessing, has developed universal templates that can be used by both FDP and non-FDP institutions. These templates
incorporate the research terms and conditions, including the circular requirements, as well as various public policy requirements and certain agency-specific terms and conditions (http://sites.nationalacademies.org/PGA/fdp/PGA_056020).

With the development of the FDP templates, the task of flowing down the correct terms and conditions to subawardees and incorporating them in subawards has become much easier.

Regardless of ease, however, the prime institution’s responsibilities remain the same — to assure that funding expended by subrecipients is subject to the same requirements as those for the prime awardee.
This section includes practical guidance and tools - checklists, flowcharts, forms, etc. - relating to subawards during their life-cycle. These materials are culled from a variety of authoritative sources.

Special thanks to the staff at University of Minnesota Office of Sponsored Projects Administration, in particular Judy Krzyzek and Andrea Marshall for sharing many of these resources.

**PI Quick Guide to Subawards**

University of Minnesota

The Office of Management and Budget (OMB) has combined many federal circulars into a single guidance document (known as Uniform Guidance, or 2 CFR 200) that can be used by all agencies. These new regulations became effective December 26, 2014.

A general guideline to UMN roles and responsibilities for subawards is available at: http://www.ospa.umn.edu/subaward/roles.htm.

**SELECTION AND RISK ASSESSMENT OF SUBRECIPIENTS**

**Applicable Uniform Guidance (UG) Section:**
200.331

The pass-through entity (sometimes known as “the prime award recipient”) is responsible for selecting capable subrecipients and is obligated to evaluate a subrecipient’s risk of non-compliance with federal statutes, regulations, and conditions of the subaward and must factor the outcome of that assessment into their subrecipient monitoring processes.

**Selection**

A Subrecipient should be selected based upon its technical expertise and potential ability to perform the scope of work successfully, within an infrastructure that meets certain federal internal control and policy requirements. PIs are responsible for assessing the technical adequacy of subrecipients and the appropriateness of their proposed budget. SPA validates the adequacy of the internal controls and policies of the selected subrecipient via its risk assessment process. SPA offers the Fair and Reasonable Cost Analysis Form 1 as an optional tool for PIs and departments to use to guide and document the unit portion of the selection process. If there is uncertainty about a potential subrecipient, consult with the SPA Grant Administrator serving your unit.

**Risk Assessment**

To initiate this assessment, PIs or departmental staff should ask subrecipients to complete a Subrecipient Commitment Form when they invite the subrecipient to send UMN a proposal. The completed form should be submitted to SPA; it is optional at time of proposal but is required prior to issuance of the subaward.

**CONTRACTOR VS. SUBRECIPIENT DETERMINATION**

**Applicable UG Sections:**
200.23
200.92
200.93
200.331

The pass-through entity holds the responsibility for deciding whether any given arrangement constitutes a subaward (carrying out an intellectually significant portion of the Federal award, creating a financial assistance arrangement) or a contractor agreement (obtaining goods and services, creating a procurement relationship).

As a reference tool, the FDP Checklist to Determine Subrecipient or Contractor Classification provides guidance about making this determination. If a PI is unable to determine whether a transaction is a subaward or a contractor agreement, contact your departmental administrator or SPA Grant Administrator for assistance. Note that it is critical for this determination to be correct at the time of proposal in order to ensure accurate pricing and efficient subaward issuance at time of award.
### CONFLICT OF INTEREST

**Applicable UG Section:**

200.112

A process must be in place for screening and managing potential conflicts of interest arising between the PI/UMN and their subrecipients.

When a PI completes the Proposal Routing Form and answers “no” to Question #15.b., they are certifying there is no conflict of interest with the subrecipient. If they answer “yes” because there is a conflict, Minnesota state law prohibits the University from entering into that transaction; contact SPA to determine acceptable alternatives.

### F&A ON SUBAWARDS

**Applicable UG Sections:**

200.331  
200.414

The subrecipient’s negotiated F&A rate or an alternative rate must be used for all subawards.

Apply these rules related to F&A on subawards to all competitive proposals and all new/renewal awards issued on or after 12/26/14:

1. If a federal program or a non-profit sponsor has a published statutory F&A cap, or a reduced rate that has been approved by the agency head and listed in an RFA, that reduced rate must be used both by UMN and all of its subrecipients.

2. In all other cases, apply the following rules in order of precedence:
   - The subrecipient’s federally negotiated F&A rate. This applies both to subawards the University of Minnesota receives from other entities (our applicable negotiated F&A rate must be used), and to subawards we issue (we may not reduce F&A for our subrecipients who have their own negotiated F&A rate).
   - If the subrecipient does not have a negotiated F&A rate, a 10% MTDC de minimus F&A rate must be used. Unless otherwise dictated by the federal sponsor, this rate is available to both domestic and foreign subrecipients. PIs may not negotiate or agree to lower rates with their subrecipients. (NIH caps foreign subrecipients at 8% MTDC.)
   - SPA will, as an alternative to the 10% MTDC de minimus rate, negotiate an F&A rate with a subrecipient that is ineligible to negotiate with the federal government but has more than $750K of sponsored award business with the University per year. Contact SPA if you believe this may apply to your situation.

For **ongoing** subawards that receive a new obligation of funds subject to the Uniform Guidance, the F&A rate will remain at the rate(s) used in the original subaward throughout the rest of the current project period (unless a federal agency has specified differently). New subawards (not yet signed at the time its parent award becomes subject to the Uniform Guidance) will be required to conform to Uniform Guidance F&A requirements listed above (unless the federal agency designates otherwise). PIs may either rebudget from their direct costs to meet any F&A shortfalls or may request supplements from the federal agencies, at their discretion. University personnel may not require or suggest to subrecipients that they forego F&A to which they are otherwise entitled.

There is no change to UMN’s recovery of its own F&A – this remains limited to receiving our F&A on the first $25K of each subaward we issue.

### RETAINING “PROFIT” ON FIXED PRICE SUBAWARDS

**Applicable UG Sections:**

200.201  
200.400  
FAQ .201-1

Excess revenue over expense on a fixed price subaward will not be considered profit as long as the price for the original fixed price subaward was properly established.

A properly established fixed price (sub)award in this context means that the cost of the subaward was determined in accordance with the cost principles in the Uniform Guidance and/or using past experience with similar types of work for which outcomes and their costs can be reliably predicted.

Principal Investigators and their departments are responsible for reviewing subaward budgets to ensure the proposed costs are in alignment with the programmatic objectives and are allowable and reasonable costs to their awards. Consult your SPA Grant Administrator if there are questions.
### FIXED PRICE SUBAWARDS

**Applicable UG Sections:**
- 200.45
- 200.201
- 200.332

**Unless waived by the federal agency, prior agency approval is required to enter into fixed price subawards, which may not exceed $150K. A certificate of completion or price adjustment will now also be required.**

(To date, NIH and NSF have waived the prior-approval requirement for fixed-price subawards. Note, however, NSF still requires prior approval to enter into any subaward not listed in the proposal.)

This will impact approximately 20% of all subawards issued by UMN, which are most commonly used for clinical trial site agreements, foreign subrecipients, small businesses, and small community organizations. To expedite agency approval, PIs/departments should add a justification statement to proposals contemplating a fixed price subaward. If no such statement was used at time of proposal, the PI must initiate a request for agency approval and have it countersigned by SPA, who will submit it to the agency. Allow 30 days for the agency to respond.

At the end of a fixed price subaward (during the closeout process), a new requirement has been imposed to certify completion of the fixed price subaward, documenting that the full effort or activity occurred. If the work was only partially completed, there is an obligation to adjust the price to fairly reflect the amount of work that was completed. Procedural details on the mechanics of this certification will be released in the future.

### SUBRECIPIENT PROGRESS REPORT TRACKING

**Applicable UG Sections:**
- 200.328
- 200.331

**Pass-through entities must specify any required financial or programmatic reports needed in their subawards and they are responsible for reviewing and retaining such reports.**

**Financial Reports/Invoices**

Specifying and tracking financial reports (invoices) from subrecipients is not a new requirement under Uniform Guidance and the University already has systems in place to meet this requirement that will continue to be followed.

**Programmatic Reports**

PIs will be asked by SPA before a subaward is issued if they want to require programmatic reports from their subrecipient. If a PI requires subrecipient programmatic reports, the PI must (1) collect, document their review*, and locally retain (in the PI’s or departmental records) those reports as part of the regular record retention schedule set forth for sponsored project files; and (2) PIs will document they have received and reviewed all required reports when approving subaward invoices for payment. To document mid-project monitoring a statement will be added by SPA to each invoice before it is sent to the PI for approval.

*e.g., an email back to the subrecipient indicating the report has been reviewed and is acceptable, or annotating on the report itself “Reviewed, Approved” with PI’s signature and date.

### SUBRECIPIENT MONITORING

**Applicable UG Section:**
- 200.331

**There is an increased emphasis on effective monitoring of subrecipients both prior to issuance and during the life of a subaward.**

SPA is obligated under federal regulations to verify that a subrecipient has adequate internal controls to comply with agency requirements and regulations prior to entering into a subaward and during its lifetime. This includes reviewing a subrecipient’s audit information or alternative verification of the subrecipient’s internal control structures, and review of subrecipient programmatic and financial progress (including invoices and progress reports.) In most cases, SPA is able to undertake initial or annual risk assessments without involving the PI, but PIs will be informed if their assistance is needed.

PIs play a major monitoring role by verifying progress and in ensuring invoices submitted by subrecipients are appropriate. In some cases, SPA will modify the terms of a subaward to manage institutional risk (e.g., require more frequent or detailed invoicing or reporting, use of a fixed price subaward, smaller but more frequent obligations of funding, etc.) or to meet specialized needs of a subrecipient (e.g., to help them manage cash flow). PIs should inform their SPA Grant Administrator of any special needs, concerns, or requirements arising with their subrecipients, either before a subaward is issued or as the subaward unfolds.
### PROMPT SUBAWARD PAYMENTS

**Applicable UG Sections:**
- 200.207
- 200.305
- 200.338

<table>
<thead>
<tr>
<th><strong>When issuing payments on cost-reimbursement subawards, pass-through entities are expected to issue payment on allowable costs within 30 calendar days after receipt of the billing.</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>With this new prompt subaward invoice payment expectation, coupled with the new emphasis on the timely closeout of awards, PIs are asked to review and approve invoices within 14 days of their receipt, and return the approved invoice to SPA for payment. For your reference, see the checklist that should be followed when reviewing invoices.</td>
</tr>
<tr>
<td>SPA is phasing in a new streamlined invoice submission process. Subrecipients will no longer submit the invoice to the PI and Grant Administrator. Instead, subrecipients will be instructed to submit invoices to: <a href="mailto:sub-inv@umn.edu">sub-inv@umn.edu</a>. SPA will send the invoice to the PI and department and monitor to ensure that it is approved by the PI and returned to SPA so that it may be paid within the 30 day window.</td>
</tr>
<tr>
<td>If a PI believes payment should be withheld from a subrecipient, they should contact their SPA Grant Administrator immediately. Under certain limited conditions detailed in the regulations, payment may be temporarily withheld while remedial activities are requested.</td>
</tr>
</tbody>
</table>

### CLOSEOUT

**Applicable UG Section:**
- 200.343

<table>
<thead>
<tr>
<th><strong>For most federal sponsors, UMN is required to submit its final reports (financial and progress) within 90 days after project termination. Subaward invoices and final reports must be submitted within 60 days to allow the University to meet this deadline.</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>If the sponsored award has a subaward, the University must receive and process all final subrecipient reports and the final invoice within 60 days. This allows Sponsored Financial Reporting (SFR) to capture the expense on the final financial report and final bill (or electronic funds draw down) with the prime sponsor. PIs must be diligent in monitoring the receipt and approval of subrecipient final invoices for processing within this 60 day deadline.</td>
</tr>
<tr>
<td>Concurrently, SPA will be requesting and monitoring the required closeout forms, including the Subaward Release Form, from the subrecipient.</td>
</tr>
</tbody>
</table>
13730.2  **Subrecipient’s Practical Guide to Proposing, Receiving, and Managing a Subaward**  
University of Minnesota

1. **What is a subaward?**

A subaward is a written agreement with another organization (subrecipient) performing a portion of a University of Minnesota sponsored project. The terms of the relationship (subaward) are driven by the requirements of the award that the University of Minnesota has received, plus any requirements that the University of Minnesota has added to ensure that it can adequately monitor the work and associated costs being performed. The UMN Grant Administrator in the Sponsored Projects Office (SPA) attempts to move every subaward forward as soon as possible but this not solely their responsibility. The UMN Principal Investigator and their University department play an important role in establishing these complex transactions. To ensure your subaward is handled as expeditiously as possible, we ask that you follow this workflow and make sure the UMN Principal Investigator and UMN SPA Grant Administrator have the information they need to initiate your subaward.

2. **What forms must I complete, when are they due and to whom? (See workflow)**

A. Proposal Stage (all of these forms are to be sent to UMN Principal Investigator)

1. Commitment Form or alternative endorsement of the proposal by the subrecipient’s Authorized Organizational Representative.
2. Statement of Work (SOW)
3. Budget & Budget Justification
4. Financial Conflict of Interest Disclosure (if the award is funded by a Public Health Service agency or other agency using their requirements – see list here)

B. Award Stage

1. An updated version of the Commitment Form if more than 12 months from date of authorized signature (this form should be sent to UMN SPA Grant Administrator)
2. Updated SOW and or budget information if revisions are necessary (these forms should be sent to UMN Principal Investigator)
3. Federal Audit Clearinghouse documents including an Audit Certification and Financial Questionnaire Form (This form should be sent to UMN SPA Grant Administrator)
4. Upon receipt of the draft subaward from the UMN SPA Grant Administrator, review and sign subaward document and return to the UMN SPA Grant Administrator. If you have questions or concerns about the terms of the subaward, contact the UMN SPA Grant Administrator before signing. Once both parties have signed the subaward, you may start work.
3. How do Indirect Costs or Facilities and Administration (F&A) impact my subaward?

Facilities and Administrative Costs are costs incurred during the normal business activities of an organization that cannot be readily identified with or directly charged to a specific project or activity. F&A costs are real, auditable costs incurred by the subrecipient each time it accepts a subaward. If a federal agency or its program has a published statutory F&A cap, that rate must be used. This is also true if the sponsor is a non-profit organization with a published policy on the payment of F&A costs. If this is the case, the UMN Principal Investigator or their departmental personnel will have told you, or it will be listed in the Funding Opportunity Announcement or proposal guidelines issued by the funding agency. If there is no published F&A cap, and if a subrecipient has a federally negotiated F&A rate, that rate must be used. If the entity does not have a negotiated F&A rate, a 10% modified total direct cost [see FAQs] de minimus F&A rate must be used instead. In certain rare circumstances the UMN PI may request an F&A rate be negotiated with the subrecipient. The subrecipient may also volunteer to accept the subaward with no F&A costs included in the budget, but UMN cannot ask or recommend the subrecipient to do so. Subrecipients are entitled to F&A at the applicable rate shown above and UMN is committed to ensuring that subrecipients receive the F&A to which they are entitled.

4. When does the monitoring of subrecipient begin?

The process of monitoring a subrecipient begins at the proposal stage. The PI obtains the proposal from the prospective subrecipient for participation in the project, and includes the proposal statement of work and budget in the prime proposal to the awarding agency. The PI also obtains the Subrecipient Commitment Form from the subrecipient. The PI’s review of the proposed subrecipient’s proposal and determination that the proposed work and budget is acceptable and desirable for inclusion in UMN’s proposal constitutes the first steps in subrecipient monitoring.

5. Why is a Subrecipient Commitment Form needed before an award is issued?

This form documents the subrecipient’s compliance with regulations and is a tool to expedite the issuance of the subaward. Having material submitted at proposal stage will allow subawards to be processed and issued more quickly however this form may also be submitted at the award stage if it wasn’t included with the proposal.

6. How is the Subrecipient Commitment Form used by UMN? Does it get submitted to the Funding Agency too?

The Subrecipient Commitment Form is to be completed and signed by an authorized institutional representative of the Subrecipient and provided at proposal stage with other proposal documents. The form also is used for awards that did not include the form at proposal stage. The UMN SPA Grants Administrator reviews the form to verify that the subrecipient can and will adhere to certain compliance obligations, such as the appropriate use of human and animal subjects, the eligibility of the subrecipient to receive sponsor funds, and the entity’s audit status. The form is
used by UMN and does not typically get submitted to the Funding Agency.

7. Why is Assessing and Managing Risk Important?
UMN SPA is responsible under federal regulations and University requirements to evaluate each proposed Subrecipient’s risk of noncompliance with Federal statutes, regulations, and the terms and conditions of the subaward. This risk assessment is performed prior to the subaward first being issued and is refreshed at least annually. Some of the attributes that will place a potential subrecipient into a higher risk category include:

◆ A qualified audit report or failure to have a current audit report
◆ An incomplete or inadequate response to the audit questionnaire (used when the subrecipient is not subject to a federal audit)
◆ A known history of non-compliance (programmatic, compliance controls, or financially)
◆ History of non-performance or failure to use funds for authorized purposes
◆ A new subrecipient or the subrecipient is new to the type of work being performed
◆ A large percentage of project funds is being passed-through to the subrecipient
◆ The subrecipient’s sponsored research portfolio is small and the subaward amount is large.
◆ The subrecipient has new or substantially changed systems (including its financial system)

UMN is also required to ascertain whether there is a potential conflict of interest between the UMN Principal Investigator and the entity or its principals. UMN also reviews to make sure a Subrecipient is not debarred or suspended from doing work with the federal government. UMN will not issue a subaward to an entity that is debarred or suspended or in the event of an unmanaged conflict of interest.

8. What is Subrecipient monitoring and why is it required?
It is primarily the UMN Principal Investigator’s responsibility to monitor the progress of the subrecipient. Subrecipients are partners in the research enterprise so it is important to identify and establish good communication with subrecipient’s representatives from the beginning. UMN Principal Investigators consider the following factors in monitoring the progress of their sub recipients:

◆ Is the work progressing according to schedule and consistent with the Scope of Work?
◆ Are deliverables/reports being provided in a timely manner?
◆ Are compliance requirements (e.g., human- and animal-subjects approvals, conflict of interest approvals, if required) up to date?
◆ Do invoices reflect allowable, allocable, and reasonable costs?
Are funds being spent according to the budget and project time lines?
◆ Is committed cost sharing verified?
◆ Has the Subrecipient done an adequate job of timely requesting any needed prior approvals?
◆ If there are unanticipated delays, has the UMN Principal Investigator been notified in a timely manner of the problems that have arisen, and has a corrective action plan already been worked out?

9. How do I get paid?
The subrecipient sends invoices to sub-inv@umn.edu on the schedule listed in the subaward. After review and approval by the UMN Principal Investigator and UMN SPA Grant Administrator, the invoice will be paid. Invoices are paid within 30 days after receipt by the University. (Sample invoice). If any programmatic reports were due during the period covered by the invoice, these reports must be submitted and approved by the UMN Principal Investigator before payment will be made.

A subrecipient can request their payments be direct deposited by completing UM Vendor ACH Authorization Agreement and returning the completed for to UM Disbursement Services (disbsvcs@umn.edu).

10. What is required if the subrecipient does not have enough working capital and needs an advance payment from the University?
The University may, in rare circumstance, provide a subrecipient with a working capital advance if the subrecipient does not have sufficient working capital to initiate the scope of work described in the subaward. A letter from the Subrecipient’s authorized official to SPA should be submitted, including the following information:

1. A sound rationale for why a working capital advance is needed and verifying that the proposed subrecipient does not have access to sufficient capital to perform the work and be reimbursed

2. The amount of the proposed advance payment. Note: the amount should be only enough to cover the projected short term working capital needs of the subrecipient organization. In this case, “short term” refers to a period of not more than 2 months, and should not exceed a 2 month pro-rata share of the first year budget unless there are unusual up front expenses (e.g., equipment, recruitment costs, etc.) If there are unusual up front expenses, explain what those costs are and how much additional money is needed.

3. An explanation of whether ongoing advance payments are needed or if this is a one-time request. If on-going advance payment is needed, the Subrecipient should typically plan to provide monthly documentation of actual expenses and projections of new cash needs. For example:

   Initial Request for Months 1 and 2 - $25,000 x 2 months = $50,000

   After first month of performance -
   Actual Expenses for Month 1 = $22,000
Cash on Hand: $28,000 ($50,000 advance - $22,000 actual expenses for Month 1)
Projected Expenses for Month 3 = $25,000
Working Capital Cash Request from UMN = $22,000 (Cash On Hand + Projected Expense for Month 3 - Estimated Cost for 2 months)

4. An endorsement by the authorized representative of the subrecipient.

Please Note: Advance payments to subrecipients will only be considered if the subaward is fully executed.

11. How can a subaward be changed / amended? When does the subaward need to be changed and when can a Subrecipient simply get UMN’s approval without changing the subaward?

The UMN Principal Investigator or UMN SPA determines when a subaward is to be amended. Common reasons for amending a subaward include providing additional funding, extending the period of performance or modifying the reporting schedule. It is important to note that some changes, such as scope of work changes, or a change in the Subrecipient’s Principal Investigator may require the prior approval of the prime sponsor (i.e. awarding agency). If a change requiring funding agency approval is required, the Subrecipient must write to the UMN PI (signed by both the Subrecipient PI and the Subrecipient’s institutional representative) and request the necessary prior approval. In general, Subrecipient’s should plan to submit their requested changed 45 days in advance of when it is needed, as time is needed both for UMN to review the request and, if acceptable, to obtain agency approval. Federal agencies normally respond within 30 days from the time UMN has submitted the request. Subrecipients may not write directly to funding agencies, but must instead submit all of their prior approval requests through UMN.

12. How is a subaward closed out?

The UMN Principal Investigator is responsible for submitting any required technical, property, and invention reports and / or any other required deliverables required by the awarding agency. Failure by the Subrecipient’s Principal Investigator to provide their reports and deliverables according to stated timelines can have a negative impact on submission of UMN reports to the awarding agency and may impact future funding from the sponsor. Prior to UMN making final payment to the subrecipient the Subaward Release Form must be received by the UMN Grant Administrator.

Frequently Asked Questions about Subawards
University of Minnesota

1. How do I tell if it is a Subaward or Other Procurement (CPS)?
FDP Checklist to Determine Subrecipient or Contractor Classification

2. What information is needed at time of proposal?
◆ Subrecipient statement of work
◆ Subrecipient budget and budget justification
◆ Subrecipient Commitment Form signed by subrecipient institutional official
◆ Any other documents required by U of M or Sponsor (for example: NSF Nondiscrimination Certification, http://www ospa umn edu/subaward/forms. htm)
◆ FCOI Forms Packet, if applicable
◆ If subrecipient is not set up as a vendor in EFS, a W9 form will be required

3. Do I need to provide an original signed copy of the commitment form and budget, or can I email as attachments to the GA?
Unless the sponsor requires it, we do not need an original. An email or fax is sufficient.

4. How should the selection of a subrecipient be documented?
Original documentation should be maintained in the department that was used in developing the proposal estimate. This information will be required to substantiate how proposal pricing and collaborator choice was derived. The forms below should be used as a tool when investigators are developing proposals and choosing subrecipient collaborators. The information gathered on these forms will help document information that may be requested by auditors. These forms do not need to be submitted to SPA, but should be kept in the department. The exception is that for Federal Contracts Form 2 should be submitted to SPA.

Fair & Reasonable Subaward Cost Analysis Form 1 - Subawards under Grants, Cooperative Agreements, and Nonfederal Contracts
Fair & Reasonable Subaward Cost Analysis Form 2 - Subawards under Federal Contracts

5. What F&A rate do I apply to a subaward?
There are two types of F&A costs on subawards - those earned by the subrecipient, and those earned by the U of M. If a federal program has a published statutory F&A cap (NIH caps foreign subrecipients at 8% MTDC), that rate must be used both by UMN and all of its subrecipients. For all other federal programs, if a subrecipient has a federally negotiated F&A rate, it must be used. If the entity does not have a negotiated F&A rate, a 10% de minimus F&A rate must be used instead, or the PI/
department may request that SPA negotiate an F&A rate with the subrecipient. PIs may not negotiate or agree to lower rates with their subrecipients. The U of M will apply its federally approved F&A rate or the sponsor-allowed F&A rate to any subaward issued. Specifically, this means that the U of M will charge its F&A on the first $25,000 of a subaward during a competitive segment (e.g., project period). For subawards under non-federal prime sponsors, the F&A rate and base will vary. More information is available on the Uniform Guidance FAQs. Please consult your GA if you have any questions.

6. What should be the period of performance on my subaward?
The period of performance on a subaward (including any requested extensions) may not be outside the U of M’s period of performance. Subawards may, however, be issued for shorter periods of time than the U of M’s full period of performance. Normally, if the University receives annual incremental funding from a sponsor, any subawards will also be funded on a year-by-year basis.

7. How can I tell if the subrecipient’s invoice has been paid?
See our Job Aid Finding Vouchers and Pay Dates

8. How do I modify a subaward?
Send the SPA GA the necessary information for the change needed (workscope, budget, performance period, deliverables, additional terms, etc.). Modifications may require prior sponsor approval.

9. What is FFATA and how does it affect me?
The Federal Funding Accountability and Transparency Act passed 9/2006. It requires a searchable website for public funding by data elements by 1/1/2008 for awards and by 1/1/2009 for subawards. SPA will be collecting and sending in this information to the Federal Government. SPA won’t sign subaward or any amendments until the FFATA form is returned by the subrecipient. Any questions/issues regarding FFATA should be forwarded to SPA. FFATA data collection is conducted by UMN Purchasing Department on Federal contracts if the acquisition cost is greater than $25k.

10. What is Risk Analysis?
Uniform Guidance, Section 200.331 requires a risk analysis to evaluate the likelihood that a subrecipient will fail to comply with the requirements of the subaward. This will be done by SPA during the issuance process and monitored during the life of the subaward. The criteria used in evaluating risk can include the subrecipient’s audit experience, the prior oversight and monitoring the subrecipient has received, the size, nature, and complexity of the proposed research project, and the fiscal maturity of the subrecipient.
13730.4  **FDP Subrecipient or Contractor Classification Checklist**

Federal Demonstration Partnership

---

**Checklist to Determine Subrecipient or Contractor Classification**

**OBJECTIVE:** Generally, the determination of the relationship with an entity is verified through the institutional review of the proposal narrative, budget justification, and other related proposal documents, as well as through discussions with key personnel prior to proposal submission. When the relationship remains unclear, this form may provide assistance in making an accurate determination.

**DEFINITIONS FROM UNIFORM GUIDANCE (2 CFR. PART 200):**

- **Subrecipient:** §200.43 Subrecipient means a non-Federal entity that receives a subaward from a pass-through entity to carry out part of a Federal program, but does not include an individual that is a beneficiary of such program. A subrecipient may also be a recipient of other Federal awards directly from a Federal awarding

- **Contractor:** §200.21 Contractor means an entity that receives a contract as defined in §200.22. Contractor means a legal instrument by which a non-Federal entity purchases goods or services needed to carry out the project or program under a Federal award.

**INSTRUCTIONS:** Complete sections one and two of the checklist by marking all characteristics that apply to the outside entity. The section with the greatest number of marked characteristics indicates the likely type of relationship the entity will have with the University. On occasion there may be exceptions to the type of relationship indicated by the completed checklist. In these situations, the substance of the relationship should be given greater consideration than the form of agreement between the University and the outside entity. Section 3 should be used to provide documentation on the use of judgment in determining the proper relationship classification.

**NAME OF OUTSIDE ENTITY:**

---

**SECTION 1 - SUBRECIPIENT**

**Description:** A subaward is for the purpose of carrying out a portion of a Federal award and creates a Federal assistance relationship with the subrecipient. Characteristics which support the classification of the non-Federal entity as a subrecipient include when the non-Federal entity:

- Determines who is eligible to receive what Federal assistance;
- Has performance measured in relation to whether objectives of a Federal program were met;
- Has responsibility for programmatic decision making;
- In accordance with its agreement, uses the Federal funds to carry out a program for a public purpose specified in authorizing statute, as opposed to providing goods or services for the benefit of the pass-through entity.

Entities that include these characteristics are responsible for adherence to applicable Federal program requirements specified in the Federal award.

**SECTION 2 - CONTRACTOR**

**Description:** A contract is for the purpose of obtaining goods and services for the non-Federal entity’s own use and creates a procurement relationship with the contractor. Characteristics indicative of a procurement relationship between the non-Federal entity and a contractor are when the non-Federal entity receiving the Federal funds:

- Provides the goods and services within normal business operations;
- Provides similar goods or services to many different purchasers;
- Normally operates in a competitive environment;
- Provides goods or services that are ancillary to the operation of the Federal program.

Entities that include these characteristics are not subject to compliance requirements of the Federal program as a result of the agreement, though similar requirements may apply for other reasons.

**FINAL DETERMINATION:**

- [ ] SUBRECIPIENT
- [ ] CONTRACTOR

**OPTIONAL - SECTION 2 - USE OF JUDGMENT:** (use only when the determination cannot clearly be made using the above criteria)

**Description:** In determining whether an agreement between a pass-through entity and another non-Federal entity carries the latter as a subrecipient or a contractor, the substance of the relationship is more important than the form of the agreement. All of the characteristics listed above may not be present in all cases, and the pass-through entity must use judgment in classifying each agreement as a subaward or a procurement contract.

**Explanation of Use of Judgment Determination:**

---

Prepared By: ___________________________ Date: ___________________________
13730.5  **Subaward Processing Checklist – Department/PIs**  
University of Minnesota – Office of Sponsored Projects Administration

**PROPOSAL PROCESSING**

PI requests proposal package from proposed subrecipient, to include:
- Statement of Work
- Budget and Justification
- Any other documents required by UMN or Sponsor (example: NSF Non-discrimination cert.)
- WB or W9 if subrecipient is new to UMN
- Signed Subrecipient Commitment Form

PI evaluates subrecipient
- Assess technical expertise and financial viability of subrecipient organization and key personnel
- Fair and Reasonable Cost Analysis (Form I or II)

PI prepares proposal
- Integrate the subrecipient’s statement of work and budget into UMN’s proposal
- Include other forms (budget, biosketches, other support) as required by sponsor
- Forward completed UMN proposal to SPA for review, including subrecipient proposal package

**SUBAWARD ISSUANCE:**

PI/Dept. provide information requested by SPA for subaward issuance
- Collaborator and contract information
- Statement of work
- Budget (including cost share, if applicable)
- Technical/financial reporting requirements
- Payment terms and schedule
- Subaward performance period
- Verification that subrecipient is compliant with IRB, IACUC approvals (if applicable)
- Fair and Reasonable Cost Analysis (Form I or II)
- Other information as needed

**SUBAWARD PROBLEMS?**

Subrecipient not submitting timely or accurate invoices?
Subrecipient not complying with the terms of the agreement or its budget?
Subrecipient isn’t performing?

Contact your SPA Grant Administrator early! We’ll work with you and subrecipient to resolve.

**SUBAWARD MONITORING:**

PI monitors subrecipient technical progress
- Communicate regularly with subrecipient PI to monitor progress on the project
- Monitor receipt of technical reports for timeliness and content
- Communicate with SPA if changes need to be made to statement of work, reporting requirements, budgeting
- PI/Dept. monitor subrecipient’s adherence to terms
- PI/Dept. verify compliance approvals remain current for subrecipient’s portion of statement of work (human subjects, animal subjects, biosafety)

PI/Dept. review, monitor receipt of invoices
- Are they arriving on schedule?
- Do they contain the right level of detail to allow adequate review?

PI reviews and signs invoices (see checklist for PIs)
- Ensure all costs are allowable, allocable, and reasonable
- Ensure all costs were incurred within the period of performance of the subaward
- Confirm that expenses are aligned with technical progress and all required reports are received
- Cost sharing is appropriately reflected, if required
- If acceptable, PI signs and dates invoice
- PI/Dept. send approved invoice to SPA mailbox spa-inv@umn.edu for processing or returns to subrecipient for more detail

**SUBAWARD AMENDMENT ISSUANCE:**

PI assesses need to modify statement of work, budget, period of performance
- Notify SPA in a timely manner to request amendment
- Provide information to SPA (budgets, dates, reporting requirements, etc.)
- Assist SPA in negotiating changes, if needed

**SUBAWARD CLOSE-OUT**

PI/Dept. plan for timely closeout
- Check status with subrecipient 90 days before end date
- Follows up on late or missing reports or deliverables
- Obtain final invoice (marked FINAL) from subrecipient
- Send final invoice to SPA
- Subaward Release Form
13730.6 Subaward Roles and Responsibilities

University of Minnesota – Office of Sponsored Projects Administration

Departments/PIs

◆ PI requests proposal package from proposed subrecipient and evaluates selection.
◆ PI/Dept. verify FCOI policy and/or obtain FCOI Forms 1 & 2 if sponsor uses PHS FCOI regulations
◆ PI/Dept. indicate subawards on PRF.
◆ PI prepares proposal and sends to SPA
◆ PI/Dept. provide additional information required for subaward issuance
◆ PI monitors subrecipient technical progress and performance
◆ PI/Dept. monitor subrecipient’s adherence to terms and cost sharing requirements
◆ PI/Dept. verify compliance approvals are current for subrecipient’s portion of statement of work (human subjects, animal subjects, biosafety)
◆ PI/Dept. monitor receipt of invoices and reviews that expenses are aligned with technical progress and all required reports are received
◆ PI reviews, signs, and dates invoices
◆ PI/Dept. send approved invoice to SPA mailbox spa-inv@umn.edu for processing or returns to subrecipient for more detail or documentation
◆ PI assesses need to modify statement of work or budget
◆ PI/Dept. plan for timely closeout and obtain prime no cost extension if needed (follow up on missing reports, receipt of final invoice)
◆ PI promptly alerts SPA when problems arise (inability to obtain satisfactory invoice, non-performance)

Sponsored Projects Administration

◆ SPA reviews and submits proposal
◆ SPA verifies FCOI policy and reviews Forms 1&2
◆ SPA works with COI office to verify FCOI training and disclosures
◆ SPA negotiates with sponsor and accepts prime award
◆ SPA follows-up with PI/Dept to obtain any additional required documentation/data required for subaward
◆ SPA reviews risk levels and, if necessary, modifies subaward agreements
◆ SPA prepares, negotiates, issues and distributes subaward agreement
◆ SPA collects, maintains, and reports FFATA data
◆ SPA activates/encumbers subaward funds in financial system
◆ SPA assists PIs and departments with monitoring subawards
◆ SPA requests and reviews annual audit reports
◆ SPA verifies corrective action plans are implemented (if necessary)
◆ SPA notifies department administrators if the invoices are incorrect
◆ SPA tracks and processes invoices with PI approval
◆ SPA prepares, negotiates, issues, and distributes amendments
◆ SPA modifies subaward encumbrances in the financial system
◆ SPA completes closeout
◆ SPA resolves problems that arise during performance
13730.7 Subrecipient Commitment Form
University of Minnesota – Office of Sponsored Projects Administration

Subrecipient Legal Name:__________________________________________________________

Subrecipient PI Name:___________________________________________________________

Address:________________________________________ City:________________________ State:__________________

Address where research will be performed:________________________________________

City:________________________ State:__________________

Proposal Title:_________________________________________________________________

Performance Period Begin Date:________________________ End Date:____________________

UMN PI’s Name:______________________________________________________________

Funding Agency:______________________________________________________________

SECTION A – Proposal Documents
The following documents are included in our proposal submission and covered by the certifications below (check as applicable):

☐ STATEMENT OF WORK (required)
☐ BUDGET AND BUDGET JUSTIFICATION (required)
☐ Biosketches of all Key Personnel, in agency-required format
☐ Other:_____________________________________________________________________

☐ Other:_____________________________________________________________________

SECTION B – Certifications
1. Facilities and Administrative Rates included in this proposal have been calculated based on:
   (please attach a copy of your F&A rate agreement or provide a URL link to the agreement)
   ☐ Our F&A rate for this type of work is limited to a published statutory F&A cap by a federal program.
   ☐ Our federally-negotiated F&A rate for this type of work.
   ☐ A rate lower than our federally negotiated F&A rate, as listed in our proposal.
   ☐ Our F&A rate for this type of work has been previously negotiated with UMN that we hereby agree to accept.
   ☐ 10% MTDC de minimus rate (Subrecipient has never had a federally negotiated rate)

2. Fringe Benefit Rates included in this proposal have been calculated based on:
   ☐ Rates consistent with or lower than our federally-negotiated rates
     (If this box is checked, please attach a copy of your FB rate agreement or provide a URL link to the agreement)
   ☐ Other rates (please specify the basis on which the rate has been calculated in Section D Comments below).

3. Small Business Concern ☐ Yes ☐ No
   Subrecipient represents that it is a small business concern as defined in 13 CFR 124.1002.
   
   If "Yes": Subrecipient represents that it is a:
   ☐ Small disadvantaged business as certified by the Small Business Administration
   ☐ Women-owned small business concern
   ☐ Veteran-owned small business concern
   ☐ Service-disabled veteran-owned small business concern
   ☐ HUBZone small business concern

4. Cost Sharing or Matching ☐ Yes ☐ No Amount:________________________
   Cost sharing or Matching amounts and justification should be included in the Subrecipient’s budget

5. Human Subjects ☐ Yes ☐ No Approval Date:________________________☐ Pending Approval
   If "Yes": Copies of the IRB approval must be provided to UMN. It is understood that no funds may be expended for human
   subject related activities until all appropriate human subject related approvals are in place.
   
   If "Yes": Have all key personnel involved completed Human Subjects Training? ☐ Yes ☐ No

6. Animal Subjects ☐ Yes ☐ No Approval Date:________________________☐ Pending Approval
   If "Yes": Copies of the IACUC approval must be provided to UMN. It is understood that no funds may be expended for animal
   related activities until all appropriate animal related approvals are in place.
7. Conflict of Interest (applicable to PHS & NSF funded projects or agencies that have adopted the federal financial disclosure requirements)

   Please check the appropriate responses below

   a. □ Not applicable because this project is not being funded by PHS (NIH, CDC, AHRQ, etc.), NSF, or any other sponsor that has adopted the federal financial disclosure requirements. See http://sites.nationalacademies.org/PGA/fdp/PGA_070596 for list of sponsors that adopted federal financial disclosure requirements.

   For PHS Funded Projects ONLY:

   b.1 □ Subrecipient Organization/Institution is listed on the FDP Clearinghouse (http://sites.nationalacademies.org/PGA/fdp/PGA_070596) and certifies that it has an active and enforced conflict of interest policy that is consistent with the provision of 42 CFR Part 50, Subpart F “Responsibility of Applicants for Promoting Objectivity in Research” and 45 CFR Part 94 “Responsible Prospective Contractors.” Subrecipient also certifies that, to the best of Institution’s knowledge, (1) all financial disclosures will be made related to the activities that may be funded by or though a resulting agreement, and required by its conflict of interest policy, and (2) all identified conflicts of interest have or will have been satisfactorily managed, reduced or eliminated in accordance with subrecipient’s conflict of interest policy prior to the expenditures of any funds under any resultant agreement and within a timely manner sufficient to enable timely FCOI reporting.

   b.2 □ Subrecipient will follow the Conflict of Interest Policy established and enforced by his/her institution. Subrecipient certifies that the Conflict of Interest Policy established is consistent with the provision of 42 CFR Part 50, Subpart F “Responsibility of Applicants for Promoting Objectivity in Research” and 45 CFR Part 94 “Responsible Prospective Contractors.” Please complete and sign Form 1 found here: http://www.ospa.umn.edu/subaward/documents/PHSFCOformpacket17Jul14.pdf

   b.3 □ Subrecipient does not have an active and/or enforced conflict of interest policy and agrees to adopt University of Minnesota’s policy located at http://www.compliance.umn.edu/conflictPolicies.htm - Please complete and sign Form 1 AND Form 2 found here: http://www.ospa.umn.edu/subaward/documents/PHSFCOformpacket17Jul14.pdf

   c. By signing below, Subrecipient certifies that the required training will be completed by each investigator prior to engaging in any research related to any PHS funded contract/grant. For those adopting University of Minnesota’s policy, the training is located online at http://z.umn.edu/coext

8. Debarment and Suspension

   Is the PI or any other employee or student participating in this project debarred, suspended or otherwise excluded from or ineligible for participation in federal assistance programs or activities? □ Yes □ No (If “Yes”, explain in Section D Comments below)

     The Subrecipient certifies they: (answer all questions below)

     □ are □ are not presently debarred, suspended, proposed for debarment, or declared ineligible for award of federal contracts

     □ are □ are not presently indicted for, or otherwise criminally or civilly charged by a government entity within three (3) years preceding this offer, been convicted of or had a civil judgment rendered against them for commission of fraud or criminal offense in connection with obtaining, attempting to obtain, or performing a public (federal, state or local) contract of subcontract; violation of Federal or State antitrust statutes relating to the submission of offers; or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements or receiving stolen property

     □ have □ have not within three (3) years preceding this offer, had one or more contracts terminated for default by any federal agency

SECTION C - Audit Status

9. Audit Status

   □ Subrecipient receives an annual audit in accordance with Uniform Guidance 2 CFR 200.

     Most recent fiscal year completed: FY__________

   □ Subrecipient DOES NOT receive an annual audit in accordance with Uniform Guidance 2 CFR 200.

     Subrecipient is a: □ Non-profit entity (received less than $750,000 in federal assistance i.e. federal funds, grants or awards)

     □ Foreign entity

     □ For profit entity

     □ Government entity

13730.8  Fair & Reasonable Cost Analysis Form
University of Minnesota – Office of Sponsored Projects Administration

When proposing a subaward for a sponsored research project to be funded under a grant (federal/nonfederal), cooperative agreement (federal/nonfederal), or nonfederal contract, the University of Minnesota requires a cost/price analysis and related matters. Please comply with these requirements by completing the following and retain in department file.

**Background/Purpose**

Subaward proposed to (name of subrecipient):

Research effort entitled:

Research sponsored by:

PRF #: University of Minnesota PI is:

University of Minnesota proposal dated: Proposed Subaward Total: $ 

Subaward Period of Performance: From: To:

Project # (if known):

**When Was Subrecipient Selected? (Check the appropriate box):**

☐ Subrecipient's proposal was included in University of Minnesota’s proposal package and was evaluated by the sponsor along with University of Minnesota as part of the overall selection process conducted pursuant to the sponsor’s award under the prime award. At that time, the technical aspects of the Subrecipient's proposal were acceptable to the sponsor, and therefore, this Subrecipient is the logical choice for this award.

☐ This Subrecipient was not included in University of Minnesota’s proposal package. This subrecipient is unique because (attach additional pages if necessary):

The reasons (other than cost) that this subrecipient was selected over others are (attach additional pages if necessary):

**Cost/Price Reasonableness**

☐ All costs proposed by Subrecipient under this Subaward were reviewed and approved by the University of Minnesota as reasonable and necessary for the proposed scope of work.

Items to be reviewed when applicable include the following:

- Salaries, type of personnel, and level of effort have been reviewed and appear reasonable for the proposed scope of work.
- Specific equipment items and/or of supplies are separately listed and are appropriately based on standard or catalog prices, or vendor quotes.
- The travel appears to be necessary, and trips are priced separately and correctly, based on both technical review and review of published air fares, hotel rates and per diem rates.
- All other significant costs are separately itemized and are reasonable.

**Department Verification**

All costs proposed by Subrecipient under this Subaward were reviewed and approved by the individual completing this form:

Signature: Date:

13730.9  **Financial Conflict of Interest Risk Analysis Flow Charts**

**University of Minnesota**

Subaward Financial Conflict of Interest (FCOI) Review procedure for Risk Analysis Form (New Subawards)

1. **Subaward FCOI Risk Analysis Review**
   - Mark n/a and proceed to next step on Risk Analysis
   - Does subaward meet FCOI requirements?
     - Yes
       - Is subrecipient in EFS under resources?
         - Yes
           - Is Subrecipient in FDP Clearinghouse?
             - Yes
               - Note subrecipient policy on Risk Analysis and proceed to next step
             - No
               - Request Form packet from Subrecipient and enter into EFS. Note on Risk Analysis Form.
         - No
           - Note on Risk Analysis Form and issue subaward if Risk Analysis is complete
     - No
       - Obtain current Forms 1 & 2 and/or training and enter into EFS. Note on Risk Analysis Form and proceed to next step
       - Is the disclosure date expired (1 year) or training date expired (4 years) for any of the key personnel?
         - Yes
           - Note on Risk Analysis and proceed to next step
         - No
           - Note subrecipient policy on Risk Analysis and proceed to next step

Subaward Financial Conflict of Interest (FCOI) Review procedure for Risk Analysis Form (All amendments)

1. Subaward FCOI Risk Analysis Review
   - Mark n/a and proceed to next step on Risk Analysis
2. Does subaward meet FCOI requirements?
   - Yes
     - Is the disclosure date expired (1 year) or training date expired (4 years) for any of the key personnel?
       - Yes
         - Note on Risk Analysis and proceed to next step
       - No
         - Obtain current Forms 1 & 2 and/or training and enter into EFS. Note on Risk Analysis Form and proceed to next step
3. Is the Subrecipient using University of Minnesota FCOI policy?
   - Yes
     - Obtain current Forms 1 & 2 and/or training and enter into EFS. Note on Risk Analysis Form and proceed to next step
   - No
     - Note subrecipient policy on Risk Analysis and proceed to next step
Subaward Federal Funding Accountability and Transparency Act (FFATA) Review procedure for Risk Analysis Form (new subawards)

New subaward FFATA Risk Analysis Review

When processing PRIME award, GA should identify “FFATA” or “NOT FFATA” in EFS and also put the FFATA term in “Terms and Conditions”

Is Subaward under federal funding?

Yes

Is subaward amount equal to or over $25k?

Yes

Mark “No” and proceed to next step on Risk Analysis

No

Email support staff at ovprffat@umn.edu with subaward details

Email copy of completed subaward to support staff at ovprffat@umn.edu

No

Mark “No” and proceed to next step on Risk Analysis

After half executed subaward is received, it may now be signed

Continue normal subaward process but DONOT presign subaward

GA will receive email from support staff confirming FFATA has been recorded. Use this information to complete subaward agreement Attachment 3B
Subaward Federal Funding Accountability and Transparency Act (FFATA) Review procedure for Risk Analysis Form (amended subawards)

Amended subaward FFATA Risk Analysis Review

Prepare subaward modification. DO NOT presign the subaward.

Has previous subaward been reported under FFATA?

Yes

Once the subrecipient returns with signature, obtain final signature and return to subrecipient.

Forward fully signed subaward amendment by email to FFATA delegate (ovprffat@umn.edu) along with cumulative funding.

No

Refer to "FFATA - New Subaward" instructions.

Note:
• See job aid for reporting details
• Once an award is reported in FSRS.gov, we still continue to report even if subaward total is reduced below the FFATA threshold ($25k).

13730.14 Checklist for Principal Investigators Reviewing Subaward Invoices

University of Minnesota – Office of Sponsored Projects Administration

- Is the PRIME award fully executed?
  - ☐ Yes ☐ No

- Is the sub-recipient award fully executed?
  - ☐ Yes ☐ No

- Is the invoice (expenditures) within the period of performance of the agreement (must be incurred before the end date or after the start date)?
  - ☐ Yes ☐ No

- Are expenses on a cost reimbursable sub-contract charged based on actual expenses or appear to be on allocation of the budget?
  - ☐ Yes ☐ No

- Are the performance goals being met and does progress relate to expenditures?
  - ☐ Yes ☐ No

- Are the performance goals being met and do the expenditures align with technical progress?
  - ☐ Yes ☐ No

- Does the invoice contain the following statement:
  "I certify that all expenditures reported (or payment requested) are for appropriate purposes and in accordance with the provisions of the application and award documents."
  - ☐ Yes ☐ No

- Is the invoice signed by the sub-recipient?
  - ☐ Yes ☐ No

- Is there cost share required?
  - ☐ Yes ☐ No
  - If yes, has cost share been met?
    - ☐ Yes ☐ No

- Is subaward number indicated?
  - ☐ Yes ☐ No
  - If no, please indicate and circle

- Is Facilities & Administrative (F&A) cost calculated correctly on the invoice?
  - ☐ Yes ☐ No

- Request was made to sub-recipient for a NEW/REVISED invoice on the following date:
  Comments:

- Is this a final invoice?
  - ☐ Yes ☐ No

- If yes, please make sure of the following before payment can be made on the final invoice:
  - Is the invoice marked final?  ☐ Yes ☐ No

- If cost share, has cost share been met?
  - ☐ Yes ☐ No

- Subcontractor Release Form  ☐ Yes ☐ No

- Is PI the same individual at both Prime and Sub. Institution?
  - ☐ Yes ☐ No

  - If yes, invoice should be reviewed and approved by an alternate approver (Associate Dean for Research, Dept. Head)
¶3730.15  **Subaward Release Form**  
University of Minnesota – Office of Sponsored Projects Administration

Subaward #:________________________

Subrecipient Name:__________________________________________

**Section I – Financial Information**

The total amount of $____________________ has been received under this subaward.

☐ There are NO outstanding claims against this subcontract. The University of Minnesota is not obligated to honor claims made after this block is checked and this form signed and returned.

☐ Only the amount included in the Final Claims Voucher/Invoice estimated to be $____________________ is due. When the Final Claims Voucher/Invoice is paid by University of Minnesota, there will be no further claims against this subcontract.

**Section II – Patents**

☐ There are no inventions to be reported under this award.

☐ Listed below are all inventions required to be reported under this award.

Name of Inventor:__________________________________________

Site(s) of Invention:________________________________________

Please note that if an invention has resulted from this project, a complete invention disclosure must accompany this form, if one has not been previously provided.

**Section III – Federal Government Equipment**

Was any equipment provided by the Federal Government, or was any equipment purchased with federal funds provided under this subagreement?

☐ No  ☐ Yes (Please see FAR 52.245-1 (j) (4) Submission requirements and (j) (8) Disposition Instructions)

☐ All equipment either provided, or purchased with funds, under this subagreement has been delivered to the US Government or is awaiting disposition instruction

¶3790 Knowledge Check

AIS editors

The Q&As at ¶3790.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 3700 has been understood. Note: For the answer key for ¶3790.1, see ¶3790.3, which appears on a separate page (page 3790:5) for testing purposes.

Discussion topics at ¶3790.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶3790.1 Q&As

1. Circular A-110 defines an **award** as
   (a) Financial assistance that provides direct loans, loan guarantees, interest subsidies, or insurance
   (b) Financial assistance that provides support or stimulation to accomplish a public purpose
   (c) Financial assistance in the form of direct payments of any kind to individuals
   (d) Financial assistance in the form of contracts that are required to be entered into and administered under procurement laws and regulations

2. Circular A-110 defines a **subrecipient** as
   (a) A beneficiary of a federally subsidized program who is accountable for the use of federal monies
   (b) The legal entity to which a federal award is made and which is accountable for the use of the funds provided
   (c) The individual principal investigator who authored the funded proposal
   (d) The legal entity to which a subaward is made and which is accountable for the use of the funds provided

3. A **proposal with subawards** is usually prepared by the
   (a) PIs from the collaborating institutions
   (b) PI from the recipient institution
   (c) PI from the subrecipient institution
   (d) Program officer from the federal agency

4. The **office responsible for subaward closeout** ensures that all of the following takes place EXCEPT:
   (a) All required reports have been received and acted upon.
(b) The subrecipient has been paid and invention reports have been submitted.
(c) Any required property management reviews are performed as appropriate.
(d) Termination of grant notice is sent to the awarding federal agency.

5. **Important items to remember about subaward agreements include all of the following EXCEPT:**

   (a) The terms and conditions section of the subaward should address the specifics of the agreement.

   (b) Subawards should be co-signed by the federal granting agency official.

   (c) Subawards should be signed by the institution’s appropriate authorized official.

   (d) Subawards should contain contact names, telephone and fax numbers, and email addresses for the authorized official and administrative, financial, and technical contacts.

6. **The Model Subaward Agreement Form is the work of the**

   (a) Council on Governmental Relations

   (b) Office of Management and Budget

   (c) Grants.gov program office

   (d) Federal Demonstration Partnership

7. **Which of the following is NOT generally used to determine the level of risk a particular subrecipient presents with regards to the threat of improper stewardship?**

   (a) Subawards to public institutions carry greater risk than do subawards to private institutions.

   (b) Programs with complex compliance requirements have a higher risk of noncompliance.

   (c) The larger the percentage of program awards passed through, the greater the need for subrecipient monitoring.

   (d) Large dollar awards are greater risks.

8. **The pass-through entity must**

   (a) Ensure that subrecipients have no audit findings

   (b) Perform an audit of all subrecipients

   (c) Ensure that subrecipients take appropriate and timely corrective action on all audit findings

   (d) Monitor subrecipients according to A-121
Discussion Topics

1. How does the relationship between the sponsor and the awardee differ from the relationship between an awardee and a subawardee?

2. What does it mean to monitor a subrecipient “before, during, and after” an award?

3. Practically speaking, are there any differences — and if so, what are they — between issuing a subaward under a federal award and a subaward under a nonfederal award?

4. Recently, federal agencies’ offices of inspectors general have been targeting subawardees for audits. What kinds of things are they reviewing and what are they finding? Are there any lessons to be learned from these audit reports for your institution?

5. Do you have any grants (or contracts) funded with monies under the American Recovery and Reinvestment Act (ARRA)? If yes, do any of the grants have subawards? If yes, have you determined how you are going to report on these subawards? Are you going to delegate certain reporting responsibilities to the subawardees? Do you know which requirements can be delegated and which you, as the prime recipient, are responsible for reporting?

6. Do you make use of a subaward template? If yes, do you periodically assess the template to ensure that it is remains an up-to-date and helpful document?

7. Do you ever have third-tier subawards? Why do such agreements require careful attention?

8. How does your department’s organization structure facilitate subrecipient monitoring? If it hinders, rather than facilitates such monitoring, explain how the situation could be improved.

9. Does your institution periodically review its subrecipient monitoring practices to ensure their continued effectiveness?

10. Do you provide help for a subrecipient, upon request, with budget preparation and other administrative requirements?

11. What special considerations must there be when subawarding to international institutions? Does your institution have separate or additional policies to address these types of agreements?

12. Are you, as the prime recipient, assessing the correct criteria and making the correct judgment as to whether the relationship is one of a subrecipient or vendor? What is the criteria and how is it applied at your institution?

13. Are you, as the prime recipient, using the Federal Demonstration Partnership model subaward agreement for subrecipient agreements under federal assistance funding?

14. Is your subrecipient agreement drafted in a way that adequately and clearly (without ambiguity) represents the interests of the sponsor, the prime recipient, and the subrecipient?
¶3790.3  **Answer Key**

Following are the correct answers to the questions included at ¶3790.1.

1. (b) Financial assistance that provides support or stimulation to accomplish a public purpose

2. (d) The legal entity to which a subaward is made and which is accountable for the use of the funds provided

3. (a) PIs from the collaborating institutions

4. (d) Termination of grant notice is sent to the awarding federal agency.

5. (b) Subawards should be co-signed by the federal granting agency.

6. (d) Federal Demonstration Partnership

7. (a) Subawards to public institutions carry greater risk than do subawards to private institutions.

8. (c) Ensure that subrecipients take appropriate and timely corrective action on all audit findings

§3901 Introduction
Richard Seligman, Ed.D.
Associate Vice President for Research Administration
California Institute of Technology

This chapter provides guidance to institutions on assessing sponsored programs offices and describes assessment tools and ways to use them effectively.

Undoubtedly, there are some research administrators who believe that an assessment of their office is something that is done to them. Peggy Lowry, formerly of Oregon State University, will easily convince most readers that an assessment of their office is something that is done for them. Lowry argues most persuasively that periodic assessment of the effectiveness of a sponsored programs office is an important part of the institution’s ongoing compliance program. Lowry provides extensive information on the two primary forms of assessment: self-directed and externally directed. The reader will quickly come to realize that assessment is not limited to bringing in high-priced consultants for a quick look at what’s going on. Many forms of assessment are possible with a modest investment of resources.

In a series of seventeen figures at the end of the chapter, Lowry provides an extensive “tool kit” of assessment materials that are easily adaptable to meet local sponsored programs office assessment requirements. These tools include survey questions, a framework for self-audit, sample site visit itineraries, and information sources for evaluators.

This chapter will continue to respond to the information needs of research administrators through the addition of new material. Future updates will contain revisions, additions, and enhancements to §3905, as appropriate. Content added to other sections of the chapter will provide readers additional discussions of related topics (at §3920), practical tools (at §3930), and case studies (§3940). A “knowledge check” containing Q&As and discussion topics is included at §3990.
Assessing the Sponsored Research Office

Peggy S. Lowry
Director (retired), Office of Sponsored Programs and Research Compliance
Oregon State University
Director, NCURA Peer Programs

In recent years offices of sponsored programs (OSPs) have received increased attention from many outside entities, including regulators and media. The oft-time resulting exposure, sometimes at the national level, can cause reputational harm to the institution accompanied by fines. The variety and level of external — and resulting internal — scrutiny of the OSP operations will continue to increase. This heightened scrutiny is occurring at the same time as the complexity of sponsored program operations continues to increase.

Therefore it is imperative that OSPs be diligent in monitoring operations and instituting management practices that regularly implement assessment activities. Such activities can ensure that all aspects of the operations are compliant with applicable institutional and sponsor requirements and meet the needs of various stakeholder groups. In some institutions, nonfinancial compliance, such as that involving human and animal research protections, may be a function housed separately from the OSP. However even if organizational structure places compliance in a unit or units separate from the OSP operation, or the sponsored programs operation is spread out among different offices and reporting lines, everyone involved in sponsored research administration plays a role in ensuring that the institution is diligent in and accountable for managing compliance.

This chapter explores a number of approaches to conducting assessments and presents models for and considerations when incorporating these activities as a standard OSP management practice, including how to prepare for and make best use of the results of any assessment activity. An OSP does not need to use all of the forms of assessment described in this chapter in order to have an effective assessment program. Most likely an OSP will find that an assessment program incorporating a combination of the approaches described will provide a balanced assessment appropriate for a specific institution.

Note: For ease of reading, most of the figures referred to in this chapter are included at the end of the narrative.

What Is Assessment?

Research administration provides service to the institution and its constituents. It contains elements of facilitation and management and both elements need to be in synch with current needs and compliance requirements. An assessment process helps maintain an appropriate balance. Some liken this assessment process to a course correction for a navigator of a ship.

Assessment is simply looking at what one does, how it is aligned to needs and expectations, and how well one is doing it. Assessment is an activity that can be
undertaken at any level within an institution. At any given time, one is likely to find some form of assessment activity going on at some operational level. At the broadest level is institutional accreditation. This assessment process uses nongovernmental organizations to review independently and credential the organization in such areas as governance and administration, financial stability, admissions and student services, institutional resources, student learning, institutional effectiveness, and relationships with internal and external constituents.

Academic departments and programs also employ periodic program assessments that typically follow a similar pattern to required institutional accreditation in terms of scope and process. Athletic departments regularly undergo a self-study and accreditation. Institutional fiscal operations undergo review through internal audit activities that are intended to determine the adequacy, efficiency, and effectiveness of internal controls and the reliability and integrity of various systems (e.g., management, financial, and operating). Faculty and staff are routinely assessed through promotion and tenure processes and performance evaluations.

**Why Consider an Assessment Program?**

Despite being part of an environment where assessment is common, often the sponsored programs office does not participate in or conduct periodic assessment activities. Today, however, an OSP can ill-afford to ignore the increased variety and level of attention accorded it by outside entities.

Numerous institutions have had human subject programs that were shut down due to noncompliance. Recent qui tam (whistleblower) lawsuits have exposed institutional practices that were functioning improperly. Additionally recent not-for-cause or proactive site visits from federal agencies have raised considerably the visibility of institutional practices as implemented by OSs. Activist groups have raised the public awareness of and interest in institutional compliance.

Beyond minimizing risk from exposure, assessment helps OSs be in line with institutional priorities and directions. As institutions shift to more complex partnerships and global relationships OSs need to be fully responsive with knowledge and staffing.

It is therefore critical that OSs be diligent in monitoring operations in order to maintain the integrity of and ensure that all processes of the operations are fully compliant with applicable internal and external policies and requirements.

Assessment, however, does more than help an OSP ensure that operations are compliant. Regular reviews of sponsored program offices also can be part of an institutional compliance and ethics program, as described in the U.S. Sentencing Commission Guidelines. Under these guidelines, the two components of a compliance and ethics program are promoting an organizational culture that encourages ethical conduct and exercising due diligence to prevent and detect misconduct. A regularly implemented assessment can address these two goals. Demonstrating a compliance and ethics program may help mitigate penalties if an organization is found guilty of a criminal

---

offense. (See Chapter 1500 for an in-depth discussion of research compliance.)

**What is an Assessment Program?**

An assessment program integrates an evaluation component in an ongoing basis with a defined cycle of activities. Thus, an OSP has a continuous stream of information about performance, customer needs, and financial and non-financial compliance management.

**Designing an Assessment Program**

Although there is a great variance in institutions and research administration operations, there are common elements to an assessment program.

- Areas to be assessed
- Stakeholders engaged in the assessment
- Form of assessment
- Frequency

As an assessment program is designed, the resulting information feeds back into operational improvements and efficiencies.

**Figure 1**

In this manner, specific elements of an OSP undergo periodic review with results either validating current processes or identifying weaknesses to be addressed. It is essential that the assessment program include an overall program assessment in addition to the specific area reviews. This allows a holistic review and can help determine how well the areas interface and are connected.
3905.2 Preparing for Assessment

Any assessment activity requires some level of resources and planning. If assessments are not already incorporated into management practices, this should be done by the office’s director or higher-ups, as appropriate. The first step in conducting an assessment is to determine its objectives and goals. In general there are two basic categories of assessments that will help focus one’s efforts:

(1) Single issue: An assessment may be focused on, or driven by, a particular function, complaint, or risk area. In implementing an assessment for a single issue, it is important to choose one or more forms of assessment that will provide the specific information needed to address the identified issue. When this approach is used, the assessment activity is a “one-time,” rather than an ongoing, activity. (The assessment tool used to conduct the assessment is often then “shelved” until needed again.)

(2) Ongoing program: An assessment may be developed as a regular, programmatic activity to monitor and review the operation. This approach uses one or several techniques to provide continual feedback, which is then used to guide decisions about necessary changes to the operation.

A successful assessment is one that
◆ objectively looks at an area,
◆ includes all appropriate views from stakeholders,
◆ is led by individuals with expertise in the area,
◆ generates credibility through the process, which leads to credibility in the results,
◆ produces results that are useful for future planning and/or decision making,
◆ balances the reality of office budgeting and staffing with existing OSP responsibilities and services,
◆ recognizes politics and “turf” issues, and
◆ is sensitive to the concerns and fears that such a process can generate.

Regardless of the form of assessment used, or whether the assessment is used to address a single issue or as an ongoing activity, there are important considerations that should be addressed in planning for a successful assessment. Such considerations are discussed below.

Office Structure

There are countless ways to structure a sponsored programs office. What works for one institution may not work for another. The size of the operation can extend from a single-person shop to a large, multunit operation with dozens of staff members. The office may include pre-award, post-award, contracting, and nonfinancial compliance functions, or any combination thereof. The sponsored programs office may encompass functions managed by separate offices that have different reporting lines within the institution. (See Chapter 300 for a discussion of OSP organizational models.)
When an OSP is initiating an assessment, or responding to one, the office needs to look at its organizational model to determine

1. who is automatically involved in the assessment activity,
2. who needs to be invited to be part of the activity, and
3. who should (needs to) be kept apprised of the activity.

Team Building. All assessment activities have the potential for team building, whether one is building teams from among OSP staff or among staff from different departments. Because assessment is a reflective process used to analyze operations and uncover potential areas for improvement, it is valuable to seek a wide range of views and perspectives in planning for and during the process.

Communications

Communication throughout the assessment process is critical to engaging individuals in the process and in improving its chances of success. Because the assessment activity can involve numerous stakeholders from various institutional offices, there is not one communication model that will apply to every situation. However in planning an assessment activity, it is important to schedule the following:

- An appropriate pre-assessment communication that includes the why and scope of the assessment
- Regular communications during the assessment that include updates on the status and next steps in the process
- A post-assessment communication that covers outcomes and future actions

As appropriate for the type of assessment used, the following stakeholders may be recipients of an initial and regular communications concerning the activity:

- Senior administrators: Before embarking on any assessment activity, senior administrators of the institution should be informed and then kept up to date on a regular basis. Even self-directed activities can raise questions or expectations from faculty or other institutional units, and in keeping senior administration informed of activities they will be better able to respond to such questions. Communication also can be used to educate and inform senior administrators on the important role of the OSP and the way it supports the research priorities of the organization.

- Sponsored programs staff: OSP staff should be well informed on the process and activities. Assessment often brings a heightened level of concern and anxiety to staff (concern about their position, possible changes to the organization, and “the unknown”). Frequent communication with staff members and providing them opportunities to ask questions will help staff appreciate the positive aspects of assessment.

- Other administrative personnel: Related offices at the institution should be aware of the assessment activity, even if they are not directly involved.

- Faculty or academic personnel; department research administrators: Depending on the type of assessment activity, faculty, academic administrators (usually deans...
or department heads), and department research administrators may need to be included in the communications process.

Resources

Every assessment requires some investment of resources. The largest resource investments will be in personnel costs and in such activities as data collection, data analysis, and report writing. There is a “management cost” with all assessment activities that could include time commitments from managers ranging from the director of sponsored programs to an institution’s senior administrator. There may be dollar outlays for creating and implementing surveys or for consultants. Before proceeding with an assessment activity, be sure the necessary resource commitments have been obtained. (Chapter 700 includes a lengthy discussion on the use of data from information systems to support an OSP’s assessment activities.)

Risks

Any assessment activity can bring with it the potential for some “risk.” For example some participants may be concerned over how results of the assessment will be interpreted or used. There is the risk that a process or policy that is found to be noncompliant could carry associated costs to correct it. There is the risk that staff morale or the office’s credibility could suffer in the event of negative findings. There is the risk of raising stakeholders’ expectations for change. With any assessment that involves surveys of faculty, there is potential that faculty opinions may be based on a misunderstanding of the OSP functions and that such misunderstandings as reflected in the survey results would be misinterpreted or generalized.

Before embarking on an assessment, an office should do a risk assessment to consider the range and types of risks that may be related to the type of assessment planned. Once risks are categorized, the office can consider how to minimize those risks. For instance, if an identified risk area is concern about a noncompliant aspect of the operation, OSP could initiate some self-directed audits, or use of the institution’s internal audit, to help identify aspects that may need immediate attention. Or, if an identified risk category relates to an institution’s decreased budget and resulting downsizing of operations, an office may want to speak with senior administrators about the timing of an assessment.

The Assessment Program

When assessment is an ongoing process where the intent is continual improvement of operational quality, the process is as critical as the results. After an assessment activity, it is imperative to invest the time and resources necessary to ensure that the methods employed are subject to the highest quality standard prior to the next assessment cycle. (See also “Quality Improvement Program” section on page 3905:20.)

In looking retrospectively at the process, one should be sure to

◆ review critically the process and consider ways in which it can be improved and solicit opinions from sponsored programs staff, individuals involved with the assessment, and reporting units;
◆ consider the types of information useful to and needed for the assessment and if there are operational changes that can be made to produce this information in anticipation of the next assessment activity; and

◆ analyze other models of assessment used by peer institutions and determine whether those models can be incorporated into the next assessment activity.

**Background Materials**

The types of information used in preparing for an assessment depend upon the form and focus of the assessment, as well as whether the evaluators will be intimately knowledgeable of the OSP operations and the institution. In general most assessments will make use of general information as outlined below.

*For broader assessments and when using evaluators from external organizations,* the following types of background information are useful:

◆ Information about the institution, including such things as academic statistics, rankings, college and institutional organizational plan, and an institution’s strategic plan

◆ Information about the OSP reporting unit, including such things as organization, functions, reporting unit strategic plan, and staffing

◆ Information about the OSP, including such things as OSP strategic plan, budget, functions, organizational structure, and the results of prior self-studies or self-audits and evaluations

*For broader assessments and when using evaluators from within the institution,* the following types of background information are useful:

◆ Information about the OSP reporting unit, including such things as organization, functions, reporting unit strategic plan, and staffing

◆ Information about the OSP, including such things as OSP strategic plan, budget, functions, organizational structure, and the results of prior self-studies or self-audits and evaluations

*For more focused assessments and when engaging individuals from within the institution,* information specifically focused on the topic of the assessment is most useful. With assessments such as internal audits, the information will focus specifically on process and policy details. With assessments such as focus groups, background materials, as appropriate, should be provided to attendees.

**Small Institutions**

At most small institutions, the culture and focus of the institution is on teaching and service. Among academic units there may be uneven support or encouragement for faculty to pursue sponsored program activities. The role and the value of the sponsored programs office may not be well understood, or uniformly understood. When an OSP at such an institution undertakes an assessment activity, it is especially important that the senior administration has endorsed an assessment activity and that the assessment reflects the institutional expectations for faculty (e.g., if the
institution expects faculty to teach, the assessment should not suggest a significant
departure from that expectation). (Chapter 2300 addresses special issues for pre-
dominantly undergraduate institutions.)

¶3905.3 Forms of Assessment

There are numerous techniques to assess operational effectiveness. To take a broad
look at operations, a formal programmatic evaluation of an entire operation may be
appropriate; for a narrower look, a more focused audit of a single area or function
may be called for. All assessment techniques can provide a unique perspective on
the operation and will help the OSP gather information and consider options for
improvement. Many of the activities discussed here can be used separately to assess
a particular issue or area, or several of the techniques/approaches can be combined
and employed to provide a broad range of data and/or perspectives.

There are two main categories of assessments: self-directed and externally
directed. Figure 3905.3-1 outlines the basic types of assessments, each of which is
discussed briefly below.

*Activities are generally undertaken at the request of the sponsored programs office or the institution.

**Self-Directed Assessment Activities**

The following are various types of self-directed or self-generated assessment activities. Several of these approaches are discussed in more detail in the sections following this outline.

*Retreat.* Retreats allow office personnel, typically at a remote location, to engage
in a focused discussion of their operation without the usual day-to-day interruptions. Retreats may involve other select individuals or groups (such as a facilitator, advisory group members, reporting unit personnel, or staff from other offices).

Advisory Group. Numerous offices have established an advisory group or body that serves as a resource for feedback or direction. The advisory group can help a research administrator obtain a reading on faculty or departmental research administrator viewpoints and is useful for ongoing assessment. Advisory groups normally represent stakeholders and might contain a mix of junior and senior faculty, administrators, or related office representatives.

Focus Group. A focus group is a relatively quick and low-cost mechanism for gathering information. It typically consists of 8-10 individuals who participate in a “group interview” led by a facilitator. A facilitator could be a consultant or someone from inside the institution. For an effective focus group, OSP should not be present during the discussion.

Survey/Evaluation. A common form of collecting information is through the use of a survey or evaluation. Evaluations typically are targeted at a specific service or function of the office and often are given to users at the time they access the service, such as evaluation forms passed out to attendees of training or educational offerings. Surveys are often used to gather customer-satisfaction feedback from a broad-based population.

Metrics and Benchmarks. Metrics are measurements of attributes of the operation. Metrics can be applied to personnel, services, or value judgments, such as statistics on personnel effort or value of an educational offering to participants. Metrics that are collected consistently over time can be used for trend analysis and projections. They are an excellent management tool for looking at how well the office is performing currently and providing a basis for future direction. Metrics can be both a type of assessment as well as information used in an assessment.

Benchmarks are standards and are used to examine a particular aspect of the operation and how well it relates to that standard. Post-award accounting operations typically have benchmarks for major functions (such as expected turnaround for cost transfers or award closeout). Benchmarks and metrics are often used together.

Self-Audit. Self-audits are an essential component of monitoring performance in that they are used to identify problems and then to help address them. An audit of any process of the sponsored programs operation can be performed by office staff, whether that function is pre-award, post-award, nonfinancial compliance, or something else. Increasingly institutions are conducting audits of animal and human research programs and extending the audit to encompass not only central processes but also an investigator’s records and processes.

Self-Study. This process also may be called self-assessment or self-review. A self-study is a method whereby the sponsored programs office conducts a critical self-review of what it is doing, why it is doing it, and what it believes needs to be done to improve performance. A self-study is more than an audit in that it looks at

---

the overall functioning of the operation and how well that operation performs and interacts with key stakeholders. It explores what specific functions and services are performed and whether performance can be improved.

Typically offices will conduct a self-study every five or six years as a means to document operational changes and as a basis for continued quality improvement. The self-study is an easily executed review process. However, due to the inherent bias that invariably occurs with staff looking at their own operation, this approach may lack credibility outside the OSP.

**External Evaluation.** External evaluation is the process whereby individuals external to the sponsored programs office conduct a review of the entire operation or a particular aspect of the operation. As with the self-study, this review is typically broader than an audit and tends to focus on how the operation relates to its customers or stakeholders and how well the office is positioned for emerging needs.

External evaluators may be individuals from within the institution. Frequently the external “evaluator” is a faculty team that is appointed by an OSP’s higher-ups and charged to look at the overall effectiveness of the sponsored programs office. Another common model is to hire consultants from peer universities, consulting companies, or professional organizations to conduct the evaluation. The evaluators usually provide a report of their findings after conducting their review.

**Quality Improvement Program.** Unlike the forms of assessment previously discussed that focus on the effectiveness of the sponsored programs office, a quality improvement program focuses foremost on the institution and the systems throughout the institution that interface with and support the institution’s overall research enterprise. This type of program often is routine and part of an integrated, system-wide management practice.

**Externally Directed Assessment Activities**

Some types of “assessment” activities are not self-initiated nor are they really assessments, but are driven by external entities. Even these types of activities generate valuable information that an OSP can use to evaluate and improve its operations.

**Audit.** The audit tests, or objectively assesses, whether management practices and policies are being followed. Audits focus on a “slice” of the operation and the controls that are in place for minimizing risk. In looking at a cross-section of the operation, the audit reviews a process or policy and assesses if associated practices are following the process and policy, or if a practice suggests a risk area within a process or policy that needs to be addressed. Audits are excellent for identifying a process weakness.

The internal audit division of an institution typically performs audits on operations or processes that are identified through an institution’s risk assessment. As applied to sponsored programs, internal audits often focus on financial operations. Similarly external audits, such as the Office of Management and Budget audit or a federal desk audit, may evaluate some of the same processes on a system or project scale.

---

3 NCURA Peer Programs – www.ncura.edu/InstitutionalPrograms.aspx
Not-for-Cause Review. Increasingly OSP operations are receiving a variety of not-for-cause, proactive, or friendly site visits. Some of these visits, such as when the U.S. Department of Health and Human Services Office of Inspector General stops by to look at effort reporting records, are driven by a need to assess risk or vulnerability. The site visit is a means to gather data. Other visits may center on looking at program implementation, such as those by the Centers for Disease Control and the U.S. Department of Agriculture to examine select agent programs.

Investigation. Investigations stem from a complaint or identified incidence of non-compliance and result in a formal review of some or all of an OSP operation. While a research administrator does not often think of investigations in the context of assessment, they can be in fact a very thorough assessment of a particular process and provide valuable feedback. Investigations may be conducted by individuals within the institution or by investigative units of the federal government or other bodies.

13905.4 Using Focus Groups for Assessment

As mentioned focus groups are a relatively low-cost and quick-turnaround technique for gathering information on a particular topic or set of topics. A focus group typically consists of 8-10 individuals who participate in a “group interview” led by a facilitator. A facilitator who is unaffiliated with the OSP could be hired to conduct the focus group if a sensitive topic is scheduled to be discussed or if the discussion could be biased if led by a representative of the sponsored programs office.

In planning a focus group, the first thing to consider is what aspects of the sponsored research operations one wants feedback on and what type of questions will best stimulate the discussion to provide the desired feedback. The following are good examples of the types of topics about which focus groups could provide solid feedback include the following:

- **Electronic systems:** How are users interacting with electronic systems? What barriers to use exist? What user needs are not being met? What system inefficiencies are there?

- **Policy changes:** How will a policy change affect a particular process? What is confusing about a specific policy? Why are there recurring instances of noncompliance involving a particular policy or procedure relating to the policy?

- **Services:** What services are of most value/least value? What services need to be improved? How does someone find out about OSP services?

After identifying a particular topic or topics for a focus group, one must next consider the type of individuals — often persons who can best speak to or have ample experience with an issue — to invite to be members of the group. In many cases more than one focus group, each with different members, will be necessary to ensure that feedback from many different perspectives is obtained.

Faculty members are especially important stakeholders for an OSP to consider as members of a focus group. They are likely an OSP’s largest — and most vocal — customer base. As one gathers feedback on various aspects of an OSP operations,
understanding faculty concerns and hearing their suggestions can help guide constructive change. As one develops a faculty focus group, it is important to consider the different perspectives that one would receive from senior faculty, junior faculty, and postdoctoral staff.

Other important stakeholders to invite to participate in the focus group could be department research administrators and department chairs. It is also important to include possible critics in a focus group; even negative feedback is valuable. Figure 2 is a sample notice provided to focus group members in advance of the meeting. (Figure 2 is included on page 3905:24.)

13905.5 Using Surveys for Assessment

Surveys of users or recipients of services are a common way of gathering information about both the need for and perceived value of existing services. When one decides to use a survey to collect information, it is recommended that someone knowledgeable in the theory and methodology of survey research (such as someone associated with a survey research lab) be consulted to ensure that questions are correctly worded, populations are appropriately identified and sampled, and data is correctly compiled.

When surveys concerning an OSP’s operation are developed by other groups (such as external evaluators), the surveys should be developed in close cooperation with the OSP, so they will appropriately reflect the relevant issues, convey the right tone, and use the right “jargon.” The following are some considerations in developing surveys:

(1) Surveys can serve as a means to promote and raise the profile of an office. One should consider the survey as a marketing tool and take advantage of that process to widely share information about the OSP’s services and activities.

(2) Many surveys ask readers to rate a particular item (e.g., an office, newsletter, or service). In doing so, the survey often relies on the reader’s ability to “recognize” the name of a particular thing. This could create a problem in a large institution with highly centralized offices and functions and diverse departments. In such situations, the survey taker could have trouble, for example, remembering that a particular service was provided by the OSP.

(3) A number of surveys ask for accurate recall of actions (e.g., “indicate the number of times you used” a particular service or “indicate whether you received an award” as a result of using a particular service). The reliability of results could diminish when respondents must rely heavily on memory to complete the survey.

A written anonymous survey provides the means to elicit feedback and reactions that are difficult to obtain in group or individual interviews or discussions. Use of tools such as Survey Monkey allow for easy response and compilation of results. Figures 3-5 include sample questions that could be included in assessment surveys for three different audiences: faculty, department heads, and OSP staff. (Figures 3-5 are included on pages 3905: 25-34.)
Using Metrics for Assessment

Research administrators, particularly managers and directors, need quality data in order to make good decisions. Well-defined metrics (measures or measurements) are central to an effective assessment program. In looking at sponsored programs operations, there are three general categories of attributes that can be measured and that will assist with assessment activities:

- operational metrics such as turnaround time for processing a proposal or turnaround time to issue a subaward;
- customer service metrics such as workshop attendance numbers or value to attendees of an educational workshop; and
- individual performance metrics such as number of proposals, awards processed by individual sponsored programs staff, or number of inquiries answered during a certain time period.

Some of the metrics represent “objective” measures (like turnaround time); others are “subjective” (such as “value of a service”). It is important to invest some time in identifying which OSP functions have associated metrics that are within the office’s capability and resources to collect. It is also important to determine how each of those measurements will help one assess the OSP operations.

Once measurements are identified, a process for collecting and recording the data should be devised. Some data can be strictly quantitative and collected through simple forms, and then compiled using spreadsheets. Other data may be obtained through a representative sampling. Sampling is a subset of data drawn from a more comprehensive set of data used to represent the whole. Figure 6 is an example of a form used to collect a representative sampling of staff effort, collected over a two-week period. (Figure 6 is included on pages 3905:35-37.)

An important consideration in developing metrics is to devise a method for their collection and display that is consistent over time. This allows data to be used for trend analysis or, for example, as a measure over time of the effect of specific operational changes implemented. Figure 7 discusses the OSP staff tracking system in place at one institution. (Figure 7 is included on page 3905:37.)

Using Self-Audits for Assessment

Self-audits provide snapshots of how effectively office processes and procedures are working. They serve as indicators of where things are working well and highlight risk areas needing attention. Further they can provide research administrators information to help them address problem areas.

A self-audit is easily executed. A simple approach is to take a specific written policy or procedure and track it to the actual “process” that is in place. The intent is to determine how well the process maps to the policy or procedure (which may suggest some adjustments to either the written policy/procedure or to the process) and then analyze whether there are any inefficiencies that should be corrected. This process involves mapping policy/procedure, process, and individuals involved in
each step. The self-audit can be conducted by a single individual within the office or by a group of individuals. In nonfinancial compliance areas, committees (administrators and/or faculty) may be formed to conduct a self-audit of compliance processes in place.

To be effective for programmatic purposes, a self-audit must be an ongoing activity. When changes are made to operational policies or procedures, a self-audit can provide necessary feedback as to how well the changes are functioning. As such the self-audit allows one to continuously monitor changes to operational processes or policies.

A helpful framework for a self-audit program is found in Managing Externally Funded Research Programs: A Guide to Effective Management Practices, published by the Council on Governmental Relations (COGR).4 The guide lays out core principles of management systems and internal controls that should be part of an assessment activity. The core principles become the basis for the review process and can help one assess risk areas and redundancies and devise improvements. The COGR framework for a self-audit program is included as Figure 8. (Figure 8 is included on page 3905:38.)

**Using Self-Studies for Assessment**

As discussed earlier, the “self-study” is a critical “self-review” of what an OSP is doing, why it is doing what it does, and what can be done differently or better. A self-study does not need to be an onerous task. If an office’s management practice is to conduct a self-review periodically, then each subsequent review should build upon the results of all previous ones.

The self-study is not to be confused with an operations manual that defines the step-by-step procedures and tasks associated with an OSP. Rather the self-study should
◆ answer critical questions about functions,
◆ provide metrics where possible, and
◆ result in some analysis of strengths and weaknesses, level of effectiveness, and needed improvements.

There are several approaches: two common approaches are for the office director to write a self-assessment document or a staff committee to create the document. Regardless of who conducts the study, the general sequence of activities should flow as follows.

**Time Frame**

A time frame for conducting the self-study must be established. In scheduling the self-study it is important to consider the impact on the individuals’ time who are involved in the activity and the time of year (staff’s availability may ebb and flow depending on the season). Depending upon how in depth and detailed the assessment will be, the time frame for conducting it could be as short as a few weeks or as long as several months.

---

Staff Roles
One or more individuals will be involved in pulling together information, developing metrics, and writing the document. One should not overlook the importance of involving staff in this process. It is important to maintain frequent communication with staff so they understand the purpose of the self-study; assessments often unnecessarily create anxiety and concern among staff members. The self-study in particular is an excellent opportunity for team building. It can afford staff opportunities for critical thinking about their own processes and functions. Figure 9 is a sample outline for staff participation in a self-study. (Figure 9 is included on page 3905:39.)

Focus and Content
The general areas that will be covered in the self-study must be determined. Within the framework of each defined area, one should carefully consider the critical questions that should be asked so as to elicit feedback on the strengths and weaknesses of the particular aspect of the operation under study. Following are several broad sections that should be part of a good self-study:

◆ Introduction: The introduction provides a general overview of the scope of the office, the organizational placement of the office within the institution, and the unit’s relationship to other related university offices.

◆ Infrastructure and management: This section covers management and the strategic planning process. It should address staffing levels, training, and how staffing relates to the overall academic environment (including faculty, department and college counterparts, and other central offices). There should be a discussion in this section on management philosophy and budget.

◆ Institutional responsibilities: This section discusses existing office policies and the process for policy development, implementation, and review. In addition to policies, there should be a discussion on operational processes and practices with special attention to how they relate to federal, state, and university rules and regulations. An assessment of data and records management (both paper and electronic) should be included.

◆ Service, outreach, and connectivity: This section discusses relationships with key stakeholders that are both internal and external to the university. This includes assessing communications channels to and from those groups. Some stakeholders may be recipients of office services (such as faculty), while other stakeholders may be regulatory in nature (such as the office of human research protection). Outreach and education/training functions of the office should be described and assessed in this section. Figure 10 includes an example of questions that can help one assess a specific educational/training program. (Figure 10 is included on page 3905:40.)

◆ Metrics: This section looks at data collected for or available as part of the self-study. Such data may include number of proposals, awards, or subawards; number of educational offerings; numbers for protocols in the compliance areas; and statistics on areas of staff effort, turnaround time on issuing subawards, or
numbers of inquiries to the office. Metrics may include summaries of previous evaluations or surveys that have been conducted by the office and any available trends or patterns of-use data. Metrics is perhaps one of the most powerful parts of a self-study and adds impact when discussing upward or downward trends. Figure 10 includes an example of the types of metrics that could be used to analyze one educational/training program. (Figure 10 is included on page 3905:40.)

**Content Specifics.** Researching content for the self-study is a process of gathering and analyzing background information relevant to identified areas to be studied. Reviewing any OSP “marketing” materials describing services offered is an excellent starting point for determining what should be looked at in the self-study. One should be sure to look at any existing OSP operational data, including

- annual reports,
- documents gathered in support of requests for budget or staff increases,
- responses to complaints,
- audit findings, and
- materials prepared for a new senior administrator.

Also look at any institutional reports or communications about the office prepared by other groups. Individuals who know the OSP operations well can be excellent resources for background information. As one defines the content for the self-study, if time permits, be sure to use a variety of techniques for gathering information, such as focus groups of targeted populations and stakeholder surveys.

**Analysis.** A self-study is intended to assess what the office is doing, why it is doing it, and what needs to be done to improve performance. When viewed as such, the analysis of a particular function should include questions designed to produce feedback that will enable one to reach conclusions or consider directions for change. The analysis should reflect critical thinking, challenging current practices as relates to best practices at peer institutions. Not only can an analysis lead to operational change, it may additionally identify resource needs.

**Final Report**

The final report of the self-study should be a comprehensive document that describes the areas looked at as part of the self-study and presents a critical review of strengths and weaknesses uncovered, supported by relevant analysis and data.

**13905.9 Using External Evaluations for Assessment**

External evaluations typically follow the same general process as a self-study. Although good management practices would regularly schedule programmatic external evaluations, when a regular cycle is not in place, external evaluations often are prompted by a change in leadership or occur after a reorganization, or in response to a surge in complaints.
Setting Up the External Evaluation

The first step in an external evaluation is for the OSP or initiator of the evaluation (which may be a reporting unit or a senior administrator) to define the purpose of the evaluation. The purpose should be articulated clearly and understood by all parties involved. In some cases, the purpose may be a state mandate that requires regular evaluations of administrative programs of institutions of higher education.

Answers to the following questions will help to clarify the review parameters and orient the evaluator to the goals and purpose of the review. (Although oriented for the external evaluator, these questions could be adapted for a self-study.)

◆ What factors have contributed to conducting an evaluation at this time?
◆ Are there plans for any other groups to additionally be involved in evaluating the office?
◆ How has this office been evaluated in the past? Was this in keeping with the typical form/frequency for the institution? Has there been a recent self-study?
◆ What expectations are there for the evaluator(s)?
◆ Who are the primary stakeholders that are interested in this evaluation? Why?
◆ What major areas are to be evaluated? Why those areas? What unique problems have been identified in those areas?
◆ What major areas are not to be evaluated? Why are those areas excluded?
◆ Will other evaluation activities besides the evaluator(s) be used (e.g., a faculty survey)?
◆ What expectations are there for the review findings?
◆ Will the evaluation report include recommendations, or will the report cover only the defined evaluation?
◆ Are specific uses already defined for the evaluation report (reorganization, budget reallocation, program improvement, other)?
◆ What lines of communication should the evaluator(s) have to: office undergoing review, office advisory committee, reporting unit, other.
◆ What level of communication do you expect or want with the evaluator(s) throughout this evaluation?
◆ What resources (including staff support) are available to the evaluator(s) to carry out some of their tasks (dollars, professional survey researchers, office staff)?
◆ Other than a draft final report (for correction of erroneous data) and a final report, are other reports or briefing sessions expected/desired?

After the purpose of the evaluation is defined, generally the next step is to select the evaluator(s). Potential evaluators should be carefully considered in terms of

◆ traits and skills that are necessary for the conduct of the evaluation (e.g., interpersonal skills and reputation for delivering on promises made);
knowledge of the research administration field appropriate to the type of OSP operation;

awareness of national trends and issues impacting research administration; and

credentials that will support further the acceptance of the evaluation results.

The evaluator(s) should receive a written “charge” letter that details the scope and purpose of the evaluation. The scope should be presented in a clear statement to all parties involved in the evaluation and typically includes

the purpose of the evaluation, which may discuss the background of and reasons for the review;

areas to be evaluated and any special concerns;

specific enumerated activities (optional);

funding or other forms of support available for the review activities;

form of the results (typically a written report, but may include oral discussions or presentations);

due date for the results; and

evaluation team composition (if more than one evaluator).

Figures 11-13 contain sample language for key elements of three types of charge letters involving external evaluators. (Figures 11-13 are included on pages 3905:40-42.)

The evaluator(s) often will further clarify their responsibilities as outlined in a charge letter by

establishing the parameters for the evaluation,

identifying concerns or sensitive areas that may not have been specified in the written charge letter,

outlining the full range of evaluation activities that may be involved and may be conducted by other groups,

determining lines of communication, and

ascertaining primary stakeholders and potential users of the evaluation results.

Organizing for and Conducting the Evaluation

If the impetus for the external evaluation comes from outside the OSP, the office leadership may not be involved in organizing many of the details. However the OSP leadership should be aware of the general factors that go into the evaluation process, including the following:

Communications: The time line for the evaluation should contain multiple opportunities for communications between the evaluator, or chair of the evaluation team, and the initiator. Frequency of communications should be determined at the outset.

Evaluation structure: The time line should detail tasks that map the scope of the evaluation to the functions covered in the review and ultimately to the specific
Assessing the Sponsored Research Office

information sources pertaining to each.

◆ **Background Information:** Evaluators should be provided basic knowledge about the institution, various office relationships, the OSP operations and staff, and users of office services. The evaluators assess existing and collect new information from a variety of sources, usually documents and interviews. The relevancy for all data collected is defined by the scope of the evaluation. Results from any previous self-studies should be given to external evaluators, as they could provide a frame of reference by presenting a summary of the operation, self-identified strengths and weaknesses, and an orientation to the broader institution. The evaluator could then use this information in formulating evaluation activities and questions.

Determining the types and range of information sources necessary is critical to eliciting complete and unbiased data from which the evaluation results are compiled. Each evaluation will necessarily select information sources based on the scope of the evaluation, matching the focus of the evaluation and the time and cost parameters for the process. Figure 15 lays out various information sources that evaluators could use in the course of their review. (Figure 15 is included on pages 3905:46-47.)

◆ **Data collection:** The type and form for data collection may be influenced by the time available and staff or dollar support. Surveys and multiple site visits may extend the time frame. Specific sources for data and background information should be identified for interviews and interview questions should be listed.

◆ **Site visit:** Generally one site visit is scheduled and used to collect information from various stakeholders through individual or small group meetings. The initiator of the evaluation generally will determine the focus and breadth of the site visit, which should flow from the areas to be evaluated. Stakeholder meetings during a site visit typically include members from appropriate groups, such as the reporting unit, sponsored program office staff and/or director, faculty users, or related offices. The use of multiple evaluators allows for greater coverage of meetings and locations. Figure 14 contains sample itineraries for site visits. (Figure 14 is included on pages 3905:43-45.)

◆ **Data analysis:** The time necessary for data analysis by the evaluator is influenced by the type and form of data collection. If data has already been collected, then only time for analysis is needed; if the evaluator is collecting data, then additional time will be needed. If more than one evaluator is involved in the project, additional time often is structured for discussion and resolution of differing perspectives.

◆ **Report writing:** The time line for report writing must be set down. If there are multiple evaluators, more time than for a single evaluator may be needed to produce a report.

◆ **Draft report:** The report should be presented first in draft form. Sufficient time should be established for review by the initiating office and other appropriate parties.
◆ Final report: The evaluator should consider all comments made on the draft report and incorporate or revise it as appropriate. Inaccuracies should be corrected, but other comments received may or may not be incorporated at the discretion of the evaluator.

Evaluation Results
Evaluators will typically provide a written report and the OSP should be given the opportunity to review a draft. One goal of the assessment is to produce a fair and accurate picture. Therefore the sponsored programs office, the institution, and those involved in the assessment should equally share in this goal. In reviewing the report, the research administrator should not refute conclusions or recommendations, but only identify errors. Research administrators should note, however, that corrections indicated to the written report do not necessarily have to be accepted by the evaluator or evaluators. The draft review also provides an opportunity for the administrator to comment on the clarity of the document.

After the evaluators have considered any comments, a final report will be submitted. Although not always a part of the evaluation process, a discussion with the evaluators after the final report has been submitted can provide an opportunity for the OSP to explore specific findings and conclusions or recommendations that have been put forward.

13905.10 Using Quality Improvement Programs for Assessment
A quality improvement program is used to create systemic change. Quality improvement programs look at assessment from a broad view and examine the institutionwide research environment, the needs of various stakeholders, and the systems used in that environment. The program facilitates the evolution of research administration systems that are successful and innovative in supporting and improving the research environment.

This approach brings a paradigm shift in the way one traditionally thinks about assessment and associated management practices. The quality improvement program blurs the lines between an assessment as one separate activity that leads to another separate activity and a process of management decision making. The quality improvement program incorporates into one model: system development, management improvements, and ongoing feedback from all stakeholders. A quality improvement program can be developed for a particular aspect of research administration (such as the proposal-processing system) or it can apply to the institution’s entire research enterprise.

Many institutions likely will discover that they have elements of a quality improvement program already in place. Some task forces or networking groups composed of central and department research administrators that provide ongoing feedback to OSPs often act as “mechanisms” for quality improvement. Similarly some offices have advisory committees that provide advice on user needs and direction for the operation. See Figure 16 for a sample document outlining one institution’s “proactive” approach to compliance. (Figure 16 is included on page 3905:48.)
Responding to Assessment Results

A sponsored programs office should critically and thoughtfully consider the information resulting from any assessment activity, and prepare a detailed, usually written, response regardless of the type of activity. There are many ways assessment results can be used, other than to address the initial reason for the assessment. In providing a written response, an OSP goes “on record” with its response in the event of changes in the research environment or decision makers. It is therefore important for the OSP to provide a detailed, written response, especially if it takes issue with some conclusions or recommendations.

Typically for those assessments that are directed from within the office, such as focus groups, self-audits, and self-studies, the OSP leadership would receive the results. Additionally OSP staff, advisory groups, or the reporting unit may be provided the results. In the case of broader and more visible activities, such as external evaluations or quality improvement programs, the relevant stakeholders (including the OSP, reporting unit, and user groups) should receive at least summaries of results, if not the complete results. Depending on the institutional structure, some or all of the results might be shared with the faculty community at large.

The response to the final report of results can be accorded the same level of formality as the format of the assessment results. If the results were shared during a verbal interface, the response could be presented verbally, but nonetheless still documented in writing and kept on file. Use the response as an opportunity to present differing views, support recommendations, or react to legitimate problems raised. The response should

◆ document areas of disagreement,
◆ provide missing or supplemental information,
◆ present different interpretations, and
◆ offer a rationale for additional recommendations.

Results of the assessment should be reviewed objectively. If the assessment appears to have been conducted fairly, the conclusions and how they translate to areas for change should be evaluated critically. While there may be good reasons for not embracing every recommendation in the final report, each one should at a minimum be considered in light of its impact on both the OSP and the institutional environment. The OSP response to an assessment recommendation made or conclusion drawn often is one of the following:

◆ It is not appropriate as it comes as a result of a process flaw (due to lack of critical information considered in the evaluative process).
◆ It deserves further consideration as a possible operational change.
◆ It presents a perspective or conclusion about which there is disagreement.
◆ There are resource implications for implementing.

If the results raise legitimate problem areas, deficiencies, or shortcomings, a clear response should be provided on what steps have or will be taken to correct the
problems. The tone of the response should be detached and written for a wide range of readers, even if the response is filed internally or directed to a particular decision maker.

**Developing the Assessment-Management Cycle**

Each assessment activity should lead to action that furthers one’s mission, demonstrates accountability, and leads to process improvement. Good management practices routinely turn “assessment” results into “management” decision making and actions. The assessment-management cycle therefore encompasses a regular sequence of activities in which one should

- Determine what the operation should look like given the constraints and opportunities within the institutional culture and research environment and recognizing that the field of research administration is constantly evolving. (Best practices, peer university models, and discussions with colleagues to identify other operational practices should be used.)
- Assess the existing OSP operation in light of what it could look like (based on the strengths and weaknesses identified through self-studies, focus groups, retreats, and advisory groups).
- Identify several areas for improvement that are reasonable in light of available resources and develop a plan for implementing changes to priority items and determining how the success of the changes will be measured (such as via retreats and advisory groups involving stakeholders). The plan should also
  - **define office goals** that relate to the institution and office mission (Goals are more specific aspects of the mission and often are three-five year targets.); and
  - **detail strategies and objectives to reach goals.** (Objectives are specific steps to achieve goals; they are often measurable and action oriented and change each year.)
- Implement ongoing assessments to review progress made in areas needing improvement. Adjust strategies as needed, based on unplanned opportunities and unplanned problems. “Anticipate” opportunities and problems and make planning for and adjusting to them a part of assessing the research environment at the institution and the OSP’s objectives. (Again ongoing assessment to monitor the impact of changes and to determine where adjustments still need to be made could include self-audits, retreats, focus groups, and advisory groups.)
- Periodically re-examine the operation based on changes made and re-assess what the operation “should” look like. (Again external evaluations and quality improvement programs allow one to incorporate various stakeholders in the assessment process and bring further insights on operational efficiencies and service.)

**Strategic Planning.** Many of the assessment activities described in this chapter use elements found in formal programs of institutional strategic planning. Although the forms of assessment are different from those described here when conducting strategic planning, the philosophy behind each approach is ultimately the same: to
scan the environment for threats and opportunities and use the assessment tool as feedback for operational decision making. Figure 17 contains elements for an effective strategic plan. (Figure 17 is included on page 3905:48.)

§3905.12 Conclusion

Today more than ever before, the research enterprise is a complicated, far-reaching, and ever-changing process. Further in recent years, university sponsored research activities have become the focus of increased attention from external parties. OSPs are always looking for ways to improve staff performance and their operations.

Assessment activities — both those that are “one shot” in nature and those that are part of an ongoing program — are conducted by OSPs to evaluate existing processes, determine where operations are running smoothly, and identify where improvements are needed. Further in examining each function of an OSP, one can easily identify areas for garnering feedback on threats or opportunities to which the office should respond.

Assessment also is conducted at the institutional level to identify a newly emerging mission at the university and consider the opportunities for the OSP to support that new interest. Assessment of the OSP enterprise also is done at the national level, such as through communications and national meetings with colleagues and information received on evolving federal issues, which can be translated into action issues for the office.

In 1978 Raymond J. Woodrow spoke about the differences between “management for research, not of research.”5 He described the attributes of programs that provide support for research as those that have a “nourishing climate, sound policies, supporting services of various kinds, financial systems, and organizational arrangements that will help research to flourish in a university.” Assessment activities of an office of sponsored programs (OSP) are part of the philosophy of management for research and reflect how OSP operations need to be responsive to best support an institution’s research enterprise, while at the same time help the OSP maintain a compliant and fiscally sound operation.

---

At Harvard University, the Office of Sponsored Programs (OSP) has been reorganized a number of times. The reorganization has been done in concert with faculty focus groups and the administration. Focus groups are composed of faculty, local school and department administrators, and OSP personnel. The groups are contacted twice yearly in order to gather feedback on the operation. Prior to meeting, the focus groups receive a feedback form identifying the general topics of discussion (see below). When the groups meet, there is an opportunity for candid discussion on the general areas.

“It isn’t always easy to hear feedback,” according to Elizabeth Mora, Associate Vice President for Research Administration. When feedback is received through this process it is fed back into the model and used for assessing operational effectiveness and decision making.

Questions Regarding Research Policy and Administration

Given that there are many changes of personnel and systems at the Office for Sponsored Programs and in central FAS (Faculty of Arts and Sciences) Administration, it seems like a good opportunity to examine the service we, the joint OSP/FAS Research Administration team, are providing to you and the principal investigators with whom you work. As part of this process, we will be meeting with focus groups in each of the divisions, which will include faculty and administrators. Our goal is to analyze the feedback from these focus groups and incorporate the knowledge gained into a better, more smoothly integrated system for managing research in the FAS.

In preparation for our meeting on Friday, please consider the following questions:

1. Please name the biggest challenges you face as lab directors with respect to research administration? With respect to research policy? What are the biggest challenges faced by your principal investigators from research administration and policy?

2. If you were placed in charge of OSP, what would be your top priority for improving research policy or administration? What about if you were in charge of FAS Research Administration?

3. What kind of resources are needed in your department/center/area spotting grant opportunities and writing and submitting grants?

4. Are the written communications you (or others with whom you work on grants) receive regarding research policy and administration adequate and clear? For example, how helpful do you find Managing Your Research: A Handbook for Principal Investigators, Research Administrators, and Research Staff and the Grey Book (Principles and Policies that Govern your Research, Instruction, and other Professional Activities)?

5. What are we (meaning the OSP/FAS joint effort to administer the life cycle of a grant) doing right? What person, process, or office has been particularly helpful to you?

If you are unable to attend Friday’s focus group or would prefer to provide written comments, please feel free to email XXX.

Source: Harvard University, Elizabeth Mora, Associate Vice President for Research Administration.
Figure 3: Sample Survey Questions for Faculty

Surveys of faculty are generally the first type of survey considered in conducting an evaluation of an OSP’s operations. The following sample questions reflect a range of subject areas and types of questions and formats for questions that could be part of a faculty survey.

Sample Question for Topic Area: Internal Support Programs
1. Besides sponsored research, please list other scholarly achievements during FYs XX that have resulted, either in whole or in part, from your Division of Sponsored Research internal support — major paper presentations, publications, exhibits, awards, fellowships, appointments, etc.

Sample Question for Topic Area: Grants Information
1. Grants Information. The Office of Research Services disseminates information about grants programs through individual mailings and a newsletter. Searches for support for faculty projects are conducted on request. The office also conducts workshops and information programs dealing with the techniques of grantsmanship.
   A. How important are these services to your own research activity? (Circle the most appropriate response.)

<table>
<thead>
<tr>
<th>Extremely Important</th>
<th>Very Important</th>
<th>Somewhat Important</th>
<th>A Little Important</th>
<th>Not at all Important</th>
</tr>
</thead>
</table>

Sample Question for Topic Area: Faculty Interests
1. How likely would you be to use the following if available electronically through the (computer system)?

<table>
<thead>
<tr>
<th>Very Likely</th>
<th>Not at all Likely</th>
<th>Don’t Know</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Faculty Research Interest Database</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

(sample compilation of faculty research interests)

Sample Question for Topic Area: Incentives
1. Below is a list of some things that might encourage you to seek support for research or creative work. Which of these incentives are available to you?

Incentives: Yes No
a. More work space or laboratory space/equipment
b. Prospect of promotion/tenure
c. Summer pay
d. Release time
**Sample Question for Topic Area:** Perception of Research Within the University

1. Indicate how highly you believe research is valued at various levels in the university by circling the appropriate response on a scale from 1 to 5. (NA = not applicable; 1 = not valued, 5 = highly valued)

<table>
<thead>
<tr>
<th>Question</th>
<th>Response Options</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. University administrators</td>
<td>NA 1 2 3 4 5</td>
<td></td>
</tr>
<tr>
<td>B. Dean</td>
<td>NA 1 2 3 4 5</td>
<td></td>
</tr>
</tbody>
</table>

**Sample Question for Topic Area:** Department/College Services

1. Typing and clerical support for research papers/proposals

<table>
<thead>
<tr>
<th>Question</th>
<th>Response Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Is service provided?</td>
<td>Yes □ No □</td>
</tr>
<tr>
<td>B. If yes, how well is it provided?</td>
<td>Not very well □  Moderately well □  Very well □</td>
</tr>
<tr>
<td>C. If no, should it be provided?</td>
<td>Yes □ No □</td>
</tr>
</tbody>
</table>

**Sample Question for Topic Area:** Other University Support Services

Below are listed a variety of support services that the university provides. Indicate how helpful or adequate you believe each is to you by circling the appropriate response on a scale from 1 to 5. (U = unknown/don’t know the service well enough to evaluate it; 1 = not helpful; 5 = very helpful)

1. Procurement and Purchasing

<table>
<thead>
<tr>
<th>Question</th>
<th>Response Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Processing purchase orders</td>
<td>U 1 2 3 4 5</td>
</tr>
<tr>
<td>B. Assistance with purchasing equipment for research</td>
<td>U 1 2 3 4 5</td>
</tr>
<tr>
<td>C. Assistance with state bid process</td>
<td>U 1 2 3 4 5</td>
</tr>
<tr>
<td>D. Supplying information about procurement and purchasing</td>
<td>U 1 2 3 4 5</td>
</tr>
</tbody>
</table>

**Sample Question for Topic Area:** Equipment, Facilities, and Resources

Below are listed a variety of resources that may be necessary in conducting research. Indicate the adequacy of each by circling the appropriate response on a scale from 1 to 5. (NA = not applicable; 1 = very inadequate; 5 = very adequate)

1. Statistical Laboratory, Department of Statistics

<table>
<thead>
<tr>
<th>Question</th>
<th>Response Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>(for consultation on experimental design and data analysis.)</td>
<td>NA 1 2 3 4 5</td>
</tr>
</tbody>

continued
**Sample Question for Topic Area:** Facilities & Administrative (F&A) Costs

Indicate your level of agreement with the following statements about F&A costs by circling the appropriate response on a scale from 1 to 5. (U = unknown; 1 = strongly disagree; 5 = strongly agree)

1. I support the way funds generated from F&A costs are handled in my college  U   1   2   3   4   5

**Sample Question for Topic Area:** Assessment of Services

For Questions 1-94, use the following scale:
(1) Strongly Disagree  (2) Disagree  (3) No Opinion  (4) Agree  (5) Strongly Agree

1. The Office of Grants Accounting serves the research community very well in the following areas:
   A. Handling of purchase requests and purchase orders
   B. Accounting reports to principal investigators (monthly and annually)
   C. Handling of refunds, returns, and credits
   D. Rebudgeting
   E. Timeliness of year-end balance information
   F. Help with grant spend outs

**Sample Question for Topic Area:** Post-Award Services

1. Post-Award Services. Examples of Research Services’ post-award services include the writing of contracts and subcontracts on behalf of the university and authority (shared with Finance) over budget transfer within grants.
   A. Please describe your degree of satisfaction with each of the following aspects of these services.
      (Circle the most appropriate response)

Sample Question for Topic Area: Compliance
As you may know, there are several committees that regulate the conduct of research to protect research subjects, animals, the environment, and society. Much of their activity is necessary in order to comply with federal, state, and sponsor regulations. There are committees of faculty, staffed by personnel from the Office of the Vice President for Research. We are interested in your experiences both with the committees and with their staff.

1. Radiation Protection Committee:
   A. Have you ever had any contact with or dealt with the Radiation Protection Committee?
      ☐ Yes, within the past 3 years
      ☐ Yes, more than 3 years ago
      ☐ No (Skip to Q 7)
      ☐ Don’t know (Skip to Q 7)
   B. How efficient and effective was the committee in meeting your needs?
      ☐ Very effective
      ☐ Effective
      ☐ Not very effective
      ☐ Not effective at all
      ☐ Don’t know

Sample Question for Topic Area: Policies and Procedures
There are various policies and procedures established to guide research and sponsored projects. In order for these policies to be effective, they must be understandable, helpful, consistent, available to you, and reasonably flexible.

1. Do you have reasonable access to the University Policies and Procedures manuals, particularly those sections covering areas such as “Research & Sponsored Programs” and “Purchasing” that detail the rules for managing your sponsored accounts?
   ☐ Yes ☐ Not sure ☐ No

2. Sponsors may have a variety of policies and guidelines concerning expenditures and reporting requirements. When you have questions about these policies, which sources do you use to find the answers? (Check as many as apply)
   ☐ Office of Sponsored Programs Administration
   ☐ Research and sponsored programs manual
   ☐ The sponsor
   ☐ College research dean or department chairperson
   ☐ Other (Who or where?) _____________________________
   ☐ Have not had questions

Source: Permission was granted by the following institutions for use of these instruments: Arizona State University; Colorado State University; Florida State University; Illinois State University; Indiana University; Loyola University of Chicago; Medical University of South Carolina; Northwestern University; Pennsylvania State University; The Research Foundation of the State University of New York; University of Florida; University of Illinois at Urbana-Champaign; University of Missouri-Columbia; and University of South Carolina.
**Figure 4: Sample Survey Questions for Department Heads**

Collecting information from department heads provides valuable insight into the overall direction for the OSP and services needed by departmental administration. The following sample questions reflect a range of subject areas and types of questions and formats for questions that could be part of a department head survey of an OSP’s operations.

**Sample Question for Topic Area: Identification of Services Provided**
1. Please review the following lists of pre-award and post-award services for external support development and grant and contract administration and put a check in the space provided for all services which your unit provides.
   [lists not provided in sample]

**Sample Question for Topic Area: Distribution of Facilities & Administrative (F&A) Costs**
A percentage of the funds generated from the Facilities & Administrative (F&A) costs (“overhead”) charged to external grants is returned as research incentive funds to the departments and centers that generated those funds. This year that percentage has increased to 40%.
(SD = Strongly Disagree; D = Disagree; N = Neither Agree Nor Disagree; A = Agree; SA = Strongly Agree)
1. It should be possible to financially reward principal investigators, during the time they are directing grants, for bringing external funds to the university.

**Sample Question for Topic Area: Distribution of Research Funds to Graduate Students**
Funds are available to provide limited support to graduate students to present papers at professional meetings.
(SD = Strongly Disagree; D = Disagree; N = Neither Agree Nor Disagree; A = Agree; SA = Strongly Agree)
1. An effort should be made to provide summer research support for graduate students with 9-month teaching appointments

**Sample Question for Topic Area: Other Priorities and Responsibilities of the Research Office**
The management policies/priorities of the Graduate School/Research Office should:
(SD = Strongly Disagree; D = Disagree; N = Neither Agree Nor Disagree; A = Agree; SA = Strongly Agree)
1. Take an active role in promoting reduced teaching loads for faculty who are successfully engaged in research activities.
Sample Question for Topic Area: Other Activities
(SD = Strongly Disagree; D = Disagree; N = Neither Agree Nor Disagree; A = Agree; SA = Strongly Agree)

1. The number of faculty research fellowships should be increased even if it means less money per stipend.

Source: Permission was granted by the following institutions for use of these instruments: Arizona State University; Colorado State University; Florida State University; Illinois State University; Indiana University; Loyola University of Chicago; Medical University of South Carolina; Northwestern University; Pennsylvania State University; The Research Foundation of the State University of New York; University of Florida; University of Illinois at Urbana-Champaign; University of Missouri-Columbia; and University of South Carolina.
**Figure 5: Sample Survey Questions for Sponsored Programs Staff**

An important aspect of assessing an OSP’s operations is to solicit feedback from staff. The following sample questions reflect a range of subject areas and types of questions and formats for questions that could be part of a staff evaluation of an OSP’s operations.

**Sample Question for Topic Area:** Job Satisfaction

Below are some questions about factors that may contribute to morale in the workplace. These include things like job satisfaction, pay, and relationships with coworkers and supervisors.

1. Doing my job well is important to the Office of the Vice President for Research.
   - □ Strongly agree
   - □ Agree
   - □ Neither agree nor disagree
   - □ Disagree
   - □ Strongly disagree
   - □ Don’t know

**Sample Question for Topic Area:** Mission of the Office

1. How well do you understand the overall mission of the Office of the Vice President for Research?
   - □ Very well
   - □ Well
   - □ Not very well
   - □ Not well at all
   - □ Don’t know

**Sample Question for Topic Area:** Pay

1. Generally, how do you think your pay compares with the pay of others who hold similar jobs at this institution?
   - □ I am paid more than others
   - □ I am paid about the same as others
   - □ I am paid less than others
   - □ Don’t know
**Figure 5 (continued)**

**Sample Question for Topic Area:** Relationships with Coworkers and Supervisors

1. How well do you think your supervisor keeps you informed about the things you need to know to do your job?
   - □ Very well
   - □ Well
   - □ Not very well
   - □ Not well at all
   - □ Don’t know

**Sample Question for Topic Area:** Training Programs

1. How useful was the “on-the-job-training” you received?
   - □ Very useful
   - □ Somewhat useful
   - □ Not very useful
   - □ Not useful at all
   
   If the training *wasn’t useful*, why wasn’t it?

   __________________________________________________________________________
   __________________________________________________________________________

**Sample Question for Topic Area:** Information about Respondent

Remember that all information provided is strictly confidential. The data will never be used in any way that would allow you to be identified.

1. How long have you worked in your current job at the Office of the Vice President for Research?
   - □ Less than 1 year
   - □ 1 year to 2 years
   - □ 3 years to 4 years
   - □ 5 years to 6 years
   - □ 7 years to 10 years
   - □ 11 years or more

continued
**Sample Question for Topic Area:** Factors Influencing Job Performance

The next two questions are about things that may either help or hinder you in doing your job well. We have provided a list of items for you to consider, along with some examples. They include:

- **Effective communication with your unit:** Meetings (number, effectiveness, scheduling); response to requests for information; support from coworkers and supervisors
- **Effective communication with other Office of the Vice President for Research (OVPR) units:** Meetings among units in OVPR; timely responses to requests for information; and dissemination of information
- **Your work environment:** Including such things as cleanliness, safety, noise, odors, lighting, and comfort.
- **Support from coworkers:** Includes answers to problems, advice, and scheduling (flex-time).

1. There are many things that may influence job performance. We are interested in finding out what you think are the major factors that assist you in doing your job well.

   Please identify and rank (1, 2, & 3 with “1” being the most helpful) the three factors within the Office of the Vice President for Research that help you the most in completing your job: (within each category, space has been provided for comments)

   - ☐ Effective communication with other units at (institution) outside of the Office of the Vice President for Research
     
     __________________________
     __________________________

   - ☐ Your work environment
     
     __________________________
     __________________________

   - ☐ Support from coworkers
     
     __________________________
     __________________________

**Sample Question for Topic Area:** Contact and Satisfaction with Related Offices

1. How often do you have contact with each of the following groups as a part of your job? (Check one box in each row)

<table>
<thead>
<tr>
<th></th>
<th>Frequently</th>
<th>Sometimes</th>
<th>Seldom</th>
<th>Never</th>
</tr>
</thead>

</tr>
</tbody>
</table>
Sample Question for Topic Area: Information Flow
1. How effective is the information dissemination by your unit to those outside the Office of the Vice President for Research? Would you say it is:
   - [ ] Very effective
   - [ ] Somewhat effective
   - [ ] Not very effective
   - [ ] Not effective at all
   - [ ] Don’t disseminate information outside OVPR
   If not, why?

Sample Question for Topic Area: Overall Strengths and Weaknesses of the Office
1. What do you see as the biggest weakness of the Office of the Vice President for Research?

Source: Permission was granted by the following institutions for use of these instruments: Arizona State University; Colorado State University; Florida State University; Illinois State University; Indiana University; Loyola University of Chicago; Medical University of South Carolina; Northwestern University; Pennsylvania State University; The Research Foundation of the State University of New York; University of Florida; University of Illinois at Urbana-Champaign; University of Missouri-Columbia; and University of South Carolina.

**Records Management** — Time spent keeping all records up to date, adding new information when needed and eliminating all old records when out of date. Includes time spent on filing, database management or training, information distribution, copying, mailing, recycling, and sorting.

**Proposal/Protocol Review** — Time spent actually processing or reviewing a proposal or protocol. Includes time spent on follow-up phone calls, emails, and any other type of communication required for processing.
At the University of Washington, a system has been developed to track individual staff activity. Staff maintain spreadsheets of their activity, including such items as proposals/awards assigned, completed, and pending. Data also is generated for days in the office (average, median, and longest/shortest number of days). Each month the data is collected and graphs are developed that reflect the activity. Results are reviewed by the management and form the basis of work allocation, staff educational needs and process improvement. The aggregated data is analyzed to provide information on possible workload trends. Currently this information is primarily collected manually, but in the future this information will be part of the automated grants system.

“In large operations, it is sometimes difficult for managers to get a clear picture of what is really happening,” according to Carol Zuiches, Assistant Vice Provost for Research. The performance metrics were developed for use as a office management tool, but also serve as data for university assessments of resource needs and allocation decisions.

Source: University of Washington, Carol Zuiches, Assistant Vice Provost for Research.
Managing Externally Funded Research Programs: A Guide to Effective Management Practices, published by the Council on Governmental Relations (COGR), defines twelve core principles of a management system. Within each principle is a set of practices supported by detailed indicators. As defined in the publication, indicators “are suggested measures to use when examining whether the effective practices are being employed or outcomes are being achieved.” One way to use the guide is to create a matrix composed of the details of one’s practices and indicators that support each principle. The matrix might include details such as responsible persons, their responsibilities, and descriptions of programs or authorities. The matrix then could be used as a tool to look at the practices at an institution and determine whether they reflect the indicators that suggest a solid program.

As an example, the first principle is “Institutional Program for Effective Compliance Practices.” This principle addresses the type of system that has been implemented by the institution to address compliance with federal, state, and local laws. Within that global principle, there are a number of practices that address such areas as policies, lines of responsibility, understanding by the leadership, education, noncompliance, and risk assessment. Each of these practices lists a number of indicators that identify whether an institution has the components to the system in place that would indicate effective compliance. An example of one practice and indicators is provided and illustrates how the COGR publication can be used for purposes of conducting self-audits.

**Figure 8: Framework for a Self-Audit Program**

Figure 9: Staff Participation in a Self-Study

At Oregon State University, the self-study is used for team building. Office staff are assigned to two-person writing teams and tasked with writing several report sections. The staff are additionally assigned to three different review teams. Each team contains a different mix of staff and reviews different sections.

After the initial writing, the first round of review and critiques is done by the first round of review teams. After revisions, a second and third round of reviews and critiques are done.

Writing Teams:
◆ Team A1
◆ Team A2
◆ Team A3
◆ Team A4

Writing Assignments:
◆ Team A1
  ◆ Communications
  ◆ Operational Processes
  ◆ Policy
◆ Team A2
  ◆ Staff Development/Staffing
  ◆ Data/Records Management
  ◆ Metrics
◆ Team A3
  ◆ Key Partners
  ◆ Outreach/Education
  ◆ Introduction
◆ Team A4
  ◆ Overall Risk Assessment
  ◆ Management/Budget
  ◆ Strategic Planning Process

Review Team – Round 1:
◆ Team B1 reviews A1
◆ Team B2 reviews A2
◆ Team B3 reviews A3
◆ Team B4 reviews A4

Review Team – Round 2:
◆ Team C1 reviews A2
◆ Team C2 reviews A3
◆ Team C3 reviews A4
◆ Team C4 reviews A1

Review Team – Round 3:
◆ Team D1 reviews A3
◆ Team D2 reviews A4
◆ Team D3 reviews A1
◆ Team D4 reviews A2

“The process allows staff to work with each other throughout the process and provides ownership in the self-study. This approach also provides the opportunity for analytical skill building,” according to Peggy S. Lowry, Director, Office of Sponsored Programs and Research Compliance. Allowing staff to have a direct part in the process helps to build the accountability for the operation at the most basic and central staff level.
**Figure 10: Examples of Self-Study Data Collection**

**Questions about Educational/Training Offerings:** What are your core offerings? How were these determined? What delivery mechanisms are used? How do you know these are the best delivery mechanisms? Who is your target audience? How do you know you are reaching your target audience? How do you know you are meeting the needs of this target audience? How do you determine satisfaction or dissatisfaction with your educational offerings? How do you use the information to support your decision making and innovation? How do you identify changing needs of your audience? What are your challenges to sustaining your educational offerings?

**Educational/Training Metrics:** Number of attendees, attendees by faculty rank and/or department research administrators, overall attendees by department/discipline, attendee rating of training, attendee rating of training by department/discipline, and attendee rating over five-year period (requires a consistent rating form).

**Focus Group on Educational/Training Offerings:** Identify 8-10 faculty or department administrators who have attended your training. Explore the questions: How effective, or not, was the delivery mechanism used? What other delivery mechanisms would be more valuable and why? What other educational topics would you like to see covered? Why are those topics so important to you?

**Figure 11: Sample Language for Inclusion in a Charge Letter: External Evaluator**

In the interests of maintaining an effective, responsible administrative organization, I intend to periodically review the various special academic and administrative units within the purview of the (reporting office name). One of these units is the (office undergoing review), which operates under the direction of (office director name). (office name) has been under the aegis of the (reporting unit name) since ___. During that time it has developed substantially, and it has undertaken a variety of services in support of the efforts of our faculty to garner external research support and in general support of campus and central administrative research administration. I believe that the unit has now matured to an extent that a review of its functions and operations is warranted. I ask that you serve under the chairmanship of ____ in conducting the review of the unit.

I ask that in your review you pay particular attention to the following questions:

- What are the research services supplied by (office name)?
- To whom are these services provided?
- Are these services valued by their recipients? Are they uniquely supplied by (office name) or do they augment or duplicate services elsewhere?
- Does (office name) serve the needs of the campus generally, or are there specific areas of the campus that benefit more than others?
- Has the existence of (office name) had a demonstrable effect on the level and quality of externally sponsored research support for our faculty? (It may not be possible to answer this question unequivocally, but I would like to know your judgment in the matter.)
- I would like you to particularly examine (list specific service or activity), and provide me with an evaluation of their present and potential utility for the university.
Figure 11 (continued)

Is (office name) properly organized and situated? Would it be possible to save significant monies by downsizing or other reorganization, without materially impairing the availability of valued services? What negative impact would any such changes have, particularly in certain areas, or on particular segments of the campus community?

What level of services such as those provided by (office name) are available at peer institutions?

Are there services not now provided by (office name) that should be added to its portfolio? If so, at what added levels of expenditures should these services be added?

I would like to suggest that you consider the possibility of conducting a little survey of the faculty to determine the extent to which they are aware of (office name), make use of, and value the services it provides. This might be done by means of a telephone survey in which 10 percent of the faculty, chosen at random from the telephone directory are called and asked a series of simple questions regarding (office name). A second survey might be taken of the departmental business managers or department heads, regarding their perceptions of (office name). Finally, you might consider a survey of identified users of the (office name) services. I would be happy to furnish funds for the employment of an hourly employee (graduate student or advanced undergraduate) to conduct such telephone surveys should you think them desirable.

I thank you in advance for your willingness to undertake this activity. I hope that it will be possible for you to report on the results of your work before the end of the (date) semester.

cc: Director of office undergoing review

Figure 12: Sample Language for Inclusion in a Charge Letter: Pre-Award Research Office Evaluation

Duties of contractor:

1. Contractor agrees to provide the following professional services to (institution):

   A. Conduct a thorough evaluation of the (office name), to include but not be limited to:
      (1) Review the program and library holdings and electronic access to information and assess them and their management systems regarding completeness, currency, and necessity.
      (2) Review the process for disseminating materials for prospective funding to the faculty. Assess efficiency, cost effectiveness, and scope, and suggest improvements or future directions.
      (3) Review the services provided by (office name) and evaluate their applicability and effectiveness and suggest improvements or future directions.

   B. Provide a report commenting on the items included in “A.” above, listing possible alternatives or improvement and providing an overall assessment of (office name) activity.

2. Contractor agrees to provide said onsite services during the period (dates). The report is to be submitted to (institution) no later than (date).
Figure 13: Sample Language for Inclusion in a Charge Letter: Multicampus Research Office Evaluation

The Goals of the Evaluation of (office name)

The goals of the planned evaluation relate to the (office name), a centralized, universitywide organization that supplies certain administrative support to researchers. Although it is clear that no office can be looked at completely apart from its context, this particular effort is aimed at improving the work of (office name). The evaluation group will likely want to have a look at some of the other administrative units and will wish to examine the university’s general posture concerning research and sponsored projects, but we hope that the evaluators will keep (office name) at the center of their concerns.

It is the goal of (office name), relying in part upon the evaluation, to improve the services offered to the university community. This may involve the addition of services not now offered, the ending of some activities, the re-assignment of responsibilities either within (office name) or among the several service units at (institution), and/or the reorganization of the office.

Charge to External Evaluators

The evaluators are asked to review the (office name) organization at (institution), and to prepare a written report, with recommendations, on aspects of the unit’s work.

The evaluators will:

Participate in preparation of the review, by providing suggestions on the evaluation’s goals, scope, and process.

Read the material submitted to them (list attached). Make suggestions about additional material.

Visit the campuses of (institution) as a team, for a two- or three-day period, on (date).

Complete the first draft by (date).

Complete a final draft within thirty days of receipt of response by (institution).

Massachusetts Institute of Technology (MIT) has created a Research Administration Improvement Initiative (RAII). This initiative is intended to improve the efficiency and effectiveness of research administration activities throughout the institution in a proactive manner. Through a broad-based initiative, the program actively solicits ideas from and involvement of the many stakeholders. Key elements of the program are high-level institutional commitment from senior management, cooperation and collaboration between academic and central administration, and input from faculty.

The RAI provides a formal organizational structure and reporting process designed to inform senior management on improvements that are needed to ensure compliance with external regulations and institutional policies, thereby minimizing risk of noncompliance. Through a team structure, the RAI will solicit input, evaluate process and policy improvements, and make recommendations to management. Management will evaluate and act on RAI recommendations. Where recommendations are identified for implementation, the senior management will direct the appropriate department head or process owner to implement the recommendations.

**Team Structure:**
1. Steering committee composed of administrators throughout campus (equally divided between central and academic administration)
2. Provost, Executive Vice President (Finance), and Vice President for Research involved to show top-level buy in
3. Faculty advisory committee used as focus group (solicit concerns and issues, share proposed solutions)
4. Co-chairs consist of an assistant dean and the Director, Office of Sponsored Programs
5. Each thrust (listed below) has a subteam that involves additional campus individuals and is led by an individual from the steering committee

**Thrusts:**
1. Roles: understand research administration roles and develop effective organizational themes and models
2. Processes and policies: create, improve, document, and communicate processes, policies, and responsibilities
3. Training: develop comprehensive training systems; improve training materials and programs
4. Technology resources: build suite of systems, tools, and reports that support research administration

“The RAI model described above is a proactive approach to compliance that focuses on the root causes for non-compliance. The focus of RAI is on prevention rather than detection and emphasizes a collaboration of both the academic and administrative community in finding ways to improve research administration at MIT” according to Patrick W. Fitzgerald, Director, Office of Sponsored Programs.

13910  **External Reviews of Sponsored Programs**

As discussed previously in this chapter, program assessment or review is a broader evaluation than found with an audit or a business process review. A program review looks at the totality of an area or operation and how that area or operation meets the needs it was designed to meet. Program reviews are found in many areas in higher education, one of the most common in higher education is the academic program review. An academic program review has the intent to improve the quality of that academic program and to allow the faculty an opportunity to reflect on practices and the role of that program in the context of the institution. The review provides the opportunity to look at strengths and challenges of the program and to help assess if the program offering is in line with the institution’s priorities and directions. Typical academic program reviews contain a self-assessment segment followed by a review conducted by a faculty committee, and many committees include external faculty. The faculty who serve on the review committee have relevant expertise and therefore are peer reviewers. The academic program review as an example of program assessment illustrates its broader scope in comparison to conducting an audit or business process review.

13910.1  **The NCURA Peer Review Program**

The NCURA Peer Review Program for sponsored programs is the administrative equivalent and a parallel process to the academic program review. Just as with academic program reviews, a review of the sponsored programs operation has the intent to improve the quality of the program and to allow the constituents an opportunity to reflect on current practices and the role of that program in the context of the evolving directions and needs of the institution. In this context, the review provides the opportunity to look at strengths and challenges of the program and to help assess if the program offering is in line with the institution’s priorities and directions. The review provides an objective standard of excellence and allows the institution to make informed decisions on programmatic directions and resources. The review is conducted by senior leaders in research administration.

While program review can proceed through many steps, and each institution and its process may vary somewhat, generally there are several common core steps that occur. The following cycle of program assessment is put in context of sponsored program operations (see Figure 3920-1).
Step 1. Inventory Overall Sponsored Program Effectiveness.

Any program has multiple stakeholders and multiple areas of the institution with which they intersect. For some types of programs, a regular review cycle is determined by the institution. For other institutions, the review cycle is not predetermined and generally occurs when either the institution pro-actively decides to assess program effectiveness or when there are fractures in the processes, systems, or with constituents. Fractures may be identified by senior institutional leadership, research or financial leadership, research advisory or other committees, or sponsored program office leadership. There are numerous reasons why fractures occur. Some reasons may include: stressed systems due to significant growth, new and inexperienced staff, or changing needs of faculty. When fractures are identified as persistent and impacting the enterprise, they generally rise to a level of importance that needs to be addressed.

Institutions may find a review of the NCURA National Standards assists their inventory of sponsored programs effectiveness. These Standards can be used as a general guide to help review areas that may need attention or that align with fractures that have been identified.

Step 2. Engage Office and Leadership in Discussions.

Discussion with both office and institutional leadership is an important next step when contemplating any review activity. This discussion is essential regardless of
what prompts a review (a regularly occurring assessment, being pro-active in reviewing office effectiveness, or identified fractures in service or operations). Discussions allow the institution to plan steps when there is a regular assessment cycle of the office, or to more thoroughly discuss identified fractures and to analyze the information related to those fractures and possible solutions.

Many institutions will contact the NCURA Peer Review Program to discuss the program and how it might assist them as they determine next steps. Preliminary discussions can help the institution see how the peer review can provide additional information to assist the institution and the type of recommendations made through the review process that would help move an operation forward.

**Step 3. Plan for Sponsored Program Review.**

When there is a regular cycle of review, a pro-active assessment, or when discussion of fractures leads to a step of external assessment, the process will necessarily extend beyond the office staff and therefore become a more visible activity. Support for and understanding of the assessment process becomes a critical step before moving forward. In this step institutional leadership makes decisions on the review, the breadth, and the timing. As appropriate to the institution, key constituents are notified and engaged in the discussion.

The NCURA Peer Review Program becomes engaged in Step 3 when the institution decides to utilize this structured review process with their sponsored programs operation.

**Step 4. Conduct Program Review.**

The ultimate outcomes of the administrative program review are unknown as of this An external program review generally involves external individuals reviewing relevant background materials, spending some period of time on-site and meeting with constituents and leadership, and preparing some type of report; some consultants utilize a verbal report-out and others a written report.

The NCURA Peer Review Program has a template for the institution to gather background materials relevant to the review of sponsored programs. After a review of the materials, the Review Team has a pre-site visit conference call with the institution to discuss relevant areas prior to their site visit. Days on-site are defined by the size of the sponsored programs portfolio and can be extended at the request of the institution. The report-out from the NCURA program is of two parts: part 1 consists of an exit meeting report that provides broad observations based on the reviewers analysis of background material and meetings with constituents; part 2 consists of a detailed written report that describes what is in place, recommendations, notable practices, and links and references to resources.

**Step 5. Analyze Review Results.**

Analyzing the review results is a critical step and allows the program and leadership to put recommendations in context with their understanding and perspectives. Where recommendations have been made based on incomplete information the program has the opportunity to discuss that aspect with leadership.

The NCURA Peer Review Program provides a final draft of the report to the institution
for review of inaccuracies. This key step allows the institution to present additional information for consideration prior to the final report being issued.

Step 6. Prioritize and Plan Program Changes.
Once the report has been finalized, the program and as appropriate the institutional leadership assesses recommendations in terms of priorities. Priorities may be defined by operational needs, constituent needs, or institutional goals and needs. Resource requirements to respond to recommendations may be a significant consideration in the timing of implementation.

Step 7. Implement Program Changes.
Implementation of recommendations that lead to change should follow a well-defined and written plan of action that includes responsible persons, deliverable dates, and specific actions.

Step 8. Monitor and Assess Specific Program Changes Implemented.
Once a change to the program has occurred, a plan for monitoring should be developed and followed. This plan should use institutional staff to regularly assess a very focused aspect of the program and/or constituents impacted by the specific change made.

(return to) Step 1. Inventory Overall Sponsored Program Effectiveness. Programs constantly evolve, constituent needs continue to change, and institutional and sponsor expectations continue to evolve. For programs to be effective, the review process should regularly occur and assess the overall program.

Features of the NCURA Peer Review Program
As an example of an external evaluation, the NCURA program follows the general description for external evaluation found earlier in this chapter and has a number of features that illustrate this category of review.

The reviewers conducting the program are experienced in the field of research administration and external to the institution. The profession of research administration requires senior and experienced research administrators engaged in the review process. Unlike a consultant who takes direction from the institution, the NCURA Peer Reviewers are directed by the Peer Review Program and have participated in extensive reviewer training and mentoring in the process of peer reviews.

The assessment encompasses the entire program. An assessment of sponsored programs is not defined by individual audits of specific policies or practices. Rather it looks at the overall operation and how well that operation is meeting the needs of the institution and constituents, is efficient, and is positioned for future directions. The assessment looks at how well the institution integrates their goals and directions with fundamental operations. The totality of policies and practices is reviewed in the context of general understanding and application.
A program review utilizes a wide variety of data. A robust assessment gathers information widely and through a number of techniques. For the NCURA Peer Review this includes such information as descriptive material, self-studies, prior evaluations, interviews from constituents representing all the stakeholders within the institution, and data that illustrates scope of activity and trends.

A written report is provided to the institution. External evaluations should provide a thorough written report following the site visit. The written report should lay out the measures used for the review, the analysis of data and information, and conclusions and recommendations offered. The NCURA Review Report provides a detailed written description of current activities, best practices, and recommendations to strengthen the program. The report is aligned to the National Standards used to frame the review.

National Standards Guiding a Review
The NCURA Peer Review Program conducts a review based on a set of National Standards\(^1\) that frame the review and define characteristics of effective sponsored program operations. These Standards were developed by leading research administrators, from all types and sizes of institutions and have been endorsed by NCURA, a 7000+ member professional organization. As such, they embody reasonable expectations for institutional commitments and operations.

As appropriate to a program-level assessment, the National Standards\(^1\) cover the broad spectrum of areas that represent a sponsored programs operation. These areas are:

1. Institutional Commitments
2. Institutional Communications
3. Research Administration Policy Development
4. Program of Education About Sponsored Programs
5. Assessment and Institutional Preparedness
6. Information Management
7. Institutional Affiliations and Relationships
8. Sponsored Program Operations: Funding and Proposal Services
10. Sponsored Program Operations: Award Acceptance and Initiation
11. Sponsored Program Operations: Award Management
12. Institutional Integration of Obligations Made with Sponsored Program Activities

\(^1\) A copy of the National Standards may be requested by contacting the NCURA Peer Review Program at www.ncura.edu
(13) Export Controls
(14) Research Integrity
(15) Protection and Oversight Related to Research Activities

Key Areas When Determining Your External Reviewer
A number of companies and individuals fall within the external evaluation category. Some institutions have utilized the services of an individual or individuals, known by someone within the institution, to conduct a review of their operations. Some institutions have used one of the several large consulting firms. Others have used the NCURA Peer Review Program. For any external review, the institutions should carefully review the following checklist of items to determine the reviewers and process that best meet their needs.

◆ The individuals performing the review are experienced research administrators, have been vetted as to their qualifications, and understand and been engaged in the review process.
◆ The reviewers have experience with the institution’s particular culture and environment.
◆ The reviewer(s) have the demonstrated expertise in the breadth of the review activity.
◆ The reviewers have no conflicts of interest and no close ties to the institution or key individuals at the institution.
◆ The cost of the review is appropriate for the deliverables.
◆ The review process itself is objective and has a consistency across institutions.
◆ The framework for the review and elements that are assessed are clearly understood by the institution.
◆ There is clear understanding on the type of report-out that will be given to the institution.

Why Institutions Initiate an NCURA Peer Review
There has been a broad spectrum of reasons why institutions initiated an NCURA peer review.

(1) Significant Growth in Sponsored Programs as a Result of Strategic Goals: Significant growth has been one of the most frequent reasons for an NCURA review. Generally the growth in activity has not prompted the review so much as the decline in corresponding support offered by sponsored program operations to investigators. As a result of stressed and under-resourced operations, efficiencies declined.

(2) Persistent Faculty Complaints: Some institutions experienced long-term persistent complaints from faculty. As a result, senior leadership wanted an objective review of operations and a clearer understanding of the underlying issues that were generating the faculty concerns. The NCURA peer review provided
the opportunity for experienced research administrators from outside the institution to listen to perspectives and assess those in the context of the review of operations.

(3) Educate and Inform: Some institutions have utilized the review to better educate and inform the institutional stakeholders about sponsored programs issues and requirements. Most often found with smaller institutions, the review provided opportunities for leadership and faculty to receive an external explanation of institutional commitments that come with sponsored program awards.

(4) Administrative Review Cycle: Beginning to emerge is the institutional requirement for a regular cycle of review of administrative units. This trend is illuminating in that it signals that institutions are recognizing the need for ongoing investment in an assessment process in order to continue to improve efficiencies and meet project director needs. This is one of the most powerful reasons for a review and it provides a strong indicator that the institution is actively managing their culture for research administration.

(5) Baseline Data and Check-in on Quality: Some institutions use the NCURA review as an opportunity to check the direction of a program. For newer programs, it provides a baseline of data for the institution.

(6) Reorganization: A number of institutions have recently implemented or are anticipating reorganization of their sponsored programs operation. When done prior to reorganization, the review provides data that is useful to the decision-making surrounding reorganization. When used after reorganization, it serves as an opportunity to check-in on merged systems and procedures.

(7) Leadership Change: Leadership change is an ideal time to implement a review when there has been none previously, as has been done by several institutions. This particular timing provides an opportunity for new leadership, whether it is the senior research administrator or a Director of sponsored programs, to come into their position with a solid foundation of information that has not been biased due to employment or history with the institution. In many ways, this accelerates the acclimation process for the new leadership.

(8) School or College Level Operations: One of the newest trends is the application of the NCURA Peer Review to a school or college level operation. In considering sponsored program operations at large research or medical universities, the organizational structure typically has a significant part of the operation residing at the school or college level. This type of organization may be very decentralized with most functions occurring at that level. As such, the NCURA review at the school or college level is a more appropriate and focused review on that particular unit, applying the National Standards to that operation, and looks at the relationships between that operation and the central operation. When the review is conducted for the central operation, the focus is on that central operation, applying the National Standards to that central operation, and looks at the relationships between that operation and the school or college operations.
The NCURA Peer Review Cycle
The cycle of steps in the NCURA Peer Review Program, and most likely in many external evaluation activities of a comprehensive nature, is illustrated in the following diagram (see Figure 3920-2).

**Figure 3920-2: NCURA Peer Review Program**

Step 3.a. Define the NCURA Review Team. Given the breadth of the National Standards, a minimum of a two-person Review Team is used (larger size institutions have larger Teams). NCURA defines a Review Team that matches characteristics of the institution. Institutions have differing characteristics that impact the culture and environment. It is important to have reviewers who are familiar with that type of culture and environment. As such, some indicators that are used for defining the team include experiences with:
- similar size sponsored program portfolios
- similar size institutions
- State, private, non-profit, or affiliated foundation experience

Step 3.b. Frame the Self Assessment Process. For any external evaluation, institutions will need to prepare materials that describe what they do and how they do it. Prior to beginning that process the institution should consider how to approach a self assessment process and which stakeholders should be engaged. The self assessment process can often be combined with the external peer review process.
**Step 3.c. Compile the NCURA Briefing Book.** NCURA provides a template Briefing Book, which is a tool to gather the list of policies, procedures, organizational charts and other information utilized by the Review Team. Guided by the National Standards, developed by NCURA, the Briefing Book provides a specific listing of documents that help Reviewers understand sponsored program operations. The Briefing Book contains select questions that provide additional information for the Review Team. The process of compiling the Briefing Book additionally satisfies the valuable step of conducting a self assessment.

**Step 3.d. Complete Pre-Site Visit Activities.** Prior to the site visit, the institution completes a number of steps. These include preparing the site visit itinerary, the charge letter to the Reviewers, a pre-site visit discussion with the Review Team, and notifying individuals participating in the site visit of the purpose and focus of the site visit. The site visit itinerary is a critical part of the site visit and reflects the range of stakeholders who need to be part of the discussion. While the institution will draft the itinerary, based on guidelines suggested by NCURA, the Reviewers and the NCURA Program Coordinator will review the itinerary and suggest modifications to best meet the needs of the Reviewers and the priorities of the institution.

**Step 3.e. Host Site Visit with NCURA Review Team.** The institution manages the overall site visit. This entails creating an environment where back-to-back meetings with multiple participants are managed in a non-intrusive manner.

**Future Updates**

The NCURA Peer Review Program was launched in the spring of 2008. Between 2008 and 2012, the program has conducted over 45 reviews of sponsored program operations. The reviews yield a number of interesting themes and trends and these will be discussed in future updates.
Supplementary Material

This section includes expanded coverage of topics relating to assessing your office of sponsored programs. These materials are culled from a variety of authoritative sources.

Turnabout Is Fair Play: Administrative Program Review of an Office of Sponsored Programs*
John Falconer, University of Nebraska, Kearney and Bill Campbell, University of Wisconsin, River Falls

Academic departments at colleges and universities typically undergo academic program reviews every five years to assess their resources, procedures, and impacts. Though program reviews can be administrative headaches, when done properly they give valuable feedback to departmental development efforts. In the spirit of continuous improvement, the Office of Sponsored Programs at the University of Nebraska at Kearney subjects itself to a review process similar to that prescribed to academic programs. This article, written by the director of the sponsored programs office (John Falconer) and the chair of the review team (Bill Campbell), describes the most recent review process. The two provide first-hand perspectives to the reader in an effort to share information that may be of value to sponsored research offices at other colleges and universities. Falconer provides the narrative frame. Campbell’s comments, printed in italics, add the external evaluator’s perspective on the process and its results.

Background
The University of Nebraska at Kearney (UNK) is a predominately undergraduate institution with about 6,500 students and 300 faculty members. The university is comprised of four colleges that include Business and Technology, Education, Fine Arts and Humanities, and Natural and Social Sciences. UNK joined the University of Nebraska system in 1991, which, among other things, led to reduced teaching loads and increased expectations for scholarly productivity.

The Office of Sponsored Programs (OSP) provides pre-award services to the campus in pursuit of extramural funding, while also operating a summer student research program. OSP does not have a fixed operating budget, but receives a portion of recovered indirect costs (about $60,000 in Fiscal Year 2007). The unit has two

* This article is reprinted from NCURA Newsletter, Vo. XXXIX, No. 5, December 2007/January 2008, published by the National Council of University Research Administrators. It is used with permission of the publisher.

John Falconer, Ph.D. (falconerj@unk.edu) has served as Director of the Office of Sponsored Programs at UNK since 1999. He previously worked as director of development for American Forests in Washington, D.C. Bill Campbell, Ph.D. (wm.e.campbell@uwrf.edu) joined UWRF as Director of Grants and Research in 1990. Before then, he directed academic assistance and honors programs and taught philosophy at several universities. He leads proposal-writing workshops and teaches a graduate course in grants and proposal-writing.
full-time professionals and a part-time secretary. UNK submits 50–70 proposals a year, and was awarded about $3 million in Fiscal Year 2007.

OSP underwent a review in 2002 and volunteered to participate in a 2007 campus initiative to more formally extend the academic program review process to administrative units. The director of OSP, John Falconer, in consultation with the associate vice chancellor for academic affairs, approached Bill Campbell of the University of Wisconsin-River Falls (UWRF) to lead the review process. Campbell was identified because of his experience in both extramural funding and student research at predominately undergraduate institutions. Together, Campbell and Falconer developed a plan for the review, which included a self study, a site visit, and the production of a final report.

I was happy to sign on for several reasons. I've known John for years and was confident we could work together. Additionally, I suspected — correctly, as it turned out — that his office would be well-run and his programs productive. UNK is approximately the same size as UWRF and produces a comparable flow of grant proposals (70–80 per year) and external funds ($3.65 million in 2006–2007). I hoped to steal some useful ideas from their procedures. Finally, though I have considerable experience as an external evaluator of grant-funded projects and of higher education programs, I had never evaluated either a grants office or undergraduate research program before, so this was an intriguing opportunity.

Self Study

UNK provides standard guidelines and procedures for academic program reviews. These guidelines were adapted to OSP through simple modifications, mostly in the design of the self study. The purpose of the self study was to give data and procedural information to the review team for their assessment, as well as to prepare them for interviews during the site visit.

The first two sections of the self study template — Mission and Resources — needed little change. Those sections simply document the purpose, planning process, budget, space, equipment, and personnel for the department. However, the third section of the self study template focused on Effectiveness, which was largely comprised of information about academic accreditation and student achievement. For the OSP administrative review, those indicators were replaced with descriptions of services offered and application and award data. The self study also included comparative information from our peer group institutions, linked the OSP mission to campus and university system mission documents, and identified areas within sponsored programs that were of particular concern to staff. The document was prepared over a period of two months (allowing for internal reviewers) but took about 10 hours of actual writing time.

UNK's self study was very complete. It included 18 pages of narrative plus appended charts, tables, and previous reports. John also listed the members of the Review Team, which I was to chair. Other team members included three faculty and one assistant dean representing the four colleges. Two of the faculty had extensive grant experience in the lab and social sciences. The third was a junior faculty member with little grant experience. (As it turned out, his relative naïveté
was an asset. He could ask the obvious questions that the more experienced members of the team didn’t think of; the answers to those questions were frequently the most revealing.) We set a date in early February for my site visit and agreed on the sorts of individuals we would interview.

Site Visit

I flew to Kearney on a Sunday afternoon, and we began work with a very congenial dinner on campus with the review team, the dean of graduate studies and research, and the associate vice chancellor for academic affairs. Following dinner, the team agreed on general strategies and procedures and began to get a feel for our common purpose and individual strengths.

The review team selected interview participants according to several factors. The first selection criterion focused on the need to involve people from each of the four colleges on the UNK campus. To do that, OSP staff composed a list of faculty with direct experience in extramural funding at UNK. The team shared the list with an upper administrator who made some additional suggestions. The listed individuals were invited to participate in interviews, as was staff with similar grant experience. Next, the review team met with the academic deans. Finally, because of the student research component of the OSP portfolio, the review team also asked to meet with several students.

The team interviewed faculty, administrators, and students during Monday morning and afternoon. The students were charming, of course, and were very open and straightforward in telling us about UNK’s Summer Research Program. Faculty were considerably more guarded. Who wants outsiders or insiders taking a critical look at their work? The members of the review team were quite successful in easing their colleagues’ concerns and eliciting the strengths and weaknesses of UNK’s grants office, and undergraduate research programs.

The toughest interviews were with administrators. All were supportive of the grants endeavor in a general way, but only the immediate supervisors of the Office of Sponsored Programs expressed either enthusiasm for sponsored programs or deep understanding of how the office works. One dean seemed distanced from the research interests of his faculty and expressed little interest in assisting them.

The self study was invaluable in preparing the team for these interviews. Absent the voluminous data John provided in advance, I would have had no idea of the institution’s history and culture. The other members of the team would have had little idea of the grants and undergraduate research activities in other departments or colleges of the university. But, armed with all that data, we were able to ask probing — though always gentle and respectful — questions in our interviews.

Late on Monday afternoon, the team met to review our impressions and agree on findings. On Monday night, I drafted some tentative recommendations which the team reviewed, edited, and approved early on Tuesday morning.

Following preparation of the draft summary, the review team debriefed Falconer to make him aware of the major findings. From the OSP perspective, this was an important opportunity to interact with the review team. In a couple of areas, the review team was interested in issues where they had incomplete information (from the self study or interviews), so Falconer was able to provide more background. In
other areas, the debriefing provided a low-pressure and interactive setting for identifying concerns. This was important preparation for the subsequent exit interview with UNK’s senior vice chancellor, associate vice chancellor, and dean of graduate studies and research.

In the exit interview, the team reported that the Office of Sponsored Programs was providing excellent service, but that it worked in something of a vacuum. Our diagnosis was that the campus is still in transition from a college to a university and that faculty and administrators vary widely in their vision of the institution’s mission and how they fit into it. We recommended that administration articulate the mission and goals of the Office of Sponsored Programs and publicize that mission and the services the office provides throughout the university. Some responses were enthusiastic; others were stoic. In retrospect, I take their response as a sign that our diagnosis was correct.

The review team disbanded at noon on Tuesday, and I flew home. Over the next week, I drafted a report summarizing our review and addressing each category of the self-study. We expressed our overall concern regarding the institution’s knowledge of and commitment to the mission of OSP and listed five specific recommendations for the office itself. The members of the team reviewed and edited the report. In short order, we agreed on a final version, which I submitted to John for distribution across campus.

Conclusion

The ultimate outcomes of the administrative program review are unknown as of this writing, but some things are clear. First, the final report provided an independent assessment of OSP operations, documenting strengths as well as areas in need of improvement. The university administration is aware of the review team findings, and may, over time, use the information to institute change. Second, establishing data on resources, processes, and outcomes will provide useful benchmarks for the future. Third, the review team offered very relevant suggestions that have been implemented by OSP, independent of broader campus change. These include more organized outreach efforts to new faculty, more relevant goal setting for OSP (in collaboration with academic deans), and better proposal writing services.

From my perspective, this was an extremely satisfying assignment. The self study was comprehensive and accurate. The review team quickly reached a critical level of trust and common understanding. Our interviews were interesting and revealing, and helped us reach conclusions about the institution and the Office of Sponsored Programs that were both sound and — in my view, at least — important. Our recommendations were received well by John and OSP staff, and at least politely by senior administration. I look forward to learning the long-term impact of our review, but John assures me that the short-term impact has been positive.
A Peer Review Reviewed: Anticipation, Expectations and Results
Joyce Freedman, Consultant; Randolph Hall, Sara Judd, Jeri Muniz, University of Southern California; and Kerry Peluso, Emory University

Over a decade ago, the NCURA organization conceived of the idea that NCURA could provide a valuable service to the community of research institutions by offering peer reviews. It took years of effort and lots of hard work for NCURA to launch this service.

This article will examine the NCURA Peer Review Program and detail the experience of a review conducted at the University of Southern California (USC).

Peer Review – Defined and Examined
Peer reviews are commonplace in the world of academia; the funding agencies perform peer reviews to determine which proposals will be funded and which not; scientific and academic journals conduct peer reviews of articles that are to be published; and academic departments consult outside peer reviewers to assess graduate and undergraduate programs.

What exactly is a peer review and why are they performed? A peer review is an outside evaluation of work or performance by people in the same field in order to maintain or enhance the quality of the work or performance in that field. The word “peer” is often defined as a person of equal standing in the same profession who are of the same or higher ranking.

Peer reviews are based on the concept that a diverse group of people, not directly connected with the work being reviewed, will be able to make an impartial evaluation. Thus most peer reviews will utilize an independent group of reviewers in order to discourage favoritism and obtain an unbiased evaluation. Typically, the reviewers are not selected from among the close colleagues, relatives, or friends and potential reviewers are required to disclose any conflicts of interest.

So how does the NCURA Peer Review Program work and what makes it so special?

The Peer Reviewers – Selection Process
NCURA’s Board appointed Peer Review Selection Committee is responsible for reviewing applications for potential peer reviewers and making recommendations to the NCURA Board for appointments of new Peer Reviewers. The requirements for an application to the peer review program include a minimum of ten years experience in the field of research administration with a history of demonstrated expertise and leadership in the field. Applicants also need to provide several references for consideration. Most Peer Reviewers have significantly longer than the required ten years of experience. Applications are carefully reviewed to ensure the highest quality of reviewers possible.

1 This article is reprinted from the NCURA Magazine, August 2011, Volume XLIII, No. 11, published by the National Council of University Research Administrators. It is used with permission of the publisher.
Once selected, Peer Reviewers are provided with training on the NCURA Peer Review process. A Team Lead is provided for all reviews. The Lead assists the reviewers with understanding the process, answers questions and provides guidance. Feedback regarding each of the reviewers is obtained for each review from the participating institution as well as the other reviewers on the team to ensure a consistently high quality level of review.

The NCURA Standards

Each peer review is conducted in alignment with the NCURA Peer Review standards. Careful consideration was given in the development of these Standards. They were developed to emphasize the key areas important to a comprehensive research administration program. The Effective Management Practices for managing externally funded research programs developed by the Council for Governmental Relations (COGR) was used as a foundation for the development of the NCURA Standards. The detailed standards cover concerns within the following topical areas:

- Organizational Structure Staffing and Resources Communication and Outreach Education
- Compliance Risk Assessment
- Electronic Research Administration
- Collection and Dissemination of Funding Information
- Proposal Development and Assistance Proposal Review and Submission Collaborative Project Development Agency Liaison
- Award Acceptance and Initiation
- Ancillary Agreements Associated with Research Grants and Agreements
- Subawards Award Acceptance Process Award Activation and Notification Award Management Research Ethics

The Pre-Visit Planning Process

An institution with an interest in having an NCURA Peer Review conducted should contact NCURA’s Peer Review Program Coordinator, Peggy Lowry, for further information on the process including the cost estimate. The cost varies by size of the institution, as larger institutions generally require additional reviewers and time. Once the institution decides to move forward with the review, Peggy Lowry will work closely with the institution to determine which peer reviewers would be the best match for the institution. The reviews are scheduled according to the institution’s needs and availability.

Once the reviewers are identified and the review is scheduled, the institution is presented with a list of documentation that needs to be provided in advance to the reviewers. This is referred to as the “Briefing Book”. Along with the Briefing Book, the institution also provides a “charge letter”, outlining their expectations for the review. While all peer reviews follow a similar pattern, the institution is given the opportunity to outline the areas that they feel should be given emphasis during the
site visit. Peggy Lowry assists the institution in planning who should be included in the interviews that will be conducted as part of the review. The reviewers will conduct an extensive review of this documentation provided prior to a pre-visit phone conference with representatives from the institution. This previsit phone conference is generally scheduled approximately two weeks prior to the site visit. During the phone call, the schedule and charge letter are discussed as well as any questions regarding the documentation. This call gives everyone an opportunity to discuss the plans for the site visit and address any questions or concerns regarding the review.

As a result of this pre-visit planning process, NCURA Peer Reviewers begin the review with an established foundation of knowledge regarding how research administration works at the institution.

The Site Visit and Assessment — Here Comes the NCURA Review Team

With the institution’s charge letter and the briefing book in hand, the next step is the site visit. Although, all parties have already put a tremendous amount of work into the preparing for the review, the site visit is the most telling part of the entire process. It is at the site visit that the review team can really get a sense of the dynamics of the institution. The site visit is normally scheduled for two to three days depending upon the size and needs of the institution and is conducted by two to four trained NCURA peer reviewers. Site visits normally start with an entrance meeting and end with an exit meeting, at which time the Review Team presents high-level observations.

What are the real areas of concern for the institution as well as what seems to work for the campus and what doesn’t all come out during the site visit. The most productive reviews usually include the senior leadership. Their support and active participation demonstrates that the institution is dedicated to the review process and committed to process improvement.

Because each review is unique and adapted to the needs of the institutions, site visits will differ from institution to institution. However, what makes the NCURA Peer Reviews so special is that every review is based on the same set of standards, so that each college, university, research institution, hospital, not-for-profit, etc. are reviewed under the same criteria. NCURA, not the institution, has established the standards. The institution determines who will participate, where it will occur and when it will happen.

The NCURA Peer Review Team conducts interviews scheduled from the break of day to the setting sun and spends its evenings occupied with writing up individual observations of the day and executive sessions where the team can discuss progress and determine what high-level observations might be included in the exit interview.

The Report

The real work for the Review Team begins upon returning home. Having pre-assigned standards to conquer, each reviewer now starts to pull together all the information gathered from the briefing book, the institution’s websites, the interviews and site visit sessions. Through this process, the final document starts to come
together in one cohesive report.

The report goes through a great number of iterations from rough outline to finished and polished document. The draft materials are sent back and forth from the individual reviewers to the team lead and to NCURA’s Peer Review Coordinator who consolidates the report and edits as well as evaluates the hard questions and formats the report. Strict deadlines are set for each step of the process. From the day the reviewers return home, the clock is ticking. A final draft report is submitted to the institution for their comments within six weeks following the visit. After receipt of any comments from the institution, and incorporating any revisions a final report is submitted to the institution.

The hope of every Review Team is that the process is received well and that recommendations are embraced and implemented. The experience at the University of Southern California (USC) was as good as a peer review could get. To this day, a year after the final report was submitted, USC is working on implementing most of the recommendations. How nice is that!

The Institutional View

University sponsored projects administration offices across the nation face similar challenges: limited resources, negative customer service perceptions, and staff turnover. Like many institutions, USC’s Department of Contracts and Grants (DCG) has long been the focus of faculty frustration with the level of customer service.

In an effort to address these concerns, DCG initiated a three-pronged review – an IT needs assessment, an internal process review and assessment, and a NCURA Peer Review. The NCURA Peer Review has proven to effect a significant change at USC, largely due to being:

◆ A 360-degree evaluation of the USC research enterprise, both central and departmental, along with their interactions. A 360-degree review identifies the problematic issues throughout the complex support network of the institution, thereby providing a balanced, comprehensive assessment.

◆ A review conducted by experts in research administration. A team is assembled that represents expertise throughout the full spectrum of the research administration services. Expertise of this scope and depth provides the foundational knowledge and experience to quickly and effectively identify the challenges that exist within the institution via the interview process, gain an in-depth understanding of those challenges and subsequently develop appropriate recommendations.

◆ An assessment conducted by external reviewers. An external review provides a balanced, unbiased review and associated recommendations.

In preparation for the site visit, significant organizational information was provided to the NCURA Peer Review Team. Interviews were arranged with key personnel from central offices involved in the research administration process, as well as the faculty and administrative leadership in the major schools and departments. Group and individual meetings were arranged with central DCG staff members at each cam-
pus. All of these activities provided context for the reviewers, but more importantly, allowed USC’s research enterprise to come together and personally participate in the review. Participation in the review process facilitated the very collaboration USC needed to implement the recommendations of the Peer Review Team.

Recommendations, provided to senior leadership within 60 days of the review, substantiated many of the issues previously identified in both central and departmental areas; however, the external confirmation provided the needed support and the associated financial resources to move forward with the establishment and implementation of a prioritized action plan to address the institutional issues at every level. USC leadership took the NCURA recommendations and developed an action item matrix and associated timeline for completion, including these results:

◆ Change in the reporting structure of DCG, so that it now reports to the VP of Research.
◆ Initiation of development for a “cradle to grave” software system for research administration.
◆ Formation of a research administration task force, chaired by the Executive Director of DCG, to resolve coordination issues across units of the university.
◆ Redesign of the DCG website to focus on “how to” information for investigators.

A first order of business was to draft an institutional “roles and responsibilities” document to clearly delineate key processes and the associated responsible party for each. Through this process, USC realigned responsibilities to eliminate duplication of tasks, and to ensure that each task was performed by the unit that is best able to do the job. Senior leadership also drafted and distributed to faculty and staff a document entitled “USC’s Partnership for Sponsored Research and Other Scholarly Activities,” which has been a major step in establishing expectations of faculty and departmental units as well as demonstrating support of the central research administration activities. DCG is also in the process of initiating a new proposal review service, coupled with a “service promise” tied to investigators submitting their proposals on time.

DCG established several internal working groups to solicit feedback from DCG staff and to more directly engage them and to expand avenues of communication and collaboration. DCG has established regular meetings with other central offices to work together on process improvement initiatives for those processes that cross departments.

The NCURA Peer Review has had a significant impact on research administration at USC. Most importantly, DCG utilized the results of the Peer Review to actively engage USC stakeholders in the change process, thereby engendering from participants a feeling of valued participation, buyin and accountability in the outcomes. DCG has successfully facilitated the proactive and vital collaboration of central offices, such as DCG, Sponsored Projects Accounting and Purchasing, as well as created close working partnerships with Schools and departmental staff. We are confident that this more unified and comprehensive approach to addressing common issues will result in creating enhanced, more efficient institutional support for the research enterprise at USC.
While it is impossible to achieve perfection in any research administration organization, DCG has performed exceptionally well in the year since these changes were enacted, with more compliments than complaints, only moderate turnover, and vastly improved services.

**About the Authors**

**Joyce Freedman** is currently a consultant in higher education. Retired from UCSF where she was the Assistant Vice President for Research. She also served in that capacity at UC Berkeley and was the Assistant Vice President for Research at The University of Chicago. She has been a member of NCURA for over 20 years, served as chair of the western region; and elected to the Board of Directors and the Executive Committee; co-editor of the Newsletter for Biomedical topics; co-program chair for a summer conference; faculty on a national video conference and a webinar; speaker at regional and national NCURA meetings. Joyce is currently a peer reviewer for the NCURA Peer Review Program.

**Randolph Hall** is Vice President of Research and Professor of Industrial and Systems Engineering at the University of Southern California. He also chairs the Executive Leadership Group for Research for the Association for Academic Health Centers, and will publish the Handbook of Healthcare System Scheduling for Springer later this year.

**Sara Judd** is the Director for the Department of Contracts and Grants at the University of Southern California (USC), overseeing the professional staff responsible for the pre-and post-award non-financial administration activities for sponsored research, training and other activities supporting an institutional annual award volume of approximately $561M. As an active member of the Federal Demonstration Partnership (FDP), Sara currently serves as Co-Chair of the Subaward Committee and is a member of the American Recovery and Reinvestment Act (ARRA) Subcommittee. Sara is an active member of both the the National Council of Research Administrators (NCURA) and is a frequent presenter at regional and national meetings in the areas of negotiation, staff training and development, ARRA and FFATA.

**Jeri Muniz** is the Executive Director for the Department of Contracts and Grants at the University of Southern California. As Executive Director, she is responsible for the overall management and administration of preand post-award non-financial services related to extramural proposals and awards. Jeri is an active member of the National Council of University Research Administrators (NCURA) and is currently Chair for Region VI (Western Region). Jeri is frequent presenter on such topics as subrecipient monitoring, working with industry, and strategies for successful negotiations.

**Kerry Peluso** is Associate Vice President for Research Administration at Emory University and has over 22 years experience in research administration. She currently serves as an NCURA Peer Reviewer.
Learning Your ABCs: Adaptability, Balance and Culture

Peggy S. Lowry, NCURA Peer Review Program

Developing and maintaining your research administration operation is not unlike a child learning their ABCs. In both there are some “basics” that must be mastered and put in place. Then, there is the need to make continual adjustments to achieve the right outcome, a constant striving for stability amongst numerous expectations and new concepts, and a growing awareness for putting the pieces into a larger context.

And sometimes, just when you think that you have mastered your ABCs, you find others are speaking a new language and the cycle of learning and change begins again.

The cycle of change is inevitable and managing and incorporating change into our operations is an ongoing activity. Our challenge in research administration is how to step back from the day-to-day operation and objectively assess where change is needed.

There are numerous assessment techniques of processes or programs that can assist operations in identifying where change is needed. Techniques can be clustered around: self-assessment, constituent assessment of services, audits, and external assessments. Each cluster has multiple approaches and each contains some advantages and disadvantages.

This article will focus on some of the observations made from the reviews of sponsored program offices conducted during the last three years through the NCURA Peer Review Program, which falls within the cluster of external assessment of processes or programs. This particular assessment technique utilizes external experienced research administrators to perform an evaluation of the effectiveness of sponsored program administration. The observations made from the peer reviews represent three broad characteristics of effective operations: Adaptability, Balance, and Culture. These characteristics illustrate the range of struggles that sponsored programs confront in order to maintain effective operations.

Adaptability

The first broad characteristic evidenced through the NCURA peer reviews centers on adaptability. The effective sponsored program operation adjusts and changes in response to the rapidly occurring shifts that have surfaced in the last several decades. The dramatic increase in complexity of relationships, external oversight, and technology requires operations to be flexible in terms of maintaining operations while incorporating new requirements, regulations, and technology.

However, as seen in the majority of the NCURA peer reviews, flexibility and adaptability have been severely hampered by the lack of institutional resources pro-

---

vided to research administration operations. Although research administrators have broadly recognized the increasing inability of resources to sustain operational needs and the accelerating high-pressure environment resulting in part from stressed infrastructure, it is an interesting phenomena to identify staffing and other resource investments to be so far behind many other institutional operational arenas. This result may reflect the historical adaptability and creativity of research administrators to manage and audit high risk areas to the point that resource needs do not have the same appearance of urgency as the needs of other institutional missions.

A few indicators identified through the review of operations that illustrate the inability to effectively support sponsored program administration include:

- not filling open positions, even when proposal and award volumes remain strong or have been increasing
- not providing “additional” resources when warranted, even though management complexities are increasing and even in the midst of significantly increased and sustained volume
- utilizing manual and time-consuming processes rather than investment in technology
- moving critical sponsored program functions outward to college, school, department or PIs, as a measure to conserve resources, without corresponding training
- lack of clear involvement from senior leadership in carrying the sponsored program message and expectations to the faculty

For many institutions, the peer review process provides a way of highlighting to senior leadership how resource constraints create risk, demoralize staff, and ultimately create impediments to faculty successes in extramural funding.

**Balance**

The second broad characteristic identified through the peer review process relates to balance. Effective operations are able to maintain their focus on facilitating research in an environment of shifting funding, sponsor requirements, and institutional priorities. Increases in research funding, especially rapid growth, tends to highlight the need for coordination of many specialized areas within the institution. Two are highlighted below:

a) As proposal volume and research funding increases at institutions, many operations begin to evolve into areas of specialization for staff. Beyond the traditional preand post-award specialization, operations begin to focus staff in specific areas such as funding information support, proposal development, contracting, or export controls or to expand their partnerships with college-level staff support. Often the needs of the faculty and priorities for the institution determine some direction, such as a priority for increasing funding may drive a need for more specialization in funding information support. Or faculty needs in contracting may suggest more attention and expertise in contracting and
negotiation skills.

b) As research funding increases, often a parallel need arises to better integrate the many business and functional silos within the organization or operation to be more responsive to researchers needs. Management of the additional requirements associated with external funding, and in particular Federal funding, often requires engagement of many institutional offices. These offices may be unaccustomed to dealing with such administrative requirements or the unique needs of managing “research.” Some examples include human resources, purchasing, or travel.

Many of the peer reviews suggest that growth in funding and the resulting increased research needs creates an imbalance between specialized institutional functions. Often, institutions struggle to balance fragmentation in two significant areas: a) adding specialization of sponsored programs expertise that is increasingly needed and inherent with a growing research enterprise and b) working across organizational silos within the organization. Adding or building specialization within the sponsored program operation results in more “moving parts” that require coordination and greater attention to communication. Business silos that are independently effective, now need to address the time-sensitive demands that come with research funding and become more nimble in moving through their review and approval processes (such as hiring personnel for externally funded projects).

A few indicators identified through the peer review of operations that illustrate fragmentation include:

◆ faculty complaints over delays in business functions, such as hiring personnel or purchasing goods or equipment on grants or contracts
◆ faculty complaints over delays in processing research-related agreements
◆ disconnects in research administration process between department or college and central staff, evidenced through complaints and confusion voiced by everybody
◆ lack of mechanisms for sponsored program operations to “hear” the faculty “voice” and use that as an indicator of changing or emerging needs
◆ scarce or no communication between offices or people, even when located in close proximity
◆ meetings of office or operations leadership at the top, but no commensurate meetings of operational staffs

The peer review process allows the external “expert” the opportunity to illustrate areas of imbalance and to help the institution or the program identify where fragmentation needs attention.

Culture
The third broad characteristic found in effective operations is understanding the multiple cultures within which sponsored programs operate. Every institution has a number of cultures, each with a unique set of expectations, needs, and priorities.
Three key stakeholder cultures include the faculty, the senior institutional leadership, and the sponsored programs administration.

Faculty Culture
The faculty drives research successes. They balance their investment in writing proposals and conducting their research activities with teaching, student advising, laboratory management, publication, service commitments to the institution, professional engagements, and other activities as they are called upon by the institution or their profession. The faculty responds to the priorities set by their academic leadership. Faculty work as best they can within the sponsored program policies and procedures; although their entrepreneurial outlook often predisposes them to be creative when interpreting and following policy.

Senior Institutional Leadership Culture
The senior institutional leadership establishes expectations related to research, the research agenda, and the message to the internal and external communities concerning research discovery. They balance research with academic and other institutional priorities and budget needs. They must be responsive to faculty issues brought forward. They must look broadly at institutional needs—across student, faculty, business and administrative arenas and balance needs with operating budgets and future directions.

Sponsored Programs Administration Culture
Sponsored program operations supports faculty in their pursuit of external funding. Their policies and procedures reflect good stewardship and accountability of sponsor support and awareness of state and federal rules and regulations. The sponsored programs staff is responsive to institutional priorities and directions established by senior leadership. They are responsive to the needs of the funding agencies. They fix problems. They meet deadlines. They enforce policy. They work in a constant pressure-driven environment.

All of these cultures intersect when the institution embraces external funding and even more so when there are institutional priorities to grow the research enterprise. Not surprisingly, as new and increased pressures have come to each of these stakeholder groups, the different cultures’ expectations, needs, and priorities are not always well understood by each other. At many institutions, the peer review process suggests that these cultures are clashing to the point that there is widespread distrust, increased risk, and at times loss of funding.

A few indicators identified through the peer review of operations that illustrate when there is disharmony between cultures include:

◆ faculty choosing to run awards through collaborators or affiliated entities rather than their prime institution, or stopping their efforts toward identifying new external funding altogether
◆ central research administrative staff not understanding, or wanting to acknowledge, the range of pressures and commitments confronting faculty
- faculty that have little understanding or interest in understanding institutional fiscal realities
- expectations that sponsored programs is the primary driver of increased funding
- assumptions that faculty and senior institutional leadership are as well connected and well versed in the details of research administration (sponsor policies and requirements) as they are in their other professional responsibilities
- central sponsored programs leadership and staff who conduct all assistance via e-mail with little recognition of the value of live, personal contact with faculty and their peers in other institutional offices

The peer review often initiates the process of bringing these different perspectives to the table. This process often engages stakeholders in a form of communication that highlights the shared goals of all stakeholder groups and acknowledges where the cultures need to be better merged.

**The Language of Effective Operations**

There are many characteristics that reflect effective sponsored program operations. The three broad characteristics highlighted in this article in some ways represent the highly pressurized environment that confronts our faculty, our institution, and our operations and the challenges to maintain effectiveness throughout the change process.

The common theme found in each of the three areas—adaptability, balance, culture—is that there is a partnership within each institution that supports and nurtures the research enterprise. The care and feeding of that partnership requires attention at both an operational and a leadership level as well as a form of communication that enables the partners to understand and contribute to addressing fractures and strengthening the shared goals between them.

As stated at the outset, the challenge in research administration is how to step back from the day-to-day operation and objectively assess where change is needed. Much like learning our ABCs, each operation needs to identify the “language” of its own environment. Incorporating a set of techniques that will help us monitor when the language is changing will allow us to shift with these changes and continue to do what research administrators do best: provide responsible service and support to our faculty, our institutions, and our sponsors.

**About the Author**

**Peggy S. Lowry** serves as Program Coordinator for the NCURA Peer Review Program. She has a 38-year career in research administration, spanning research and predominantly undergraduate universities. Her responsibilities included oversight for pre-award and non-financial research compliance. Peggy has given over 200 national, regional and local presentations and workshops and served on numerous national NCURA committees and twice served on their Board of Directors.
3920.4 Research Administration Metrics: Making Your Numbers Tell the Right Story
Martin Smith, George Washington University, and Andres Chan, University of Southern California

Numbers alone have little to no meaning unless they are evaluated in a proper context. Does 4% mean more or less than 87%? If the context is change in F&A cost recovery and 4% represents an overall increase and 87% represents a decline in awards with no F&A recovery, then they are both meaningful in a positive way. The number $0.00 could mean something negative if it represents a zero dollar growth in research, but could mean something more significant if it represents a variance between a research dollar goal and actual research dollars brought in. Numbers are objective in that they have a finite value; however, when or how we assign a context to those numbers may place more subjectivity on their relevance.

We want to introduce you to how we stumbled on how a statistical revolution in professional baseball called Sabermetrics, which is generally defined as “the search for objective knowledge about baseball” and “the mathematical and statistical analysis of baseball.” What does this mean? Very simply put, it means numbers of home runs or strikeouts alone do not determine whether your favorite star player is better or worse than my star player. To illustrate will require us to digress from research administration just a little to share a story we hope many of you can relate to.

We worked together at a consulting firm and when traveling to the home office outside of Chicago, we would often meet up for dinner and talk about something other than research administration—but of course, not for long. Martin is from Philadelphia, Pennsylvania—home of the Philadelphia Phillies and Andres is from Los Angeles, California—home of the Los Angeles Dodgers. Both teams are not natural rivals being on separate coasts in different divisions. However, the summer of 2008 was a good baseball year for both the Phillies and Dodgers. That year, Andres’ Dodgers acquired Manny Ramirez, a future Hall of Famer with great statistics, while Martin’s Phillies acquired Matt Stairs, somewhat of a journeyman player at the end of his career with far less stellar statistics. It turned out that the celebrated acquisition of Ramirez helped the Dodgers make the playoffs. However, the Phillies also made the playoffs and with the help of Stairs in a key playoff game against the Dodgers propelled the Phillies to an unlikely win en route to the World Series.

During that series, the Phillies’ Stairs had only 1 at bat, where he hit a homerun.

---

1 This article is reprinted from the NCURA Magazine, May/June 2011, Volume XLIII, No. 3. It is used with permission of the publisher.
3 Chen, Albert, Stairs’ home run moves Phillies within a victory of World Series, Sports Illustrated, October 14, 2008, found online at http://sportsillustrated.cnn.com/2008/writers/albert_chen/10/14/phillies.dodgers.game4/
that drove in 2 runs. Meanwhile, Ramirez had 15 at bats, with 7 hits, 2 home runs, scored 4 runs, and batted in 7 runs. Who had the better series? From a numbers standpoint, it was the Dodger’s Ramirez. Using the more objective Sabermetrics criteria, it was the Phillies’ Stairs with his sole at bat in one game during the series that made a more significant impact.

How does this relate to research administration? Well if your institution recruits a renowned, well-funded faculty member will this mean your research base will be more fruitful than had it recruited 3 junior faculty members in promising areas of science? How about from a compliance standpoint; would a cost transfer performed 12 days after the original transaction occurred be more compliant than a cost transfer performed 89 days after the original transaction occurred? What if the 12-day cost transfer happened 45 days after the award ended, which would have meant the original transaction also posted after the award ended.

The purpose of this article will help you think about using Sabermetrics techniques to analyze different types of research administration metrics for more objective and subsequently meaningful results. Using a secondary variance analysis will be a key component to achieving more meaningful analysis from those metrics.

**Performance Metrics**

A common question asked this time of year as institutions that close on June 30th are completing performance reviews, self-assessments, and analyzing whether goals were met will ask “how did we do?” This is a simple yet oftentimes difficult question to answer. If you work in a Post-Award office, you know you submitted numerous invoices, drew-down from letters of credit, processed more cost transfers than you would have preferred, and engaged in countless debates that usually begin with “well, it depends...” but still struggle with what are good performance metrics?

Performance metrics should be captured to identify areas of concern to build improvement in those areas. For example, if your accounts receivables are aging well over 180 days then your institution may be interested in creating performance metrics to manage its way into improved accounts receivable numbers. Creating a simple schedule (see Figure 3920.4-1) to breakdown the A/R portfolio could provide some meaningful, objective information to start analyzing why the collections are taking so long for cash to come in.

In this example, the Average Days Outstanding metric is only 55 days where $3.5M of the $31M portfolio is outstanding. The outstanding amount represents 11.29% of the portfolio ($3.5M / $31M). The anomaly in this case that is driving the higher Average Days Outstanding metric seems to be related to State and Local Government sponsors.

---

4 Matt Stairs’ career playoff statistics found online at http://www.baseball-reference.com/players/s/stairma01.shtml
5 Manny Ramirez’s career playoff statistics found online at http://www.baseball-reference.com/players/r/ramirma02.shtml
Another metric to use for a Secondary Variance Analysis would be Days Variance from Mean. This is the variance between the Average Days Outstanding for each sponsor type (Figure 3920.4-1, last column) compared to the weighted Average Days Outstanding for the entire portfolio (55 days). This secondary variance analysis will tell you a different story to help you fine-tune your analysis.

In this second case, your federal sponsors are paying you 30 days better than average, with industry sponsors coming in next at 13 days better than the average for your portfolio. Management could respond by focusing collection efforts on the state and local government sponsors and foundation sponsors to improve the overall metrics. This analysis, with subsequent prescribed actions to improve collections, may translate into an improved cash position for your institution.

Performance metrics could be used for anything ranging from award set-ups, to closeouts, to analyzing number of transactions processed. Adding a secondary variance analysis, similar to the last column in Figure 3920.4-1, will enhance the analysis. Also, preparing this type of table for a series of periods (e.g. months in a fiscal year, or fiscal year over fiscal year) will add a trend dimension where improvement can be tracked over time. If the numbers spike up in one fiscal year, that could have corresponded with a system enhancement or some other major obstacle that delayed invoicing and skewed the numbers. Be sure to bring in outside factors when analyzing the metrics so your results tell a proper story.

**Compliance Metrics**

Mitigating financial compliance risks is simple to do when transactions are analyzed using proper metrics, including a secondary variance analysis. Any auditor can tell you there are numerous ways to find financial transactions that stick out so much that you should be able to catch them before your auditors do. Approaches range from analyzing spending patterns on different types of awards to looking at content-specific metrics for effort reporting, cost transfers, and direct-charging of administrative costs.

Typical award spending may look like the graph in Figure 3920.4-2, where expenditures are slow to start as new staff come on board and project work then increases as the project ramps up. However, if award spending occurs so late into the project this may be a red flag that is indicative of other project risks (see Figure 3920.4-2).

---

**Figure 3920.4-1: Sample Performance Metrics to Analyze Accounts Receivable:**

</tbody>
</table>
3920.4-3). Plotting these trends is very simple to do using award expenditure data by high-level object code categories. A program such as Microsoft Excel will allow you to create charts with ease. Similar to the discussion earlier, be sure to choose multiple periods of time (e.g. fiscal months) to ensure reliable trending data.

Some other tips and tricks to use when analyzing spending patterns include:
1. Prepare Common-Size Statements by representing each MTDC or TDC Category as a percentage of TDC; compare variances between different awards
2. Exclude unique awards that will skew data (training grants, equipment grants, and multi-site cooperative agreements)
3. Perform analysis by sponsor types and group by award types for similar awards to compare to one another
4. Never jump to conclusions—find the trends and ask the question of the PI and/or Department Administrator to learn the story behind the trend

Another good financial compliance area to deploy objective metrics would be with evaluating cost transfers. As we mentioned earlier, there appears to be a focus on the timeliness of the cost transfer (i.e. within 90-days); however, competing circumstances may be ignored. Consider whether other underlying circumstances are driving the reason for the cost transfer.
Questions to ask include:

1. Was the award being charged set-up late?
2. Should a pre-award spending account have been established?
3. Is the award that will be debited ending soon?
4. Was the transaction initially denied, charged to another award, and now coming back for a second chance via cost transfer?
5. Is the award that will be credited overspent?

Assume your institution defines cost transfer discovery-date as the month-end date from when a transaction occurs. Using timeliness criteria alone may make many institutions more comfortable to approve cost transfers when occur within 90 days of month-end of the original charge. Using data presented in Figure 3920.4-4, this would mean transactions #1, 2, 4 & 5 would be acceptable and transactions #3 & 6 would be risky. Bringing in a secondary variance for criteria such as Days from Award End-Date provides another dimension where transactions #1 and 4 would be just as risky as those where the timeliness standard was used alone.

There are other criteria that could be pulled into your metrics to tell different stories. For example, adding a column to know whether the principal investigator (PI) approved the original transaction would be helpful to establish how allocability of the original charge was determined. The best part about constructing objective metrics and associated secondary variances is that there are multiple approaches without a wrong way to do it.

Looking at direct charging of salaries is another area where we can use these types of analyses. Normally one would focus their activities to job titles containing the more common administrative functions. Those with keywords of administration, administrator, clerical, admin staff, etc. While those job titles should be included in your routine analysis there are others that may need a closer look-at. While job titles vary by institution, look for those where you believe additional review may be needed.

In Figure 3920.4-5 for instance, there is a series of “Program” title codes. While most of the salaries for these job titles are paid by non-sponsored funds, additional
focus should be made to the individuals being paid from sponsored funds. Depending on how many individuals fall into that category, you may choose to sample all or some transaction, and conduct interviews with the staff to determine their actual duties. You may discover the individuals who are paid from sponsored funds are actually performing administrative duties such as proposal preparation, grant management and other administrative functions. If these employees are paid 100% by sponsored funds and the accounts do not meet the criteria of a “Major Project” then you may have a compliance risk.

**Figure 3920.4-5: Sample of Job Codes and Salary Distribution of Sponsored/Non-Sponsored Funds**

</table>

**Conclusion**

Whichever approach your institution takes to performance metrics—be sure to analyze whether your numbers are telling the right story. This can be accomplished through a variety of approaches including using more objective criteria, considering other circumstances, or calculating a secondary variance. Remember the numbers only tell enough of a story to send you down a better path to ask the right questions in order to resolve performance issues or mitigate financial compliance risks. Diligence in the follow-up actions to those metrics will yield the best results.

**About the Authors**

**Martin Smith** recently joined The George Washington University as the Associate Director for Strategy and Compliance, in the Office of Grant and Contract Accounting Services. Martin earned an M.B.A. in Finance from La Salle University, and a B.B.A. in Accounting from Temple University. Martin has 9 years of research administration experience working directly for higher education institutions in financial compliance, finance, and post-award roles; and as a consultant performing compliance risk assessments and effort reporting system implementations.

**Andres Chan** is a Senior Manager at the Office of Financial Analysis at the University of Southern California. He has over 11 years of experience in post award administration with primary focus on Indirect Costs, Space Studies, Recharge Centers and A-21 compliance issues. He has also worked as a consultant for 2 years with MAXI-
MUS where he was responsible for preparing and negotiating F&A proposals along
with numerous costs analyses projects including space surveys, along with compli-
ance and cost reviews of Recharge Centers. Prior to that, he worked for 7 years at
the California Institute of Technology under similar roles.
Benchmarking
Tim Patterson, Zach Belton, and Marisa Zuskar, Huron Consulting Group

Let’s assume you have finished your weekly grocery shopping and are making your way to the front of the store to pay. As you evaluate whether to enter lane #2 or #4, one factor for consideration may be the number of individuals in line ahead of you. Lane #2 may have two people, each with only a few items to purchase, while Lane #4 only has one person, but with an overflowing shopping cart. Which lane do you go to? Don’t look now, but you are benchmarking. You are using available data – the number of customers with items in front of you and your past experience with visiting the store – to make a management decision, i.e., do I go left or right?

Benchmarking is assessing a measurement against a point of reference. It is the process of comparing one’s processes and performance metrics to industry standards or best practices and evaluating the results. Benchmarking can be an internal analysis of your institution or an external review of peer institutions, or both. Internal and external benchmarking have distinct and complementary benefits. Internal benchmarking provides a good method for calibrating performance within the parameters of a common system, while external benchmarking provides insight into how performance may differ from peers.

In the grocery store example, you made a decision about the fastest line based on an internal comparison of the available options at the store. Perhaps you opted for the slower line so that you would have time to mull over a gum purchase or compare your NCAA basketball bracket to the editor’s picks in a popular sports magazine, but at least you had the information necessary to make an informed decision. You might also make an external comparison that another nearby grocery store is typically less crowded overall, which may influence your future shopping choices.

Defining the Performance Metrics
Whether you have identified a targeted area for improvement or sense a general need for improvement, it is beneficial to first map your operational landscape to clearly visualize how processes are related. This will help identify factors that should be improved. For instance, accounts receivable balances may be overly delinquent, but that performance issue may be directly tied to resource allocation issues in another area, such as financial reporting.

To begin, you should create an inventory of key tasks performed by your office and other core responsibilities. In a post-award office, some activities may be based on recurring monthly or annual cycles that adhere to sponsor-driven due dates, like billing, financial reporting, or effort reporting. Other associated tasks that are equally important, but not tied to a specific cycle time, may include providing customer service (help desk support), award set-up, accounts receivable management, expenditure review and approval, budget or overdraft monitoring, etc.

---

This article is reprinted from the *NCURA Magazine*, Volume XLV, No. 2, March / April 2013. It is used with permission of the publisher.
Next, determine what to measure, the reasons for measurement, and the basis for comparison. How will the data be used and how will you establish priorities? Your focus may be based on historic customer service feedback, cost (both dollar value and opportunity costs), risk assessment, audit findings, available resources, etc.

Once you have metrics, you can establish a target goals and service level expectations, which will help promote delivery of consistent and reliable service. This provides a baseline to review past performance, for recurring comparisons with other units, evaluation of key cycle times, and an approach to managing compliance risk.

As an example, if the number of award set-ups were to increase by 25 percent, what would the measurable impact be on the process or the individuals assigned to support the process? Perhaps the influx in award set-up requests uncovers workflow issues that lead to a longer cycle time. Without benchmarking, this may not be uncovered, understood, or worse yet, not proactively managed.

Internal Benchmarking

Internal benchmarking requires making comparisons within your institution, either across similar functions or for a single unit over a period of time. These comparisons can be useful to establish a reasonable norm under existing operations. For instance, you may be able to determine that most departments, on average, process grant approvals within a two-day period. Depending on its reasonableness, this two-day measurement might then set the standard for performance goals and expectations across all departments. In the case of a post-award office, there is no other “like-unit” at your institution. The only valid comparison is a snapshot of the same office from a week, month, or a year ago.

Internal benchmarking is the best way to compare performance across a standard baseline for institutional operations. Comparisons within an institution allow for perspective under a common set of policy constraints, level of centralization, degree of risk tolerance and overall research culture. To understand the baseline, it is helpful to first see the picture without variations.

Another benefit of internal benchmarking is that the metric definition and measurement techniques can be institutionally driven. When examining your own operations, you have the ability to define what metrics should be and how they will be collected. The only limits are the time and resources required to collect the data.

A few common examples of metrics gathered for internal benchmarking purposes are below:

<table>
<thead>
<tr>
<th>Volume and Productivity</th>
</tr>
</thead>
<tbody>
<tr>
<td>◆ Number of proposals</td>
</tr>
<tr>
<td>◆ Number of active awards</td>
</tr>
<tr>
<td>◆ Anticipated billing</td>
</tr>
<tr>
<td>◆ Actual billing</td>
</tr>
</tbody>
</table>
Many institutions are striving for “best practices,” but may not have taken time to define what that means. Some might describe “best practices” as finding the desired balance between operational costs, financial and compliance risk, high quality customer support, and streamlined and efficient work products. Others might focus more heavily on processing time or maximizing resources.

External benchmarking is a structured process of identifying those “best practices” by comparing one organization’s operations and performance metrics to that of other institutions. Whereas, internal benchmarking is useful to better understand relative performance within your current structure, external benchmarking can provide insight on how improved performance is achieved in a differently structured system. Internal benchmarking is the first step to establish your baseline of improvement opportunities; external benchmarking is the calibration step to identify best practice possibilities.

A key point to remember is that what works for one institution may not automatically work for another, but using metrics to compare performance can help to identify the areas where the potential for greatest improvement exists. Benchmarking allows an institution to understand what is attainable.

When making external comparisons, the good news is that many of the core processes of research administration are largely consistent; while responsibilities and workflow may vary slightly, most institutions have processes in place for

- Number of financial reports
- A/R by date range (30, 60, 90, 120, etc)
- A/R by sponsor
- A/R by department or PI

**Cycle Times**
- Average number of days to review and submit a proposal
- Average number of days to issue a subaward
- Average number of days to set up an award in the system
- Average number of days to complete billing/invoicing requirements

**Compliance Considerations**
- Number of financial reports submitted late
- Number of late cost transfers
- Number of late effort reports
proposal submission, award set-up, financial reporting, award closeout, etc. Each of
those processes have the same basic steps. For example, proposal submission almost
always involves reviewing a proposal for RFP requirements, reviewing a budget for
institutional consistency, verifying COI disclosures and routing a proposal for some
level of institutional approval and sign off.

Choose Your Peers Wisely
Choosing the right institutions for comparison is an essential component of external
benchmarking. As a rule, benchmarking should reveal the differences and opportu-
nities in processes not reflect the differences in the type of institution. For instance,
say you wanted to understand what staffing is optimal for a post award office. For
that analysis, an institution with $10 million in annual research awards would not
compare favorably to an institution with $300 million in annual research awards.
The infrastructure needs and varied economies of scale introduce too many differ-
ences to make a fair comparison.

In addition to research volume, a few of the other key factors for consideration
when defining an appropriate peer class include similar research portfolios, schools
or colleges within a university, institution type (public, private, research foundation,
hospital, university), system affiliation, and geographical region. Although it is not
necessary or likely even possible to align all of these factors, the goal should be to
choose the closest comparison. Also consider identifying aspirational peers to find
areas where enhancement opportunities exist, which will help establish manage-
ment goals for your institution.

Obtaining Value from Benchmarks
After you have chosen your metrics, selected your peers and collected the bench-
marking data, it is important to perform additional due diligence. Understanding
the underlying causes for variances in your data is truly the key to discovering best
practices. For example, a peer institution may process contracts in an average of 30
days, whereas your institution might require three months. Before you impose that
standard on your office, you should seek answers to a few follow-up questions,
such as:
1. Are the start and end points of the peer metric consistent with my metric?
2. Does this peer require fewer approval steps in its review?
3. How many contract administrators does the peer’s office employ?

   Based on the answers to these questions, the required action could be as simple
   as adjusting your benchmarking metrics or as complex as realigning your resources
   and processes. Benchmarking data raises the question, but should only be the start-
ing point for discussion.

Get Into the Game
Internal and external benchmarking, by way of cross-unit comparisons, reviewing
against historic averages, and evaluating performance against peers, helps to insure
institutions are well equipped to set attainable performance goals and proactively
manage portfolios and make important management decisions to attain these goals. Rather than guess or hope, institutions are able to use fact based data and metrics to set goals, establish service level expectations, and calibrate desired performance.

Those analytical skills you have been practicing at the grocery store can now be put to good use, provided you are able to find an appropriate balance between the value gained by having data available to make and support management decisions and the cost of gathering the data in the first place. By paying close attention to the areas you wish to focus on and by prioritizing your efforts, you will find yourself off the bench and in the game. Good luck!

About the Authors

Tim Patterson is a Senior Director in the Higher Education and Life Sciences practice at Huron Consulting Group. Tim has close to 18 years of experience working in areas such as university operations and research administration with an emphasis on grant and contact administration, compliance with cost accounting standards, operational improvement, training development, and audit resolution. He has presented a number of regional and national NCURA conferences. Tim can be reached at tpatterson@huronconsultinggroup.com.

Zach Belton is a Director in the Higher Education and Life Sciences practice at Huron Consulting Group. Zach has dedicated over 12 years to assisting clients better understand their research enterprises through assessment, metrics and benchmarking. He is also a frequent presenter at regional and national NCURA conferences. Zach can be reached at zbelton@huronconsultinggroup.com.

Marisa Zuskar, a Manager in Huron’s Higher Education practice, has spent the majority of her career focusing on operational and performance improvement at research institutions. She has designed operational, performance, and compliance management metrics and reports allowing institutional leadership to monitor operations. She has extensive experience using metrics to identify opportunities to increase the efficiency and effectiveness of sponsored projects administration. Marisa can be reached at mzuskar@huronconsultinggroup.com.
Enhancing Research Administration: From Targeted Improvements to Wholesale Transformation

Cathy Snyder, Vanderbilt University; Matthew Staman, Rick Rohrbach, and Joe Taylor, Huron Consulting Group

Introduction

For time-starved research administrators (RAs), efforts at making lasting changes in day-to-day operations are often tied to “special projects” related to compliance issues, implementing new information systems, or the ramping up that occurs from winning a large grant, hiring a new faculty member, or responding to faculty complaints. The efforts toward improvement are well-intended, but too often focus on incremental change in targeted areas which can result in unfortunate consequences such as:

◆ Increased complexity and less efficient business processes
◆ Decline in communication and service levels
◆ Increase in FTEs and costs that could have been avoided or more limited
◆ Too much attention by the institution, faculty and/or staff on the “crisis issue” at the expense of focus and investment in other core service areas

Because of a confluence of events occurring in today’s research administration world, it is becoming apparent that RAs would benefit from focusing more on comprehensive transformation. A combination of external factors — most notably the decline in government support for research funding, the budget challenges facing private and public universities and health systems, and the changes related to the new healthcare reform law — have significantly increased pressures on research institutions. These pressures are beginning to stimulate dramatic change in the focus of the research enterprise at many organizations, and will likely demand more of RAs.

This article will address how RAs can best prepare for this evolution, balancing the traditions of academic cultures with the transformation efforts needed to meet the new pressures.

What is “Transformation?”

For the purposes of this article, transformation means a research enterprise-wide change that:

◆ Ensures tight alignment of investments, processes and incentives with the strategy and goals of the institution;
◆ Balances service, efficiency, and compliance;
◆ Motivates employees to surpass their own interests and direct themselves to the interests of the institution; and

Significantly raises the level of performance and allows the organization to respond to threats and opportunities.

In practical terms, this will mean making more extensive and intensive changes which allow institutions to better respond to the pressures of the environment.

Management of the research enterprise will need to become more strategic especially in terms of resource allocation

Research administration processes will need to become more efficient to reduce costs

Research administration service will need to be more focused and nimble to support strategic plans and adjustments to the environment

RAs will be called upon to play an even greater role in providing information to institutional leaders to support effective decision making

**Transformation at Your Institution**

Successful transformation of the research enterprise will be highly dependent on leadership from the highest levels of the institution. Change is hard at any organization; at research institutions, with a tradition of shared governance, it is often very difficult. Institutions can and do respond to burning platforms. However, institutions now need to focus on developing and communicating more comprehensive plans for change that are tied to their mission and values to optimize progress and enhance results.

**Transformation Vision**

The essential elements of a transformation vision include a clear set of goals, guiding principles and an objective appraisal of the current state of a research organization’s operations. Guiding principles help articulate why the institution needs to make changes, what parameters and constraints must be observed, what the intended outcomes are, and how those outcomes support the research mission. Some guiding principles that might be considered include:

- Making the Principal Investigator (PI) your “true north” (e.g. what process/procedure changes are needed to meet their needs?)
- Balancing efficiency, responsiveness and compliance in developing business processes, rather than setting up separate “compliance” functions and processes
- Making information available to decision makers from research teams to Deans and VPs for Research (i.e., transparency and communication)
- Simplifying processes

As organizations develop a vision for transformation, they must also define a picture of what success will look like. This includes both qualitative statements about services to the research community and compliance, and whenever possible, quantitative goals related to efficiency and effectiveness. These key objectives then provide a basis against which success can be measured.
Current State Assessment
Understanding the current environment is also an essential element of the transfor-
mation: where is the organization today? This involves assessing all aspects of the
operation including business process, organizational structure, people, technology,
and performance measurement.

The scope of the current state assessment should be guided by the scope of the
overall effort which may include some or all research administration areas. Some of
the questions that should be considered in carrying out the assessment include:
◆ Business process: How many steps / handoffs are needed for each process? Is
compliance baked into the process or layered on as extra steps? Is the process
understood by customers in the research community?
◆ Organizational structure: Is the organization structured to promote effective
communications and provide good service? Do reporting lines impede
effectiveness?
◆ People: Are roles and responsibilities appropriate and widely understood? Are
the right people assigned to do each function and task? Are they qualified and
trained?
◆ Technology: Are there opportunities to better leverage technology? Is the same
information keyed into different information systems numerous times?
◆ Performance Measurement: Is information readily available to enable effective
decision making? Are there metrics in place to measure improvements and can
baseline measures be developed?

Developing a Planning Roadmap
The results from the current state assessment, along with the guiding principles, will
serve as a strong foundation from which research administration leaders can devel-
lop a roadmap for improvements that aligns with institutional priorities. The benefit
of developing a roadmap is that individual improvements can be implemented
over time while still focusing on the path to achieve the broader vision and goals.
For most institutions, comprehensive transformation will occur over an extended
period of time, but benefits in costs, effectiveness and PI satisfaction can be realized
throughout the process. In developing the roadmap for improvements, many ques-
tions should be considered:
◆ What are the opportunities for improvement? What are the priorities? Where will
the institution get the biggest bang for the buck, and what changes most align
with the guiding principles?
◆ What opportunities will have the greatest impact on reducing faculty burden?
◆ How should specific change efforts be sequenced? Considerations might include
priority, interdependencies, and the ability to achieve “quick wins” that build
support.
◆ What resources are or can be made available to the effort? Can a case be made to
invest short-term resources for a long term benefit?

◆ How should the overall effort be governed? How should the institution balance the cultural norms and values of shared governance with the need for potentially significant change?

**Communication**

Communication is vital in any transformation effort. Many initiatives face challenges because insufficient communication allows for confusion and frustration, which can lead to or increase resistance. Effective communication enables all stakeholders to engage effectively in the process.

◆ Regular leadership updates to the research community

◆ Creation and use of advisory committees of PIs and research personnel

◆ Forums with various stakeholder groups for insights and feedback

◆ Targeted updates to individuals most directly affected by changes

◆ Website / newsletter updates

**Implementing Changes**

Within the context of the comprehensive transformation, an institution is likely to carry out several individual projects in targeted areas – redesigning a set of related processes, developing a set of policies, rolling out training, implementing reporting tools and metrics, etc. – but each will be aligned such that it is contributing to the broader objectives. Each new project should have its own appropriately scaled project plan that lays out the work to be done, the resources assigned, the timeline and the objectives and expected benefits. As the plan is implemented the team will work together to design the changes and determine how to implement them. During this process, several steps can be taken to increase the likelihood of success and acceptance of change:

◆ Include advisory groups as appropriate in reviewing changes to be sure that they are clear and to gather suggestions for improvement.

◆ Whenever possible (often for systems, reporting and metrics and for new processes), conduct a pilot before full rollout. This allows for feedback and refinement before the entire research community is affected.

◆ Plan for adjustments through the rollout process as more information is learned.

◆ Incorporate metrics into processes where possible. This allows the organization to show progress against baseline metrics (from the current state assessment) and communicate

To optimize results, it is essential to have the right people leading the changes, and to have the right people in place to perform the new roles. An organization can have the most elegant plan, the right workflow and incentives, measurements for productivity and progress and still risk failure if the right leaders and teams are not in place and aligned.
Summary
Helping organizations react to a highly regulated and changing environment, while managing and supporting the routine activities, has always been a crucial role for RAs. This is becoming increasingly acute and difficult to balance, and as such, will force RAs to lead their institutions through larger scale changes that allow for enhanced efficiency, greater focus, quicker adaptations, and more data-driven decisions by key institution leaders. Several institutions are becoming increasingly proactive to prepare for the new environment. Don’t wait and fall behind – it is time to be prepared!

Case Studies

Peer Reviews at the University of California, Merced: Part One
Peggy S. Lowry, NCURA Peer Review Program Manager

In recent years, institutions of higher education have paid increasing attention to implementation of formal processes for assessing research administration infrastructure. In some instances that process has been driven by assessment requirements established by the institution or state. In other instances institutions adopt these formal processes as an opportunity to have outside experts provide baseline operational data and benchmarks.

The following case study of the University of California, Merced (UC Merced) provides unique insight into an institution’s approach to assessing research administration operations and infrastructure and utilizing these assessments in their decision-making process. As the first new American research university established in the 21st century, UC Merced faces the same challenges as any existing research university, but must also deal with challenges around building and sustaining the research enterprise in an environment that has many characteristics more commonly found in a predominantly undergraduate or emerging research institution. As a new institution UC Merced faces unique challenges in meeting competing institutional priorities while creating a new research administration infrastructure from the ‘ground up.’

Throughout this challenging process of creating research administration infrastructure, UC Merced has retained a focus on forging the necessary partnerships between offices and stakeholders within the academic and administrative community. These stakeholders include the faculty and students engaged in extramurally funded research as well as staff and administrators involved in the administrative, business, and regulatory oversight functions that are necessary for good stewardship and protection of those sponsored activities.

This case study is intended to provide a deeper look at the challenges and lessons learned as an institution proceeds through multiple assessments and engages with their stakeholder groups in the change process. This case study continues the series of topics related to the NCURA Peer Review Program and the themes and impacts from the assessment process.

The Decision for External Review and the Preparation Process
Susan Carter, Director, Research Development Services, University of California, Merced; Autumn Salazar, Director of Contract and Grant Accounting, University of California, Merced; Thea Vicari, Director, Sponsored Projects Office, University of California, Merced

This is the first of a multi-part case study about the assessment and change process for the research administration infrastructure at the University of California, Merced (UC Merced). This first part focuses on the decision to engage external assessments:
how this decision was reached, who was involved, the timeliness of the reviews, and details of the preparation for the Peer Review Teams’ site visits. Subsequent parts of this case study will discuss how UC Merced evaluated the recommendations made by the reviewers; the ways in which the recommendations drove institutional change, including significant impacts on the budget process; the challenges faced during implementation; and the outcomes and on-going assessment.

**The University of California Merced: Our Story**

UC Merced is the newest and tenth campus in the prestigious University of California (UC) system and the first new American research university opened in the 21st century. The campus opened in 2005 and is located in the San Joaquin Valley, an under-resourced region with high poverty and unemployment rates compared to the rest of the state and the nation. UC Merced’s undergraduate enrollment as of Fall 2012 was approximately 5,700 students, with over 5,400 undergraduates. Planned growth will bring the total campus population to 10,000 students (20% graduate and professional) by the year 2020, with the expectation that enrollment will eventually reach 25,000 students. UC Merced is a doctoral granting research institution offering graduate programs across the full spectrum of academic disciplines. Currently the campus has three schools (School of Natural Sciences; School of Engineering, and School of Social Sciences, Humanities and the Arts) and two Organized Research Units (the Sierra Nevada Research Institute and the Health Sciences Research Institute).
The Beginnings of the Research Administration Infrastructure

Three offices currently play a distinct and important role in obtaining, maintaining, and overseeing extramural research funding support for the University: Research Development Services (RDS), Sponsored Projects Office (SPO), and Contracts and Grants Accounting (CGA). A fourth office, Academic Resource Center (ARC), was merged into the SPO operation. The current research administration structure evolved from initial models established at the outset of the University but which ceased to be as effective as the institution grew.

Research Development Services

Research Development Services (RDS) in the Office of Research was started by the Vice Chancellor for Research in 2008. The overall mission of RDS is to support the institutional capacity to pursue and obtain extramural funding for research initiatives. RDS services to faculty include identifying and disseminating information regarding funding opportunities; providing advice and assistance regarding responses to new, emerging, and changing funding opportunities and environments; identifying potential collaborators; providing training on proposal writing and grantsmanship; providing support for planning, coordination, and submission of research proposals; and proposal writing and editing. RDS also works with faculty to build effective relationships with extramural research funding agencies.

The Director of RDS has served in that capacity since the unit was founded. The Director was hired initially as a part time grant writer/proposal coordinator; however the duties of that position quickly expanded to that of RDS Director of a one-person (one FTE) office. An additional full time staff position was added in September 2011. Initially the RDS office focused primarily on providing support for the preparation and submission of large, multi-disciplinary, center-type proposals; over time this focus has been expanded to provide proposal development support and advice to faculty more generally. In the past three years the office has also emphasized training and support in proposal development for junior faculty, as the need for such support has increased in concert with overall campus growth.

Sponsored Projects Office

In 2002, the founding Vice Chancellor for Research (VCR) hired the founding Director of the Sponsored Projects Office (SPO) who remained a one person office for almost four years. In her initial year, which preceded the arrival of faculty, the Director of SPO spent most of her time establishing an identity for the campus by obtaining such items as DUNS, CAGE Codes, Employee Identification Number (EIN), establishment of an F&A rate, and registering with numerous sponsor’s electronic research administration systems. Also, in that initial year, the VCR and Director of SPO entered into an agreement with Lawrence Livermore National Laboratory to outsource the Institutional Review Board (IRB) and the Institutional Animal Care and Use Committee (IACUC) given that there was no UC Merced faculty quorum to serve on these compliance committees. The Research Compliance and Integrity Office, the Graduate Division, the Technology Transfer Office, and the Research Devel-
In its early days of the campus, SPO was responsible for assisting the faculty with proposal preparation, proposal submission, award transfers to UCM, and award acceptance to UCM. While SPO still performs some proposal development functions, it is anticipated that SPO will perform a traditional role of review and authorization of proposals and awards as the staffing levels in Research Development Services as well as in post-award services increases.

Contracts and Grants Accounting
Unlike SPO and RDS, the Contracts and Grants Accounting Office reports to the Controller’s Office. The grant accounting functions were performed within General Accounting by a senior accountant with knowledge of sponsored funding until the current Director of Contracts and Grants Accounting was hired in October 2007. CGA provides central office post-award support. The primary functions of CGA are award setup and appropriation in the financial system, issuing financial reports to sponsors, invoicing and collection of cash owed to the University, assistance with grant related audit coordination, compliance with all terms and conditions of the grant or contract including Effort Reporting requirements, campus-wide training and policy guidance, and financial closeout. CGA is also responsible for the development and maintenance of the faculty reporting system which provides faculty with real-time online access to their grant budgets and expenditures.

Academic Resource Center/Sponsored Projects Accounting
The day-to-day monitoring of the fiscal activities of the awards was initially managed by the Academic Resource Center (ARC); a centralized service center responsible for financial monitoring, travel, purchasing, and human resources. The number of staff within ARC remained stagnant even with a substantial increase in the number of faculty. In 2008, after six years, the ARC model was deemed to be unsustainable and was disbanded. Those staff who were responsible for the daily financial monitoring of contracts and grants were reassigned to report to the Director of SPO. In an effort to distinguish this new group from the established pre-award functions of SPO, it was called Sponsored Projects Accounting. This was a defining moment for research administration as faculty soon became confused about “who” did “what” as roles and responsibilities became blurred.

Discussion
The confusion created by the poorly coordinated dissolution of ARC was compounded by already existing confusion surrounding the difference between the post award services provided by ARC and those provided by Contracts and Grants Accounting (CGA). The faculty found themselves unsure of when they should interact with the post-award personnel in SPO (the reassigned ARC staff) or staff in CGA.

Much of the initial organizational structure that was put into place at UC Merced was intentionally designed to ‘make things happen’ and was geared towards attracting students to the nascent University. Building the research administration infra-
structure, by necessity, took a back seat to building the more basic infrastructural needs of the campus. In addition, the fiscal climate led to considerable challenges in the development of infrastructure to support the new University. As a result, the development of research administration infrastructure had not occurred as quickly as might have been expected given that it was modeled after established UC campuses.

The Decision for Assessment and the Charge to the Reviewers

The need for a self-assessment of UC Merced Research Development Services (RDS), Sponsored Projects Office (SPO), and Contracts and Grants Accounting (CGA) was driven by the required internal assessment policy implemented by the Senate Administration Council on Assessment (SACA). SACA implemented an annual and periodic review assessment process in 2011. It was expected that the results of Annual Assessment and Periodic Review would inform the planning, decision-making, and budgeting processes of units and/or divisions in a manner that reinforces evidence-based improvements in function and service. Self-assessments were conducted as an initial response to the Annual Assessment and Periodic Review requirement.

The self-assessment undertaken by SPO staff was conducted during January through June 2011. The self-assessment included data collection of staff time and effort reporting, proposal tracking, online survey collection, and proposal workflow mapping. Results from the survey underscored that respondents did not understand the distinct roles and responsibilities of the three central offices; rather viewed these three offices as one collective body. In part, this lack of clarity was due to the overwhelming number of assistant professors who did not have prior university experience; an additional challenge at UC Merced. CGA, along with the other units under the Vice Chancellor for Administration, was evaluated in a series of campus customer service surveys. These surveys focused on the services provided by CGA and how the campus as a whole felt about the delivery of those services. This information was not made available publicly but was shared between the Directors of CGA and SPO. The most significant finding from the customer service survey’s for CGA was that much of the campus did not understand the difference between CGA and SPO.

RDS conducted a similar self-assessment process between September 2011 and June 2012. Self-assessment activities undertaken by RDS included a self-assessment
document outlining the history and achievements of the unit, written in conjunction with the UC Merced Internal Assessment Coordinator. The self-assessment process also included a customer satisfaction survey sent to all UC Merced faculty by the Office of Institutional Planning and Analysis. The purpose of the survey was to gather information about faculty awareness of RDS services and satisfaction levels. Similar to the surveys conducted by SPO and CGA, these surveys revealed that there was considerable confusion among faculty regarding the relative roles of RDS and SPO in proposal development, as well as widely varying experiences in terms of satisfaction with research administration services.

Following the self-assessment and as part of the overall assessment process, an external evaluation of SPO and CGA was conducted at the request of Samuel J. Traina, Vice Chancellor for Research and Mary Miller, Vice Chancellor for Administration. An external evaluation for RDS was conducted at the request of Dr. Traina. The evaluations were performed in the spring of 2012 by a Peer Review Team from the National Council of University Research Administrators (NCURA) for SPO and CGA and in the summer of 2012 by a Peer Review Team from the National Organization of Research Development Professionals (NORDP) for RDS.

The University asked the review teams to evaluate the following:

◆ The research environment at UC Merced;
◆ The staffing levels within the offices;
◆ Whether it was feasible to continue with central post-award administration versus having the functions performed at the local level (within research institutes and Schools);
◆ The relationship between SPO and the Schools;
◆ The relationship between SPO and CGA;
◆ The effectiveness of RDS and interactions with key stakeholders; and
◆ The ability of RDS to contribute to the strategic research goals of the organization.

Although the external evaluations covered a broad range of areas, these particular areas of emphasis were chosen based on the results of both the self assessments and the customer surveys, including the apparent faculty frustration brought about by the confusion around roles and responsibilities. In addition, the staff in the three central offices confirmed that many of the challenges they faced in their day to day work was the result of one of the areas to be reviewed by the external reviewers. In retrospect, the decision to review these areas was critically important; it would have been difficult to institute some of the changes needed to grow the research enterprise without the existence of an independent review of operations by organizations with no political stake in the outcome.

**Preparing Background Materials for the Reviewers**

Beginning in November 2011, the Director of SPO compiled a Briefing Book for the NCURA Peer Review Team; a process that took five months to complete. The Briefing Book compiled background materials (policies, procedures, organizational and
staffing details) for the review team and utilized some information from the self-assessments. The completion of this Briefing Book required cross-campus coordination and included information drawn from RDS, SPO, CGA, Institutional Planning and Analysis, Purchasing, Environmental Health and Safety, and the Research Compliance Office. The final product was 739 pages and contained the campus’ vision statement, demographics, profiles of faculty population, and the manual practices and procedures for research administration in light of the fact that there was no electronic research administration system.

RDS also prepared briefing background materials for the NORDP review; materials were shared via a ‘cloud’ based private website available to the NORDP review Team. Documents shared with the review team included Annual Reports from the RDS office, job descriptions for all RDS staff, copies of the UC Merced and Office of Research Strategic Plans, Training Agendas and participant evaluations from RDS-sponsored training sessions and workshops, Reports on Proposals and Awards on a fiscal year basis between 2008 and 2012, information on the institution’s Organized Research Units, and a copy of the self assessment of the RDS unit completed by its Director with assistance from the UC Merced Assessment Coordinator. This self-assessment included a copy of the faculty survey on RDS services that was conducted in fall, 2011. The NORDP Peer Review Team also reviewed and considered all public documents related to research infrastructure, including materials available on the RDS, SPO and Office of Research websites. In addition, the Peer Reviewers were able to review the report of the NCURA Peer Review evaluation since that peer review had preceded the NORDP site visit. NORDP peer reviewers were also given biographical information on all key stakeholders scheduled to meet with them during the site visit.

Discussion
The preparation of background materials for reviewers was more challenging than initially anticipated. The process was time consuming and required coordination with campus office staff members who did not always understand how the work of their units fit into the research enterprise. Indeed, in some instances key stakeholders did not really understand the role of infrastructure support within a research institution. Thus, it was occasionally challenging to obtain the necessary documents from these units given that they did not understand why it was necessary or even important for them to participate in the review. Additionally, there was discussion around whether or not to provide certain information that could potentially reflect poorly on a specific department. Although the review teams were very explicit about not creating procedures that did not exist before the review, there were administrators and staff within the institution that were not comfortable disclosing that certain policies or procedures did not exist. All materials were eventually provided and all stakeholders understood that without full disclosure the University would not benefit completely from the reviews. The preparation of the briefing binder brought about a broader understanding of the role of all campus offices in the research infrastructure. This was an unanticipated positive side effect.
It became very evident that clear communication was extremely important in getting cooperation. The Directors of SPO and RDS and others involved in the review spent considerable amounts of time explaining to stakeholders how what they did fit in to the overall research structure. It also was very time consuming to discuss the benefit of full disclosure in gaining the full benefit of the reviews.

Preparing our Community for the Peer Review Site Visits

After Peer Review teams from NCURA and NORDP were identified for each unit review, the staff of each unit began preparation for the site visits. As noted above, there was a tremendous amount of preparation necessary in order to assure that the peer review teams had access to the information needed to understand the historical context of development of the research enterprise at UC Merced and to conduct appropriate interviews of key stakeholders. In addition, stakeholders needed to be informed of the site visits and the charge given to the peer review teams so that they would understand the importance of their availability and be prepared and willing to give candid and open feedback during the key stakeholder interviews. In some instances where participation was deemed particularly critical, the Vice Chancellor for Research also contacted key stakeholders regarding the site visit.

In one instance, an invited staff member who had participated in the NCURA review did not participate in the NORDP review because he was instructed at the last minute not to attend by his supervisor, apparently because the supervisor felt that the staff member was not senior enough to provide pertinent information. This instance illustrated the importance of fully preparing all potential members of the University community regarding the peer review; the supervisor may not have understood the nature of the review or possibly was motivated by inter-departmental political conflicts. This situation did present a ‘lesson learned’ for other institutions undergoing an external peer review. Education as to the importance to the institution of the assessment is an important initial step in overcoming initial resistance during the peer review process.

The Review Team Site Visits

NCURA Review

After receipt of the Briefing Book and supplemental documentation, the NCURA reviewers scheduled a conference call with the Directors of SPO & CGA, the Vice Chancellor of Research, and the Vice Chancellor of Administration to discuss the charge for the site visit. This call briefly reviewed items received and confirmed areas the University wished the peer review team to focus on, as well as gave an indication of other areas that the reviewers would be reviewing based on potential areas for improvement identified in the documents already provided.

The Director of the Sponsored Projects Office coordinated the site visit and served as the single point of contact. The reviewers identified various stakeholders for interviews. The SPO Director worked with the Vice Chancellor of Research to coordinate various schedules and ensure the largest possible pool of participants. A single location on campus was identified as the NCURA Peer Review Team’s on-
campus meeting site. During the site visit the reviewers spoke with the SPO Director and her staff, the VCR, the VCA, the CGA Director and her staff, all Deans of the three Schools, the Directors of Operations within those Schools and Directors of Organized Research Units, Director of Research Compliance, Director of the Development Office, Director of Health and Environmental Safety, the Internal Auditor, General Counsel, Information Technology member, and members of the faculty.

The NCURA Peer Review Team spent two and one-half days on campus. The Director of SPO was the primary contact during this visit. The itinerary was altered to accommodate individuals that the Team wanted to “bring back” for additional discussion.

On the final day, the Review Team held an exit briefing for the Vice Chancellor for Research, Vice Chancellor for Administration, and for the Directors of SPO and CGA. In this briefing, the Review Team identified seven broad themes resulting from this visit, including:

1. Organizational Structure,
2. Roles and Responsibilities,
3. Education and Training Plan,
4. Communication Plan,
5. Electronic Research Administration,
6. Responsible Conduct of Research Training, and

The initial observations made during the exit briefing by the NCURA Review Team were not surprising; what was surprising is how obvious the weaknesses were to the Review Team. The draft report was sent to the campus for comments thirty days after the site visit. After the draft was received, the Directors of SPO and CGA disclosed the initial observations made by the NCURA Review Team at the monthly Research Administrators meeting in an attempt to communicate to this campus community that changes to the present organizational structure, at some point, would occur. The final report was sent by NCURA ten days following the campus comments. The VCR circulated the final report to the campus’ Cabinet members and the Director of SPO placed the final report on the SPO website.

**NORDP Review**

Prior to their site visit the Peer Reviewers from NORDP held an initial teleconference briefing with RDS staff and with the Vice Chancellor for Research to discuss the charge to the Peer Reviewers and to develop and confirm a final agenda for the site visit.

The NORDP Peer Review site visit was scheduled over two full days, with key stakeholder meetings interspersed with time for the peer review team to meet individually to review and compare notes. In addition, time was scheduled on the evening prior to the first day of interviews for a campus tour and for an introduc-
tory dinner with the RDS staff, Vice Chancellor of Research, and the Internal Assessment Coordinator. During the NORDP site visit, key stakeholder interviews were held with each of the Organized Research Unit (ORU) Directors, Deans of all three schools, the Vice Chancellor for Research, all RDS staff, Director and staff of the Sponsored Projects Office, the Director of Federal Relations, and the Vice Chancellor for Development and Alumni Relations. Finally, several sessions were held for faculty to give input on RDS services; one session was targeted to specific faculty who had been assisted on major proposals; two other sessions were open to any faculty members.

Although lack of participation because of scheduling was minimal and approximately 20 faculty members were able to participate, it still was a ‘lesson learned’ from the NORDP review that scheduling is a major consideration and that it probably would be wise to schedule peer review visits well in advance and during the academic year rather than in summer, particularly if maximizing faculty participation is a goal.

At the end of the site visit, the NORDP Review Team met with the Director of RDS and the Vice Chancellor for Research to discuss the themes from their visit and anticipated findings and recommendations in the final report. In general, the reviewers reported high levels of satisfaction with RDS services among stakeholders (particularly faculty members) who were familiar with the unit activities. However, the Team also reported that staffing levels in RDS were not adequate to meet current or anticipated need. In addition, the team identified several themes regarding needed changes to the research infrastructure more generally; these areas of concern closely mirrored those themes identified by the NCURA Review Team. The final NORDP report was issued in August 2012 and was circulated in the same fashion as the NCURA report, as described above.

**Figure 3940.1-3.**

After the Peer Reviews: The Final Reports

UC Merced received a number of recommendations from both NCURA and NORDP for changes to the systems of research development services, proposal development services, research administration functions, and contracts and grants accounting systems to better support the research enterprise as the campus grows and develops.
into a mature research university. In virtually every instance the reviews from the NCURA and NORDP Review Teams were complimentary, which greatly enhanced their persuasiveness in ‘jump starting’ potential institutional change. In addition, the campus administrative leadership is beginning to transition from a ‘start-up’ model to a more standard model of ongoing operations at a research institution. Part Two of this Case Study will discuss the process for assessing recommendations, both short-term and long-term, and how the University community was engaged in that process.
The change process at institutions often brings a level of organized chaos to the environment as priorities are identified, strategies defined, and new approaches or models implemented. One of the key steps in the change process is engaging stakeholders in the strategies and approaches that are being considered. Their understanding, at a minimum, helps to ease the often lengthy process of shifting models or modes of operation. And stakeholder buy-in, optimally, results in a strengthened culture of service.

The University of California, Merced provides us with a glimpse of the nuances involved with engaging the institution’s stakeholders in this change process. The care with which communications occurred and discussion of proposed models has resulted in a positive outcome, even if different than originally designed. Two particular aspects are worthy of note. First, the strengthened collaboration between Office of Research leadership (research development, pre-award and post-award areas) both strengthened the process and helped guide the positive outcome. That collaboration continues to bring synergy and excitement to the research infrastructure. Second, the process illustrates the importance of nimbleness in adapting a change model. The resultant model has been strengthened by full buy-in within the partnership while working within the culture and adapting to primary stakeholder concerns.

Case Study Part Two: Assessing External Review Recommendations
Susan Carter, Director, Research Development Services, University of California, Merced; Autumn Salazar, Director of Research Accounting Services, University of California, Merced; Thea Vicari, Director, Sponsored Projects Office, University of California, Merced

This is the second of a multi-part case study about the assessment and change process for the research administration infrastructure at the University of California, Merced (UC Merced). Part One, which was released in July 2013, focused on the decision to engage external assessments: how this decision was reached, who was involved, the timeliness of the review, and details of the preparation for the Peer Review Teams’ site visits.

This Part Two discusses the Peer Review recommendations and the process that was undertaken to assess those recommendations, including both short-term and long-term response strategies; community engagement and response to the review; and the strategic process to gain buy-in for development of an implementation plan. Later parts of this case study will discuss the ways in which the recommendations drove institutional change, including significant impacts on the budget process; the challenges faced during implementation; and the outcomes and on-going assessment.
Recommendations from the Peer Review Process

As discussed in detail in Part One of this Case Study, two independent peer reviews of the research administration and research development infrastructure at UC Merced were conducted by teams from the National Council of University Research Administrators (NCURA) and National Organization of Research Development Professionals (NORDP); final written reports from these two reviews were issued in June and August 2012, respectively. Both reports were circulated to the campus’ Cabinet members and placed on the Office of Research website where they are publicly available².

The NCURA Peer Review Report identified 87 recommendations as opportunities to strengthen research operations in two broad areas as described in the NCURA National Standards: Institutional Infrastructure and Core Operations. The subcategories within Institutional Infrastructure included Organizational Structure; Communication, Outreach, and Education; Compliance and Risk Assessment; and Electronic Research Administration. Core Operations consisted of Proposal Services; Award Acceptance and Initiation; Award Management; and Research Ethics.

The NORDP Report focused more specifically on operations within the Research

Development Services (RDS) Office. The report contained 30 recommendations within ten areas in which the University should strategically invest in order to grow and strengthen RDS. Investment in these areas was expected to strengthen the research enterprise in general and more specifically in such areas as: the research environment and strategic planning; proposal development and submission; funding opportunity dissemination; training and professional development; communication and outreach; proposal tracking and assessment; and funder/agency strategies.

In nearly every instance, the recommendations from the NCURA and NORDP reports were complimentary. Both reports identified clear institutional barriers to the effectiveness of the research development and administration enterprise, notably in the areas of staffing configurations and the lack of electronic research administration infrastructure. The overlap and synchronicity between the recommendations in the two reports has proven to be extremely beneficial in beginning and implementing institutional change.

**Process of Assessing the Peer Review Recommendations**

Immediately following the exit meeting by the NCURA Peer Reviewers, the Vice Chancellors for Administration (VCA) and for Research (VCR) and the Directors of the Sponsored Projects Office and the Contract and Grant Accounting Office, discussed anticipated findings. All individuals involved in those discussions were fairly certain that the findings would confirm existing campus observations of challenges in research administration. Receipt of the draft NCURA report confirmed this conjecture by including recommendations covering all of the expected areas. There was nothing in the report that came as a surprise to leadership in the Office of Research. The draft report was shared broadly with research development and research administration staff in both the Office of Research and in Contracts and Grants Accounting in order to obtain sufficient feedback on any inaccuracies within the report. Only minor modifications were made to the draft report, most of which related to clarification of processes or policies. There were no recommendations with which the campus took issue. A very similar process was followed for the NORDP draft report, and again, the recommendations contained in the report were not surprising or unexpected.

After receipt of the draft reports, those involved in the review began to discuss how this information would be disseminated to the campus. There were discussions surrounding how broadly the information should be disseminated and what the impact of that dissemination would be. Ultimately it was decided, given the importance of the recommendations and of maintaining transparency in the response, to make both reports widely available on the Office of Research website.

Upon receipt of the final reports, the UC Merced VCR met individually and jointly with the Directors of the Sponsored Projects Office (SPO) and Research Development Services (RDS), as well as with campus top leadership and representatives of the Academic Senate, to discuss campus assessment of the recommendations. Because Contract and Grant Accounting reported to the Controller’s office at the time the report was issued, there was some coordination with the VCA. The
VCA was kept updated by the VCR as he updated all senior leadership. As an initial step, the recommendations in the reports were ‘triaged’ into two categories.

1. The first category consisted of those recommendations that had no significant budget or ‘political’ implications and thus could be implemented quickly based on internal discussions within the Office of Research and without engaging key stakeholders. Many of these recommendations were adopted almost immediately as long as the VCR and unit directors deemed them to be necessary. For example, pursuant to a recommendation in the NORDP report and with the concurrence of SPO, the responsibility for managing the campus process for sponsors that limit the number of proposals received from UC Merced was transferred from SPO to RDS. Similarly, the Directors of the Sponsored Projects Office and the Contract and Grant Accounting Office immediately adopted an NCURA recommendation to co-chair monthly meetings for the research administration staff in the Schools and Organized Research Units (centers and institutes) in an effort to address how the business activities in these units support the research enterprise.

2. The second category consisted of the recommendations that required either significant resource expenditure and/or institutional restructuring of unit roles and responsibilities to fully implement. The VCR recognized that campus administrative leadership, including units external to the Office of Research, would need to be engaged to participate in the response to these recommendations. An example of this type of recommendation would be the recommendation that the campus implement an electronic research administration system. This not only meant a significant cost to the campus but also the start of conversations around the appropriate structure of research administration to support the campus in the future.

As an initial step in this engagement process, the VCR asked the Director of SPO and the Director of RDS, along with the Director of Contracts and Grants Accounting, to form an assessment and implementation team to respond to the recommendations made by the NCURA and NORDP Peer Reviews. Specifically, the Directors were asked to develop a ‘White Paper’ whose purpose was to take into consideration the recommendations made by the two Review Teams and to propose new research administration models which would create efficient, scalable processes for the entire grant life cycle. The White Paper was also to include a strategic plan to support these services through 2020; the year the campus is expected to reach a size necessary for financial self-sufficiency and world-class research university recognition. While the White Paper did not address all of the recommendations of the NCURA and NORDP assessment reports, the proposed models assumed that some of the basic elements of a research development and administration system, notably the implementation of a fully functioning electronic research administration system, would be in place as the model was rolled out to the Schools and Organized Research Units (ORUs). Both reports recognized and stressed the importance of implementation of electronic research administration as part of their core recommendations.

The following timeline illustrates the overall steps that will be explained in the subsequent sections.
Figure 3940.2-2.

Developing the White Paper

The Directors met weekly between July and September 2012 to work on the draft White Paper. The initial strategy was to focus on those changes that could be accomplished without significant budget implications given that the call for a new University budget request would not be made for several months. In addition, the Directors felt that this approach would have greater appeal to the University leadership. While the White Paper was primarily focused on the short-term benefits of adopting recommended changes, a significant portion was devoted to cost effective solutions to transitioning to a long-term research administration model.

Given this collaborative approach used by the three Directors as well as ‘buy in’ from the Vice Chancellor for Research and the complimentary focus of the recommendations in both the NCURA and the NORDP reports, the Directors were reasonably confident that their proposed model would be sanctioned to move forward toward implementation subject only to budgetary constraints. Indeed, as the White Paper was being written, drafts were shared periodically with both the Vice Chancellor for Research and the Controller for feedback. The Directors wanted to be sure that nothing was included that would be impossible to implement or that would violate institutional policy. This continued dialogue also ensured that the Directors were continually aware of, and could incorporate, higher-level decisions that would impact the models being proposed.

An unexpected, but incredibly beneficial, side effect of the work on this White Paper was the working relationship that was developed between the three Directors. Prior to this process, the Directors of RDS and CGA had never met one another. Working so closely together allowed each Director to gain extremely valuable insight into how their unit impacted the other, as well as to develop models for future communication between the units.

The initial draft White Paper was finished at the end of September 2012. It was significantly longer than initially expected and had morphed into more of a proposal than a White Paper. The model proposed was a traditional one. Under this model, RDS would maintain a central office but also place RDS coordinators in the schools and Organized Research Units. The staff would continue to act as a liaison
with the funding agencies, manage the limited submission process, provide faculty training on grantsmanship, and assist faculty with finding funding opportunities and development of strategies to expand their research funding portfolios. The SPO would return to a more traditional model where the research administrators would no longer provide pre-award or proposal preparation services and instead only review proposals prior to submission and negotiate and accept awards. CGA would continue to function as the central post-award office handling fund setup, invoicing, cash collection, and reporting. The day to day management of the awards would be moved out of SPO and would be performed by department level administrators who, in addition to managing the award, would also assist the faculty with traditional pre-award proposal development, including preparation of non-technical forms, budgets, and budget justifications.

The implementation of this model would have had no impact in the budget year in which it was initially proposed. It required only a shifting of responsibilities in the short term. There would have been a need to request new staff in the following year. It was projected that there would need to be an additional person in both SPO and CGA; there would need to be four additional staff hired in RDS in order to have one per school and organized research units; and the departmental research administrators would need to be increased by 1.5. Based on this model, the total FTE being added for that next budget year would have been 8.5.

Sharing the White Paper with Stakeholders

Once completed, the draft White Paper was shared with leadership via a presentation by the Chancellor’s Cabinet as well as with the Academic Senate. The VCR reported that initial responses from individuals in these meetings were very positive.

From September through November 2012, the Directors waited for comments and reactions to the final draft White Paper from University Leadership. When it did come, it was not what the Directors expected – at all. Most Cabinet members were supportive but had little comment. However, one of the School Deans was adamant that a single research administrator in the School could not perform both pre- and post-award functions. Specifically, this Dean felt that all pre-award services should be centralized and asked that RDS fulfill this role in addition to the roles outlined in the White Paper. This Dean acquired buy-in from the other two School Deans and subsequently became a spokesperson for this group.

Given previous discussions between the VCR and campus leadership in review of White Paper drafts, the Directors were greatly surprised by this response. The Directors had several meetings to attempt to identify the reason for the opposition to the proposed model. Some of the issues discussed were:

- the extent to which the Dean’s alternative model was based on that other institutions (notably the Dean’s last institution),
- whether the Dean was proposing a model that avoided possible staffing and personnel concerns within his School, and
- what evidence existed that supported his division of pre and post award duties.
as a more effective model.

Subsequently, a meeting between the Vice Chancellor for Research, the Dean, and the Directors was held. In this lengthy meeting, a frank discussion ensued where the Directors were able to ask the Dean for his rationale and motivation for proposing his model. It was obvious in this meeting that the Dean was not going to be persuaded to change his mind. The Directors agreed to a compromise where Research Development Services would assist all faculty with pre-award proposal preparation should their services be requested. In addition, the Director of Contract and Grant Accounting agreed to serve as a dotted-line supervisor for those individuals in the Schools and the Organized Research Units who performed post-award monitoring of grants and contracts. The Sponsored Projects Office would return to a traditional role of reviewing and authorizing proposals and reviewing, negotiating, and accepting awards on behalf of The Regents of the University of California.

Lessons Learned

One of the lessons learned from the entire process of vetting the White Paper was that it is probably wise to seek input on the specifics of such reorganization proposals, as early in the process as possible. Leadership, including the Deans, had been kept apprised of developments at the ‘thirty thousand foot’ level, but it would have been wise to be sure they were fully aware of some of the details. This is a particularly important lesson when working with faculty leadership, since as scientists and engineers they are often concerned with micro-level details in their daily research and teaching activities.

Another major lesson was the importance of communication in change management: it was difficult to communicate to office staff changes that happened quickly and sometimes unexpectedly, but the end result of not communicating the uncertainty and discussions around the White Paper was that staff were anxious about the impact on their job responsibilities for a longer than expected implementation phase.

Community Engagement in the Response to the Proposed Model

As a result of the discussions of the White paper, the resulting proposed model was ready to be shared with the broader community. It was important that those employees who had research administration responsibilities in the central offices and in the Schools buy into this new proposed approach, since it involved considerable realignment of job duties and lines of supervisiorial reporting. The Directors of RDS, SPO, and CGA communicated this new proposed model to their direct reports. These direct reports had participated in the Peer Reviews and were versed in the recommendations made by the Peer Review Teams. Nonetheless, the initial response to the proposed restructuring based on the peer review recommendations and subsequent discussion with leadership varied: the proposed changes were threatening for some and confusing for others. This chain reaction of emotions made it difficult for the staff in these three offices to focus on work since they were no longer certain what their job responsibilities entailed or would entail in the future. To complicate the issue, there was no definitive timeline as to when the proposed restructuring
changes would take place or could take place given that the current University’s budget cycle was in mid-fiscal year. Through this period of upheaval, the Directors remained committed to working toward a single model of research administration for the campus and transparency to the affected staff.

A breakthrough occurred when the VCR requested and received mid-year funding for two new positions in RDS and in SPO. In addition, the VCR was able to redirect funds in order to purchase software to accommodate the submittal of system-to-system proposals to some federal agencies, as a first step in the development of a complete electronic research administration system. These advances demonstrated to the research administration community that change was imminent and that the campus would implement the recommendations made by the Peer Review Teams in an incremental and ordered manner.

Once support for the revamped proposed model was gained from the Deans, much of the process of gaining support from other leadership was relatively easy. Faculty were very supportive of the plans because it was seen as a promise of expanded service levels. Additionally, it was clearly communicated to faculty that any changes would be made from a customer service focus (with the faculty as the customer). Indeed, the faculty were some of the strongest supporters of implementing the recommendations, precisely because of the proposed increased administrative support. In that regard, the fact that the University of California operates under a shared governance system was a benefit in implementation; it is conceivable that the entire process might have proceeded differently at an institution without shared governance.

The only real barrier encountered in later stages of implementation was from the campus IT Department, which historically had not provided much support for research and research endeavors on campus. The IT Department was not fully versed in the importance of research administration (and had declined to participate in at least part of the peer review process, as discussed in part one of the case study); most importantly, the IT Department lacked the resources that would be necessary for implementation of a full-scale ‘in house’ electronic research administration system. Ultimately, these concerns were addressed by a decision to move to purchase an external software as part of a cloud based system and that bypassed the need for large amounts of in house technical support.

**Part Three of the Case Study**

Part Three of this case study will discuss the process of obtaining funding support in the University budget process for the expanded research development and administration services once the leadership in the Cabinet and in the Academic Senate accepted the basic concepts and proposals contained in the revised White Paper. Subsequent parts to this case study will also discuss the design of the system as implemented, challenges during implementation, and on-going assessment.
Peer Reviews at the University of California, Merced: Part Three
Peggy S. Lowry, Director, NCURA Peer Programs

This third part of a case study continues to examine the research administration change process at the University of California, Merced. Described in this third section are some of the challenges that occur with organizational change and the resulting difficulties when shifting positions and responsibilities. Visioning the change and implementing the change can bring to the forefront the need for in-depth communications between offices as well as significant attention to individuals who are impacted by the change.

Three particular aspects are worthy of note in this portion of the case study.
1. First is the significant change that is occurring with transforming services. This transformation is focused on identifying and implementing the types of services that will benefit faculty, through services offered by both people and software. While it is apparent service has always been a priority at UC Merced, there is sustained and clear expectation to create an infrastructure that supports research growth, with faculty needs at the core.

2. Second is the continuing attention to communication between the offices that support the research enterprise. This communication strengthens the understanding of the broad continuum that is research administration and the important roles that each office, and person, play in those services.

3. Third, as the research administration profession has become established with career opportunities offered throughout the world, the often difficult aspects of successful recruitments and offering established career paths becomes a key focus for many institutions, as it was with UC Merced. Given additional challenges of location and pay scale, many institutions are faced with investments in conducting national recruitments that may ultimately result in training and developing local personnel.

This in-depth review of the evolving research administration infrastructure continues to offer a number of valuable lessons learned in the process of implementing change.

Case Study Part Three: Navigating the Budget Process and Beyond
Susan Carter, Director, Research Development Services, UC Merced
Autumn Salazar, Director, Research Accounting Services, UC Merced
Thea Vicari, Director, Sponsored Projects Office, UC Merced

This is the third part of a case study about the assessment and change process for the research administration infrastructure at the University of California, Merced (UC Merced). Part One focused on the decision to engage external assessments: how this decision was reached, who was involved, the timeliness of the review, and details of the preparation for the Peer Review Teams’ site visits. Part Two, which was published in January 2014, discussed the Peer Review recommendations and
the process that was undertaken to assess those recommendations, including both short-term and long-term response strategies; community engagement and response to the review; and the strategic process to gain buy-in for development of an implementation plan.

Part Three discusses the process of obtaining funding support in the University budget process for the expanded research development and administration services. Also discussed are the challenges faced in recruiting for the new positions, issues with existing personnel, the importance of communication, the need for data, implementation of an electronic research administration system, workload determination of the “new” model, and lessons learned. Part Three will cover the period April 2013 through October 2014.

The Budget Process at UC Merced

Prior to the formal budget decision process in July, and as mentioned in Part Two of this case study, a breakthrough in implementation of a new research administration infrastructure at UC Merced occurred in April 2013 when the Vice Chancellor for Research (VCR) requested and received mid-year funding for two new professional positions in Research Development Services (RDS) and the Sponsored Projects Office (SPO). An additional professional RDS position was created when the Dean of one of the Schools offered to transfer an FTE from the School to RDS in order for that FTE to work in proposal development. Additionally, the VCR was able to re-direct funds to purchase software to accommodate the submittal of system-to-system proposals to some federal agencies, as a first step in the development of a complete electronic research administration system. These advances demonstrated to the research administration community on campus that change was imminent and that the University would implement the recommendations made by the Peer Review Teams in an incremental and ordered manner.

The University call for the July 1, 2013 through June 30, 2014 academic year operating budget was issued in January 2013. Each area of the institution submitted funding requests before the end of March 2013 for their unit’s highest priorities that were in line with one or more of UC Merced’s 2013-14 budget priorities, listed as follows:

1. Strengthen the research infrastructure
2. Build capacity and excellence in graduate programs
3. Respond to critical undergraduate enrollment demands
4. Improve the student experience, academic success and retention
5. Address faculty or staff retention challenges
6. Promote operational efficiency or effectiveness
7. Ensure campus safety and regulatory compliance

Budget narratives were reviewed by the Budget Review Committee, which makes recommendations to the Provost and Chancellor regarding the highest priorities for support. In the spirit of transparency, all budget narratives were posted on a...
password protected website. The Chancellor, with the assistance of the Budget Office, posted her funding request decisions online and discussed these decisions with faculty and staff in an open forum.

Research administration infrastructure competed with all areas of the University for funding. The VCR presented a budget request that focused on the need to address the recommendations of the peer review process through adaptation of a ‘research ecosystem’ that included elements of the peer review recommendations. This request also focused on providing ‘cloud based’ support for the research administration ‘ecosystem’ through the purchase of an entirely web-based electronic research proposal and award administration system. The VCR pointed out in his budget request that this electronic system aligned with almost all of the budget priorities listed above, particularly items 1, 2, 6 and 7. The requested additional budget items were given high priority and at the conclusion of the budget process, in addition to the mid-year positions discussed previously, the Office of Research was given an FTE in Research Accounting Services (RAS) and a third professional position in RDS in support of the new structure. The School of Engineering and the School of Natural Sciences each were allocated one new FTE to complement the VCR’s budget request.

**Challenges in Recruitment**

*General Recruitment Challenges*

Given the geographical location of the University, recruiting new staff to support research poses unique challenges in two areas.

1. For many higher level positions there is a limited local talent pool from which to pull. The closest research universities are either in the Sacramento or San Francisco Bay areas, both of which are approximately two to three hours’ drive from Merced. While the cost of living is lower in the Merced area, recruits are asked to give up the conveniences of living in the city for a more rural lifestyle. This reduces the number of candidates who are interested in pursuing positions at UC Merced, regardless of skill level. In addition, the pay scale is lower at UC Merced compared to other University of California campuses, although cost of living is also lower, particularly for housing. This makes the campus potentially less attractive to those employees who want to relocate but still remain within the UC system.

2. Recruiting from existing employees is also difficult. The University is growing rapidly but there has been little focus on training employees on research administration. There is training available to those who are currently in research administration at UC Merced but these trainings are rarely offered to those outside of the research administration classification. When the trainings have been offered campus-wide, there has been little interest in attending. There has long been a perception that the work is difficult. This unique environment can make it difficult to recruit from within for higher level positions like those that were a part of the proposed research administration restructure.

In addition to the challenges posed by geographical location, we faced the chal-
lenge of recruiting for positions that were not well defined. Given the major restructure that had taken place, it was difficult to say exactly what the job duties would be going forward. Because of the compartmentalization of the duties in research administration, positions were posted specific to RDS with the additional work of proposal pre-award assistance; the SPO positions lost any proposal development aspect; and the departmental research administrators became strictly post award. This was unique enough that we faced questions from candidates regarding exact job descriptions, which we did not have, and found ourselves with unusual candidate pools.

RDS Recruitment Challenges
Recruitment started for the three new RDS positions following the budget approval in April to August 2013; the recruitment was completed in September 2013. The formal classification for these positions was that of a Research Administrator 3; the working title was “Research Development Officer” (RDO); these positions were advertised as ‘front line’ positions that would work with faculty both individually and in groups, to provide support for proposal development as well as for facilitating research collaborations and helping faculty plan strategically to obtain funding for extramural research.

For one of the three positions, RDS was able to promote an existing RDS staff member from an administrative/analytical position to a professional RDO position after determining that a majority of that staff member’s actual duties had been at a higher level than her classification. A national search was conducted for the other two new positions.

RDS encountered a number of challenges in this recruitment process. The pool of applicants was small, despite an aggressive recruitment process. In addition, several top candidates withdrew from consideration based on what they viewed as limitations of relocating to the Merced area (these concerns focused mostly on personal issues related to services and schools in the Merced area). Lower salaries than offered by other institutions were also a barrier to external recruitment. In the end both candidates that were hired based on the external search had prior work history at other UC campuses or affiliates. Once the RDS unit was fully staffed the RDOs were matched to specific duties and faculty based on RDO experience and interests, and to assure continuity.

Departmental Post-Award Recruitment Challenges
In addition to the RDS positions, there were three departmental post award positions which opened up as a result of the reorganization. There were two positions in the School of Natural Sciences and one in the School of Engineering. In preparing to hire these positions, it was decided that the Schools and the Director of Research Accounting Services would come together and standardize the job description for these positions. Because of the standardization, the jobs were posted together and interviewed by the same committee. The idea behind this was to be able to pull candidates across position pools if there was one School who received more qualified candidates than the other.
For one of the two positions in the School of Natural Sciences, an existing employee in that School, who had been working in grant administration as a contractor, was hired into the permanent position. The second position was much more difficult to fill. Similar to the RDS search, several of the top candidates withdrew based on issues with relocation to the Merced area. The second post-award position in the School of Natural Sciences remained unfilled until December 2014, taking over a year to fill.

The position allocated to the School of Engineering had a pool which yielded no qualified candidates. Complicating this was an administrative restructure in that School. The decision was made to put the position on hold and attempt to recruit for it again after the administrative restructure. That position is currently unfilled and was reposted in October 2014.

In the end, there were few qualified candidates who applied for the open post-award positions even though, as with the other research administration positions, there had been aggressive recruitment.

Challenges with Existing Personnel
The confusion regarding the exact responsibilities for the new positions was not felt by the job candidates alone. The existing staff, particularly in SPO and Research Accounting Services (RAS), which had larger, more established staffs than did RDS, also struggled to understand the new structure. The staff became confused about how they fit into the bigger picture; what their own career prospects were; and what benefit they ultimately provided to the University. Although there had been very high-level definition of the new responsibilities of the offices (see below), this was not translating well to existing staff.

High level responsibilities:
◆ Research Development Services (RDS) – Assist faculty with identifying funding opportunities and assistance with proposal preparation.
◆ Sponsored Projects Office (SPO) – Proposal review and submission. Award negotiation and acceptance.
◆ Research Accounting Services (RAS) – Central office financial management of extramural awards.
◆ Departmental Staff – Post award extramural funds management.

Impact on Existing SPO Staff
The reorganization impacted several employees in the Sponsored Projects Office who were not happy about losing the proposal preparation portion of their job. As a result, one individual in the office actively sought a similar position at another institution and eventually left when the University could not counter the offer. That departure left some remaining staff stressed and concerned about how they would keep up with the volume of work under a new structure. Recruitment for the vacant position in SPO began immediately but the candidate pool did not contain seasoned candidates, for many of the reasons discussed earlier. Instead, the outcome of
this search resulted in selecting an incumbent who would need to be trained due to lack of direct experience.

Impact on Departmental Research Administrators

The departmental post-award research administrators were also upset about the restructure, specifically the changes made to their job descriptions which omitted any pre-award work. They struggled to understand how one could decouple pre- and post-award and still be efficient. They were concerned about identifying hand off points for the budget information that goes in to the proposal and how this reduction in scope would ultimately impact their own career. This was further complicated by the fact that initially the RDS staff did not have the financial access necessary for budgeting which required the department RA’s to provide this information. This confirmed their opinion that the new structure was inefficient.

The loss of all pre-award work performed by Departmental RA’s adversely impacted their relationship with the faculty as they now only interacted with the faculty member when discussing administrative transactions on existing grants. While assisting with pre-award the departmental RA’s gained an understanding of the scope of work tied to the funding and could better assist faculty with navigating policy. That understanding of scope was reduced significantly once they were no longer involved in the preparation of the proposals. The end effect was that they no longer felt as though they were partners in the research process and struggled to see the value they added to the research enterprise or the University as a whole.

Additionally, when the departmental research administrators were involved in the pre-award process, they had found it easier to manage their workload because they had an idea of the number of and restrictions on potential future awards. This insight into future awards was eliminated with the restructure and would not be reintroduced until the electronic research administration system was implemented.

Impact on RDS Staff

The integration of some of the proposal development and pre-award services with the strategic work that the RDS staff performed to help faculty identify and pursue funding opportunities did lead to new, strong relationships between faculty and these newly hired staff, who were assigned to work with the same faculty members over time. While outcomes have not been fully measured, preliminary indications are that in fact the RDS staff were successful in significantly increasing research funding during this period.

Determining Appropriate Workload and Business Processes

After the implementation of the new research administration structure and prior to embarking on the implementation of a new electronic system, it became clear that there was a need to map current business processes as well as ideal business processes. To this end, SPO, RAS, RDS and the departmental research administrators met with a facilitator for several days in July 2013 to begin this process. The resulting business process maps formed the basis for identifying areas for improvement,
areas where automation was possible/encouraged, and served as a roadmap for where we currently saw ourselves at the conclusion of the implementation of electronic research administration system.

The July sessions also began conversations around how the units within the Office of Research interact with each other and with their stakeholders. It was enlightening to have all parties in the room discussing how they assumed they were supposed to operate. The varied units began to really understand their dependence on one another and gain an understanding for why things were being done a certain way. This understanding led to less frustration and to more introspection.

**Development of the New Electronic Research Administration System**

In winter 2014, the VCR convened a functional team, the ERA team, to help bring about full implementation of the new ERA system. This group included:

◆ the Directors of RDS, SPO, and RAS,
◆ a representative from campus IT assigned to work with the Office of Research,
◆ the Assistant Director of SPO,
◆ one of the new RDS staff, and
◆ the VCR.

Subsequently, a project manager was hired for the implementation of the new ERA system and to oversee the work of the ERA team. The team met every other week beginning in October 2013. Utilization of the ERA system for proposal submission and for collection of proposal data began in July 2014. While full implementation of the system will be discussed in Part Four of this case study, it is important to note that system implementation created additional pressure on staff in all three central units as they began to learn a new electronic system at the same time that basic job duties were being altered.

One interesting outcome of the establishment of the ERA team is that, while it originally focused on giving input into the development of the new electronic system, it became a forum for communication and development of the research administration ‘ecosystem’ overall. A number of the team discussions focused around such areas as workflow and roles and responsibilities.

**Interaction among Research Development Services, Sponsored Projects Office, Research Accounting Services**

As mentioned earlier, one positive outcome of development of the new system was the implementation of a variety of mechanisms to increase communication and improve workflow between the RDS, SPO and RAS units. RDS and SPO staffs implemented weekly team meetings. These meetings are held on Monday mornings to provide a platform to discuss any unusual workflow issues anticipated during the week. Meetings are typically brief (a half hour or less) unless unusual issues arise, and meetings are held via videoconference due to the various campus and off-campus locations of the units. Additionally, the SPO and RAS Directors convened standing meetings to discuss implementation of the new Office of Management and
Budget Uniform Guidance which could alter business processes for their immediate staff and for departmental research administrator staff.

**Lessons Learned**

The development of the research administration ecosystem and the implementation of the new systems at UC Merced resulted in a number of ‘lessons learned’ that could be very important to consider at other institutions facing the challenges of major institutional change.

One lesson is to be very cognizant of the importance of change management in helping to address staff concerns about changing roles. As the process was rolled out, it became obvious that it was very important to clearly determine and document the roles and responsibilities of staff in those related roles. In that regard, it soon became clear in the context of rolling out the electronic research administration system that better definition was important even after the changes in staffing were well underway.

The staff of the RDS and SPO departments held a retreat in summer 2014 to discuss the changes that had occurred and to outline expectations about roles and responsibilities. One outcome is that both units are developing and revising desk manuals to contain this information. As part of the work of both the ERA Team and the RDS/SPO teams, the groups have begun to define and document workflows between the departments including expectations regarding response times, turn around times on interdepartmental requests, and various other interaction points. A follow-up retreat is scheduled for October 2014.

Additionally, the groups worked to define reasonable expectations about response times to faculty requests, particularly those sent from faculty at the last minute. These discussions led to set timeframes and submission deadlines that will be communicated to faculty from the VCR. An important ‘lesson learned’ is that communication on issues of timelines and submission deadlines should be made by the administrative leadership in as clear a fashion as possible.

The need for clear communication and the importance of the dissemination of information was a lesson learned from the ERA team meetings. The discussions at the team level did not necessarily always get fully communicated to all staff who did not participate in the team meetings. In that regard, it is an important lesson learned that even if there are structures in place for units to work together on a project, full communication to all involved staff and faculty is critically important.

One very interesting development happened during the hiring of the two departmental post award positions. There was a marked difference between the School of Natural Sciences and the School of Engineering candidate pools. A slightly different title had been given to the Engineering position, Post Award Analyst in Engineering versus Research Administrator – Post Award in Natural Sciences, with identical job descriptions. The Natural Sciences candidate pool drew much more qualified candidates than did the Engineering pool. It was a lesson in the importance of marketing the position correctly.

Part Four of the Case Study will cover the period November 2014 through April
2015 and will discuss the plan to assess the implementation of recommendations made by the Peer Review Teams - evaluate outcomes and ultimately determine if there is an improvement in services to the faculty.
Knowledge Check

The Q&As at ¶3990.1 are intended to be used in the training of new staff and others who may be less familiar with sponsored research administration. They are designed to measure how accurately the material contained in Chapter 3900 has been understood. Note: For the answer key for ¶3990.1, see ¶3990.3, which appears on a separate page (page 3990:5) for testing purposes.

Discussion topics at ¶3990.2 are designed to engender dialogue among staff on general issues of importance in the field.

¶3990.1 Q&As

1. Possible “risks” involved in conducting an assessment could include
   (a) A risk that a process or policy that is found to be noncompliant could carry associated costs to correct it
   (b) A risk that staff morale or the office’s credibility could suffer in the event of negative findings
   (c) Both (a) and (b)
   (d) Neither (a) nor (b)

2. In its basic sense, what is assessment?
   (a) A process to answer critical questions about staffing
   (b) A process to identify and categorize key information about the award
   (c) A process to look at what one does and how well one is doing it
   (d) A process to sensitize staff about the concerns and fears of stakeholders

3. Typically a site visit by a federal agency is
   (a) A means to gather data
   (b) Another word for an A-133 audit
   (c) A for-cause self-assessment
   (d) One approach to conduct a focus group

4. Another word for metric is
   (a) Measurement
   (b) Database
   (c) Integration
   (d) Optimization
5. The evaluator(s) should receive a written “charge” letter that
(a) Details the scope and purpose of the evaluation
(b) Concludes the evaluation assignment
(c) Provides follow up to the evaluation
(d) Includes payment for the engagement

6. As discussed in ¶3905, in using metrics for assessment, there are typically three general categories of attributes that can be measured and that will assist with assessment activities. Which of the following is NOT one of the categories?
(a) Individual performance metrics
(b) Operational metrics
(c) Primary consolidated metrics
(d) Customer service metrics

7. As discussed in ¶3905, benchmarks are standards used to
(a) Include all appropriate views from stakeholders
(b) Examine a particular aspect of the operation and how well it relates to that standard
(c) Recognize politics and “turf” issues
(d) Provide continual feedback

8. What is the so-called assessment-management cycle?
(a) Consideration of the types of information useful to and needed for the assessment
(b) An analysis of all models of assessment used by peer institutions to determine whether those models can be incorporated into the next assessment activity
(c) Another term for a successful cost feasibility study
(d) Good management practices routinely turn assessment results into management decision making and actions

9. Characteristics of a focus group as described in ¶3905 include all of the following EXCEPT:
(a) They are a relatively low-cost technique for gathering information on a particular topic or set of topics.
(b) A focus group typically consists of 8-10 individuals who participate in a “group interview” led by a facilitator.
(c) It is a relatively high-priced, expansive technique for gathering feedback.
(d) A focus group facilitator could be a consultant or someone from inside the university or the OSP.
13990.2 **Discussion Topics**

1. What types of assessments does your office regularly use for evaluating its operations and performance? Be sure to identify the purpose of each type now in use. Are existing assessments in your opinion adequate? Explain your answer.

2. Regular reviews of sponsored program offices also can be part of an institutional compliance and ethics program. How does this work at your institution?

3. It is valuable to seek a wide range of views and perspectives in planning for and during any assessment process. Discuss how this practice is implemented at your institution.

4. What is the relationship between training and assessment in your office?

5. In this period of limited resources, assessment might be relegated to the sidelines? Discuss some relatively and inexpensive activities you could undertake to determine the adequacy of your services?

6. Have you ever discontinued or dramatically modified a service you were offering (for example, a training session)? How did you learn/realize that the service was not meeting the needs of your constituents? How did you determine what modifications needed to be done, or how did you conclude that the services was best eliminated?

7. Think about the last time you hired a consultant. Describe the process used to select the consultant and the after-the-fact process to evaluate his or her effectiveness (including cost-effectiveness). Were the processes adequate? Is there anything you would change?

8. Do you regularly review existing assessment tools for continued effectiveness and breadth of coverage?
13990.3  **Answer Key**
Following are the correct answers to the questions included at ¶3990.1.
1. (c) Both (a) and (b)
2. (c) A process to look at what one does and how well one is doing it
3. (a) A means to gather data
4. (a) Measurement
5. (a) Details the scope and purpose of the evaluation
6. (c) Primary consolidated metrics
7. (b) Examine a particular aspect of the operation and how well it relates to that standard
8. (d) Good management practices routinely turn assessment results into management decision making and actions
9. (c) It is a relatively high-priced, expansive technique for gathering information.

Introduction

Anthony Ventimiglia, Associate Director, Education & Communication, Office of Sponsored Programs, Auburn University

Why leadership? Such a basic question has a profound impact on how we interact with others and focus on daily activities (both professionally and personally). Three fundamental points are to be considered when addressing this question:

1. **Leadership is a central aspect of the human condition.** Whether sitting through a staff meeting or in a sports arena cheering on our favorite team, leadership is seen as a pervasive aspect of our lives.

2. **The vitality of an organization succeeds or fails based on leadership.** We have all read about high performing organizations that have seen an increase in profit, productivity and job satisfaction due to effective leadership. Unfortunately, we are also aware of failures caused by ineffective leadership.

3. **Effective leaders are made not born.** In order to truly mature as leaders, we are continually learning and refining our abilities.

With these fundamental points in mind, the goal of this new chapter of the Guide is to provide informative articles and leadership tips that can serve as a resource as you navigate through life’s daily challenges. We will explore topics in developing human capital, mentoring, leadership skills and management with the goal of not only contributing to the development of an individual as a leader, but also as a well-rounded Research Administrator.

A question that is often asked, especially by research administrators, is “Why should I be concerned with leadership – particularly since I am not in a management position?” This was best answered in the March 2006 NCURA Newsletter “Leadership Tips” article written by Suzanne Rivera and Toni Shaklee:

Some readers may think, “I’m not a leader. What does this have to do with me?” But research administrators are leaders! Interpreting laws and regulations, creating forms and business processes, developing and delivering training programs, reviewing proposed budgets; providing appropriate protections to research subjects – each of these activities is a leadership function. Perform these functions well and with integrity and you teach others how to do research responsibly. Do them poorly and the quality of research at your institution will suffer.

Wikipedia describes leadership as “a process of social influence in which one person can enlist the aid and support of others in the accomplishment of a common task.” This viewpoint of leadership is focused solely on goal accomplishment. However, leadership can also be defined as the capacity to influence others by unleashing their power and potential to impact the greater good. Through this viewpoint, strong leaders initiate action, provide motivation and guidance, create confidence, build morale and support an efficient work environment. The focus of this chapter...
will be on understanding the role that human capital has in an organization’s success and recognizing and cultivating the potential of others.

In *The Essence of Human Capital in Research Administration*, Nancy Daneau and Michael Hadjiargyrou provide a framework for the effective development and management of human capital.

Two related articles, *You Mean it’s Not All About Me? Building Relationships using MBTI*, (Theresa C. Partell and Candyce C. Lindsay) and *Playing to Your Strengths: Bringing Out the Best in Both the Introverts and Extroverts*, (Erin Bailey, Julie Guggino and Samantha J. Westcott) discuss the benefits of utilizing the Myers-Briggs Type Indicator (MBTI) assessment tool in order to develop an awareness and appreciation of the ways in which different individuals process and act on information.

In *Mentoring*, Govind Narasimhan, Margarita Cardona, and Randi Wasik provide the perspective of a mentee, including tips on selecting a mentor and the importance of establishing a healthy mentee-mentor relationship.

A quote attributed to Jeffrey Pfeffer sums it up best: “Your most important task as a leader is to teach people how to think and ask the right questions so that the world doesn’t go to hell if you take a day off.”
§4101.1 Self-Assessment

While not a big fan of the classic western or war movie, when I do pause long enough during channel surfing I am often intrigued by the charismatic leader who is able to rally his troops and lead them into life-altering circumstances. In politics and business (and maybe within our own institutions) we often see leaders emerge who are truly inspirational. Research shows that transformational leaders – leaders who are positive, inspiring, and who empower and develop followers – are better leaders. They are more valued by followers and have higher performing teams.

A quick Google search will return various web sites touting the “10 characteristics of a Good Leader,” “23 Traits of Good Leaders,” and “Seven Qualities of a Good Leader.” Honesty, focus, passion, respect, confidence, clarity, motivation, spontaneity -- all very admirable traits and characteristics -- tend to be a recurring theme in many of these lists. The question is - how do we develop our leadership style and capabilities in order to become the leader we want to be? It has to start with the individual – with a focus on ‘the leader within.’ It is impossible to be a successful leader if you lack an understanding of your own motivations, limitations, values and personality traits.

In this update, the focus will be on the theme of self-assessment and the correlation this has to the development of our leadership skills.

In Wisdom in a Window: On Becoming a Leader, Gale S. Wood addresses the concept of self-assessment through the framework of the Johari Window, a conceptual model that has been used extensively for over 60 years as a tool for personal growth.

Winnie Ennenga, in the article Self-Leadership: The Life-Long Challenge, addresses the issue of self-regulation and provides guidance on leadership inventories that can assist in this on-going learning process.

In the article entitled The Incredibly Trustworthy Leader, Mary Louise Healy discusses the model of servant leadership and the importance of trust.

A Leader Listens, an article written by myself and Robert Holm deals with the importance of “active” listening – a skill all too often ignored.

Stephen Covey provides a great summation related to self-assessment:

“Personal leadership is not a singular experience. It is, rather, the ongoing process of keeping your vision and values before you and aligning your life to be congruent with those most important things.”
¶4101.2 The Art of Leadership

Full disclosure – I am not “creative” within the realm of visual arts. This would not come as a surprise to my 8th grade art teacher who (much to her credit) never gave up hope on me even after an inauspicious papier-mâché disaster (which I believe was meant to be a mask….). That said, the focus of this update will be on the art of leadership and management.

“Art” has been defined as “the expression or application of human creative skill and imagination, typically in a visual form such as painting or sculpture.” However, most people automatically equate art with the visual form(s) and overlook that the “application of human creative skill” lends itself to the principals of leadership. In a TED Talk given by John Maeda (President of the Rhode Island School of Design), he discusses the topic “How Art, Technology and Design Inform Creative Leaders.” Within the talk, Dr. Maeda discussed the intersection of art and leadership and (what I found most interesting) provided a comparison of the characteristics of traditional leadership versus creative leadership:

<table>
<thead>
<tr>
<th>Traditional Leadership</th>
<th>Creative Leadership</th>
</tr>
</thead>
<tbody>
<tr>
<td>One-way</td>
<td>Interactive</td>
</tr>
<tr>
<td>Concerned with Being Right</td>
<td>Concerned with Being Real</td>
</tr>
<tr>
<td>Follows the Manual</td>
<td>Improvises when Appropriate</td>
</tr>
<tr>
<td>Loves to Avoid Mistakes</td>
<td>Loves to Learn from Mistakes</td>
</tr>
<tr>
<td>Reliability</td>
<td>Validity</td>
</tr>
<tr>
<td>Orchestra Model</td>
<td>Jazz Ensemble</td>
</tr>
<tr>
<td>Community in Harmony</td>
<td>Community in Conversation</td>
</tr>
<tr>
<td>Wants to be Right</td>
<td>Hopes to be Right</td>
</tr>
<tr>
<td>Open to Limited Feedback</td>
<td>Open to Unlimited Critique</td>
</tr>
<tr>
<td>Sustaining Order</td>
<td>Taking Risks</td>
</tr>
<tr>
<td>Closed System</td>
<td>Open System</td>
</tr>
</tbody>
</table>

While both styles of leadership “may” lead to expected outcomes, it is clear that creative leadership seeks to be a much more collaborative experience – one that benefits all parties, and increases the potential of all involved.

The following articles explore the intersection of art (creativity) and leadership in different ways.

In Leadership as Art, Beth Kroger discusses three essential themes which recur through the topic of “artful” leadership (integrity, building and nurturing relationships, and the crucial nature of community building).

Lealie M. Perry, in the article entitled The Evolution of Emotional Intelligence, discusses the concept of emotional intelligence. You may ask, “How does this relate to art?” This is addressed in two ways. First, when you review the components of emotional intelligence you notice that they have a striking similarity to the characteristics of creative leadership. The second way this is addressed is through Lealie’s use of the arts – literature in particular – to reflect how different levels of emotional intelligence and leadership abilities are exhibited (specifically in Shakespeare’s Taming of the Shrew).

Finally, Jeffrey Cufaude provides seven fundamental points for innovation in the article What is Required for a Facilitated Session to Produce Bold Thinking and Fresh
Ideas? The goal of this article is to help you to think more creatively in facilitating meetings – and for those of us for which meetings are a staple of our daily interactions, this is useful information!

“If your actions inspire others to dream more, learn more, do more and become more, you are a leader.” John Quincy Adams
¶4101.3 Leadership Tools

I am not particularly mechanically inclined. If it involves tools, construction and/or a motor, I am normally at a loss. I often share the story about coming home from church one Sunday and while pulling into the driveway noticing that my son’s window screen had fallen out of his window. Upon mentioning this to everyone in the car, my son exclaimed from the back seat that I should probably call my neighbor to help me put it back in. Clearly my reputation precedes me – even at home!

Having said that, tools are important in many ways -- from those which serve a purpose in accomplishing a task -- to the natural ability people have that can be utilized to further develop their capabilities. This update will provide you with some “tools” for your leadership toolbox.

In *The Tools of Extraordinary Leaders*, Kimberly Pace and David Furse provide some great recommendations that you can implement to further develop your leadership abilities.

Two articles in this update will address the importance of Emotional Intelligence (EI) as a “tool” for leaders. EI refers to the ability to perceive, control, and evaluate emotions. In a Harvard study, EI was found to be twice as predictive of excellent performance as expertise. It is also positively correlated with participative management, putting others at ease, relationship building, doing whatever it takes to win, and managing change effectively.

In the article *Exploring Emotional Intelligence (EI) for Better Leadership*, Michelle Vazin, Helena Moynahan and Robyn Remotigue provide an introduction of EI and its components. It also introduces the concept of “amygdala hijacking” (managing the trigger point for the fight, flight, or freeze response), which is further discussed in *Emotional Intelligence, Paper Tigers, and Pause Buttons*. In this article, Robyn Remotigue and Laura Letbetter more fully discuss how these concepts relate to research administrators.

Finally, the last tool for your toolbox is optimism. Ann Smith and Maria E. Valero-Martinez provide a great foundation for its benefits in the article *Is Your Glass Half-full or Half-empty? Creating a Framework of Optimism*.

“The expectations of life depend upon diligence; the mechanic that would perfect his work must first sharpen his tools.”

*Confucius*
Transformational Leadership and Team Performance

As the father of two boys who have both played sports (primarily baseball) since the age of five, I spend an inordinate amount of time on baseball fields. Over the years, I have enjoyed analyzing the interactions between various coaches and teams (whereas most people would just enjoy watching the games and their children…) and there are many cases where I noticed a direct correlation between the coaching style and the outcome of the game (although sometimes it just comes down to a great play!). How a coach “leads” his team has an impact on how the team performs.

Team interactions that, in some cases, seem to come naturally on the playing field do not often translate as well in the “real world.” However, the benefits of organizational teamwork are abundant and include (but are not limited to) the following: work efficiency (accomplishing tasks faster and more competently than tackling projects individually); improved employee relations (providing employees an opportunity to bond with one another); increased accountability (team members do not want to let each other down and do their best to contribute to the success of the team); and the establishment of learning opportunities (cooperating on a team enables newer employees to learn from more experienced staff).

The focus of this update will be on team performance, with an emphasis on the significance of transformational leadership to guide the process.

In Transformational Leadership’s Impact on Team Performance, Jo Ann Smith addresses the growth and significance of teams and how transformative leadership can positively impact the performance of teams in research administration.

Karen Woodward Massey provides tools and goals for developing and sustaining innovative and high-performing teams in the article entitled Creating and Maintaining Effective and Innovative Teams.

The Art of Facilitating, an article by Jeffrey Cufaude discusses the role of facilitation in an effort to build the capacity of teams, with tips that tie directly to the organizational benefits of teamwork.

As Research Administrators, teamwork and transformation are “buzzwords” that we often hear mentioned in meetings. The hope is that the information within these articles will provide you with the knowledge and tools needed to develop and maintain effective teams within your own institutions.

“The strength of the team is each individual member. The strength of each member is the team.”

— Phil Jackson
¶4101.5 Psychological Contracts

Psychological contracts are a contemporary concept which represents the mutual benefits, perceptions, and informal obligations between an employer and an employee. There are various models that illustrate this, but I find that the ‘iceberg’ model (found at http://www.businessballs.com/psychological-contracts-theory.htm) provides a useful tool for explaining and exploring the concept and its meaning for team-builders, trainers and leaders.

In most cases, only a small portion of the entire iceberg is visible above sea level. Now, picture the iceberg split down the middle as an employment relationship, reflecting the input (work) of an employee on one side and the reward (pay) of the employer on the other. While this “contractual” (employment) relationship is what is known (that which is seen), there are many factors just below the surface that can contribute to a stronger employment relationship (status and respect may lead to loyalty; responsibility can lead to innovation/performance). As these factors are initiated, more of the iceberg becomes visible, enhancing the relationship.

In most scenarios, discussions of psychological contracts focus on the employee’s position, however in Psychological Contracts and the Employment Relationship: What Managers Should Know, Bonnie O’Neill examines the dynamic between employees and employers in relation to psychological contracts with a focus on the manager’s perspective.

“People who never do any more than they get paid for, never get paid for any more than they do”

– Unknown
¶4101.6 **It Starts with You**

There are many quotes that refer to leadership as “a journey” attesting to the fact that it is not a stationary activity. However, do you ever stop to consider those who are on the journey with you? When I think about team building activities my memory automatically drifts back to college when I was a member of a service organization participating on the leadership team. At a retreat for the group, we participated in an activity in which all the team members held the end of a piece of rope in different locations throughout the room with the overarching goal of navigating to the person at the other end of your rope without becoming entangled with the other multiple rope trails that crisscrossed the room. If my memory serves me correctly, I do remember some cases of rope burn, but the activity required all the participants to work together and not individually in order to be successful.

In *It Starts with You: Five Ways to Build an Outstanding Team*, Donna Obeid provides her secrets to cultivating a great team with the hope of sharing information that will be both of value and of interest to those facing the challenges of team building.

*Individual commitment to a group effort - that is what makes a team work, a company work, a society work, a civilization work.*

– Vince Lombardi
¶4101.7  **Leadership in a “Smaller” Setting**

Is it possible to be a leader when you work in a setting with no (or limited) direct reports? Absolutely! Contrary to what is often expected, leadership is NOT management. Leadership is the capacity to translate vision into reality, and this is even more important at predominantly undergraduate institutions (PUIs) where one (or two) individuals tend to wear multiple hats: from pre- and post-award administrators to research compliance and technology transfer officers. Navigating a path from vision to reality is often very arduous when you have a team; imagine the issues that can arise in a smaller office!

In *Leadership of One: How to be a Leader at a Predominantly Undergraduate Institution*, Jeanne Viviani provides insights into the challenges and “opportunities” that are often encountered by individuals working in a smaller office setting.

*As a leader, the first person I need to lead is me. The first person that I should try to change is me.*

— John C. Maxwell
The Art of Juggling (better known as Work-Life Balance)

In twenty-three years of my professional career, I have had the opportunity to report (both directly and indirectly) to a number of managers with varied degrees of “balance” between their work and life. In one situation I worked directly for an individual whose work was her life. She had never married, had no children, was in the office before 7am every day and was often the last to leave. She had very high expectation for those who worked for her (thankfully, this was before the prevalence of smart phones and 24-hour availability)! Interestingly enough, while I reported to this individual, I was supporting a unit that was led by someone who was a leader on women’s issues for more than 20 years (at the time) and who had also wrote numerous articles and publications on work-life balance! Needless to say, it was an interesting three years.

While technology is wonderful, it can also contribute to an imbalance in our lives. Anyone else ever take a phone call from a panicked faculty member while on vacation? I had the pleasure of walking someone through the steps of submitting a report via the NIH eRA Commons system for thirty minutes while sitting in a pavilion in Italy (well, EPCOT Center, but it was still the Italy pavilion…).

Finding the right balance in our lives is important. Doing so as a leader is imperative.

In Leadership and Work-Life Balance, Laura Letbetter and Robyn Remotigue adeptly walk us through some of the research conducted in this area, providing tips for developing and maintaining balance, while also utilizing Kouzes and Posner’s five practices of exemplary leadership in bringing together leadership and work-life balance.

Imagine life as a game in which you are juggling some five balls in the air. You name them — work, family, health, friends and spirit and you’re keeping all of these in the air. You will soon understand that work is a rubber ball. If you drop it, it will bounce back. But the other four balls — family, health, friends and spirit are made of glass. If you drop one of these, they will be irrevocably scuffed, marked, nicked, damaged or even shattered. They will never be the same. You must understand that and strive for balance in your life.

— Brian Dyson, former vice chairman and COO of Coca-Cola
¶4101.9 The Building Blocks of Leadership

In order to be effective, leaders need to have a strong foundation. Ask anyone who lives in an area affected by severe weather conditions how important a home’s foundation is and you would most assuredly get the same answer – critical! Although I never was as enthralled with Legos® as some of my friends when I was younger (and, from what I’ve seen now, you need to have a Ph.D. in industrial design to build with them), I did grasp the concept of developing something of value from what would seem to be various inconsequential parts (or painful parts if you ever had the displeasure of stepping on them barefoot…).

In various articles, white papers and web postings, you can find many references to the “building blocks” of leadership. Depending on author, these range (in no order of importance) from “vision, interpersonal style, communication and decision making” to “passion, confidence, resilience and patience.” Is there a “right” set of building blocks? As is the mantra of research administrators everywhere, “it depends!”

In People First, Business Second – The Building Blocks Needed to Achieve Research Compliance, Roseann Luongo and Denise Moody describe five key competencies (building blocks) that a research administrator needs to establish to effectively balance customer service and compliance.

It is important to note that the building blocks of great leadership must be considered against the backdrop of performance objectives. Organizations need to identify their own appropriate building blocks, but the information provided within the attached article should give you guidance on your road to building that firm foundation.

“The basic building block of good communications is the feeling that every human being is unique and of value.”

— Unknown
¶4101.10  **It’s All About You**

At some point, we have all dealt with the “it’s all about me” mentality, especially those of us who have experienced parenthood, owned pets, or worked with a specific type of individual. However, in leadership (as in our daily lives), there are times where personal development and growth is necessary and warranted.

Within this update, we will be sharing five articles in which you will note a trend – it is all about you – and that’s ok!

In *Creating a Richer Life*, Christine Pacheco provides tips on managing yourself based on Stewart D. Friedman’s article *Managing Yourself – Be a Better Leader, Have a Richer Life*.

Riddick Smiley and Denise Moody discuss the concept of replenishment (and reflection) in their article *Replenishment Enhances Leadership Success*.

*Encouraging the Heart: Being a Positive Leader during Stressful Times*, an article written by Tammy J. Custer, offers tips on stress management for ourselves and those who work with us in order to set a strong leadership example.

Finally, two remaining articles *Using Nonviolent Communication in the Research Office* (by Cheryl Anderson, Carolyn Elliott-Farino and David Ngo) and *Difficult People: How to Know Them, How Not to be Them* (by Leerin Shields and Anita Mills) address the dark side of leadership – how to identify and deal with difficult people and situations.

“Knowing others is intelligence; knowing yourself is true wisdom. Mastering others is strength; mastering yourself is true power.”

— Lao Tzu
Effective Leadership for Research Administrators

What does it mean to be an “effective” leader? Meriam-Webster defines effective as “producing a decided, decisive, or desired effect.” Within the field of research administration, the word effective is used quite often – are our policies and procedures effective? Our training programs? Our support of faculty? Our compliance programs? In a recent NCURA Magazine (October/November 2014), the word “effective” was used 26 times! It is important that things be effective in our world.…

In the contingency theory of leadership, the success of the leader is a function of various contingencies in the form of subordinate, task, and/or group variables. The effectiveness of a given pattern of leader behavior is contingent upon the demands imposed by the situation.

As leaders, we need to be aware that effective leadership is not achieved solely through personal growth and reflection but through the ability to analyze and incorporate external variables into our decision-making.

In his article, Contingency Theory: An Alternative for Identifying Effective Leadership in a Constantly Changing Higher Education Landscape, Dr. Thomas Roberts integrates this theory into the ever evolving realm that research administrators live in order to better equip leaders with an understanding of the variables that impact leadership and the decisions that have to be made on a daily basis.

“Effective leadership is not about making speeches or being liked; leadership is defined by results not attributes.”

— Peter Drucker
||4101.12 **A Step-by-Step Guide to Discovering the Leader in You**

Tricia Callahan, Director of Proposal Development, Office for the Advancement of Research and Scholarship, Miami University

When assisting faculty new to electronic proposal submissions, I find it’s helpful to list the steps they need to take from start to finish:

- Step 1. Log into FastLane.
- Step 2. Select “Proposal Functions.”
- Step 3. Select “Proposal Preparation.”
  …and so on.

Providing a set of instructions assists faculty in navigating new systems and in learning new ways to do things. Listing the steps also ensures that nothing is missed along the way. Because I prefer a structured approach to most things — and I don’t want to miss anything along the way — I am always seeking guides to help me get from A to B.

Recently I began a leadership journey. I started out by attending NCURA’s workshop on *The Practical Side of Leadership*. From there I was fortunate enough to be selected to take part in NCURA’s Executive Leadership Program (ELP). I discovered, somewhat to my dismay, that there is no one step-by-step guide to leadership. That’s because leadership is a practical skill, and the art of leadership is often dependent upon the task or situation, the team being led, the organizational structure in which leadership occurs, and the experience and traits of the leader.

The good news is that while there may not be instructions for leadership per se, there are a number of leadership tools at our disposal that can help guide us on our leadership journey. The purpose of this chapter update is to showcase some of the steps, tools, and resources needed to begin and continue the leadership journey, beginning by discovering the YOU and ending by — well, it’s a journey, not a destination.

**Discovering the YOU**

One of the first steps on the leadership journey, as explored by Derick Jones in *Achieving Leadership by Moving “YOU” Out of the Way*, is to understand and own those experiences and personality traits that shape you as a person and as a potential leader. Once you understand, accept, and trust who you are, you can move from the “YOU” as a person to becoming an inspiring leader.

But how, exactly, do you come to understand yourself — including the abilities you possess and the traits you value in a leader? In her article *Tools for Assessing Your Leadership Skills*, Michelle Schoenecker compares two well-known, reliable inventories (the Leadership Practices Inventory® and the DiSC® Profile) that provide in-depth assessments into behavior styles, personality traits, and leadership qualities. These tools are explained in terms of indicators, use, and scoring. Schoenecker sums up each tool by sharing insights gleaned over the course of her NCURA ELP experience after using these assessments to better understand her YOU and her leadership journey.
Rounding out this update is a description of the Lead Me Program. Lead Me has launched over forty NCURA members on their personal leadership journeys. Here’s what participants in the program have to say about Lead Me - Discovering the Leader in YOU:

“The program challenged me to think outside my comfort zone. I still think to this day that they didn’t realize they awakened a roaring lion within.”

– Derick Jones

“The program acts as both a mirror and window.”

– Theresa Caban

“This program is a great stepping stone for those wanting to discover more about themselves…”

– Nelson, Moya, Pettis, and Purves

A quote by Vince Lombardi sums up this update best: “Leaders are made, they are not born.” I hope this update provides the tools you need to help guide your steps as you embark on your leadership journey.
¶4101.13 **Leadership and Staff Development**

“Staff development represents an intentional effort by supervisors and administrative leaders . . . to improve staff members’ effectiveness, leading to improved organizational effectiveness.”

— Winston & Creamer, 1997

Staff development, whether formal or informal, helps staff acquire and cultivate the skills and competencies necessary to advance the missions of their organizations. While promoting improvement in organizational effectiveness, staff development also promotes individual professional growth.

The most effective staff development practices are ones that are mutually beneficial to both the individual and the organization, and ones that tap into the innate talents and interests of our people and our organizations. Because this is an intentional effort, staff development requires planning and an investment of resources—both financial and non-financial.

In her contributing article, *Staff Development and Creativity*, Felicity Snyder leads us through ways to engage staff in thinking and acting more creativity. In addition to defining creativity, Snyder advises us on how to prepare to implement creative activities in the workplace while fostering a safe space for learning to occur. Much of the guidance builds on our current practices, reminding us that “creativity is innate, but sometimes it needs to be ‘re-learned.’”

Also included in this update is an article by David Lynch on financial planning for staff development. *Budgeting Professional Development for Sponsored Research Staff: A Scaled Approach* offers advice on planning for, implementing, and sustaining staff development activities. To maximize limited funds available to support operations, Lynch emphasizes identifying needs, setting expectations, and establishing guidelines when budgeting for development activities.

We hope you find this update on leadership and staff development innovative as well as practical for supporting your staff in their personal and professional growth.
**4101.14 Attributes of an Effective Leader: Practice Makes Perfect**

Humanity  
Humility  
Integrity  
Vision

These are just a few of the attributes common to effective leaders. These attributes show up time and again in books, on the Internet, in leadership development courses, and in numbered lists from three to a dozen or more. They have been tested and incorporated into practical leadership guides, like the one explored in this update’s first article, “Challenging Traditional Ways: Leadership, Trust, and Reducing the Administrative Burden,” (Mills et al.). They have been put into practice by millions of people around the globe. But it’s not just the attributes that matter; it’s the practice, perception, and results of those attributes that ultimately determine a leader’s effectiveness.

In the article, Mills et al. guide us through “The Five Practices of Exemplary Leadership,” (Kouzes and Posner), giving us an overview of each practice coupled with real life examples of each practice in action. To top things off, the authors issue leadership challenges throughout, inspiring us to flex our leadership attributes and encouraging us to make a difference as we travel on our leadership journeys.

In her article “Authentic Leaders, Effective Leaders,” founder and President of Candid Culture Shari Harley states, “People want to work with other real people,” reminding us that it’s the real-life practice of the leadership attributes that make a leader effective.

And rounding out the update is an insider’s perspective on “Women in Leadership,” by Suzanne Rivera of Case Western University. While the attributes of an effective leader show up in the media time and again, Rivera reminds us that how we put our leadership skills into play and how they are perceived may vary by gender, culture, and other factors outside our control (or are they?).

This leadership update reminds us to own our leadership attributes and hone our leadership skills, so that we can help our teams achieve amazing results.

“Effective leadership is not about making speeches or being liked; leadership is defined by results not attributes.”

— Peter Drucker
¶4101.15  **New Leader’s Resolutions**

Tricia Callahan, Director of Proposal Development, Office for the Advancement of Research & Scholarship, Miami University

Each New Year nearly half of Americans resolve to better themselves in one form or fashion, whether it be through saving money, reducing stress, or improving their overall health. Studies show that less than half are still on target six months into the year and likely no more than 15% will achieve their New Year’s resolutions. Reasons for failure include unrealistic goal setting, lack of follow-through, and simple forgetfulness. Those who are successful are found to be more committed to effecting change and have developed effective strategies for implementing change.¹

This update is focused on goal setting for leader-managers and on practices for conscious leadership. In her opening article, Kerry Peluso, Associate Vice President for Research Administration at Emory University, explores “Managers as leaders: Delivering the WHY?” Peluso emphasizes that moving beyond the what, when, where, and how of leadership to the “why” is important to becoming an effective leader. According to Peluso, successful leaders seek to better understand leadership, plan for (and own) their leadership development, and continually develop themselves as leaders. In other words, successful leaders are committed to effecting change.

In a related article, NCURA’s Tara Bishop provides the tools for developing effective and conscious strategies for implementing change. Bishop likens the tools shared to garments in a dressing room that can be taken out and tried on, one at a time, as we intentionally and mindfully travel on our leadership journey.

While resolutions can be easy to make, studies and personal experiences show they can be difficult to maintain. So where do we begin? Bishop suggests that, “[a]s with any change we are hoping to create, we start with ourselves.”

We hope this update adorns you with a myriad of garments you can try on as you commit to achieving your New Leader’s Resolutions and develop strategies to make them reality.

“A true leader walks the path of the heart and inspires others to work towards the creation of a better world.”

— Roxana Jones, co-creator of HealThruWords®

Leadership Lessons from Academia

Research administrators support grant seekers throughout the grant cycle, ensuring project goals and funders’ regulations are met. During our daily work with faculty, staff, students, and colleagues, we face challenges and opportunities, whether we are leading or being led.

“Being a leader has less to do with position and title and more to do with having or attaining the main characteristics of a great, successful leader... These characteristics are not stand-alone—they interconnect.”¹

But just how does one go about identifying leadership traits and honing leadership skills? In this update, Dr. Jim Oris, Associate Provost for Research & Scholarship and Dean of the Graduate School at Miami University, shares about opportunities for leadership development he’s encountered in his career—from time spent in the lab, to teaching, to leading his peers, to now leading a professional staff of over 20.

Following Oris, Dr. Megan Gerhardt, Professor & Co-Director of Miami University’s Center for Business Leadership, rounds out this update by sharing her vast knowledge and practice on leading others to identify and strengthen their leadership traits. The focus of Gerhardt’s article is on pinpointing one’s talents while managing weaknesses to become part of a successful, well-rounded leadership team.

The academic flavor of this update blends years of research, inquiry, and experience to help us identify and strengthen our leadership skills, while reminding us that we are never too seasoned to learn new things.

“…every single person is in a position to be a leader even if they are not the head of an organization and do not have direct reports.”¹

— Miriam A. Campo, The University of Tennessee, Knoxville

¶4101.17  Sport Leadership: Lessons Learned

As a head coach of a team, success comes from being able to inspire a group of people to achieve a common goal. An effective coach, like any effective leader, must be able to bring out the best in her players and does so by understanding the skills that each player brings to the game. While the goals of any team - whether it be volleyball, baseball, or research administration - may vary, success comes from having an organized leader who can inspire confidence and who can effectively guide team members through to the goal.

In her article, “The Sport of Leadership,” Katherine Durben, the Executive Director of the Office of Research and Sponsored Programs at Marquette University, shares analogies between leading a sports team and leading in research administration. Effective leadership takes teamwork, knowing and understanding the rules, developing a strategy, being willing to fail, and having a genuine love for the game.

“Leaders and great players are leaders and great players no matter what ‘sport’ they play.”

— Katherine Durben

In a related, follow-up article, Sue Kelch, Senior Financial Analyst in the Department of Otolaryngology at the University of Michigan, discusses being a good sport in addition to being a good leader - or rather how good leaders are also good sports. While good leaders must be willing to fail, the best leaders fail with grace and dignity. As importantly, they learn from their failures and model the way for others to succeed.

“As professionals, we need to prepare how to lead effectively for both outcomes; not only as the winner but as the ‘also-ran,’ ‘runner-up,’ or dare we say ‘loser.’”

— Sue Kelch, University of Michigan

Batter up!
¶4101.18 The Art of Communication

“The art of communication is the language of leadership.”

– James Humes

This quarter’s update is about the complexity leaders face when communicating in today’s multi-generational workplace. This workforce includes the Pre-Boomers (born 1925-1945), Baby Boomers (born 1946-1964), Generation X (born 1965-1976) and Generation Y, also known as Millennials (born 1977-). Such diversity has huge implications for employers in terms of managing people with varying needs, backgrounds, priorities, expectations, and attitudes. Leaders need to avoid expanding the generational divide, while remaining cognizant of the real differences in the ways employees learn, work, and communicate. To help us navigate these complexities, Carolin Munro, professor and consultant, offers tools for building relationships and breaking through communication barriers. Munro recommends first identifying the top communication crushers in our organizations: devaluing others, dominating conversations, and using evaluative language. Second, she recommends learning to connect in meaningful ways: engaging through inquiry, showing our imperfections, and seeing the possibilities in our differences. Finally, Munro suggests reflecting on what has worked and what needs improvement.

Using the simple tools offered in this update will allow us to recognize and break through our communication barriers. It will also empower us to learn from our mistakes, own up to our imperfections, and bravely take the first step in connecting with others. It is Munro’s hope that we learn to “connect in extraordinarily semi-perfect ways.”

It’s up to you to take the first step.
The essence, health, viability, and success of any organization, be it a private corporation, non-profit, university, even government, is in the way that its employees are treated. If employees are treated with respect, fairness, appreciation, understanding, flexibility, and are compensated equitably, financially and with good benefits, they will feel valued, be more productive, acquire a sense of belonging, and possess strong allegiance to the organization. Employees should not be thought of as commodities that can be “bought”, “used”, and “discarded”, but rather as assets in human capital. But what exactly is human capital and how does it relate to research administration?

What is Human Capital?

Human capital has been defined in various ways. Coff (2002) offers a very restrictive definition of human capital by referring to “knowledge that is embodied in people”\(^2\), whereas a much more encompassing definition is offered by Wikipedia; it is “the stock of competencies, knowledge, and personality attributes, including creativity, embodied in the ability to perform labor so as to produce economic value”\(^3\). The United States General Accounting Office (GAO) defines human capital as “people”\(^4\). But the GAO also follows its definition by stating that “people are assets whose value can be enhanced through investment” and the “organization’s human capital policies must be aligned to support the organization’s ‘shared vision’—that is, the mission, vision for the future, core values, goals and objectives, and strategies by which the organization has defined its direction and its expectations for itself and its people”\(^3\).

We are sure that there are additional variations on the definition of human capital. Regardless, this team of a research administrator and faculty member uses the terms “people” and “human capital” interchangeably, where human capital does extend beyond the individual’s knowledge and it includes his/her technical expertise, abilities, interpersonal relationships, and personality, especially responsiveness and adaptation to dynamic work-related, personnel, and organizational evolutionary changes. More importantly, we believe all aspects of human capital are interrelated and therefore the metrics of human capital are intrinsically linked to the productivity and ultimately the success of any organization.

---

1 This article is reprinted from the NCUIRA Magazine, Volume XLIV, No. 4, August 2012, published by the National Council of University Research Administrators. It is used with permission of the publisher.
3 http://en.wikipedia.org/wiki/Human_capital
If this is true, the goal of any organization should be to utilize those assets efficiently to maximize their impact so the organization’s success (as a measure of productivity or performance) can then be proportionally amplified and replicated. But how does any organization, particularly a research administration operation, go about “right sizing” its human capital and utilizing what is available to it in order to be “successful” and achieve its mission, core values, goals and objectives, strategies, and vision for the future?

Three Factors to Enhance Human Capital

As an organization evaluates the human capital it currently has or learns what it needs, leadership experts suggest there are three factors that commonly enhance human capital. First, an organization needs visionary leaders who assess the landscape related to employee commitment, morale, and motivation and who promote continuous improvement models. Second, key to the environment is a network of relationships and trust amongst colleagues that must be well understood so that collaboration and creativity can provide co-workers the opportunity to exercise influence. Third, culture and leadership styles must become important foci because hiring and employee development (beyond skill sets) affords an organization the flexibility it needs to adapt and respond to a dynamic and changing environment.

These factors are critical foundational components in the strategic development of an organization’s most important asset—its employees. Successful leaders conduct early and continual assessments of their organization’s human capital and respond accordingly. Given the current landscape of the ever-changing field of research administration, leaders must continually refine and set metrics by which to evaluate their “assets”. Knowledge, skill set, character, integrity, priorities, reputation, experiences, professional affiliations, and association memberships are just a few aspects of an individual to be considered carefully in relation to human capital components necessary for team building. Regardless, an employee who is transparent, trustworthy, and never compromises on the delivery of the best service and support within the organization validates the underpinnings of the organization’s human capital.

Recruitment, Retention, and Leadership

Recruiting the best and brightest and retaining competent employees is a challenge but as experts agree, top talent and people in critical roles are always in demand, and they are expensive and difficult to replace. Investments in recruitment and retention must be given top priority to solidify long term commitments from employees and in order to meet the organization’s mission and critical objectives. Failure to invest in the recruitment and retention of the best and brightest will only serve to send the wrong signal throughout the organization, one that simply says, “We are unwilling to invest!” Similarly, the devaluation of human capital can result from the loss of an individual that is well respected and admired within the organization as workforce morale can suffer because the harmony of the work environment is

---

Leaders interacting and connecting with employees directly is equally important to a research administration office that seeks to stabilize and strengthen organizational and interpersonal relationships as well as promote enhanced human capital. Leaders within the organization who are visible, optimistic, and confident and who communicate with their employees, even when there aren’t major milestones to report on, promote feelings of mutual respect which engenders loyalty and trust. Managers who provide intellectual stimulation and active mentoring/guidance in the workplace foster a collegial, entrepreneurial environment which helps the organization realize process improvements and efficiencies to gain a competitive advantage.

**Evaluation**

Every organization should periodically examine itself under a microscope, evaluate all of its assets to identify gaps, and plan resource requirements and allocations to achieve its mission and critical objectives. The combination of: a) the need to identify knowledge, skills, abilities and behaviors required to support the organizational mission; b) the ability to measure the extent to which employees have them; and c) the wherewithal to identify gaps and implement training programs to address those needs all play a key role in how the organization develops its human capital. This is also a critical measure of the organization’s success or failure. Part of the iterative and evaluative process by which employees can further seek growth is through the conduct of a performance evaluation. There are personal and professional development benefits (e.g., knowing their own strengths and weaknesses) to employees who participate in the process on an annual basis and those individuals are more suitably positioned to improve their performance and help to achieve organizational and institutional goals.

**Stress Management**

Without a doubt, as the world of scientific discovery continues to increase in diversity and complexity, the only constant in research administration is change. The fast pace of information and instantaneous communication flow places stress on human capital within our organizations. Stress levels of individual employees and groups within the workforce must be managed. Organizations should aim to capitalize on a “work hard”, “play hard” culture if it expects to be able to proactively respond to the equally fast-paced work ethic of the faculty it serves. An organization that is proactive in mitigating negative impacts to its human capital is one that recognizes the need for stress management and deals with it in a direct manner. Organizations focused on team building and promoting work/life balance for its employees benefit from strong human bonds and a collegial and entrepreneurial environment.

**Organizational Structure**

Given today’s complexities, another factor to be considered which plays a significant role in the management of human capital is organizational structure. Is a centralized or decentralized model best? Clearly, there are advantages and disad-
vantages to both approaches that arise and each organization must decide how to approach this aspect of operation depending on the responsiveness of its workforce. For example, if the organization recognizes early on that its workforce possesses the appropriate knowledge, skill set, character, integrity, priorities, reputation, and experiences to achieve success, then it can certainly support a more decentralized model and foster independence. In contrast, if the organization evaluates its human capital and identifies substantial weaknesses and gaps, then clearly it needs to take a centralized approach to management to ensure that its workforce is appropriately mentored and trained and costly mistakes are avoided. Implementation of centralized and decentralized management can and have been converted from one to another as workers become well trained, productive and independent by gaining confidence in their work and as the human capital of an organization develops specialists and generalists.

One Size Almost Never Fits All

So how does your research administration office “right size” its human capital to achieve its mission, core values, goals and objectives, strategies, and vision for the future? One size doesn’t fit all, but the exploration (a SWOT [Strengths, Weaknesses, Opportunities, Threats] Analysis) of your institutional/organizational culture and beliefs about human capital and the assets to the organization remains at the core of both the questions and answers. While this article focuses on research administration, the same can be very easily applied to academic departments and yes, even down to individual principal investigators training the next generation of scientists.

This team of human capital comprised of a research administrator and faculty member leaves you with inspirational words from Lowell Milken that both capture the essence of our philosophy and leave us hopeful for the future of science and those who dedicate themselves to advancing it: “There is something inherently optimistic about the fact that we can create and foster what our society [organization] most needs in order to flourish. And in this age of uncertainty, it’s a good thing to know that far from being finite and nonrenewable, the world’s most important resource—human capital—is limitless and generative. It is up to each of us to make the most of the opportunity.”

About the Authors

Nancy Daneau serves as the Associate Vice President for Research and Deputy Operations Manager for the Research Foundation for SUNY at Stony Brook University. Nancy is a Certified Research Administrator with over twenty years of experience providing research administration service and support at public and private research universities including those partnered with federally funded research and development laboratories. Nancy is a member of the Board of Directors, National Council of University Research Administrators and has served as an active faculty member, volunteer, and mentor for the professional organization since 1997.

dics and Genetics at Stony Brook University. Previously, he has served as Graduate Program Director and Associate Vice President for Research. He is a member of the American Society for Bone and Mineral Research and the Federation of American Societies for Experimental Biology and serves on the Editorial Board of a number of scientific journals.
4120.2  You Mean it’s Not All About Me? Building Relationships using MBTI¹
Theresa C. Partell, SUNY at Binghamton University, and Candyce C. Lindsay, Arizona State University

With research administration changing at such a rapid pace, promoting effective work relationships is essential to our interpersonal and organizational success. By gaining awareness and appreciation of the different ways you and your colleagues prefer to process and act on information within your environment, you can learn to work more effectively and become a better leader. In his book, Type Talk at Work, author Otto Kroeger writes about the importance of understanding those around us so that we may connect quickly to solve the problems at hand. He states that “success at any level requires that you must rely heavily on others and be tuned in to each individual’s needs, preferences, and styles.”

One tool that can help research administrators acquire such awareness and appreciation of others is the Myers-Briggs Type Indicator (MBTI). NCURA’s Leadership Development Institute (LDI) uses this tool to help research administrators learn to understand why people act or say the things they do and, as a result, interact more effectively with faculty and colleagues in their institutions and communities. After completing the assessment online as a homework assignment, LDI students share their results and learn how the knowledge of others’ styles can make a difference in their work.

The MBTI is one of the most commonly used assessment tools today. Developed over 60 years ago by Isabel Briggs Myers and her mother, Katherine Cook Briggs, the MBTI is based on psychologist Carl Jung’s theory of personality types. The tool provides a framework for understanding why people behave and think the way they do. The MBTI indicates one’s natural preferences along four scales:

◆ Extraversion or Introversion: Whether you get your energy from the world of people and things (E) or from the reflective inner world of images and ideas (I)
◆ Sensing or INtuiting: Taking in information by attending to facts, details and the present (S) or by attending to patterns, themes, possibilities and the future (N).
◆ Thinking or Feeling: Making decisions by objective, facts-based analysis (T) or by subjective, values-based analysis (F)
◆ Judging or Perceiving: Dealing with the outside world by being decisive, planned and orderly (J) or by being more flexible, open and spontaneous (P).

Each of these four dimensions is made up of a pair of opposite preferences or “dichotomies,” all of which are valuable and are used by everyone at least some of the time. This results in sixteen possible psychological types, each having different strengths and areas of growth. However, Myers and Briggs theorized that individuals naturally prefer one dichotomy, using it more than the other.

¹ This article is reprinted from the NCURA Magazine, Volume XLI, No. 2, April/May 2009, published by the National Council of University Research Administrators. It is used with permission of the publisher.
It is important to note that there is no “right” or “wrong” personality type; there are only differences. Individuals are unique, each with their own combination of personality preferences, interests, values, talents and skills. Kroeger teaches people to apply the knowledge from the MBTI model to celebrate these differences and use them constructively rather than to create conflict. It helps us understand that we all have different preferences and ways of thinking, thus enabling us to objectively view actions that we might previously have taken personally. Once the MBTI is administered and you understand and confirm your four-letter ‘type’ (ISTJ, ESFP, etc.) you can appreciate your innate strengths and recognize possible weaknesses or blind spots. Knowing your MBTI profile allows you to seek opportunities that capitalize on your strengths and develop skills in your areas of growth. Furthermore, the MBTI can help you gain a perspective on others’ personality types and what that means for your effectiveness, and theirs, and your interactions with each other. For example, an Introvert who prefers to do things independently, think things through before speaking, and work quietly, might be interested in knowing that her extroverted colleagues could be misinterpreting her as aloof and uninterested.

By improving our understanding of the needs and behavioral preferences of the people around us, we can learn to promote collaboration and reduce conflict by defining problems in typological terms rather than interpersonal ones. Anita Mills, a 2007 LDI graduate and Associate Director of Research Administration Training at New York University, finds that this level of self-awareness has enabled her to create a productive workplace environment that allows conflicts to be dealt with more easily. Utilizing the MBTI has helped her to relax and have fun with individual differences, while at the same time continuing to move projects forward. MBTI knowledge can also be used as a powerful team-building tool. It can help identify your team’s strengths as well as areas for growth, and assist you in developing a plan to further improve the interaction and, thus, the effectiveness of your team. Understanding individuals in your team whose preferred behaviors might be different from the others can improve your team’s overall effectiveness and productivity. According to Kroeger, preferred behaviors will emerge very early in a group’s formation and such behaviors will tend to support the typological needs and tendencies of the group members. He asserts that the goal for any successful group is not to change or neutralize individual members’ preferences, but to use this knowledge in an effort to maximize the effectiveness of the group. An astute leader will utilize the group’s typological information to ascertain how decisions are made and what level of information is needed to make such decisions.

◆ First, by looking at the EA distribution, the leader can identify what effect these differences will have on general interaction among the group members. When faced with a decision, Extraverts typically seek out guidance and support from others — they prefer to talk things through and use the energy they gain from others to help make their decision. Introverts, on the other hand, prefer to be alone so that they can process their thoughts — they tend to use introspection when making decisions.

◆ Second, by looking at the group’s SIN distribution, the leader can identify the
group’s dominant need for receiving information, be it detail-oriented or big picture. Sensing people choose to rely on their five senses — they prefer to gather data and focus on the here and now. Conversely, iNtuiting people trust their intuition — or “sixth sense” — and prefer to rely on themes, patterns, hunches and impressions in order to understand things or people.

◆ Third, by looking at the group’s T/F distribution, the leader can identify the group’s most-preferred decision-making style, be it based on logic or based on feelings. Thinkers base their decisions on objective criteria — they are more interested in finding practical solutions and making decisions quickly. Feelers, on the other hand, base their decisions on values, emotions and effect on people — they trust their gut and care about how their actions will make others feel.

◆ And, finally, by looking at the J/P distribution, the leader can better balance the process for making decisions with making the decision itself. Judgers are decisive and product-oriented — they can analyze the pros and cons of a situation quickly — while Perceivers are process-oriented and in search of alternate possibilities and solutions.

Leaders who have used the MBTI know what a difference it can make in their ability to work well with others and improve team relationships. With this new knowledge, leaders can begin to recognize the variations of the personality types and the importance that such diversity brings to the workplace. Furthermore, once leaders understand why they do things a certain way, they can learn to appreciate how others may interpret their actions. Many people who participate in this powerful self-understanding process discover a new self-worth and personal belief in their own abilities and potential.

About the Authors

Playing to Your Strengths: Bringing Out the Best in Both Introverts and Extroverts

Erin Bailey, Buffalo Center for Social Research, Julie Guggino, Central Washington University, and Samantha J. Westcott, University of California, Irvine

Demanding leadership challenges in both work and personal relationships often originate from the personality differences between introverts and extroverts. How many of us have been in a meeting with individuals who are quick to respond, often talking over one another or talking over anyone who speaks? At that same meeting, others may sit quietly, seemingly taking everything in, or appear bored or overwhelmed. Meetings and other workplace activities often fail to be productive when conflicting personalities contribute to a breakdown in communication. Neither personality type is better than another; however, learning to successfully lead your team to coalesce where all members play to their strengths and understand how to work together can lead to greater success for the entire organization.

Tips for Extroverted Leaders

Be concise. While you are invigorated by talking, are energized by interruptions, others may consider you overbearing and overpowering. Circulate information ahead of a meeting. Provide as much written information as is feasible before a meeting so that introverted team members have a chance to review the material in order to give you their best thinking.

Don’t expect immediate decisions. Pressuring introverted team members to come up with a decision on the spot may likely result in a decision that they don’t fully buy-in.

Allow silence its moment. A common complaint of introverts about Extroverts is about their listening skills—in particular, their rush to fill the silence. Practice self-management by valuing pauses which allow the real conversation to be heard.

Ask introverts for their thoughts. Introverts generally dislike having the light shining on them, so you may have to seek out their opinions. It is often more fruitful to meet one-on-one rather than in a public forum.

Respect introverts’ need for privacy. Practicing good social awareness skills entails understanding that extended extroverted activities can be draining for introverts.

Tips for Introverted Leaders

Give visual clues when listening. While introverts are often better listeners, their ex-

---

1. This article is reprinted from the NCURA Magazine, Volume XLIII, No. 10, May/June 2011, published by the National Council of University Research Administrators. It is used with permission of the publisher.

pressions may sometimes give the impression that they lack interest or involvement in the topic being discussed. Remedy this with simple things like a nod, a smile, and leaning forward—micro gestures that go a long way to signal to others that they are indeed being heard.

Raise your comfort level with public speaking. If public speaking ranks among one of your top dreads, resolve to conquer this. Developing the ability to stand up in front of an audience to deliver an engaging presentation is a strategic imperative. Lee Iacocca once said: “You can have brilliant ideas, but if you can’t get them across, your ideas won’t get you anywhere.” Develop the skills to help you share your brilliance with a wide audience.

Beware of voids created by non-communication. A void will be quickly filled by rumors, misinterpretations, and grapevine musings. Take the initiative to share information.

Provide timely feedback. Consider voicing your opinions sooner. Providing critical feedback once a project is well underway can frustrate or de-motivate others on the team.

Learn the art of small talk. If this is not a preferred activity for you, consider that small talk is the oil that lubricates relationships and paves the way for more important discussions.

Share more personal information. This helps more people know you better and increases the level of trust. Transparency strengthens our connections to others.

**Introverts and Extroverts 101**

The terms “introvert” and “extrovert” may be defined as follows: “(1) Introvert: An individual in whom exists an exaggeration of the thought processes in relation to directly observable social behavior, with an accompanying tendency to withdraw from social contacts. (2) Extrovert: An individual in whom exists a diminution of the thought processes in relation to directly observable social behavior, with an accompanying tendency to make social contacts.”

Since 1975 the Myers-Briggs Type Indicator (MBTI) has been used for psychological assessments and as a self-exploration tool. It considers four personality preferences:

- Extroversion/Introversion: how people derive their energy;
- Sensing/Intuition: how individuals perceive the world around them;
- Thinking/Feeling: how individuals make decisions; and
- Judging/Perceiving: how individual’s public personas, or outer world orientation are viewed.

In this article, we will discuss the Extroversion/Introversion personality preference. As with many aspects of the human personality, introversion and extroversion spectrum can be seen as a continuum.

---

Each individual’s preference falls somewhere along the continuum. Introverts are internally-directed. An introvert needs time to reflect, appears reserved, contained, and guarded in public. Introverts are often considered “deep” by others. The introvert typically thinks before speaking. Extroverts, on the other hand, are externally-directed. An extrovert is often action-oriented, appears gregarious, expressive, and unreserved in public. An extrovert typically needs to speak to think. These observable behaviors intuitively make sense when some of the physiological differences between extroverts and introverts are examined. With newer technologies like brain scanning and mind mapping, scientists are beginning to identify physiological differences. Introverts, for example, have a longer neural pathway in their brains and more blood flow to the parts of their brains related to internal experiences like remembering. Extroverts’ blood flow, conversely, is increased in the areas of the brain supporting sensory input: seeing, smelling, sensing. Introverts and extroverts also rely on different neurotransmitters. Extrovert pathways utilize dopamine differently than do introvert pathways whereas introvert pathways utilize acetylcholine.

**Introverts and Extroverts in the Workplace**

With such a broad spectrum of personality types ranging from the most reserved to the most outspoken, respecting one another’s work styles and finding ways to accommodate the continuum of personality types will result in greater job satisfaction and increased productivity. We will explore opportunities where leadership can bring out the best of everyone on the team. In meetings, for example, while introverts may find meetings stressful and often times draining, extroverts may see meetings as a way of being productive: a way to energize their batteries and energize those around them. For many introverts, their voices will be heard later, sometimes much later, after they have had a chance to examine all the facts and come up with a sound and informative answer. The leadership necessary for making successful meetings begins with awareness: the leader who can see those quietly biding time and find opportunities to make sure their voices are heard will enrich the interactions in meetings. With proper planning, effective leaders can intervene and create conditions that bring out the best in both the introvert and the extrovert and lead to more productive, effective meetings. Setting a tone and stating expectations for meetings can help curb the distraction or talking over and allow each voice to be heard. All those on the spectrum benefit from one another being a party to the meeting. The introvert needs the spontaneity and energy of the extrovert to start discussions and bring ideas to the table; while the extrovert learns to value the introvert’s ability to look at all the facts and problem solve.

In day-to-day interactions, consider some of your colleagues - you can probably name those who get their energy being around people. Those team members are likely extroverts. When extroverts are faced with a problem, they like to bounce their ideas off others. The extrovert may pick up the phone and call someone or drop by a colleague’s office. They have a need to connect with people. They externally process information and thrive on the energy from others to solve their problems. Extroverts are typically vocal, spontaneous and comfortable expressing
their ideas. Introverts, on the other hand, get their energy from working alone and processing information internally. When faced with a problem, introverts need to gather all the facts and need time to process the information before giving an answer. To work most effectively, introverts need to have a space where they can retreat and work quietly. They dislike interruptions and are content to work alone. They don’t mind working on long, complex, even tedious, projects. Extroverts can more easily adapt to open concept office environments and may actually increase their productivity due to the constant interactions. They are more welcoming of interruptions and physically move around more. They are quicker to become bored or impatient with repetitive tasks.

Effective Workplace Leaders: Introverts or Extroverts?
A good leader can be anywhere on the spectrum: from the shiest introvert to the most outspoken extrovert. Outgoing personality traits are often associated with top leadership roles. They are the ones seen as outgoing, assertive and excellent at giving directions. However introverts can also be great leaders with their attention to detail, listening skills, and their ability to think through issues in a more focused manner. Research suggests many businesses fail when they do not promote executives with more understated styles. Both introverts and extroverts have various talents and strengths and neither should focus on what they are not. Successful leaders know they are not perfect at everything nor do they want to be, hence they select team members who compliment their challenge areas as well as having a strong track record.

Effective leaders who are aware of the interpersonal dynamics of the members of their team can help alleviate problems based on the differences between introverts and extroverts. There are often assumptions or misunderstandings that occur when individuals come from different personality types. The two different types are diverse in the way that each processes information. If a person is rewarded for participating in meetings in an office, it can create tension for those who find it uncomfortable to speak up in meetings. On the contrary, if the atmosphere is unwelcome to those who think creatively in the moment and who may stray off-topic to follow a train of thought, it can stifle some of the ideas of those who work best when in a group setting. The best listeners in a group are not often the ones who share openly and their contributions can be missed. A lack of response may be misread as a lack of interest by someone who is openly sharing ideas and working within the group. Sometimes, conflict can be extended beyond what is necessary to solve it due to a need to talk everything out by some in the team. Other times, conflict avoidance can be detrimental, as key problems do not get addressed if they are not brought to the surface.

Given that effective leadership is not tied to a specific personality trait or type, the benefit of accepting the different personality types exists in how a leader both understands himself and how he understands and works with his respective team members. A major portion of a leaders’ role is communication, so it is very important for leaders to understand how their employees’ process information, so the
leader can adjust their approach to fit their audience needs. Also the leader with this insight can create a safe space in meetings to seek input from those who may be reluctant to speak. Through the resulting diversity of thoughts shared, the end result likely will be more effective and have greater buy in by the entire team.

A leader’s natural style will also offer enhanced development opportunities to the team members. Since a leader’s success is normally a direct result of his team members’ success, everyone wins when everyone’s strengths are leveraged. A leader who is on the far extreme end of the extroversion side of the scale may offer his team the networking and interpersonal skills that make connections to effectively improve business. A leader who is extremely introverted may offer his team the benefit of long-range strategic planning and written communication skills. The extrovert can lead those team members who are not as likely to stand up to opportunities to shine by connecting them to projects for which they would not volunteer. The introvert can lead those team members who are outspoken to more introspection by modeling the benefits of taking the time to make a thoughtful decision.

The differences in personality types are real and they matter. The contributions of the individual to the team are best when the individual can work at his best. While it is impossible to create an ideal environment that works for all members of a team all the time, knowing how each works best and providing those opportunities for the team member to thrive and do his or her best is the job of the leader. Giving the introvert the time to think, work independently, work quietly, and to get the job done right is key. Offering the extrovert the time to connect and work with others, to listen to others, and try doing things differently than before while still meeting the deadline can lead to success. Furthermore, forming teams that are balanced and sharing the expectations up front of how the team will work together and use their strengths to achieve the goals can offer the chance for every member of the team to share in the success.

About the Authors

Erin Bailey is the Center Manager and Senior Research Administrator for the Buffalo Center for Social Research where she is responsible for the daily management
of the Center, strategic planning, administration of all research grants both pre and post award, provide oversight and direction to faculty regarding research support activities, sponsor guidelines, grant or contract application requirements, post-award project administration and research policies and procedures. She received her CRA in 2007, has a bachelor’s degree from Wheeling Jesuit University and is currently enrolled in the Emmanuel College working on her Master of Science with specialization in Research Administration.

**Julie Guggino** is Associate Director of Research and Sponsored Programs in the Office of Graduate Studies and Research at Central Washington University. She is responsible for all pre-award functions, oversees grant-funded units and research centers assigned to Graduate Studies and Research, and manages graduate studies personnel and functions. Julie received a BS in Administrative Management and an MS in Family Studies from Central Washington University.

**Samantha J. Westcott** is the Assistant Director, Sponsored Projects Administration for the University of California, Irvine where she supports the efforts of research administration for the UCI campus. Sam is involved in strategic planning, training, and supporting the IT infrastructure enhancements and implementations, among her many duties. Sam is a long-standing member of NCURA and has served NCURA since 1995 in many capacities. She is a graduate of the 2010 class of the NCURA Leadership Development Institute. Sam is also a faculty member of NCURA’s Departmental Research Administration traveling workshop teams and was elected to the NCURA Board in 2010.
4120.4 **Mentoring**

Govind Narasimhan, University of Texas M.D. Anderson Cancer Center, Margarita Cardona, University of Baltimore, and Randi Wasik, Texas Christian University

The world of research administration is changing almost as rapidly as the research we support. As we face increasingly tighter fiscal constraints locally, uncertainty at the federal level and the disappearance of AREA funding, the organizations whom we serve and our peers who are in this “quicksand” playing field with us must grapple with the challenges of the economy, complex and ever changing regulations and goals set for us at all levels. For research administrators, mentoring continues to emerge as a viable alternative to conferences and other more costly professional development opportunities.

**Traditional and Non-Traditional Methods of Mentoring**

Traditional peer-to-peer relationships meet these individual needs, but increasingly there are also less traditional ways to mentor, such as via professional organizations; via higher ranking, more experienced managers; via similar organizations — i.e. university to university/similar positions; networking; group mentoring arrangements where a more senior leader will work with several high-potential learners; etc. Using an outside organization can be beneficial when the office is small. For those of us in the research administration environment, this can be the case more often than not even at large institutions. By using peers from surrounding institutions, one can further enhance their knowledge and career despite having limited resources close at hand. Professional organizations, peer institutions, and sometimes even our sponsors can serve as excellent resources.

**The Value of the Mentoring Relationship**

Mentoring enables one to be introduced into an organization, to be educated in a career for which, until recently, there was no formal training and to stay abreast of the massive amount of information that must be mastered. This said, our organizations increasingly recognize the value of mentoring and rush towards implementing formal and informal mentoring programs. They are beginning to view mentoring as a developmental stream, a reality of the workplace and an alternative to off-site trainings/conferences. Mentoring is first and foremost a relationship that meets the intrinsic values of the mentee and the mentor resulting in enhanced leadership skills and traits, wisdom and maturity that can lead to satisfying life experiences and objective decision making. It is all about the mentee, and the mentor has to view themselves as a caring friend, a role model and nurturer. After all, the mentee has entered into the relationship because he or she views the mentor in a special way, as someone the mentee respects and looks to for advice.

---

Selecting a Mentor

When people seek out others to mentor them, they desire:

◆ Sponsorship that opens doors
◆ Coaching
◆ A measure of organizational protection
◆ Opportunities for greater visibility in the institution
◆ Challenging assignments that stretch one’s capabilities
◆ Role modeling of appropriate behaviors and values
◆ Counseling
◆ Support and acceptance
◆ Friendship that makes one feel secure and appreciated

Zachary (2009) proposes a criteria-based decision-making model to selecting a mentor in order to make the most of the relationship:

(1) Identify your goal — examine your background and career path and determine why you want a mentor and what is it that you want to achieve from the relationship.

(2) Create a list of criteria — identify those qualities that you would like to see in your mentor without having someone in mind yet.

(3) Determine qualities that are “must haves” — from the list you generate, select two or three qualities that would make or break the relationship.

(4) Rank the remaining criteria or “wants” — rank order the remaining criteria you want to see in a mentor in the order of relative importance to you, basically assigning them a weight.

(5) List possible options — Brainstorm a fairly comprehensive and open-minded list of possible mentors, taking into consideration that they do not need to work in your own organization.

(6) Eliminate options that don’t meet the “musts” — if an individual in your list does fare well against your must have criteria, eliminate them as an option, as they will not make a good mentor for you at this stage of your career.

(7) Rate each option against the “wants” — rate the candidates against the other criteria using a numeric scale. Weigh the scores based on the ranking previously assigned to each quality.

(8) Make the decision — if you have made an honest assessment of your candidates against your list of criteria, the decision can be as simple as totaling the scores

---

and determining who came on top.  

(9) Along the way a third party should be checking in. Make sure regular meetings are being held/attended, what the participants feel is working and what is not and what else could be done/changed to enhance the relationship.

(10) Foster acceptance through listening

(11) Ask curious questions vs. accusatory ones

(12) Support and advice are gifts, both offered freely to be received with the understanding that they are just that — advice — it is up to the mentee how they will use this wisdom

(13) A mentor should bolster self-direction and independence — growth

Establishing a Healthy Mentee-Mentor Relationship

No matter what form of mentoring relationship is entered into, it should be a relationship from which both parties can learn, grow, share experience, and provide empathy and mutual support. Each form of mentoring relationship has its advantages and disadvantages. At a point in time when training budgets are dwindling, travel/conference dollars are tight, and loyalty isn’t what it once was, it might be necessary to enter into a mentoring relationship that is dynamic and may take on multiple forms across time to provide the most benefit. No matter what relationship(s) are entered into, it needs to be dynamic and evaluated/re-evaluated across time. As soon as it is recognized the relationship is not working, it needs to evolve and change.

It is important for a mentor to appreciate the mentee, their background, what they bring to the table and what they can themselves garner from this relationship. The mentor should not try to change the mentee into becoming “you.” It must be a relationship built on trust and viewed as a deliberate exercise in knowledge enhancement, sharing of wisdom by coaching and counseling that meets the mentee’s intrinsic and extrinsic values and expectations. As a mentor, one should approach the relationship with caution. While immediate work related gains like content expertise and skills of the mentee can be shaped, the mentee is looking to the mentor to contribute to her or his personal growth as well. Mentors should make every effort to relate to their mentees’ personal aspirations and assess early on in the relationship their ability to meet the mentee’s expectations. The mentoring relationship, whether formal or informal, must clearly establish expectations and be alert to signs of failure.

A supervisor and employee mentoring relationship is more complex and often fails because both parties fail to make clear distinctions between performance expectations and mentoring expectations. As a supervisor mentor, it is important not to make commitments that cannot be fulfilled, for example promotions, title changes, or raises. It is critical the mentor and mentee understand successful mentoring

---

experience can lead to satisfying professional development and career paths, but it does not necessarily equate to promotions and pay raises within the work unit or the organization.

After the relationship is established, the most common error is walking away. There are no set guidelines, no check-ins, no change as the relationship and participants grow and develop no additional insight/opinions, etc. If the relationship does not meet the needs and goals of the mentee, the relationship will fail. Change and growth has to manifest itself through ongoing dialogue, response to growth, response to outside factors, etc. If this doesn’t occur, it is highly unlikely the relationship will achieve positive results.

It is critical for both the mentee and the mentor to buy into the relationship based on a deep-rooted sense of mutual respect and caring. For mentoring to succeed, it has to mean something personally to both the mentor and the mentee. It is very easy in our profession of research administration for the mentoring enthusiasm to quickly fade away. There are a multitude of stressors which face us on a day-to-day basis. To enter into this relationship — this agreement —whether in the one on one scenario or a group scenario, all parties have to buy in and commit. An informal contract where both/all parties sign provides a healthy formalization of the relationship. Once an agreement is entered into, goals and strategies should be established. They should not be “etched in stone,” but rather be a basis for the relationship to work and grow from.

One must remember that a mentor-mentee relationship is just that — a relationship. That said, for any relationship to work it should be equal, open, sharing, without judgment, and ever changing. The relationship needs to be open to change and expansion beyond its original nucleus. Always think and move within and outside the box to best grow, learn, develop, and reach and exceed your goals.

About the Authors

Margarita Cardona is a Certified Research Administrator and holds a Bachelor of Science degree in Chemistry and Master of Science degrees in Chemistry and Materials Science. She has served as the Director of Sponsored Programs at the University of Baltimore since 2008.

Govind Narasimhan holds a Bachelor of Science degree in Finance and is the Associate Director of Research Finance in the Division of Cancer Medicine at the University of Texas M.D. Anderson Cancer Center.

Randi Wasik is a research administrator for the Department of Biochemistry at the University of Washington. She received her BFA in Music Performance from Carnegie-Mellon University and MBA from Texas Christian University.
There is good reason that the final articles read in NCURA’s Leadership Development Institute (LDI) and its successor, the Executive Leadership Program (ELP) are Level 5 Leadership: The Triumph of Humility and Fierce Resolve by Jim Collins and Leadership Run Amok: The Destructive Potential of Overachievers by Scott W. Spreier and Mary H. Fontaine. As with all good leadership development programs, NCURA’s begin with a focus on ‘the leader within’, helping participants learn and know as much about themselves as they can. Interestingly, often the more people know themselves, the greater the danger of blind spots that act as blinders that can derail them as they strive to lead others.

Collins describes what his research has found to be the pinnacle of leadership: those rare people who “blend the paradoxical combination of deep personal humility with intense professional will.” Among other characteristics, Level 5 leaders “demonstrate a compelling modesty” and act “with quiet, calm determination” relying on “inspired standards.” As someone who has studied leadership development and organizational dynamics for more decades than I want to enumerate, I have translated this concept into the importance of knowing one’s self as deeply as possible and seeking to understand how your internal motivations and natural preferences for knowing and doing may be different from those you seek to lead. Knowing this helps you manage your own behavior, communication and actions in ways that those you seek to lead can understand more easily.

Earlier articles in the NCURA Magazine by LDI/ELP graduates have highlighted the importance of ‘emotional intelligence’ in leadership development. Drawn from Daniel Goleman’s seminal work on the topic, self awareness and self regulation are two of the five components of emotional intelligence. In what is considered a Harvard Business Review (HBR) classic article, “What Makes a Leader?” derived from his book of the same title, Goleman defines self awareness as “the ability to recognize and understand your moods, emotions, and drives, as well as their effects on others” and self-regulation as “the ability to control or redirect disruptive impulses and moods and the propensity to suspend judgment, to think before acting.”

To self awareness, I add knowing your own strengths and stretches, your communication styles and problem-solving modes, and understanding how your life and the people in it have shaped your values and motivations. To self regulation, I add knowing your triggers and ‘calmers’, as well as knowing how the way you understand and deal with your world may be different from others and the effect those differences may have in the way you interact with them. After all, leadership is all about people.

In my leadership practice, I have found the Johari Window to be one of the most useful frameworks for self awareness and self regulation. Originally developed by Joseph Luft and Harry Ingham in the early ‘50s, this conceptual model has been used extensively for over 60 years by psychologists, organizational development practitioners, and coaches as a tool for personal growth. The Johari Window has
four panes, which I’ll review, going clockwise:

**Johari Window**

![Figure 4120.5-1. Johari Window](image)

- **The Public Area** depicts what you know about yourself that others also know about you (Figure 4120.5-1). The more you know yourself and can share with others so they know it, too, the larger this pane will become and the smaller the other panes will be. The theory is that the degree to which you and others know about you, the greater the trust will be between you and others because less is hidden. The foundation of leadership is trust, so the larger this pane is relative to the other panes, the better the chance that others will be comfortable with you as their leader. To make this pane larger, you need to disclose more about yourself to others, telling them what’s important to know about you and how you respond, communicate and lead.

- **The Blind Area** depicts your blind spot: what others know about you but you don’t know about yourself. In order to grow as a leader, you need to be open to learning how you are seen and experienced by others. The saying “perception is reality” is an important one to keep in mind as you seek to become more self-aware as a leader. To make this pane smaller and your public pane larger, you need to solicit and welcome feedback from others. You need to learn how effectively you are communicating and working with others, including learning from, and admitting to others, your mistakes. As importantly, you also need to
know where your leadership may be ‘going amok’ and driving others away. It’s easy to go into ‘overdrive’ without realizing that your behaviors might be counterproductive to the task of leadership.

◆ The **Hidden Area** depicts what you know about yourself but have kept hidden from others. It’s your ‘façade’ because it doesn’t reveal aspects about yourself that may be guiding your actions. Your behavior may not appear consistent with what you say you are, making you harder to read and, therefore, harder to trust. The more you share what you know who you really are and what drives you, the more others will feel they ‘know you’ as a leader and the more credible you will be to them. This may mean being vulnerable to others, but being willing to do so is important in what James M. Kouzef and Barry Z. Posner (The Leadership Challenge, www.leadershipchallenge.com) list as the first of five practices of exemplary leadership, that of Modeling the Way. The more open you are both in disclosure and acceptance of feedback, the more open others will engage in those behaviors to the benefit of your team.

◆ The **Unknown Area** depicts what neither you nor others know about yourself. Together, you and those you seek to lead can learn more about who you are. Through sharing your inner journey of leadership development and others sharing their observations about you, important discoveries can be made that will make you more effective as a leader. It is through this process that you may learn about your hidden talents. Often, it is through rising to the occasion during the most difficult and challenging times that such discoveries are made. Shrinking this window for a leader takes ‘fierce resolve’ and inner discipline. Indeed, one of the “truths of leadership”, according to Kouzes and Posner in their book of the same name is that “challenges are always the crucible for greatness in leaders.”

I believe, as do most practitioners in my field, that becoming an authentic leader that others want to follow is an ongoing process. Expanding the Public Area of your Johari Window can be an important quest in your leadership journey, the key to which is self-awareness along many dimensions. This includes reflecting and drawing from the story of your life and the people who have influenced you along the way. As you do so, always be cognizant of how unique you are as an individual and how those you seek to lead may be very different from yourself along many dimensions. Knowing your answers to these questions will also help you self-regulate.

◆ **Clarify your values:** what is most important to you, core to your very being? How do you live those values? In the HBR article, Discovering Your Authentic Leadership, the authors write “Leadership principles are values translated into action. Having a solid base of values and testing them under fire enables you to develop the principles you will use in leading.” Identifying and managing the gaps between your values and commitments is described well in another HBR article, Do Your Commitments Match Your Convictions by Donald N. Sull and Dominic Houlder.

◆ **Discover your motivations:** What drives you to action? What makes you want to achieve? What is most rewarding to you? In short, what makes you tick and why?
◆ **Learn your strengths:** What do you especially well and especially easily—and how do you know these to be true? (Over-confidence can be part of your blind spot.) What do you do that inspires others and enables them to act, two more of Kouzes and Posner’s five practices of exemplary leadership?

◆ **Know your stretches:** What is difficult for you to do and why? How does this affect your leadership? What do you need to learn to be more effective outside your comfort zone?

◆ **Know your emotional triggers:** What are your pet peeves? What causes you to feel like you are going off the deep end? What causes you to feel out of control? What are your pitfalls and stressors? What can you do to monitor and manage them? What calms you down?

◆ **Know how you learn:** How do you learn best? Are you someone who learns best by doing or by studying? Are you someone who learns more easily by looking back or by imagining forward? Do you understand best by looking at details or by looking at the big picture? Learning from an inventory like the Myers Briggs Traits Indicator (MBTI) can be very useful for such self-assessment.

◆ **Know when you are connecting…and when you are not:** How well can you read others to know that you are connecting with them in a way that they understand and can follow your lead? How can you be more aware of this? What can you do to alter your style when and as necessary? Many have found the DiSC instrument (Dominance, Influence, Steadiness, Conscientiousness) to be a useful tool in helping you understand how you behave in certain situations and how you can alter that behavior as situations change.

◆ **Know how to flex:** How might you adjust your communication style when you are dealing with someone who learns differently from you? How might you find ways to encourage the heart of others whose motivations and values might be different from others?

In *The 21 Irrefutable Laws of Leadership*, author John Maxwell describes the first phase of leadership growth as “I Don’t Know What I Don’t Know.” The Center for Creative Leadership in North Carolina, one of America’s preeminent institutes for leadership development (www.ccl.org), suggests questions for you to ask yourself in order to “lower your mask” so that you expand the Public Area in your Johari Window, thereby shrinking the Hidden and Blind Areas:

◆ What might be keeping you from trusting others?

◆ What needs to happen for you to be comfortable trusting others and what can you do to demonstrate this?

◆ What can you do to help others feel more comfortable trusting you enough to offer feedback?

◆ How can you show self-respect for others and what do you need from others for you to feel respected?

◆ How can you prepare yourself for being open to feedback that might not be
pleasant to hear?

The journey to become the allusive Level 5 Leader is an ongoing process. Peering intensely through the Johari Window and seeking to answer the many questions reflected in each pane is an inner journey that can lead you to your vision of leadership. It requires you to be ever vigilant and honest in your assessment about yourself, as well as to be constantly attuned to the ways in which you may be different than those you seek to lead, so that you can, as Arthur Ashe famously said “Start where you are. Use what you have; Do what you can.”

¶4120.6  **Self-Leadership: The Life-Long Challenge**

Winnie Ennenga, Northern Arizona University

“One can have no smaller or greater mastery than mastery of oneself.”

*Leonardo da Vinci*

As leaders we’re responsible for building teams at the same time that we are team members in divisions which are themselves components of a larger whole. Anyone who leads, is led, or like most of us, does both, has by interest or sheer dint of necessity spent some time thinking about the qualities of great leadership: their own, those of their team(s), and those of the leaders they report to. In integrating these various roles within our universities and community and professional organizations, self-leadership is key to becoming a truly effective leader. Great leaders recognize that they have the ability to make choices and changes that impact their ability to be effective. Accomplishing this requires self-reflection and ultimately a commitment to selfleadership; that is, to lead ourselves in accordance with our values.

**Self-Leadership**

This is no small endeavor! From the Myers-Briggs Type Indicator (MBTI) personality inventory, to the five practices of exemplary leadership described by Kouzes and Posner (2012), and the leadership parables enshrined in *Who Moved My Cheese* (2002) and *The Five Dysfunctions of a Team* (2002), the consensus from the field of leadership theory is that great leaders become through rigorous daily practice and reflection that represent a lifelong commitment to strengthening core leadership competencies.

Presidential leadership has been a powerful theme during this election year, and I’ve been struck by the key importance of self-leadership in affecting the success and failure of candidates from across the political spectrum. In his first inaugural address in March 1801, Thomas Jefferson wrote that “Sometimes it is said that man cannot be trusted with the government of himself. Can he then be trusted with the government of others?”

For Daniel Goleman (1998), an indispensable component of what he terms Emotional Intelligence is self-regulation, or the ability to control one’s feelings and impulses that is essential for trust and foundational for integrity. This concept of self-regulation is at the center of the larger notion of self-leadership. Consider the case of Abraham Lincoln, who throughout much of his career used satire and invective against opponents. At a political gathering in 1840, for example, he so cruelly mocked and ridiculed his opponent, Jesse Thomas, impersonating him “in gesture and voice, at times caricaturing his walk and the very motion of his body,” that Thomas was reduced to tears and driven from the stage, weeping and politically vanquished (Bray, 1995). Wadhwa (2012) regards that moment, referred to as “the skinning of Thomas” as a turning point for Lincoln, whom she believes began

slowly thereafter to change himself. But changing oneself is not easy, and similar behavior was recorded in ensuing years (Bray, 1995).

By the time of the Civil War, however, rather than giving free rein to his rage in public, Lincoln wrote what Doris Kearns Goodwin termed “hot letters” that were then set aside, unsent. In *A Team of Rivals* (2005), she describes one such letter to Major General George G. Meade regarding his failure in 1863 to capture General Robert E. Lee, the leader of the Confederate Army, in the wake of triumphs at Gettysburg and Vicksburg. Lincoln wrote “…He was within your easy grasp, and to have closed upon him would, in connection with our other late successes, have ended the war. As it is, the war will be prolonged indefinitely.” Obviously this letter would have greatly disturbed General Meade, and in the end, Lincoln placed the letter in an envelope inscribed “To Gen. Meade, never sent, or signed” (p. 628).

Most leaders demonstrate a mix of leadership strengths and weaknesses that can be tied to the notion of self-leadership. Although imperfectly accomplished, Lincoln’s deliberate effort to control his anger points to a high degree of self-awareness that stands in stark contrast to President Richard M. Nixon’s launching of the covert campaign against his perceived enemies that doomed his presidency. Even so, Nixon’s strength as a strategic thinker and his willingness to take risks enabled him to shift from a strong Cold War anti-communism stance to establish a relationship with the People’s Republic of China by the end of his first term.

Goleman and Boyatzis (2008) distinguished Emotional from what they termed Social Intelligence, with the latter incorporating such leadership qualities as empathy, articulating a compelling vision, teamwork, coaching and mentoring others, etc. Bill Clinton’s ability to empathize with Americans in his 1992 debate with President George H.W. Bush and Ross Perot contrasted sharply with President Bush’s apparent disinterest and impatience for the debate to end, highlighted by his checking the time on his watch, underscoring the feeling that he was disconnected from the problems of real people. However, even as President Clinton’s empathy enabled him to appreciate the real concerns and fears of Americans, impulsive and high-risk behavior in his personal life reduced his effectiveness in his second term.

Kouzes and Posner (2012) write that to become a credible leader, “You have to discover what you care about, what defines you, and what makes you who you are” (p. 48). That self-knowledge enables great leaders to communicate their ideas, make choices, and act consciously and with determination (p. 50). That, as these cases illustrate, is difficult to accomplish even with self-knowledge, and this is where self-leadership is most critical.

**Becoming a Great Leader**

Assuming the baseline skills of leaders already include mastery of technical skills and core competencies, great leaders distinguish themselves through self-leadership. Self-leadership involves thoughtful reflection on the qualities of exemplary leadership; a thorough inventory of one’s own leadership attributes – both weaknesses and strengths; and a *choice* and *commitment* to retool/rewire one’s thinking and one’s behaviors. Equally important, it also involves a commitment to better
understand, collaborate with, and empower others to act.

**What are the qualities of great leaders?**

Much is written about the qualities of exemplary leadership. To take but one example, for more than 25 years, James Kouzes and Barry Posner (2012) have asked the basic question “What did you do when you were at your personal best as a leader?” (p. 17). The responses to those questions led them to identify the *Five Practices of Exemplary Leadership*©. When leaders do their best, they Model the Way, Inspire a Shared Vision, Challenge the Process, Enable others to Act, and Encourage the Heart. A short list of leadership behaviors reflecting these practices includes setting a personal example, following through on promises and commitments, building consensus around the organization’s values, describing a compelling image of the future, setting goals and milestones to reach those goals, supporting decisions other people make, giving team members appreciation and support, and recognizing that team accomplishments are just that and not the result of a single person’s actions. Such lists are a good starting point from which to begin to examine one’s own leadership qualities.

Leadership programs offered by many universities or professional organizations (like NCURA’s Executive Leadership Program) are commonly designed to nurture leadership traits in individuals who have been identified as having the potential to lead their organizations into the future. These programs foster a shared vision of the organization, its operating principals, mission, goals, and objectives, and characteristically include significant participation by senior leadership.

**How do I measure up?**

Other good starting points include the MBTI leadership inventory of your particular strengths and challenges, as well as those of other individuals who differ from you. A thorough inventory definitely requires leaders to step outside their comfort zones to critically examine their own behaviors and also to invite such 360 degree assessments from others including your boss, colleagues, and staff.

The goal is to arrive, however painfully, at a realistic starting point from which to appreciate your strengths and begin to reshape behaviors in areas where you’ve identified weaknesses.

**What is my plan to become the leader I want to be?**

Just as external feedback is critical for developing a thorough understanding of your leadership attributes, the same may be true for identifying next steps. Take, for example, an intention to follow through on promises and commitments. Separating that goal into its component parts may reveal tendencies towards procrastination, taking on too many obligations, a reluctance to work as a member of a team, or to share/delegate responsibility to others, all of which indicate and acerbate distrust within and among team members. Self-leadership in this case begins with addressing these core trust issues. For Kouzes and Posner (p. 47), it is consistency between words and actions that builds credibility and thereby trust.
The good/bad news is that this is a life-long process that begins with one’s willingness to adopt new behaviors and commit to the daily practice of self-leadership. The inventory is the beginning; daily practice is the work of self-reflection and assessment of your leadership practices, and how they change, rearrange, and modify over time, whether leading your team or acting as a member of a team led by someone else.

4120.7 The Incredibly Trustworthy Leader
Mary Louise Healy, Johns Hopkins University

Jumbo shrimp. Act naturally. Advanced beginner. A definite maybe. Conspicuously absent. Oxymorons all – apparent contradictions in terms that are nonetheless true. How about “collaborative leader?” Is this an oxymoron or simply a contradiction? Isn’t a leader supposed to lead the team rather than to collaborate with the team members in carrying out the shared mission?

Leader as Servant
Not so fast. What is leadership if not the building of trust and the enabling of cooperation among team members? Collaboration is essential to success because it allows for the free exchange of ideas that would not otherwise be possible. Collaboration requires a focus on accountability, solutions, and effective communication – all necessary to success (Heyman, 2011).

Servant Leadership – Collaborating for Success
Greenleaf (1977) described the concept of “servant leadership” as a leadership style in which leaders guide their organizations to better serve humanity, in which the leader first feels compelled to serve and then, through that service, to lead. The term “servant” seems counter to the idea of collaboration as well as to the concept of “leader,” and servant leader appears to be another oxymoron. But servant leadership relies heavily, and focuses heavily, on the interactions between the leader and the team members (van Dierendonck, 2010). It is based on respect for team members and on mutual trust, and on the ability to build community (Joseph & Winston, 2005). Because the focus of the servant leader is on the followers rather than on the leader him or herself, or even on the organization (Senjaya & Pekerti, 2010), there is an inherent reaching outward, an integral focus on collaboration. Kouzes and Posner state this same concept a bit differently: “The relationship between leader and constituent is strengthened when leaders are obsessed with what is best for others – not what is best for them” (2010, p. 15). Servant leadership relies on interdependence, mutual trust and respect.

It’s a Matter of Trust
Back to that word, trust. A simple concept with a simple definition as it relates to leadership: vulnerability. Mayer, et al. (1995) describe trust as subordinates’ willingness to be vulnerable to their leaders’ behaviors and actions that are beyond the control of the subordinates. It’s even fairly simple to understand why trust is an important aspect of leadership, a cornerstone of servant leadership, and why, without it, collaboration would be impossible. Trust itself is a collaborative construct. A leader may strive to be trusted, but that trust depends on how he or she behaves. One must

1 This article is reprinted from the NCURA Magazine, March / April 2012, Volume XLIV, No. 2, published by the National Council of University Research Administrators. It is used with permission of the publisher.
prove oneself, through words and actions, worthy of trust. But trust also depends, and perhaps more so, on the team members’ willingness to make themselves vulnerable to — and place their trust in — the leader.

Simple, right? It’s easy enough to understand the importance and mutuality of trust but not so simple for a leader to inspire trust in those he or she is leading. How does a leader go about this? Zeffane (2010) believes that leaders must identify and share their values, on a day-to-day basis, and then act accordingly to allow those values to shine through. This builds trust: saying one thing and doing that same thing.

**The Five Practices and Credibility**

In order to build trust, it’s necessary to establish credibility. Kouzes and Posner (2002) describe five practices of exemplary leaders:
- Modeling the way and leading through your own example
- Challenging the process
- Inspiring a shared vision
- Enabling others to act
- Encouraging the heart

Combined, these practices create credibility. The leader who does what she says she will do, makes her beliefs and values known, and is willing to take risks as she works with the team to accomplish its goals is honest, authentic, credible, and thus trustworthy. And there is little that’s more important in a leader than honesty and trustworthiness. In a worldwide survey, Kouzes and Posner (2007) asked 75,000 people what characteristics they admire in a leader – what characteristics they look for in a person they would be willing to follow. They found that honesty was the single most important factor, chosen by 90% of respondents.

**The Path to Trust**

Be honest. Be credible. Act in concert with your beliefs and values. Others will trust you. This sounds great, but what are the concrete steps a leader should take to show that she is honest, to build credibility, to show herself as worthy of others’ trust? Wilson (2009) describes three practical actions leaders can take as they build trust:
- Speak with transparency. As Kouzes and Posner (2007) state as the first rule of leadership, “If you don’t believe in the messenger, you won’t believe the message.” Speaking with transparency allows others to believe you and means not only doing what you say you will do, but also being willing to share your thoughts, ideas, and feelings as well as facts. Wilson believes that sharing more rather than less is important and suggests leaders share twice as much as they think necessary (p. 51). It can be the case that a lack of trust is more attributable to what you don’t say than to what you do say.
- Keep promises and commitments. Each time you do what you say you will do, you show that you are worthy of the trust you are asking others to place in you.
- Balance competencies. Leaders need not have all the answers but must be able to
bring technical expertise and know-how together with leadership skills. They need enough technical competence to earn respect. Perhaps more importantly, they must be willing to acknowledge that they don’t have the answer when that’s the case.

Each of the five practices is apparent in these three actions. In addition to those practices, Kouzes and Posner (2007) also advise a congruency between the “say” and the “do” as the practical action to take in building credibility, and thus trust. In deciding whether or not a leader is credible, others first focus on the “say” – the leader’s words – then on the “do” – his or her actions, and then compare the two. If the say and the do differ, the leader is not credible. There must be a consistency between the two. Kouzes and Posner call this consistency the second rule of leadership: “Do what you say you are going to do.” Simple.

**There Seems to be a Pattern Here**

So what is the leadership takeaway from all of this?

◆ Know what you’re doing
◆ Know that you don’t know everything
◆ Be open about your beliefs and act in accordance with them, and, above all,
◆ Do what you say you will do at every step and turn along the way.

Then look forward to the highest compliment that can be given to a leader: “She’s a collaborative leader. And incredibly trustworthy.”

A Leader Listens

Robert Holm, Butler University, and Tony Vertimiglia, Auburn University

Plans fail for lack of counsel, but with many advisers they succeed.

Proverbs 15.22

At some point in our careers, there has been a supervisor that truly heard what we said when we provided input or suggestions for improvement (in some cases, we WERE that supervisor). Unfortunately, this tends to be the exception rather than the rule. In order to be effective, a leader must know how to listen. While this sounds simple in theory, it often proves quite difficult in practice for leaders, depending on their individual personality traits and time commitments/constraints.

The following is provided as guidance for those willing to tackle the “listening” challenge.

A Leader Should Seek Input

Ask those with whom you work to share their thoughts and ideas about the direction you are setting for your staff, office, department, etc. People value the opportunity to offer input which often leads to their “buy in” for an idea. A leader must, however, be sincere in their request for input.

A Leader Must Want to Listen

If you are not interested in what others are saying, you will not adequately focus on what is being said. In this case, both curiosity and empathy are important factors in successful listening. For leaders who adhere to what Belasco and Stayer call the “head buffalo” leadership paradigm—that it is their job to plan, organize, command, coordinate and control—they may hear what is being said to them, but they are not truly listening. Even worse for a true leader is believing that he/she has all of the answers and does not need to seek, or listen to, input from his/her coworkers or staff. If you do not want to listen to input from others then do not ask for it. A word of caution for this approach, your staff will happily stand by the side of the road as they watch you walk off the cliff into the abyss of failure.

A Leader Must “Actively” Listen

When you are listening to an employee or coworker, are you automatically formulating a response while they are still talking? Even worse, are you preparing your list of “things to do” in your head, checking e-mail, looking at your watch, or answering your phone? If so, you are not actively listening. Active listening requires that you focus your attention on what is being said, not what your response will be. If someone has enough respect to bring their thoughts, concerns and ideas to you, it is your responsibility as a leader to actively listen to them. After they have finished

speaking, you can work collaboratively to develop a solution or a plan to address their concern or input. This is very difficult for many people.

**Hearing vs. Listening**

The following summary from the Management Strategies Newsletter by Melissa Shaw, Network World, 09/09/031, is an excellent portrayal of what many of us do to those who are trying to have us listen to what they are saying. Try not to be the one who hears, but the one who empathetically listens.

“When it comes to the similarities between listening and hearing, the only one is you use your ears for both. After that, they’re very different. For instance, have you ever had an employee come in your office and you’re on the computer? You’re busy, you’ve got stuff to do, so while they stand there and talk to you, your body is facing the computer, your eyes are on the computer and an ear, or maybe two, is devoted to the poor soul on the other side of your desk. Aside from the abominable body language you’re displaying (‘What I’m doing on the computer is more important than you’) you’re probably not really listening to what the person’s telling you.

Next time you’re in a conversation with someone, or overhearing another, see how many times one party interrupts the other before he or she is finished speaking. Check yourself if you get the urge to jump in before the other person is through. We’re such a microwave, drive-thru, high-speed society these days; we’re rush-rush-rush, even when it comes to the art of conversation.

To improve your responsive listening skills, management expert Don Andersson suggests you recap what the person says after he or she is through speaking to ensure you got it right, a la, “Here’s what I’ve heard you say, tell me what I may have heard inaccurately.” “Most people will be really open to that,” he says. “Most want to know you’ve really listened, whether you’ve agreed or not.”

Then there’s the skill of listening for what’s not said. If you think a person is holding back or is not stating everything he or she wants, respond with a simple “Like...” “Because...” or “And...” “Frequently I can use a word like ‘because’ and shut up and listen to them.” Andersson says.”

Leadership As Art
Beth Kroger, JILA

“Leadership is difficult and important, and a fundamental subject” (De Pree, 1987, p. ix). You have influence as a leader, regardless of your job title and regardless of the thought or lack thereof that you give to your own leadership. Surely, this influence could be strengthened and utilized more fully if some deliberation and intentional awareness were given to your own personal leadership. You have a choice: Shall your leadership be an absent-minded doodle in the margin of a page or will it be a carefully crafted work of art specifically and deliberately created?

This article will first review some basic leadership theory and then finish with ways in which leadership can mirror the artistic process. The information below is derived from several different books combined with my own personal experience and leadership training and the leadership curriculum I developed with a colleague for a college honors course.

Before we delve into leadership theory, I’d like to plug one of my favorite leadership books. Leadership is an Art by Max De Pree (1987) has been foundational to my personal and organizational leadership philosophy for many years. It is a relatively easy read and combines story telling with theory in an engaging way. If you read only one leadership book, this is the one I recommend. I lend this book to new supervisors and re-read the book myself every few years. It is a book that can seem deceptively simply on the surface but has many layers.

According to De Pree there are three essential themes which recur throughout the topic of artful leadership: integrity, building and nurturing relationships, and the crucial nature of community building.

This article will primarily focus on the two latter themes; but briefly, and to ensure we’re all on the same page, I’ll clarify what I mean when using the word integrity, which is the first recurring theme of leadership. Integrity is consistency in actions, words and beliefs. Integrity is achieved when what you believe comes through in what you do and what you say. Said another way, integrity is being true to yourself. Without integrity you cannot build and nurture relationships or build a community. Integrity is foundational to leadership.

The second recurring leadership theme is building and nurturing relationships. To clarify, these relationships are with people; the key word is people. Below is a brief excerpt from the book Leadership is an Art to help illustrate the importance of nurturing relationships:

My father is ninety-six years old. He is the founder of Herman Miller, and much of the value system and impounded energy of the company, a legacy still drawn on today, is a part of his contribution. In the furniture industry of the 1920s the machines of most factories were not run by electric motors, but by pulleys from a central drive shaft. The central drive shaft was run by the steam engine. The steam engine got its steam from the boiler. The boiler, in our case, got its
fuel from the sawdust and other waste coming out of the machine room—a beautiful cycle.

The millwright was the person who oversaw that cycle and on whom the entire activity of the operation depended. He was a key person. One day the millwright died.

My father, being a young manager at the time, did not particularly know what he should do when a key person died, but thought he ought to go visit the family. He went to the house and was invited to join the family in the living room. There was some awkward conversation—the kind with which many of us are familiar.

The widow asked my father if it would be all right if she read aloud some poetry. Naturally, he agreed. She went into another room, came back with a bound book, and for many minutes read selected pieces of beautiful poetry. When she finished, my father commented on how beautiful the poetry was and asked who wrote it. She replied that her husband, the millwright, was the poet.

It is now nearly sixty years since the millwright died, and my father and many of us at Herman Miller continue to wonder: Was he a poet who did millwright’s work, or was he a millwright who wrote poetry? (De Pree, 1987, p. 7)

I challenge you to consider the people with whom you work. Are they grant accountants, contract administrators or are they also someone else; maybe primarily someone else? How can you as a leader build and nurture a relationship if you don’t know the person? How can you as a leader build up meaningful professional development programs if you’re only looking one-dimensionally at job titles rather than people?

Think about building relationships with people in another way. Getting to know a person also enables the leader to discern the multiple gifts and talents that people bring to the department or organization. People are so much more than a skill set! The diversity present in your workplace, the different paradigms and experiences and talents, comprise a valuable resource just waiting to be tapped into on behalf of the organization. Building relationships is key to tapping into those hidden resources.

Consider a geode or an oyster. You might never guess, by looking solely at the exterior, that there is a beautiful treasure just waiting to be discovered inside. An important part of leadership lies in seeing the potential and the gifts that people bring. This recognition requires developing and nurturing relationships. Further, the best leaders not only see potential but also intentionally develop, liberate and utilize all of the talents and abilities that people bring to the organization.

When you consider the role of leadership often there is a strong component of procuring resources, saving resources and utilizing resources effectively. Clearly unnoticed and underutilized talent and unused abilities of the organization’s employees is a waste of the resources available to an organization.

De Pree goes on to say that “…in addition to all of the ratios and goals and
parameters and bottom lines, it is fundamental that leaders endorse a concept of persons. This begins with an understanding of the diversity of people’s gifts and talents and skills.

Understanding and accepting diversity enables us to see that each of us is needed and enables us to begin to think about being abandoned to the strengths of others of admitting that we cannot know or do everything.

The simple act of recognizing diversity in corporate life helps us to connect the great variety of gifts that people bring to the work and service to the organization. Diversity allows each of us to contribute in a special way, to make our special gift a part of the corporate effort.” (De Pree, 1987, p. 9)

You may have read or heard about *Good to Great* by Jim Collins. This book explains Collins’ research comparing companies that were deemed good to those that were considered great. Collins and his team identified eleven pairs of good companies. These pairs were in the same industry, about the same size, and were in similar financial and industry positions. Then during the same time frame of fifteen years, one of the paired companies just took off while the other didn’t. Those companies who dramatically outperformed their peers took a leap going from being a “good” company to being “great.” The researchers then analyzed each company in great detail trying to find the consistent differences between the good and great companies. One of the “Good-to-Great” findings is the great company’s approach to staffing and setting the company vision:

When they began the research project, the researchers expected to find that the first step in taking a company from good to great would be to set a new direction, a new vision and strategy for the company, and then to get people committed and aligned behind that new direction. They found something quite the opposite. The executives who ignited the transformations from good to great did not first figure out where to drive the bus and then get people to take it there. No, they first got the right people on the bus (and the wrong people off the bus) and then figured out where to drive it.

Now you might be thinking, “That’s just good management—the idea of getting the right people around you. What’s new about that?” You’re right; it is just plain old-fashioned good management. But what stands out with such distinction in the good-to-great companies are two key points that made them quite different.

The main point is to FIRST get the right people on the bus (and the wrong people off the bus) BEFORE you figure out where to drive it.

The second key point is the degree of sheer rigor needed in people decisions in order to take a company from good to great.

What advantages are gained from this rigor in people decisions?

1. If you begin with who rather than what, you can more easily adapt to a changing world.
2. If you have the right people on the bus, the problem of how to motivate
and manage people largely goes away.

3. If you have the wrong people, it doesn’t matter whether you discover the right direction; you still won’t have a great company. Great vision without great people is irrelevant. Not ruthless but rigorous.

Rigor is needed to create an environment or culture where the right people thrive. Think about it….the only way to deliver to the people who are achieving is to not burden them with the people who are not achieving. To be rigorous means consistently applying exacting standards at all times and at all levels, especially in upper management.

Being rigorous does not mandate ruthlessness. Remember it’s all about the people. By instilling rigor into getting the right people on the bus and in the right seats; you’ll also be creating an environment or culture where the wrong people either jump or get thrown off the bus. (Collins, 2001, pg. 41)

Throwing someone off the bus may sound ruthless but in reality a leader’s rigor in making people decisions not only helps the right people thrive but also helps those wrong people go to another opportunity where they may be the right people; where their gifts can be better utilized or where the company culture is more in-line with their own values. Not to say it’s easy—but in the long run it not only benefits you, and your team, but also the person moving off the bus. Building relationships not only helps a leader to understand the resources and gifts people bring but also helps a leader to more fully utilize people by understanding the appropriateness of their bus and/or seat assignments! For example, I’ve personally counseled accountants into nursing and customer service people into less people-oriented positions and I’ve provided positive references for really good people who were just in the wrong job or department. It’s a great feeling to help another person along to where their gifts will be used and valued.

A final thought: I encourage you to think about whether you personally are on the right bus and in the right seat. If not, what are you waiting for? Time to change buses!

Let’s move now to the third recurring leadership theme: the crucial nature of community building. Not only do an organization’s employees shape the environment or company culture, but the reverse is also true. The community and culture of a workplace also shape the individual.

“With the aid of culture we learn how to create ourselves” (Eisner, 2001, pg. 2). What is culture? In his book, The Arts and Creation of Mind, Elliot Eisner refers to two definitions of culture. The first is anthropological: a shared way of life. The second is biological: a medium for growing things. Eisner goes on to say that a workplace functions in both definitions of the word culture, making possible a shared way of life and a sense of belonging and community, and also as a medium for growing things (in our case people). How a workplace or other community is organized, the norms and the relationships they foster, all shape experiences that are central to growth. (Eisner, 2001, pg. 3)

Currently, I lead a research institute called JILA (which originally stood for Joint
Institute of Laboratory Astrophysics and is now just JILA). JILA is a partnership formed in 1962 between the University of Colorado at Boulder and the National Institute of Science and Technology (part of the United States Commerce Department). Three JILA scientists have been awarded the Nobel Prize in Physics, and JILA is a leader in recruiting and retaining women physicists. Additionally, both JILA scientists and JILA staff consider themselves to part of the same team, each person providing necessary expertise and effort as well as creativity and innovation as contributions to the shared success of the Institute. One of my leadership responsibilities is to ensure that our culture or community is conducive to the cross-pollination of ideas amongst great minds and is supportive of individual contributions and gifts. JILA requires a culture of creativity, interaction, high energy and fun to allow our scientists to shine. Keep in mind, this means fostering interaction within a community of introverts! So, we do a lot of things to bring our people (JILAns) together. We celebrate important holidays such as National Tug Of War Day, National Sugar Cookie Day, National Bad Poetry Day and of course National Frog Jumping Day. We make our own days like Decadent Desserts Day or Crazy T-shirt Day. We get together on Tuesday and Thursday afternoons for cookie time. On the outside it may just look goofy—but it is goofiness with a purpose and a very specific plan. Our fun is intentional rather than accidental. Our culture is specifically designed for JILA. What works well in one culture may not necessarily be successful in another. A leader needs to be keenly cognizant of their particular community and work to shape that culture effectively in a way that allows that community and those people to shine.

There’s a book I read a few years ago called *Work Like Your Dog* by Matt Weinstein and Luke Barber. The basic premise of the book is the importance of putting enjoyment and fun back into work. The authors discuss how a dog goes about their work, say catching a Frisbee. There’s a certain amount of joy and enthusiasm involved. I’d like you to consider for a minute how a dog acts when he catches the Frisbee. How do you act when you hit a home run at work, finish a project, make a presentation, catch an error or fix something? Likely your reaction is similar to the dog’s: pride, enjoyment, a sense of accomplishment and an eagerness to get back in the game. Now think of a different scenario. How does a dog act when he misses the Frisbee? Does a dog tell himself he messed up? Or does he wait with anticipation for the next Frisbee. How do you act when you make an error at work? I’m not saying that you should ignore errors. But rather than spending time and energy berating yourself, move on! Adjust your approach! Get back in the game! I’m saying that you should focus on what you’re doing well, on enjoying your work and the challenges it presents, and on anticipating the next problem rather than on criticizing yourself. If you enjoy your work, you’ll perform better and so will your co-workers and team. Fun is an important part of work. I believe that fun often is the difference between a high-energy, productive and successful team and a mediocre team. What are you doing specifically and intentionally to add enjoyment to your own work life and to that of those around you?

Ronald A. Heifetz, in *Leadership Without Easy Answers*, suggests that the leader’s work is to foster a community that allows for not only personal growth but also for
successfully grappling with the issues. Heifetz goes on to describe the most productive community as a “holding environment” that promotes learning and growth for both the individuals and for the department or organization. This holding environment allows for focus on issues and challenges while stimulating personal and professional growth, what Heifetz calls “adaptive work.” He advances the theory that adaptive work increases both the personal and organizational capacity for problem solving and for dealing with current and future realities. According to Heifetz, there are five steps in creating a holding environment:

1. Identify the adaptive challenge (or diagnose the situation) in light of the values at stake, and unbundle the issues that come with it. Early on in my career, I got some great advice from a mentor that I still use all the time: If you’re dealing with an issue and the reactions of one or more of the people involved seems disproportionate to the identified issue that you’re dealing with; then you have not yet fully identified the problem (or unbundled the issues that come with it). You can’t get where you all need to be until you diagnose the situation AND unbundle the issues. There could be pride or political capital or insecurity or something personal that follows you into the workplace. Think about other’s issues AND your own.

2. Keep the level of distress within a tolerable range for doing adaptive work. For example, think of a pressure cooker. You want to keep the heat up without blowing up the vessel.

3. Focus attention on ripening issues. Identify which issues can currently engage attention, and while directing attention to them, counteract work-avoidance and stress-reducing mechanisms such as denial, scapegoating, externalizing the enemy, pretending the problem is technical, or attacking individuals rather than issues. In a previous position I held, there were some major financial issues in the institution. A consultant was hired to come in and tell us the “truth” of our situation from an objective perspective. Good strategy, perhaps, but what ended up happening is that once the report was received; focus turned to assigning blame to individuals and arguing with the report rather than on solving the actual problem. This behavior completely distracted the community by giving them scapegoats and data to dispute, allowing them to avoid grappling with the real truth, that financial survival of the institution was not assured.

4. Give the work back to people, but at a rate they can stand. Place and develop responsibility by putting the pressure on the people with the problem and the power to address it. Most people rise to the challenge! Especially if they are in a community that values the truth and promotes growth and personal responsibility and accountability. It is counterproductive to put pressure on people to solve a problem and to withhold the necessary support and resources from them.

5. Finally and importantly, protect voices of leadership in positions without authority. Give cover and validation to those who raise hard questions and generate distress. These are the people who point to the internal contradictions of the community. These individuals often will have latitude to provoke rethinking that
authorities do not have. (Heifetz, 2002, pg. 128)

So let’s have a quick review, the three interlocked themes in leadership of integrity, relationships and community focus on, and are centered on, people, and each theme impacts the other.

Great. So how is that art? If you recall, the title of this article is “Leadership as Art.” To answer I refer to the book The Arts and the Creation of Mind by Elliot W. Eisner.

In his book, the author explains how an artist’s work enables us to experience our environment or culture, and to learn within it and through it: “Work in the arts is not only a way of creating performances and products; it is a way of creating our lives by expanding our consciousness, shaping our dispositions, satisfying our quest for meaning, establishing contact with others, and sharing a culture. (pg. 3)

It seems to me that leadership is not only a way to direct the creation of goods or services; it is also a way of creating an environment or community in which people can utilize their gifts, satisfy their need to belong and to give and to connect with others; accomplishing goals moving towards a shared purpose.

I encourage you to think for a moment about the artistic process and how it is similar to leadership. The artist has her materials (a leader has her team or co-workers). There is a vision by the artist/leader and they begin. During the process of creating art and:

in the process of working with the material, the work itself secures its own voice and helps set the direction. The maker is guided and, in fact, at times surrenders to the demands of the emerging forms. Opportunities in the process of working are encountered that were not envisioned when the work began, but that speak so eloquently about the promise of emerging possibilities that new options are pursued. Put succinctly, surprise, a fundamental reward of all creative work, is bestowed by the work on its maker...surprise is itself a source of satisfaction...it is from surprise that we are most likely to learn something. What is learned can then become a part of the individual’s repertoire, and once it is a part of the repertoire, new and more complex problems can be generated and successfully addressed. (Eisner, 2002, pg. 7)

Think again of the millwright who was a poet, and the surprise of that realization. This surprise and discovery set forth another paradigm to consider in leadership. Think about a project you’ve led or been a part of. Often there is an “Ah Ha!” moment or a turn that makes all the difference. Think about your work community and relationships. Do they shape you as you shape them? Perhaps in unexpected ways!

“If your camera is loaded with black-and-white film, you look for shadows, for light and dark, but if the same camera is loaded with color film, you seek color. What the film in your camera can do influences what you will do. If the only tool you have is a yardstick, you look for what you can measure.” (Eisner, 2002, pg. 8) Returning to De Pree’s bus analogy, consider the people in your bus, how they
impact the work you do and how they impact your working community. Then consider how do you impact them?

So too, like the artist and material, do the leader and their people influence each other, and help define, shape and transform their work, relationships and community. The element of surprise and discovery are present all around us in our workplace. The creation of a culture or holding environment in which people are free to think and grow and learn from each other, develops and realizes the best in each of us.

The center of the three recurring themes in leadership, integrity, building and nurturing relationships and crucial nature of community building is people. The three themes also are intertwined and are interactive and reactive with each other. Just as the artist and her work interact with each other in the creation of art, true artistry is also present in the leadership of people and a community with integrity aligning belief and action.

Slow down...wait a minute...breathe!

In today’s fast paced world of e-mail, text and voice mail messages, it is a challenge to fine-tune our interpersonal skills. Do you remember the last time your boss stopped by your office just to say hello? When was the last time you asked a colleague, “How are you today?” and stopped to listen and hear their response? As you read this article, evaluate yourself and objectively assess if you are emotionally intelligent. R U EI?

As a student of NCURA’s Leadership Development Institute, I learned about emotional intelligence and its components. We discussed Daniel Goleman, who first brought the concept to the world’s attention in his book entitled Emotional Intelligence. According to Goleman, emotional intelligence is the kind of intelligence or skill that involves the ability to perceive, assess, and positively influence one’s own and other people’s emotions. [See the table for Goleman’s five components of emotional intelligence.]

During our studies, we also discussed and learned the attributes that a good leader must possess. Some might say a good leader is a person with superior communication skills; others may say that a good leader is an individual who has great management style and can make people do their job. What would you say? Does a great orator make a great leader? Does a good manager necessarily develop into a great leader?

To help us answer these questions, I wish to turn to literature – specifically, Shakespearean literature. At some point in our past academic years, we have been forced to read, dare I say it, Shakespeare! You probably remember being told to read Romeo and Juliet or Hamlet by your Literature instructor. In the true form of Shakespeare, especially the comedies, the scenes are elaborately displayed. The language is strong and at times vulgar, but Shakespeare is timeless. Shakespeare colorfully exhibits different levels of emotional intelligence and leadership abilities in all his characters.

We need only examine one of Shakespeare’s characters to determine her leadership abilities and level of emotional intelligence, beginning with Katherine Minola from Taming of the Shrew. In this play, there are five main characters: Petruchio, Lucentio, Baptist Minola, and his two daughters, Katherine and Bianca. Though each of these characters displays some form of, and growth in, emotional intelligence, for purposes of this article, I will focus on Katherine and show how her character grows and more fully develops her emotional intelligence and thus reaches full leadership potential.

Taming of the Shrew plays itself out as Petruchio desires to ‘tame the shrew,’ who is known as Katherine. Katherine is the oldest daughter of Baptist Minola, a

wealthy, gentle, unassuming man. Katherine is a strong willed, independent, incorrigible, outspoken, and unruly young woman. During the sixteenth century, such women were referred to as shrews. She challenges, in the most outrageous ways, all that is expected of women of that time period.

As the play unfolds, we learn that Katherine is totally aware of her behavior. She believes she is justified in her temper tantrums and otherwise outrageous behavior. She has no self-management, self-regulation, empathy, or social skills. As Katherine is courted by and married to Petruchio, she quickly realizes that she can have it all if she plays by the game of the day. She observes every action by Petruchio, understands what he desires, and persuades him to believe that he is a leader. Even through her strategic behavior, she is able to motivate others. As Katherine matures, she becomes more self-aware and learns to manage her behavior and exhibit appropriate social skills. Through this maturity, she wins the love, respect, and support of her servants. By the end of the play, she has earned the respect of her women friends and the adoration of her father. In the very last scene of the play, Petruchio is swept away by her generous words and they proclaim their love and admiration for one another.

Petruchio arrives in Padua and he is very attracted to Katherine’s dowry. Petruchio is stubborn, unruly, and outrageous and seemingly has no respect for anyone, not even himself. He seems to amuse himself with his inappropriate behavior and comments. Though we believe him to be a leader, his effectiveness is a result of the fear he instills in others.

In the same way that Shakespeare often hides a play within a play, here he also hides the true leader deep within the play’s center of attention: Katherine. While each of the main characters has leadership traits, the real leader, the one who develops a high level of emotional intelligence, is Katherine.

Katherine, though considered a shrew, has learned that others, even her family members, succumb to her whims as a result of her outrageous behavior. Katherine is often found berating Bianca for her beauty and her inability to choose between
her many suitors. As the play progresses, we find Katherine often caught in her own silence. Is this reflective thinking, or a simple blank stare? Katherine matures over time and her unruly behavior begins to subside. We begin to see the rough edges of Katherine’s leadership ability become smoother. She spends time alone and learns to understand her true desires, becoming more self-aware and learning to regulate her behavior. She quickly learns that when she behaves and communicates with others in specific ways, she meets her goals and achieves her desires. This is an example of Katherine’s self-awareness and self-regulation being developed.

As a leader, Katherine’s greatest challenge is learning how to get Petruchio to provide all things to satisfy her needs and desires. Like a manager and employee relationship, she ‘courts’ his emotions (Katherine’s display of empathy) throughout the play and when he believes he has finally captured her, she provides a complimentary speech at the end of the play, which strokes his ego. She masterfully delivers this speech in front of Petruchio’s peers and other women.

Katherine is a strong and independent thinker. Her decisions are swift and she is able to carry them out. She challenges the process by not allowing herself to be forced in the mold for women of that time period. We also learn that Katherine has vision and is able to motivate persons to change their behavior in more positive ways.

In an unlikely way, we learn that even in Shakespeare’s comedy, Taming of the Shrew, leaders reveal themselves. We also learn that we all possess the ability to develop our emotional intelligence and enhance our leadership ability. Yes, even the strong-willed Katherine.

Under the proper set of circumstances, one can reach into one’s inner core and reflect, observe, and learn. Through this process, a leader learns objectively to assess the circumstances and develops a higher level of emotional intelligence. When compelled, the leader in all of us will rise to the occasion. Leadership is within us...but it may be dormant. These leadership skills can be developed through personal and professional experiences. Just as a baby is born, is nurtured, and grows, there are growth stages in every leader. We see this growth in Katherine from her infancy stage of being a shrew to her adult stage of mature emotional intelligence and leadership.

As you continue your leadership journey, take a moment to breathe. Stop by a colleague’s office just to say hello (and listen to their response) and to extend an honest compliment on the day’s work performance. And, as you continue your journey, periodically check yourself and ask, M I EI?

I wish to extend a humble thank you to Dr. Percy Thomas, NCURA, Gale Wood, and the entire LDI Class of 2007. Your inspiration, encouragement, and input have been invaluable, and without it, this article would not exist.

¶4120.11 What is Required to Produce Bold Thinking and Fresh Ideas?
Jeffrey Cufaude, President and CEO, Idea Architects

As more organizations focus on innovation, this is a question that every facilitator must be prepared to answer. We have to increase our understanding of the relationship between creativity and innovation, become more familiar with the discipline of design thinking and its applications, and build our capacity and competence to design and facilitate ideation and rapid prototyping sessions that help individuals and groups move through the creative, critical, and constructive thinking stages.

Here are seven fundamentals I have found critical to facilitating innovation:

1. Let’s remember Kurt Lewin’s adage that behavior is a function of people interacting with the environment. Your session needs to take place in an environment that is conducive to expansive thinking. You want a room with ample space, flexible configurations, windows, lots of whiteboards and walls for posting ideas, comfortable and varied furniture. In short, you want a space that you are unlikely to find in a typical hotel. Conference centers sometimes are better, but you may have more success choosing a non-traditional venue: an art gallery or museum, an ad agency’s meeting space, an open room in an artists’ warehouse, a grade school (hey, it’s where we last played with unbridled creativity).

2. The environment is important, but let’s not forget the other key ingredient in Lewin’s formula: the people. Research shows a correlation between a group’s diversity of perspectives and innovative results. Who can be included in the session that will expand the natural thinking and viewpoints present? Who are good thinkers outside the team being convened who should be included, both from other areas within the team’s organization, as well as individuals outside the organization itself? Who are wild cards ... the unusual suspects ... who could shake up the conversation if present?

3. As Steven Johnson notes in his book, Where Good Ideas Come From, “Good ideas often result from the collision between smaller hunches so that they form something bigger than themselves.” Your facilitation needs to more intentionally help participants make their hunches public so that they can collide with others’ thinking and perhaps lead to a bigger and better idea. This requires both creating the safe climate for people to share partially-formed thoughts, as well as using more visual facilitation tools and techniques to archive ideas expressed. Two tactical tips: (1) instead of you capturing others’ ideas, stock the room with sheets of paper, notecards, jumbo post-its, and a variety of pens and markers and ask participants to note their own ideas and post them appropriately; and (2) set a challenging goal for the # of ideas to be generated. Having a quantified target often enables participants to more freely share half-baked notions that they otherwise would have self-censored.

4. Even when you diversify the participants, further stimulate the thinking that will take place through the pre-work that participants complete. Share diverse pre-readings to broaden participants’ perspectives; on Twitter, have them follow
interesting individuals, scan Tweets related to particular hashtags, and/or participate in an appropriate Twitter chat; assign them a thought leader to interview and report on at the actual meeting; and expose them to data that may interrupt their biases or pre-conceived notions. As Johnson also noted in his book, “chance favors the connected mind.” Use pre-work to diversify and expand the connections the session participants will bring to the conversation.

5. Engage participants in field research. If we accept that innovation yields a new dimension of performance or value as Peter Drucker asserted, we must also accept that the enhanced value is in the eyes of the customer, member, or end user. Whenever possible, involve participants in actual pre-work that includes observation of the target audience in action to see what patterns of behavior they notice, frustrations that the end user works around, aspirations they may not be expressing. As Gary Hamel has noted, “innovation often results from insight into the unarticulated need.” Acting as anthropologists, participants can use observational research to help unearth those unarticulated needs.

6. Use provocations or disruptive hypotheses to stimulate fresh thinking. This approach engages participants in exploring lines of thought that seem unreasonable given present reality, but ones that often yield the ideas that dramatically escalate the value of a product, program, or service. Until someone asked, how could we make it possible for people to carry their entire music library with them (leading to the invention of the mp3 player), we were forced to select with dozen or so CDs we want to put into the music wallet to take with us on vacation.

7. Draw on a variety of techniques and activities to engage participants in different thinking. In the creative thinking stages of the innovation process, I find it beneficial to churn the group process more, to use more varied exercises and activities to remix and recombine participants and their thinking. Three of my favorite resources for doing so are IDEO’s method cards, the exercises in Dan Pink’s book A Whole New Mind (full disclosure, I authored some of them), and the Stanford d.school Boot Camp bootleg for methods and activities.

About the Author

Jeffrey Cufaude is an architect of ideas. His areas of work include strategy think tanks that bring fresh eyes and thinking to critical questions; volunteer and staff development workshops and retreats; content design and facilitation of leadership conferences and learning experiences; and major keynote presentations. His past experience as executive director of two national associations and as a student affairs staff member at two large public universities informs much of his work today. He graduated cum laude with a BA in English and an MA in Communication Theory from Northern Illinois University. Jeffrey has helped train NCURA workshop faculty for several years, as well as been a presenter for the NCURA Executive Leadership Program.
Tools of Extraordinary Leaders
Kimberly Pace & David Furse, Owen Graduate School of Management, Vanderbilt University

Every great leader must be a great communicator. Clear, consistent, comprehensive communication represents the single most powerful tool for a transformational leader.

Randy Dobbs, former CEO, GE Corporation

Transformational Leadership
Transformational leadership is about communicating a compelling strategic vision. Leaders use vision to transform the culture and build esprit de corps. In this transformed culture everyone shares the vision and feels enthusiastic about being part of accomplishing it. Job #1 of the transformational leader is to transform the culture.

The transformational leader must not only communicate a compelling vision, but must also deliver results. Even if you improve the culture, the esprit de corps, and the communication, you have not transformed the organization until you transform the financial results. This is the simplest and clearest measure of a transformational leader.

Finally, the leader’s most lasting mark is that the transformation doesn’t stop when she or he leaves, but is self-sustaining through a cadre of transformational leaders, trained and mentored by the original leader.

Communications Down, Out, and Still Up
Authentic leaders are surrounded by team members, peers, employees, and administrators who desire to listen to them and help them execute the strategic vision. Great leaders are great communicators.

Before you were a leader in your organization, even if you managed others, you communicated up – up to top administrators of what you were doing to carry out the strategy of your division.

Now, you are the one in the leadership position. Things have changed. You spend more time communicating down to those who execute the work. Although, you still communicate out to your peers, and up to your stakeholders.

The Everything-Matters Rule
Imagine yourself as a professional basketball coach. You coach, train, and motivate your players during practice. Now, it’s game day. You don’t get to go on the court and play. In fact, the game is often moving so fast that your players are calling most of the plays. Because the circumstances change in an instant, your players must be ready to make smart decisions, quickly.

As the leader, you’re like the professional basketball coach. You are responsible for the vision and strategy. But your real job is to persuade, compel, and motivate your team to go out and get it done. If you have to tell them how, you probably have the wrong team.
As the leader, you are always onstage. Everything you do and don’t do, say and don’t say, will be noticed. Everyone is watching you. In the role of the leader, what you communicate and how you communicate it matters. There is no little or insignificant communication from you – everything matters.

**Personal Brand – Your Nike “Swoosh”**

As a leader, it’s important to not only think “like a CEO, but lead and act like a CEO.” As a leader, you have the foundational skills of listening and feedback. It’s time to review and hone your executive communication skills. In order to do this, consider creating your own personal brand – your own Nike “swoosh” that influences, motivates, and persuades others. Your “swoosh” represents your personal brand – what makes you unique, what you promise always to do, and what you can do consistently.

To understand personal brand, think about a product or service. You think “safety” when you hear Volvo, or “Guaranteed On-time Delivery” with FedEx, or “Just Do It” with Nike. Just like products and services, you have a brand. Your brand is how other people perceive you, but you define your own leadership brand. As a mid-level administrator you had a brand that was defined by your job, your team, and the executives above you. Then, when you moved into the leadership role, you are in control of your own brand.

**Perception is Reality, So Manage It**

To create your brand, an extraordinary leader must first manage perceptions. It is true that what others think about you is their reality. Your employees will base their perceptions of you based on their past experience working with you. If this has been great, you are off to a strong start. If not, you’ll need to manage their future expectations. Your leadership is a product. What are the key benefits that you bring to the table? What unique benefits do you offer that no other leader can? You must be exceptionally clear about your own values and what drives your decision making process. For employees to trust you, they must know this clearly.

Go sit in a Starbucks coffee shop, watch, and talk to the customers. Some walked blocks for their cup of coffee. Many come, set up their laptops, and stay for hours. Most are paying over $3.00 for their coffee. The line is long. Even when they mess up the coffee order, customers rarely get angry. Around the “water cooler” at work, you’ll hear people recommend a new coffee drink or a new CD.

Even with new competition in the gourmet coffee industry, Starbucks has the kind of brand that would be helpful for you to adopt as a leader. You want people to be willing to travel to meet with you, stay as long as needed, pay you what your time is worth, wait longer for a deadline if needed, forgive you quickly if you make a mistake, and recommend you to others.

**Be In Tune with Your Touchpoints**

Your personal brand is communicated every time someone comes in contact with you or any information about you. These occasions are called touchpoints – and they
happen before someone even meets you, while they are with you, and after they leave. If you Googled yourself, what would you find? How do others describe you when someone asks what you are like? While they are with you, are you prepared for the meeting, approachable or distant, focused or distracted? After they leave, do you follow through on what you promised to do in a timely manner? Managing all your touchpoints is the hidden secret of great leaders.

How you work with a colleague, employee, client, customer, and even your own family defines your personal brand. It’s also something that you do consistently and over-time. It’s not a one-time “going on stage,” but what you do on a daily basis, especially in stressful situations that defines you.

**Know Your Leadership Style**

To manage your touchpoints and brand, it is important to understand how others perceive you. One way to gain a reality check is to engage others in a discussion about your leadership style.

To be a transformational leader, it is important to understand your preferred leadership style and also develop additional leadership styles to use depending on the situation.

Daniel Goleman completed a three-year study with over 3,000 managers published in *Harvard Business Review* as “Leadership That Gets Results.” In this article Goleman’s discusses six leadership styles. Are you better at:

- mobilizing others to a vision (authoritative),
- creating emotional bonds (affiliative),
- modeling excellence (pacesetting),
- developing people (coaches),
- demanding compliance (coercive), or
- building consensus (democratic)?

Pick out which type of leader is most consistent with your leadership style. Then, consider how to improve and when to use all of these leadership styles. To be an extraordinary leader, you need all six of these styles in your tool kit.

**About the Authors**

Pace and Furse are partners in a leadership development company called Executive AURA, and work with leadership teams to effectively create strategy, lead it, and communicate it.
Exploring Emotional Intelligence for Better Leadership

Michelle Vazin, Vanderbilt University; Helena Moynahan, University of Maryland College Park; and Robyn Remotigue, Mississippi State University

As research administrators we function in a fast pace work environment with emails, instant messaging, texting, and voice mails. It is so easy to get caught up in the world of electronics, that it becomes a challenge to work on our interpersonal skills. For example, when was the last time you thought about your own interpersonal skills? How long has it been since you stopped by one of your colleague’s office just to say “hello” or ask “how are you doing?” In fact, I have wondered myself when someone asks “how you are doing?” do they really want to know and do they really want to take the time to listen – really listen?

As students of the Leadership Development Institute, we learned about Emotional Intelligence (EI). As a part of the LDI, we learned that leaders who possess (EI) are generally distinguished as those that are outstanding rather than just being adequate. These leaders have the technical and analytical skills that are required in a leader, but they also possess the personal qualities of a humanistic approach. Emotional Intelligence has to do with knowing when and how to express emotion as well as how to control it.

Daniel Goleman was the first to bring the term “Emotional Intelligence” to the world’s attention in 1995 when he titled his book the same name. Goleman found that traditional qualities such as toughness, determination and vision are required for success. However, alone they may be insufficient to be a truly great leader. Leaders that are most effective distinguish themselves from the rest because they possess a high level of (EI). In this article we will describe the various components of (EI) and we will share ideas and tips on how to boost your (EI) to strengthen your leadership abilities.

Defining EI

So if the really effective leaders in society possess a high degree of Emotional Intelligence, what are the skills or attributes we are talking about? Daniel Goleman does a great job of describing what the skills are in his article for the Harvard Business Review, entitled “What Makes a Leader?” and his book, “Emotional Intelligence”. Goleman lays out what the five components of Emotional Intelligence are at work. First, one must have a sense of Self-Awareness. This is demonstrating the ability to recognize and understand your own moods and emotions and what is important to you as well as how they affect those around you. People with this trait tend to be self-confident and realistic about their capabilities and limitations. Second, there must be a degree of Self-Regulation. Basically this is “thinking before you leap”. A person with self-regulation has the ability to effectively control their impulses or moods. When this trait is present, people tend to be seen as trustworthy and hon-

1 This article is reprinted from the NCURA Magazine, September/October 2011, Volume XLIII, No. 5. It is used with permission of the publisher.
People who are motivated, love what they do for the sheer joy of it and as a result, they tend to bring a lot of energy and drive to the table. Adjectives that could be used to describe someone with motivation would be optimistic, driven to achieve, and committed. The fourth attribute of EI is Empathy. When one possesses empathy, they have the ability to understand the emotional makeup of those around them. They tend to be successful in building and retaining talent in an organization and satisfy their clients and customers needs effectively. The fifth component that Goleman attributes to Emotional Intelligence really ties the first four together. It is Social Skill. When people’s social skills are healthy and present, they exhibit a proficiency in managing relationships and building networks within an organization. Building a rapport and finding common ground amongst groups comes easily. They are very persuasive and excel at leading change.

It seems clear that Emotional Intelligence is very much focused on the “people-side” of things. That is, the more accepted qualities of leadership such as intellect, determination, strength, vision etc. are definitely important traits in successful leaders. However, when these traditional qualities are partnered with the traits described above that are associated with Emotional Intelligence; the leaders’ success rate rises dramatically. Being able to understand and connect effectively with the people being managed and led is critical. The human aspect of an organization is the heart of its success and the leader that acknowledges that fact, understands that fact and can tap into that vital resource as a result of a high Emotional Intelligence factor will succeed with outstanding results.

Tips to Boost EI to help prevent the “amygdala hijack”:

You feel like you are a good leader, but you know there is always room for improvement. Tapping into the EI components described above may be the secret for you. Where should you start? What are the things to be considered? Let’s start by introducing one more concept that Goleman developed – an “amygdala hijack”. An amygdala hijack was a term coined by Goleman. The amygdala is in the center of the brain, the “emotional brain”. It controls the proper emotional reaction to triggers. When the amygdala erupts from an overheated limbic system, it has been hijacked. So the opposite of an amygdala hijack is emotional intelligence. If we agree that having a high degree of EI enables one to become a better leader, then preventing “amygdala hijacks” would be beneficial.

Try these worthy strategies for boosting your EI components and preventing the amygdala hijack effect. These might offer you some tips which will help you improve you leadership skills and ensure that you don’t “lose it” in work settings which can be awkward and unproductive.

Self-Awareness - Know who and what pushes your buttons. Keep a journal. Knowing how someone or something produces a negative reaction is critical in developing the ability to take control of the situation and maintaining your composure and calming yourself down. Seek feedback from others. This can be a real eye-opener. How do your emotions and reactions affect other people? Seek specific
examples and situations. How you are perceived is great feedback for working on those emotions and reactions that are impacting others negatively. Watch the ripple effect. Even those seemingly on the sidelines are impacted. Get to know yourself under stress. Most people recognize the warning signs. Take the time to recognize the signals and recharge your batteries.

**Self-Regulation** - This component builds upon self-awareness which is necessary for effective self-regulation. You need to be aware of your emotions in order to manage them. Take slow deep breaths...The next time you find yourself in a stressful or emotional situation, focus on taking in more oxygen. The short shallow breaths that most people take are enough to run the necessary basic functions of the body, but if you want to remain focused and calm, try deep breathing. Count to ten...this one our mothers reinforced when we were young. It works. Both the counting and the breathing will help relax you and keep you from making a rash decision or action long enough to regain your composure and perhaps gain a more rational perspective of the situation. If you’re in a meeting, bring a drink. You may not want to count to ten but taking a drink gives you the same amount of time to regroup and it’s subtle. How about sleeping on it? Time may help you to self-regulate. Time helps you gain control of emotions that might lead you down the wrong path. Wait for the dust to settle before you act. Try smiling and laughing more... Our brains respond to the nerves and muscles in our faces. Customer service is a huge portion of our jobs. Put on that ‘pudding face’ when you’re really not feeling up to it. It will help counteract that negative emotional state. Don’t let your bad mood paralyze your judgment. Be aware of your own self-talk. Negative self-talk is unrealistic and can be self-defeating. Stop beating yourself up over every mistake and you’ll stop making your problems and issues bigger than what they are. Make your self-talk factual not judgmental. This may take some practice.

**Motivation** - You need to like what you do in order to stay motivated. Be an optimist in adverse situations. Being around a negative person is deflating. Inspire service, effort and commitment by your own actions.

**Recognition** - take the time to acknowledge a job well done or that person who shows initiative. Make the extra time it takes to recognize your staff because the rewards are great. Know the strengths of your people and set goals that are attainable and well-defined. Make time for fun.

**Empathy** - Observing people will help in your ability to recognize and understand the emotions in others. Step into their shoes. Try to gauge what their reaction to a problem might be. Be curious about the other person. The more you know the better you are at meeting and understanding their needs. Don’t give mixed signals. If you are telling someone they did a good job on a project but your body language and voice are not projecting this in a positive way, the person will trust what they see over what they hear. Match your tone with body language. Be sincere.

**Social Skills** - Greeting people by name is a strategy to live by in all walks of your life. Everyone is important and addressing people by name is extremely important. Try not taking so many notes in a meeting. Focus on the people to recognize and understand how they are feeling and thinking. By focusing on note tak-
...ing, you might miss the clues that shed light on how others are feeling or what they are thinking. Don’t interrupt a conversation. Wait until the person is completely finished. You should be fully engaged in what the other person is saying. We’re in the discussion to learn not necessarily to make our own points. Practice listening. Hear the speed and volume of the voice. When you are on a phone call, don’t type an email. When someone enters your office, turn toward them and away from your computer. Use ‘please’ and ‘thank you’ more. Incorporate these into your relationships. Building trust is a big one. Consistency over time with our words, actions and behavior will build trust.

Hopefully, some of the points made in this article already resonate with you. There is definitely food for thought here in bringing more of the human connection back into our professional interactions. The concept that “people matter” can truly get lost in this age of technology. We can do almost everything remotely. Choose not to more often. Connect with the people around you. If you want to see ‘eye to eye’ then you might need to meet ‘face to face’. Build and maintain your relationships. Tap into your EI attributes and make a difference in your corner of the world. You may be surprised by how effective you can be as a leader once you attain a high degree of Emotional Intelligence.

About the Authors

Michelle S. Vazin is the Director of the Office of Contract and Grant Accounting at Vanderbilt University. Michelle is a long-standing member of NCURA and has been actively involved for over 15 years. She is an alumna of the NCURA Leadership Development Institute Class of 2010. She received a Bachelor of Science degree in Finance and Accounting from the University of Tennessee at Knoxville.

Helena A. Moynahan is the Manager of the Office of Contract and Grant Accounting at the University of Maryland College Park. Helena is a past-treasurer of NCURA Region II and a member of NCURA for over twelve years. She is an alumna of the NCURA LDI Class of 2010. She holds a Bachelor of Science degree in Mathematics from Towson State University.

Robyn B. Remotigue, CRA, is Assistant Director of Sponsored Programs Administration at Mississippi State University. She has been in the field of Research Administration for more than 16 years. She serves as the NCURA Magazine Contributing Editor for the Pre-award Corner, past chair of the Neighborhood Program Committee, and the Region III Volunteer Coordinator. Robyn is a graduate of NCURA’s 2010 Leadership Development Institute.
¶4120.14 Emotional Intelligence, Paper Tigers, and Pause Buttons
Robyn Remotigue, Mississippi State University, and Laura Letbetter, Kennesaw State University

Renowned lecturer and science journalist Daniel Goleman is widely credited for bringing the concept of emotional intelligence to the general public and to the business world. His 1995 book *Emotional Intelligence* remained on the New York Times bestseller list for a well over a year, and there are five million copies in print in numerous languages. His article “What Makes a Leader?” is highly recommended reading for leadership courses and seminars, including those organized by NCURA. In this definitive article, Goleman describes emotional intelligence as “the sine qua non of leadership” (p. 3), and he defines and describes each of its five components: self-awareness, self-regulation, motivation, empathy, and social skill (p. 2). Three members of the NCURA Leadership Development Institute class of 2010 provided an overview and their personal insights on the five components of emotional intelligence in the September/October issue of this magazine. In June of 2012, eight members of the NCURA Executive Leadership Program (ELP) Class of 2012 participated in an emotional intelligence workshop led by Susan Dunlap of Susan Dunlap & Associates. Dunlap directed the group’s attention to Peter Salovey and John D. Mayer’s definition: emotional intelligence is the ability to monitor one’s own and others’ feelings and emotions, to discriminate among them and to use this information to guide one’s thinking and actions. How one can use this information about emotions in an important question for research administrators.

Research on emotional intelligence indicates that it can have a far greater impact on being a successful leader than IQ or technical skills. Research also indicates that emotional intelligence can differentiate between an average leader and an exceptional leader. According to Goleman, “If your emotional abilities aren’t in hand, if you don’t have self-awareness, if you are not able to manage your distressing emotions, if you can’t have empathy and have effective relationships, then no matter how smart you are, you are not going to get very far” (qtd. in Hughes, 2004). This statement should resonate with research administrators. We work in a charged environment. Ideally research is an objective endeavor, but in real life, it is riddled with emotion. Applications, proposals, and contracts can be risky ventures for principal investigators. Their careers and their sense of self-worth are often at stake. Our own careers and sense of self-worth are predicated not only on what we know and what we can do, but also on whether PIs, colleagues, supervisors, and sponsors believe we know what we are doing. Trust between PIs and research administrators is essential, and emotional intelligence is the key to building trust.

If it is intuitively obvious as well as supported by social science research that our technical abilities, cognitive skills, and competencies just aren’t enough, then what gets in the way of our exercising and developing our capacity for emotional

---

intelligence? The answer to this question may lie in how human beings are wired. There are specific reasons why we sometimes react to stress as though we are not ourselves. Dunlap (2012) offered the ELP class several examples: a person whose normal state is to be a considerate, good natured team player may under stress become possessive, detached, stubborn, or insensitive. A person who is normally pioneering, assertive, and positive may become abrasive, arbitrary, controlling, and opinionated. A colleague who is normally considered to be knowledgeable, thorough, and diplomatic may transform into a perfectionist who is hard to please and defensive. The outgoing, persuasive, or inspiring individual may seem overly confident, a poor listener, or a self-promoter. Dunlap asked us to consider what could explain such extreme transformations. She then introduced the concept of *amygdala hijacking* and how it impacts us at work. The term comes from Goleman’s 1996 book, *Emotional Intelligence*. The amygdala is an almond-shaped mass of gray matter in the anterior portion of the temporal lobe of our brain. Its job is to process our emotional reactions and survival instincts. The neocortex, located on the outer surface of the cerebrum, is in charge of higher functions such as language and memory. In a 2011 interview, Goleman explained in lay terms how amygdala hijacking works:

The amygdala is the trigger point for the fight, flight, or freeze response. When these circuits perceive a threat, they flood the body with stress hormones that do several things to prepare us for an emergency. Blood shunts away from the organs to the limbs; that’s the fight or flee. But the response is also cognitive—and, in modern life this is what matters most, it makes some shifts in how the mind functions. Attention tends to fixate on the thing that is bothering us, that’s stressing us, that we’re worried about, that’s upsetting, frustrating, or angering us. That means that we don’t have as much attentional capacity left for whatever it is we’re supposed to be doing or want to be doing. In addition, our memory reshuffles its hierarchy so that what’s most relevant to the perceived threat is what comes to mind most easily—and what’s deemed irrelevant is harder to bring to mind. That, again, makes it more difficult to get things done than we might want. Plus, we tend to fall back on over-learned responses, which are responses learned early in life—which can lead us to do or say things that we regret later. It is important to understand that the impulses that come to us when we’re under stress—particularly if we get hijacked by it—are likely to lead us astray.

Dunlap asked us to consider how the amygdala is perfectly designed for activating our response to a saber toothed tiger, but far less helpful in the 21st century workplace! The amygdala hijack is common in every level of the research administration environment. You receive notification at the last minute that a proposal is due on a day you asked off weeks ago, and the PI is a college dean. Hello, amygdala! You spend hours developing a detailed five year budget that includes a team of 22 faculty, only to find that the lead PI has manually overwritten every formula in your spreadsheet. Can you feel your cortisol level rising? In response to deadline pressure, you submit a multidisciplinary proposal minus one dean’s signature, with the understanding you have approval to move forward, only to learn later that that dean has significant issues with the submitted proposal and is unwilling to sign off.
Now your amygdala is going off like a rocket! Venting to a colleague may provide some immediate relief, but the price is that you are spending precious time doing something other than working the problem.

The trick is to find a way to give your neocortex a chance to catch up. How many times have you wished your life had a pause button? Not only so you could enjoy the wonderful moments, but so that you could have that extra moment to think about how to respond in a high pressure situation? As research administrators, we need to be mindful of what triggers our emotions and identify strategies for redirecting ourselves from emotional reactions. It is important to remember that we do actually have pause buttons at our disposal; we just need to find them. Think about what sets you off emotionally. Is it when someone doubts your knowledge or interpretation of a program or policy? Is it a late breaking email insisting upon an unreasonably last minute proposal submission or contract deadline? Is it when a PI assumes you must be an unfeeling bureaucrat who doesn’t care about science? A perceived lack of disrespect for one’s time, experience, intelligence, or humanity is a big trigger in academia and in the research administration environment. Simply acknowledging what upsets you and what can help you find potential pause buttons. Dunlap suggests easy meditation by taking three deep breaths or a quick walk inside or outside your office. You may be on a tight deadline, but you will save time and improve relationships by taking a moment on the front end. One ELP member suggested the use of a mirror at your desk so you can keep watch of your facial expressions while taking a phone call! Learn to smile more at yourself in the mirror. Turn off your light for thirty seconds and then turn it back on again, visualizing the light as a reset button. Naming your emotions by keeping a journal is a time tested method. Another ELP member suggested writing words and thoughts about how you feel at the moment and then throwing them in the trash to symbolize your mastery over those feelings. Dunlap even suggested pinching your finger during times when you are triggered, a Reiki technique for increasing awareness and management of your emotions. Whatever technique you choose, the idea is to find a way to buy yourself enough time to allow the thinking brain to catch up, to recognize that there is no tiger. Then your next steps can be directed by your neocortex and not by your amygdala.

Finding the pause button is an act of leadership. When you redirect yourself from a potential amygdala hijacking, you are also defusing the situation for the person who initially triggered you. You will find yourself spending less time venting and more time doing what you do best, as will those around you. We are more valuable to our PIs, our colleagues, and our institutions when we are able to master our own emotions. Many of us would like to fine tune our self-awareness. Like learning to play the cello, speak another language, or interpret OMB circulars, it takes practice. Self-mastery is a lifetime journey, a process rather than an event. Knowing a paper tiger when you see one is a good starting point.

¶4120.15 Is Your Glass Half-full or Half-empty? Creating a Framework of Optimism

Ann Smith, Michigan State University, and Maria E. Valero-Martinez, University of Miami

It seems quite easy to encounter stressful changes and events these days. Whether facing challenges with ARRA reporting, bleak economic news, compliance audits, lay-offs or other disappointing circumstances, do you permit your mindset to hold that the “glass is half empty” or are you a person who could be called an eternal optimist? An optimist is widely thought of as someone who sees the positive aspect in every cloud and views the world through rose-tinted spectacles (or a glass that is always half full). Great leaders believe that treating every day with the “glass is half full” attitude is one of the keys to successfully dealing with stress and living a more satisfying and healthy life.

Individuals have different styles for how they define a positive or negative event. An individual’s optimism is measured by one’s “explanatory style” or how one chooses to view a positive event. An event can be categorized as internal or external, stable or unstable, isolated or global. Characterization of an event as internal or external means the event is a result of something an individual did (internal) or something out of their control (external). Stable or unstable refers to whether the positive event will re-occur (stable). Global events are viewed as having an effect on other areas of an individual’s life, whereas isolated events are viewed to have little or no impact on the future.

An optimist will often define a positive event by: (a) something they did (internal), (b) a sign of more good things in the future (stable), and (c) evidence that other areas of their life will be positively affected (global). Negative events are viewed as: (a) not their fault; and (b) an isolated occurrence that will not affect future events or areas of their life. For example, an optimist who is promoted is likely to believe the promotion is because she/he is good at her/his job and will receive more benefits and promotion in the future. If she or he is passed over for the promotion, it will likely be attributed to having an off-month or extenuating circumstances, but that she or he will do better in the future.

Pessimists tend to think the same way about negative events. They typically believe that they are responsible for negative events (internal) and that one negative event will trigger more in the future (global), because they personally are the cause. They typically see positive events as an isolated incident (local) caused by things outside their control (external) and that probably will not happen again (unstable). Not only will pessimists view a promotion as a lucky event that is unlikely to happen again, they may even worry that they will now be under more scrutiny. Being passed over for promotion would probably be explained as not being skilled enough. The pessimist would, therefore, expect to be passed over again for future promotions.

1 This article is reprinted from the NCURA Magazine, January/February 2010, Volume XLII, No. 1. It is used with permission of the publisher.
Researchers like Martin Seligman, Director of the University of Pennsylvania’s Positive Psychology Center, have been studying optimists and pessimists for years, including the effects of optimism on a person’s general level of happiness. They have found that an optimistic worldview carries certain advantages. Optimists typically see hardships as “learning experiences” and often, even the worst day holds the promise that “tomorrow will probably be better.” Optimists often see the brighter side of things and believe that they experience more positive than negative events and that the good events will enhance everything they do.

Optimists also tend to experience less stress than pessimists do. Because optimists believe in themselves and their abilities, they expect good things to happen. Negative events are seen as minor setbacks that can be easily overcome. They do not feel overwhelmed when things do not go as planned. In fact, optimists believe that things happen for the best and another opportunity will present itself because they are in control of the future. Positive events are seen by optimists as further evidence of good things to come. Because optimists believe in themselves, they are more likely to take risks and therefore create more positive events in their lives. In a longitudinal study of ninety-nine Harvard University students, those who were optimists at age 25 were significantly healthier at ages 45 and 60 than those who were pessimists. Other studies have linked a pessimistic explanatory style with higher rates of infectious disease, poor health, and earlier mortality. Highly pessimistic individuals have a higher risk of suffering from cardiovascular disease and other ailments. Do these studies prove that having a positive attitude can add years to your life? Maybe not, but having an optimistic outlook on life may bring with it less stress, increased self-esteem and greater health benefits.

Optimism also undoubtedly has a remarkable effect on helping teams to stay healthy, efficient and productive. Seligman also analyzed the explanatory styles of sports teams and found that optimistic teams performed better than the pessimistic ones. Optimistic teams also had better synergy. Optimism can be contagious and can have a positive effect on office staff during difficult times. Office morale can improve and individuals can have a better outlook about themselves and their institutions. With an optimistic attitude, teams can accomplish tasks that might otherwise seem insurmountable to their pessimistic counterparts. Increases in overall performance and productivity may also be seen when the staff have optimistic attitudes. Optimists do not give up under challenging situations and they are more likely to achieve success because of their persistence.

As leaders, it is important to lead with optimism and a positive attitude. Our attitude and actions affect, in one way or another, the people around us. This happens not only verbally, but also instinctively and on a subconscious level, through thoughts and body language. Negative thoughts, words and attitude bring up negative and unhappy moods and responses from others.

By choosing to be an optimist, we have the ability to positively affect our staff and, in turn, inspire them and help them to make positive impacts in their work and lives.

Consider whether you are a leader who leads with optimism. If you are interested knowing where you are on the scale of optimism, take the Optimism Test.
developed by Seligman at http://www.authentichappiness.sas.upenn.edu/testcenter.aspx. If you are not satisfied with the result, there are steps you can take to re-direct yourself to more positive attitudes, positive thinking and action. One approach is to re-frame events by identifying negative thought patterns and replacing them with more helpful or adaptive thoughts. It does take effort, but remember that negative thinking can be changed. Start by banishing negative remarks from your conversations. When you catch yourself thinking a pessimistic thought about an event in your life, first evaluate the evidence. What are the facts not the fears? Next, think about alternate explanations and outcomes. Practice this and you might find that you simply feel better with this new positive attitude. Additional avenues for increasing your optimism include reading good self-help books, injecting humor into your responses and interactions with others, and maintaining balance. Other specific practices could include observing those instances in which you discount the positive, neglect your well-being, play the role of victim, or over-generalize one negative situation. An optimistic attitude will help you deal with prevailing circumstances with fortitude and patience. It is never too late to change, and that change may bring with it better health and a happier life.

We cannot choose how many years we will live, but we can choose how much life those years will have. We cannot control the beauty of our face, but we can control the expression on it. We cannot control life’s difficult moments but we can choose to make life less difficult. We cannot control the negative atmosphere of the world, but we can control the atmosphere of our minds. Too often we try to choose and control things we cannot. Too seldom we choose to control what we can ... our attitude.

— John Maxwell (“Developing the Leader Within You”)

Transformational Leadership’s Impact on Team Performance
Jo Ann Smith, University of Central Florida

If I could solve all the problems myself, I would.
— Thomas Edison, when asked why he had a team of twenty-one assistants.

Abstract
One of the stimulating aspects of our profession is working with some of the most brilliant and cutting-edge thinkers in the world that are dedicated to solving significant and complex problems. Being involved in supporting researchers keeps the research administrator on their toes and gives them unique challenges beyond those in most any other profession. I find it both invigorating and extremely challenging. Facilitating the efforts of pioneering researchers can create complicated administrative circumstances that have never arisen before or at least situations new to us and our organizations. As the complexity of the problems faced by researchers intensifies, our work becomes more complex as well. Often following the established policies or processes is not suitable and we must think critically about how to resolve these new challenges. One of the approaches scientists are using to tackle complex research questions is to work in teams. As a matter of fact, teams are more prevalent in every type of organization today, including research administration. Because of this growth in the use of teams within various organizations, social scientists have been researching teams and team performance. One primary question being analyzed is what types of leadership styles work best when working with teams? This article will describe the growth and significance of teams and how transformative leadership (TFL) can positively impact the performance of teams in research administration.

Growth and Significance of Teams
As science pushes our researchers to new heights in discoveries and innovations, we find the complexity of the issues intensifying. A term used to refer to these complex societal problems is wicked problems. Wicked problems are multifaceted and require the collaboration of experts from different scientific disciplines to examine and develop successful solutions. The science of team science has documented the benefits of working in transdisciplinary and multidisciplinary teams in the research literature (Brown, Harris, & Russell, 2010; Fiore, 2008; Wuchty, Jones, & Uzzi, 2007). Not only are researchers seeing the necessity and benefit of working in teams, there has been exponential growth in the use of teams in almost all organizations. This can be attributed to the fact that teams are ideal for forming solutions to complex challenges that are more effective and efficient than if a team approach is not used (Hackman, 2011; Salas, Stagl, & Burke, 2004). Today, leaders that approach solutions to problems or challenges alone are at a disadvantage. I have witnessed this scenario many times when decisions are made without the benefit of a multiple-faceted team; unfortunately in those cases researchers are impacted negatively due to unperceived and unintentional outcomes. In a recent report related to the future of American research universities, Fenwick (2012) affirmed the critical role research administration...
has on research productivity--research administrative units “can either present a significant barrier to the success of the faculty” or “promote and enable institutional success by providing the faculty with a significant competitive advantage” (p. 50). Teams are one way to effectively address problems in research administration that will give our research organizations a competitive edge.

Leaders in research administration are finding that teams work well when confronting complex problems that may involve internal and external units within an organization or university. Teams allow us to emerge with solutions that are more effective, comprehensive, and innovative in accomplishing their mission of reducing research administrative burden and maintaining compliance, accountability and transparency within our organizations. The need and increased growth in the use of teams in research administration can be attributed to multiple trends which include:

◆ Issues facing research administration are more demanding and complex (Shambrook, 2012; Yaeger, 2011)

◆ Challenges and fragility among research administration offices caused by fluctuations in research funding, increased regulatory compliance, increased collaboration and coordination required across multiple organizational divisions each with a specific research management or operations task such as financial management, risk management, policy development, facility safety, information technology, etc. (Fenwick, 2012)

◆ The increase of specialization in our profession interferes or makes it more difficult to communicate among the entire spectrum that typically falls under the research administration profession (research development, pre-award, post-award, compliance, financial management, export control, technology transfer and commercialization, etc.) (Smith & Torres, 2011).

The changes mentioned above have themselves created additional demands that require a team effort to effectively address. These include the need for: continuous training and education, innovation in structures for more productivity, and the redesign of business processes using technology for increased transparency, accountability and efficiency (Yaeger, 2011).

The Business Dictionary (www.buisnessdictionary.com) defines a team as:

A group of people with a full set of complementary skills required to complete a task, job, or project.

Team members (1) operate with a high degree of interdependence, (2) share authority and responsibilities for self-management, (3) are accountable for the collective performance, and (4) work toward a common goal and shared rewards(s). A team becomes more than just a collection of people when a strong sense of mutual commitment creates synergy, thus generating performance greater than the sum of the performance of its individual members.

Team performance is often associated with process-oriented projects that use a team-focused approach rather than a task-oriented focus. Naturally, interpersonal
relationships among the team members have a significant impact on determining the level of team performance. Three critical team constructs that impact successful team performance are:

1. **Team Cohesion** – Defined as the level of motivation for the team to continue working together (Shaw, 1976). Team cohesion and team performance have been identified as having a positive correlation (Dionne, Yammarino, Atwater, & Sprangler, 2004).

2. **Team Communication** – Healthy team communication includes listening, providing feedback, and openness to suggestions. Dionne et al. (2004) identified several studies that found good communication among team members improved team performance (Dyer, 1987; Zander, 1994; Swezey & Salas, 1992).

3. **Conflict Management** – Conflicts occur when two or more members of the team disagree. It can be detrimental if it impedes the team’s ability to accomplish their goal(s). Otherwise Dionne, et al. (2004) states that managed conflict serves a positive role by stimulating alternative solutions or approaches to solving the problem, and can inspire innovative ideas and creativity.

These three team attributes are important because they focus on the interpersonal relationships among the team members. When interpersonal relationships suffer it can create dysfunctional teams, which is worse than not having teams. Dysfunctional teams can damage organizational morale and decrease a teams’ productivity by engaging members in disputes or the formation of barriers that ultimately interfere with the productivity of an entire team. Leaders can play an important role in maintaining a healthy and functioning team. Therefore, both the leadership of teams and the teams themselves are strategically important to generate positive performance and to strategically achieve organizational missions. Leadership style has also proven to have a significant influence on team performance and productivity.

**What is Transformational Leadership?**

Transformative leadership (TFL) was first identified and studied by Bass & Avolio (1994). Transformational leaders are said to have four major behavioral attributes: intellectual stimulation, individualized consideration, individualized influence and inspirational motivation. The two leadership styles that are most often compared with each other are the TFL and the more prevalent Transactional Leadership style (see Figure 4120.16-1). Transactional Leadership is a more readily practiced leadership style in many organizations (Bass, 1985; Hater & Bass, 1988; Liu, Liu, & Zeng, 2011). Generally speaking, Transactional Leaders exchange one thing for another. This exchange may include material and non-material rewards such as greater job security, recognition, a special bonus, or simply receiving positive feedback. Those that successfully complete their tasks as assigned are rewarded and those who fail are punished with negative feedback, disapproval, and/or disciplinary action. Transactional Leaders like to have clearly designated roles established and will delegate well-defined tasks to be carried out as specified. Transactional leadership can be effective because they have an understanding of those under their direction and will provide rewards and punishments in accordance to the performance and
outcomes of those they lead. Transactional Leaders emphasize following established processes and rules and tend not to be comfortable with initiating innovation or challenging the status quo. In contrast, Transformational Leaders appeal to those they lead by aiming at higher aspirational ideas, ethical standards, and values. Transformational leaders promote the connection of team members to each other by putting the good of the team as a priority and focusing on a shared vision. TFL is geared more toward promoting the adoption of innovation and change to produce strategic outcomes. Transformational Leaders tend to look at the big picture, focus on long-term goals, and the development of new talent and leaders. A research study conducted by Liu, Liu, & Zeng (2011) found that in working environments where there is direct contact with clients or in providing a direct administrative service function, TFL had more positive effects on team innovativeness than transactional leadership. Other studies have also indicated that overall team performance is improved when using the transformative leadership style (Dionne et al., 2004; Bass, 1985, 1988).

TFL originally was considered a leadership style used only for the highest levels of management, but with the flattening of organizational hierarchies and technological advancements, this style has been effectively incorporated at middle manager levels improving workplace performance and job satisfaction (Bass, 1999, Bruch & Walter, 2007; Spreitzer & Quinn, 1996). Atkinson & Pilgreen (2011) also identified TFL as an effective leadership style for research administrators who are often “required to be savvy and use leadership skills that promote collaboration, the individual, and the intellect because information produced by the organization is ever-changing and fluid” (p. 3). Bass and Avolio (1994) identified four behaviors of TFL (Figure 4120.16-2).

Transformational leaders alter organizational climate by connecting those they lead to shared values and high ethical standards, and by using “a balanced approach to achieve short- and long-term results” that will strategically improve performance (Northouse, 2012).
Transformational Leadership and Team Performance

Dionne et al. (2004) identified how the four major attributes of the TFL correlated with the three team performance elements needed for high performing teams (see Figure 4120.16-3). The TFL behaviors related to Idealized influence and Inspirational motivation are shown to promote team cohesion. The TFL factor for Individualized consideration is shown to positively impact team communication and knowledge transfer, and finally, Intellectual stimulation is shown to positively influence the management of conflicts in teams. Figure 4120.16-3 illustrates practical application of the TFL behaviors that would increase team performance.

<tr>
<td>Idealized influence</td>
<td>Cohesion</td>
<td>Transformational leaders can positively influence the cohesion of those they lead by promoting trust among group members through the creation of shared values, high ethical standards, and focusing on the importance of the shared group mission and vision.</td>
</tr>
<tr>
<td>Inspirational motivation</td>
<td>Communication and Knowledge Transfer</td>
<td>Transformational leaders communicate and encourage individual talents, coach, mentor and promote learning and professional development through team members’ attendance at professional conferences or other workshops and provide opportunities for those they lead to share knowledge with other team members.</td>
</tr>
<tr>
<td>Individualized consideration</td>
<td>Conflict management</td>
<td>Transformational leaders can effectively manage team conflicts thorough effective listening, encouraging the use of rational thought, valuing alternative approaches or perspectives on a single issue, and keeping the focus of the team on the shared mission over individual agendas.</td>
</tr>
</tbody>
</table>

In summary, with the changes in our profession and organizations and the increasing complexity of the problems we face with researchers and as research administrators, it will take creativity, innovation and team effort. Leaders of teams need to know how to build team cohesion, communication and knowledge transfer, and manage conflict. Today’s research organizations need more transformative leaders in research administration, especially when the organizational environment warrants improvement and the adoption of innovations to facilitate effective changes that are critical to increasing research productively and efficiency.

Smith teaches graduate courses that include: Organizational Models & Leadership, Introduction to Research Administration, Strategic Planning & Management, Program Evaluation Techniques, Financial Management, and has also taught Introduction to Research Design.

¶4120.17  Creating and Maintaining Effective and Innovative Teams
Karen Woodward Massey, Harvard University

Author’s Note: This article will attempt to give you concrete tools and goals to choose a team, get it off to the right start (or restart), and foster innovation so that the team can perform extraordinarily, think outside the box, and sustain itself for as long as necessary.

When thinking about starting a project it is important to first ask yourself “Do I need a team?” Teams can take longer to do things and require extensive coordination to work well. If facilitating meetings, communicating, and coordinating is not your forte then don’t form a team or instead find someone else to partner with who can help you. Planning, organization, communication, and trust are all keys to effective teamwork. If the team doesn’t address all of these things and more, it might be better to do the project yourself, or to delegate it to someone else.

That said, teams are essential when one person can’t do it alone (Mind Tools, Ltd, 2009-2011).

Diverse teams can be great at complex problem solving because multiple perspectives allow the team to see most, if not all, sides of the problem. Great satisfaction also comes from working with a high-performing team to explore options and make the necessary missteps to produce exemplary innovative work. Finally, teamwork is especially important when a complex problem or project requires change management. The more people can be involved and have suggestions incorporated into the work, even tangentially, the more buy-in is created. People who have buy-in naturally support and advocate for the project.

Long Term Teams vs. Ad Hoc, Project Based Teams
There are two types of teams (Mind Tools, Ltd, 2009-2011). The first type is the official, long term team: people you work with every day, colleagues participating in

![Figure 4120.17-1. The Five Dysfunctions of a Team]

1 This article is reprinted from NCURA Magazine, Volume XLIV, No. 5, September/October 2012. It is used with permission of the publisher.
standing committees, or the members that lead an organization (NCURA Regional advisory committee work comes to mind). These teams are probably not of your choosing, and can pose particular challenges when one is working with people who are volunteering their time. As a new manager you may inherit a team, as a long term manager you may have the luxury of populating your team over months or years. One would think that as a supervisor you would be allowed to direct others to do what you want, exactly how you want it. However, savvy managers know that making someone do something is much less effective than allowing them to choose what they want to do, steering them towards work that plays to their talents, and giving them the autonomy to do the work in the manner that the employee wants. For the most part, long term teams are made up of people that you did not choose and they pose particular challenges to teamwork, especially if bad habits are entrenched. Helping this type of a team to become effective and innovative can be especially challenging. However, some of the information in this article can be applied to long term teams as well as ad hoc, project based teams.

Ad hoc, project based teams are different in that you, as an organizational leader, probably have more control over who you choose. In addition, the project or mission, of the team is most likely pretty clear from the outset. The ultimate “due date” may also be clear. For instance, the program committee of an annual conference knows that they need to plan and carry out a conference to be held on a certain date. However, everything else about how the team will operate, what the culture will be, who will do what, specific milestones, etc. is open to interpretation. Finally, these working groups are temporary in nature and must be adjourned at some point, hopefully with a celebration of success and a record of how the project was accomplished. In the case of a program committee for an annual conference, the members of the following year’s committee may be completely different. However, they may appreciate knowing how the committee was structured, who did what by when, etc., so that they don’t have to reinvent the wheel.

**Team Theory: Forming, Storming, Norming, Performing, and Adjourning**

Bruce Tuckman introduced the above team development model in the article “Developmental Sequence in Small Groups” (Tuckman, 1965), ultimately adding the Adjourning stage. Here it is in a nutshell:

**Forming**

People are introduced to each other, are positive and polite, excited and anxious, the team facilitator plays a key role in setting the tone and expectations with the group. A formal or informal team charter is a great thing to create (see below for more). At the least, the group leader needs to help the group define what the goals, deadlines, culture, and processes for accomplishing the work are.

**Storming**

Team members jockey for position, and try to figure out who will do what and how the project will be accomplished. Some people may question the scope of work of the project. It is important for the team leader to encourage professional discussion
and debate at this point. The team needs to consider all options and be honest with each other in order to move to the next stages.

**Norming**

Hierarchy and roles are established, processes and structures are created, team members hold each other accountable and ask each other for help, everyone commits to the group goal. Storming may still happen but Norming becomes more and more prevalent.

**Performing**

Aided by the structures, roles, and processes established in previous stages, team members work hard to progress toward team goals and achieve results. The team leader is able to delegate the work and help individuals develop themselves.

**Adjourning (or, “Mourning”)**

When the project is finished, or the team is disbanded for other reasons, it is important to celebrate lessons learned and achievements. If the team is high-functioning, members have developed close working relationships. Acknowledgement and celebration is crucial to the creation of future teams. Documentation of roles, processes, and lessons is especially important if this is a project (such as planning an annual conference) that will need to be re-created periodically.

**Forming: Research, Diversity, and Agreeing on Direction**

The three most important aspects of starting a project are researching, determining who will be on the team, and reaching consensus with the team on what will be accomplished, how it will happen, and what success will look like.

**Research and “External Activity”**

According to the book “X-Teams: How to Build Teams that Lead, Innovate, and Succeed” (Ancona, 2007), teams must always be observing and communicating with people and groups external to the team.

Before you choose team members, consider who the major stakeholders in the project will be. For instance, if you’re forming a team that will develop Responsible Conduct of Research (RCR) policy, procedures, and pedagogy your institution’s chief compliance officer is probably a major stakeholder. Departmental staff are also stakeholders in that they may be needed to identify who has to take RCR and track who has taken it. Principal Investigators may be needed to design and teach the courses. The Dean may need to provide monetary support. If you take the time to identify stakeholders it may be possible to invite representatives of each major stakeholder in order to get maximum diverse perspectives and, ultimately, a broad range of support for the project and/or team.

Great teams will also research within and outside their organization to see if anyone else has already attempted or succeeded at what the team is trying to do. Another consideration is how this project fits into the goals of the organization. RCR
may be extremely important to the office for sponsored projects but when resources are tight and no one has ever been audited or fined for non-compliance it may be pretty far down on the institutional risk assessment list. You can help the project to ultimate success by doing at least some of this research before the team is convened.

Diversity of Strengths
If you have the luxury of inviting people to the team this is where you, as a leader, can set the team on the path to success. If you are inheriting a team you can still set the team on the path to success by considering some of the following factors, keeping the structure of the team flexible, allowing current members to play to their strengths, and by adding team members as necessary. The book “Strengths Based Leadership, Great Leaders, Teams, and Why People Follow” (Gallup, Inc., 2008) details four types of people that should be included in any team. It is unlikely that one person has all of the traits listed after each type but I have attempted to encapsulate them below.

Strategic Thinkers: People Who Plan
Strategic Thinkers are people who find it easy to plan and organize. These include people who are analytical, like to research and put things in context and who think ahead. They may also be fascinated with ideas and make connections between things that, at first glance, seem to have no commonality.

Executors: People Who Do
People strong in execution like to achieve things that will make a difference. They believe in fairness and like to take time to choose the right way forward. They are disciplined and have the focus to finish what they start. If they take on something they will follow it through, no matter what. They may also be natural problem solvers.

Relationship Builders: People Who Glue
Relationship builders are the people who hold the team together. They are adaptable, like to develop people, enjoy connecting with others, and can easily understand where others are coming from. They may also be able to instinctively assess other people and pinpoint how team members can best help the team move forward.

Influencers: People Who W.O.O.
Influencers are very good at getting projects started and, once the project is in progress, in Winning Others Over. They have great communication skills and wide networks and they can easily identify people outside the team who are needed to maintain and ensure the success of the project. Influencers may be comfortable taking charge and may automatically exude the confidence needed to keep people going.

Agree on Direction via Team Chartering
We have already discussed identification of stakeholders and considering team goals in the context of organizational goals. These are two things that should be discussed and agreed upon in a formal or informal team charter. A charter will help the
team get off to the right start, or may be used to jump start a team that is not working cohesively (Mind Tools, Ltd, 2009-2011).

There is no “right” way to create a charter. Just the act of considering and coming to consensus on some of the following questions allows the team members to get to know each other and to start to work together. Questions that the team may want to address include:

◆ What is the scope of work/problem to be solved?
◆ Has any work already been done that can help us?
◆ How will the team communicate with each other?
◆ How will the team be structured?
◆ What are the project milestones?
◆ What is the timeline for results?
◆ What will each team member be expected to do?
◆ What will individuals specifically be in charge of/responsible for?
◆ What support does the team need to succeed?
◆ When will the team meet and what will be accomplished?
◆ How will meetings be run?
◆ What will happen if someone can’t attend?
◆ How often should team members check in with each other and review what has been accomplished?
◆ If a team member is having trouble accomplishing something, who should he/she talk to for help?

Again, negotiation and agreement are keys to this process. The team doesn’t need to agree on each item necessarily, but everyone should be on the same page and working towards the same goals.

As a leader, you will have to do a lot of work to prepare for these initial meetings, as a facilitator you set the tone, introduce people, try to create a safe environment where everyone’s voice can be heard and “speed bumps” are allowed. It is also your job to ensure that everyone knows what has been decided, what the next steps are, and who will try to accomplish what by when.

**Storming: Challenges to Great Teamwork**

Before I get into the challenges inherent to team work, I want to emphasize that the Storming phase is essential to creating a great team. As team members jockey for position, and debate how and when the project will be accomplished, they build trust and respect for each other. They become brave enough to be honest and express how they feel, and they learn to focus on the issue and not make things personal. It is the leader’s job to help the team work through this stage, focusing on individual development when needed and ensuring that the team is truly reaching consensus.
The team, however, must deal with growing pains in order to blossom.

Everyone who has been part of a team or who has led a team knows that it is easy to miss the mark. The book “The Five Dysfunctions of a Team” (Lencioni, 2002) does a good job of identifying root causes of some of the challenges (see the pyramid at the beginning of this article).

Trust is the foundation of all effective teams. Trust is engendered when people come to know each other’s strengths and are able to take the time to build relationships with each other. Lack of trust is exacerbated when the team is separated by distance and must communicate via email and telephone. If trust is present and if team members respect other’s perspectives and talents then members can stay focused on the project instead of taking things personally, making discussions into diatribes where other team members are vilified, or staying silent because they don’t want to “rock the boat.” Debates are a healthy part of moving through the Storming phase. If a team can manage to steer through them and reach consensus then they will be able to commit to the project, even if they may not agree with certain aspects of how the project will get done.

Another challenge comes when individual team members don’t want to work as a team. They may be star performers who get things done extremely well on their own terms but are unwilling to bend, communicate what they are doing, and stick to goals and schedules that the team has agreed to. When this happens it is the leader’s job to decide how disruptive this is to the team and, if needed, take steps to mitigate the problem. You may be working with someone that has a lot of experience, historical knowledge and has put a lot of work into the project or the organization. However, when a project is long term and/or titanic it is imperative to have people who are committed to teamwork, especially if the individual is taking on too much, missing deadlines, and/or disrespecting the team process. If this situation goes unchecked the work will be less satisfying and other team members will never be able to hold each other accountable for accomplishments because the work is not spread out. This may also result in a “blame game” when deadlines are missed. If lack of progress is always someone else’s fault then it is unlikely that extraordinary success will ultimately be accomplished.

Norming

Storming is an essential stage for team growth. It cannot be skipped because an effective team must be able to be honest with each other and work through conflict. When the Norming phase develops, the team may still revert to Storming occasionally but eventually the team will work out who will lead which effort and who will be responsible for which deliverables. The team will start to agree upon processes and structures, to hold each other accountable, and to ask each other for help. Eventually, everyone will be able to commit to the group goal or will decide to leave the team (literally or figuratively) by not attending or participating in debates, etc. At the end of this phase, a leader will want to scope out a seat in the dugout and let others step up to the plate.
Performing: What does a high-performing team look like?
The best teams reach a point where they can operate effectively without the leader and can take it in stride when individual members depart or join the team. These teams have trust and respect for each other, hold honest debates about issues, and are committed to the project and to each other. They are also great at holding one another accountable and, ultimately, accomplishing results. If a leader is lucky enough to shepherd a team to the Performing stage her focus may be able to shift towards developing individual members of the team, and helping the team communicate successes to stakeholders.

Adjourning/Mourning or Sustaining the Team
Ultimately, the leader and the team must work on identifying the conditions needed to sustain the team indefinitely or decide when and how the team should be adjourned. If there is good reason for the team to continue team members and leaders may need to be replenished periodically or permanent staff may need to be hired. If it is determined that the team should be adjourned then it is important to assess what went well, what could be done differently next time, and how satisfied the stakeholders were. There may also be records/systems/processes that can be documented and forwarded to the next team. Also, the closer a team has become the more important it is to allow yourself and individual team members to “mourn.” This is a little extreme, perhaps, but there is a loss to disbanding a team, and it is wise to be aware of it (plus, “Mourning” is a better rhyme than “Adjourning”).

In any case, temporary teams and long term teams should be encouraged to take the time to celebrate their success. This helps people to look forward to the next project and creates good will amongst team members and stakeholders alike.

Final Thoughts on Innovation
Innovation is a catchphrase in today’s workplace. It is synonymous with creativity, taking risks, and thinking outside the box. In order to foster an innovative team, the group must be encouraged to be flexible and gain inspiration by reaching outside itself. The team should always be aspiring to learn from the world, from each other, and from people in all strata of the organization. The more a team can connect across networks the more likely it is to be able to innovate and find the resources and gravitas to succeed (Ancona, 2007). Teams must have the time to be creative and must be encouraged to take risks, even if this means that they might take longer to succeed (Pink, 2009).

Thank you for taking the time to read this article. If you found it helpful, please consider attending the session of the same name and/or the Drive Book Club at the NCURA Annual Meeting in November 2012. Questions and comments may also be addressed to the author. kwmassey@fas.harvard.edu.

The Art of Facilitation: Maximizing Others’ Contributions

Jeffrey Cufaude

[Senior Editor’s Introduction: The author was the facilitator at the adult learning workshop sponsored by NCUIRA immediately preceding the last Annual Meeting. This article very much captures the themes of that workshop. As research administrators, facilitation is a large part of what we do on a daily basis.]

If leadership is about doing the right thing and management is about doing things right, then facilitation is about helping individuals and groups do the right thing right.

Indications are everywhere that we need individuals at all levels of an organization to possess facilitation skills: more work is being completed in cross-functional teams and internal or external partnerships; more decisions are being made collaboratively in consultation with others; and a yearning for greater community in organizations comes at a time when the diversity of perspectives, talents, and cultures present in the workplace is increasing.

Though facilitation might most be associated with a workshop or strategic planning process when an external consultant is hired to facilitate the program or process, it actually is a fundamental skill any individual can master.

The Essence of Facilitation

Facilitation encompasses a wide range of skills and techniques that allow individuals to more effectively accomplish common organizational tasks: leading department or team meetings, managing conflict among colleagues, presenting training workshops and professional development programs, or coaching individuals. The essence of facilitation can be summarized in five major themes.

Facilitation makes connections and helps make meaning. In a fast-paced environment overloaded with information, the need for connections is great: connections between individual people, connections between ideas and concepts, connections between projects and mission or vision, etc. When facilitating, individuals are listening for and seeking to make (or help others make) the connections between what is occurring in a conversation and what has occurred in other places or at other times. Effective facilitation involves periodically asking the question, “So how does this discussion connect with others we have been having?”

Facilitators always seek to connect comments made by various individuals in a workshop or meeting; i.e., “How does Bill’s observation relate to what we discussed earlier this morning?” Because facilitation involves deeper and more active listening, a facilitator likely has a greater overall sense of the connections present among disparate threads of conversation. The facilitator must pose questions and use techniques that help group members make these connections, as well as identify the meaning behind what is occurring: “What stands out most for you about the

1 This article is reprinted from NCUIRA Magazine, Volume XLIII, No. 1, January / February 2011. It is used with permission of the publisher.
conversations today? What are the relevant implications we need to consider as we move forward?"

Facilitation is providing leadership without taking the reins. Some see facilitators’ as “flipchart patsies,” individuals who stand at the front of the room and merely note on the flipchart what others say. The fact that group members often do not see facilitators taking control of the group is by design, not by accident. Individuals using a facilitative approach provide leadership to the group without actually assuming a more formal leadership role.

When group members (be it in a workshop or a team meeting) do not themselves share ownership of the group and its outcomes, any commitments made are likely to lack sustainability. Too often, individuals abdicate their leadership responsibility to the facilitator. “Oh since Jeffrey is facilitating I don’t need to be concerned with group process, making connections, etc.” In order for groups to realize their full potential, every individual must be concerned with the good of the whole, even if a designated facilitator is assigned that primary responsibility. Because of this, facilitators more often are seen asking rather than telling groups exactly what they need to be doing ... helping them move forward rather than directing their movement.

Facilitation balances managing content and process. Individuals using a facilitative approach are concerned both with what the group is discussing or deciding, as well as how they are actually doing it. A decision made without consideration of its impact, the diversity of perspectives possible on the decision, the other alternatives available is a decision that may not be the right one.

Effective facilitation often involves working with group members to establish some shared agreements for how they will have their conversations with each other ... the group process aspect of their work. The facilitator then uses these agreements as guidelines for discussions and as evaluation criteria for how well the group actually accomplished its charge: “We’ve made some significant decisions today. When you reflect on the conversations that led to them, how well did we do on the agreements we established earlier?”

Some individuals too quickly dismiss group process as “soft stuff” that keeps groups from the real work of making decisions. In command and control hierarchical organizations, less attention to group process might be acceptable. But in the more collegial environment of most associations, individuals want their perspectives considered and their contributions and ideas solicited and appreciated. As a result, individuals leading groups and teams must share the facilitator’s commitment to appropriately balancing attention to content and process. As the old adage suggests, people are more likely to support what they help create.

Facilitation helps surface unacknowledged or invisible beliefs, thoughts, or patterns. One of the real values of external facilitators is that they help a group identify and discuss the important issues that group members themselves might be unaware of or unwilling to address. While this role can be more difficult for an internal colleague serving as facilitator to play, it is still a necessary one.
Call it what you want—the dead cow on the table, the elephant in the middle of the room, or the skunk smelling up the place—most groups have some issues they need to discuss in order to move forward on key decisions and efforts. Effective facilitation uses gentle (or in some cases forceful) questioning to help bring those issues to the surface: “What are the real issues we have yet to discuss today?”

A common strategy I use is to ask session participants to note anonymously on an index card what they believe most needs to be addressed, but is unlikely to be brought up by anyone during the day’s conversations. I collect and shuffle those cards and then read them all aloud. Doing so gets the issues into the room so participants can now face them without some of the political pressures associated with having actually been the one to bring them up.

Facilitation focuses on building the capacity of individuals and groups to accomplish more on their own, now and in the future. Facilitation is not just about the immediate task, it also is about helping a group or team learn together so that they might be more productive in the future. Similarly, a manager coaching an individual employee is not focused just on an employee’s immediate need, but with laying a foundation for

**Figure 4120.18-1. Facilitator Fundamentals**

Individuals wanting to become more effective facilitators in their own organizations would look to develop their abilities to do the following:

◆ Use active listening skills including paraphrasing, summarizing, reflecting, and questioning
◆ Encourage and generate participative discussion in groups
◆ Help stimulate creative thinking through use of brainstorming and other idea-generation processes
◆ Stimulate strategic consideration of alternatives and informed decision-making of appropriate choices
◆ Manage contrasting perspectives and opinions that might result in conflict among members of a group
◆ Intervene with individuals and groups without taking total control of the situation
◆ Design meeting processes to accomplish a wide range of goals and objectives
◆ Draw out others’ ‘opinions’ in an objective and nonjudgmental manner
◆ Support teams in various stages of group development
◆ Help individuals and groups reflect on their experiences and capture relevant learning
◆ Lead or design inclusive group processes that honor individuals’ different learning and participant styles
◆ Help shape more powerful and strategic questions for exploration
future strong performance.

This long-term definition of success also helps keep facilitators from assuming too much leadership of a group. Doing so could leave group members unable to manage their future conversations or efforts without the facilitator being involved. To prevent such dependence from developing, effective facilitation requires having individuals and groups debrief their meetings, workshops, and planning sessions to reflect on how they did what they did and what lessons can be learned for their future efforts.

“We’ve had a great day of strategic planning. Let’s take 15 minutes and talk about what we’ve learned about your ability to engage in strategic conversations with each other. What are some lessons worth remembering for your future work together?” Simple questions like these help focus a group’s attention on an area they might otherwise ignore. This reflects the facilitator’s capacity-building commitment.

Making the Commitment to Facilitate

All of us can add the role and lens of a facilitator to our relationships with others. Making a commitment to do so, however, needs to be done thoughtfully. But in choosing to do so, you must do so with authenticity, one of the hallmarks of the full-time facilitator. As the Sufi philosopher Rumi says, “If you are unfaithfully with us, you are causing terrible harm.” Appropriating a few techniques learned in a workshop or from a book without authentically incorporating them into your overall leadership identify will cause them to be seen and experienced as insincere or manipulative.

Any time we choose to alter the “normal” style most individuals would associate with our work, we need to be sensitive to how that change might be perceived and received. If you are viewed by your colleagues as a real “take charge” type of person, shifting to a strong facilitation stance will be seen as a dramatic change, one that could lead them to question your intentions.

Rather than changing overnight, you will be better served by gradually introducing a greater commitment to the essence of facilitation in your regular interactions with others. When you find yourself about to tell someone or a group what to do, pull back a bit and ask a thoughtful question that might help them discover for themselves what most needs to be done. When you feel a conversation is becoming too narrow invite the group to consider alternative perspectives. When you need to coach an employee on a job-specific issue, make sure to probe if other relevant issues are what actually need to be discussed.

Rigid lines between leadership and management are often drawn in the professional literature, almost suggesting that one is right and one is wrong. In reality, organizations need individuals who both do the right thing and are capable of doing things right. Organizations also need individuals who can help individuals and groups do the right things right ... the very nature of facilitation. Each of us has the ability to commit to adopting the perspective and making the contributions to a conversation that we might associate with a designated facilitator standing outside the group. If more people choose to add facilitation to their skill set, we are more likely to experi-
ence sustainable commitments and successes on behalf of our organizations.

Unsure if you can effectively adopt a facilitative stance as part of your overall leadership repertoire? Perhaps the following advice from Rainer Maria Rilke in *Letters to a Young Poet* can offer you some guidance: “...your doubt can become a good quality if you train it. It must become knowing ... and the day will come when, instead of being a destroyer, it will become one of your best workers—perhaps the most intelligent of all the ones that are building your life.”

Psychological Contracts and the Employment Relationship: What Managers Should Know
Bonnie S. O’Neill, Marquette University

It’s probably safe to say that most managers are familiar with the concept of “contracts.” Depending on the organization and its characteristics, recruitment and hiring activities may occasionally require managers to negotiate and establish some type of employment contract—whether explicit (formal) or implicit (informal)—with job candidates. Even in the absence of a formal employment contract, when an offer of employment is made and accepted, both managers and employees typically develop expectations about the employment relationship which result in perceptions that an implicit contract exists between them. And, even though the original employment contract may or may not be formally altered by either party at some point in the future, patterns of obligations develop between the parties based on day-to-day interactions. Inevitably, these obligations ultimately become part of the organization’s social structure. As a result, employees may begin making assumptions and develop expectations that they can alter their relationship with the employer. Such assumptions and expectations take the form of an implicit contract known as “psychological contracts.”

Historically, psychological contracts were examined from the employee’s perspective, since the organization’s interests were thought to be adequately represented by the existence of company policies and practices (e.g., via company handbooks). More recently, however, the key role of the immediate manager has been examined relative to creating and influencing employees’ psychological contracts, since they are the individuals who develop high levels of closeness (both physical and psychological) with their direct reports. Such closeness typically begins during the recruitment and hiring process, and it increases during their day-to-day supervision of employees’ tasks. What is interesting about focusing on the role of immediate managers is that the organization cannot always guarantee that the manager is working in the best interests of the organization. Rather, he/she may be working towards their own self-interests (e.g., promising early raises or promotions to an applicant they want to hire even when policies require a specific length of time before raises/promotions can occur). Although a discussion of managers’ dual roles as an agent representing the organization’s interests and representing their own self-interests raises a host of interesting questions, that discussion is left for another article, at another time!

One important challenge managers often face regarding employees’ psychological contracts is that their cognitive nature makes them unseen. However, the implications of psychological contract evaluations by employees can be observed in the behavioral outcomes that result from such evaluations, especially when discrepancies or inequities are thought to exist. In other words, employees regularly evaluate the promises they believe have been made to them and how well they have been fulfilled. A simple example is provided to illustrate this point.

In some organizations, despite the lack of formal policies relative to when overtime can be worked, certain employees may regularly work extra hours dur-
ing the week in order to leave early on Friday afternoons. At some point in time, it becomes understood—though not explicitly stated—that this practice is acceptable. As a result, one or both parties may feel an obligation to continue the practice for a variety of reasons (e.g., to balance workflow, to better manage customer deadlines, to maintain employee morale, to name just a few). Therefore, although it was never promised to employees that this practice can—and will—continue, employees may perceive that the organization has made such a promise to them by allowing the practice to continue. As a result, they believe that the organization now owes them Friday afternoons off from work when extra hours are worked beforehand. Subsequently, any change to this practice by the employer is likely to be perceived by the employee as a breach or “violation” of their psychological contract. Managers and co-workers may hear the affected employees uttering attitudes such as, “It’s not fair; we’ve always done this in the past!”

In the example above, since a formal contract or company policy is nonexistent regarding the “extra work hours/Friday afternoons off” practice, managers may wonder why employees are reacting so negatively to any changes affecting this practice. Despite pressures from customers or clients for additional service on Friday afternoons, employees may feel as though the organization is reneging on a promise they believe was made to them. What managers are overlooking in this example are very clear attitudinal and behavioral reactions to a perceived psychological contract breach. Such reactions could be mild, and result only in short-term grumbling as employees adapt to the change. However, it is far more likely that breaches manifest themselves in employees’ feelings of anger, betrayal, distrust and, perhaps, a loss of faith in the employer’s good intentions. Employees experiencing a minor incident are not typically making judgments about psychological contract breach. Psychological contracts (and their violation), however, are viewed as more intense than simply the anticipation one attaches to the receipt of certain rewards or benefits. This is primarily because of the level of trust many employees have with their organization. Individuals develop attitudes relative to their jobs (e.g., job satisfaction, organizational commitment, intent to stay/leave) that involve more general beliefs about respect, codes of conduct, and a variety of other patterns of behavior that are associated with the employment relationships. Since attitudes are learned predispositions to behave consistently in a certain manner, they are not likely to change merely as a result of a one-time disappointment or an occasional unmet expectation. Instead, researchers tend to agree that psychological contract violations are much more commonplace, which suggests that employees are frequently making psychological contract evaluations that go well beyond relatively simple feelings of anticipation. As a result, it is far more common for employees to respond to psychological contract violations by reducing their contributions to the organization (e.g., taking longer lunches, calling in sick for relatively minor illnesses, arriving late for work) or in more extreme situations, by leaving the organization altogether. Despite the recent rise in employment opportunities, the market for most job-seekers is still rather limited. Therefore, it may be difficult for an employee to leave his/her organization in the face of psychological contract violations. So, when discrepancies persist over a longer period of time, judgments of unfairness can linger, causing a host of unanticipated negative outcomes.
for the employer, including workplace deviance, lower job satisfaction, reduced commitment to the organization, and greater absenteeism and tardiness. Although we may not see direct costs associated with these behavioral outcomes, any well-seasoned manager or human resources professional can tell you the indirect costs that result from these types of negative outcomes!

A question you may be asking yourself (in addition to, Why did I start reading about this?) is, what triggers employees to begin thinking about their psychological contracts, and is there something I can do now? Even if you had not yet gotten to the point of asking yourself that second question, it is a logical question for good managers to consider. Although psychological contracts exist between individuals and the organization, most individuals are not likely to simply wake up in the morning thinking about them. Something must prompt an employee to compare perceived promises to perceived fulfillment in order to evaluate his/her psychological contract. In other words, until some sort of comparison is made, fulfillment (or breach) determinations have not taken place and may theoretically never be made. One of the key drivers of psychological contract evaluation, however, is uncertainty. When employees face uncertainty in their organizations (something that has been commonplace for many years now, especially given economic conditions in the U.S. and abroad), individuals are prompted to seek comparative information. Uncertainty makes us feel uncomfortable, and we begin to scan the environment for clues as to what is happening. Accordingly, this increased employee vigilance also leads to more perceptions of PC breach.

Some researchers (including this author) have argued that there are a variety of common HR activities that can cause uncertainty and/or convey commitments and inducements to individuals on behalf of the organization. Such activities provide an excellent starting point for identifying trigger events that result in psychological contract evaluations. Some common activities may include: updating existing job descriptions, procedural changes within the department or organization, making recruiting decisions, compensation decisions, attending training events, creating or updating personnel manuals, and updating employee benefits. In addition, research on how individuals make sense of things describes situations that provoke an individual’s switch from an automatic mode (i.e., noticing) to a more conscious cognitive processing mode. Researchers identified events involving the individual that were likely to trigger this switch, such as conducting performance reviews, engaging in career and succession planning, assessment activities, role shifts that encompass promotions or transfers to a new job, job loss, or new employees entering the organization. Sensemaking goes beyond simply noticing something in that noticing involves activities of filtering, classifying, and comparing things in our environment. Sensemaking, however, refers to more active interpretations of an activity and determining what the noticed cues mean. For example, individuals might compare job duties from a prior position with current job duties to help make sense of their current obligations. This is especially common for newcomers to an organization. Individuals might also compare current job accomplishments with established performance goals, especially when performance review time rolls around. And, what
employee has never made a comparison between his/her current job situation and some ideal job? Each of these activities involves interpreting and making judgments about comparisons we are making relative to our job experiences. Accordingly, these judgments can trigger employees to consider their psychological contracts and the degree to which they have been fulfilled or violated.

Psychological contract triggers are not limited solely to comparisons between promises made at the time of hire and present conditions. Instead, employees engage in comparisons throughout their employment. For example, annual benefit changes are frequently driven by current market forces and, in an effort to better manage skyrocketing costs; we have seen many employers modifying employee contributions toward insurance premium increases. Although this may be a potentially unavoidable action, it also sets the stage for perceptions of breach, especially when employees are asked to contribute toward benefits that may have previously been provided at no-cost or very low-cost. Here, managers need to actively manage breach perceptions not only with realistic job previews at the time of hire, but they must make concerted efforts to actively involve employees in the change process and provide regular and on-going communication regarding efforts to effectively manage costs. Failure to do so can trigger employees’ psychological contract evaluations, resulting in some of the negative outcomes discussed earlier.

Despite the somewhat somber and cautionary tone so far, there is some good news for managers. Recent research suggests that when employees perceive their organization to be supportive, they are more likely to exhibit citizenship behaviors (e.g., extra role behaviors) within the organization. In other words, they are more likely to help out co-workers when they need it, they may go the extra mile in providing top-notch customer service, or they may be more likely to support long-term organizational change initiatives. In addition, trigger events such as attending training sessions, mentoring junior colleagues, or networking with individuals at other firms—particularly if facilitated by the organization—may actually decrease breach perceptions. When employees believe that managers are interested in them, they are more likely to view psychological contracts as fulfilled. Management can also mitigate potential breach perceptions by focusing on fairly executing procedures and processes and by more actively promoting trigger events that are viewed favorably by their employees. Knowing what such activities are, though, requires managers to maintain open lines of communication with their employees. The positive evaluations that result from such activities, though, are likely to contribute towards the development of positive psychological contract perceptions now and in the future. At a minimum, they enhance trust between managers and employees, which tends to increase overall job satisfaction and organizational commitment.

Finally, managers should try to involve employees in decision making and make explicit efforts to treat all employees fairly (although not necessarily equally). And, conventional wisdom dictates that managers communicate, communicate, and communicate some more about upcoming changes and why they are necessary. Doing so will reap positive outcomes when the inevitable psychological contract evaluations occur.

Newspapers and social media are rife with examples that highlight how many
of these managerial behaviors may be declining. Many employees report feeling more overworked than ever before, and there has been a significant increase in the use of part-time and contingent workers. Managers need to take time to identify, understand and manage the trigger events in their organizations that are most likely to lead to both positive and negative perceptions of fairness, and focus their efforts on effectively managing those events most salient to employees.

In conclusion, the reality of most contemporary organizations is such that individual motives for power, control and personal outcome maximization vary as a result of differing perceptions of how well mutual obligations are fulfilled throughout the employment exchange. Admittedly, there are likely to be a variety of differences between employees with varying lengths of tenure, not the least of which is their concern over the changing nature of work. Understanding how the changing work environment leads to perceptions of psychological contract breach can help mitigate threats against the relationship and trust that seasoned workers have developed with management and may also help establish stronger relationships among newcomers. Such efforts will not be wasted!

¶4120.20  It Starts with You: Five Ways to Build an Outstanding Team
Donna Obeid, Stanford University

Teams change the world. From U2 to the Harlem Globetrotters to the Saturday Night Live cast and crew, we’ve been in awe of the work of great teams.

Throughout my career in instructional design and development, I’ve had both the privilege of collaborating with teams so strong they seemed almost magical and the misfortune of witnessing a few rather lousy teams. Through it all, I’ve learned some secrets to cultivating a great team. Here are five of them:

1. Develop and Implement a Mission Statement and Goals.

A mission statement is your department’s compass…without one, it’s going to be very difficult to know which direction you’re all headed. If you don’t already have a mission statement, develop one. A strong mission statement should be 2-3 sentences long and should answer these questions: What do we do? How do we do it? For whom? What value do we bring? Once you have a mission statement, post it on your website and talk about it often.

Then consider your team’s goals, for if the mission statement is the compass, the goals are the map. Every team needs both organizational goals and individual goals – these should be as specific as possible and focus on the bigger picture of what is ultimately trying to be achieved. I recommend utilizing the S.M.A.R.T. goals model to assist you.

SMART goals are Specific, Measurable, Attainable, Realistic and Timely. An example would be: By August 1, develop a 10-class training program so that staff can increase competency, streamline procedures and provide more effective customer service.

Dedicate a meeting for your team to brainstorm on what specific things they’d like to see the department achieve. After the meeting, organize the goals into a manageable document which is distributed to the whole team. Then develop an action plan on how the goals will be achieved, by whom and by when. Including everyone in the development of goals gives everyone a chance to be heard and increases the likelihood that goals will eventually be reached. Why? Because teams that fully understand the purpose of what they do are usually more engaged than teams without this focus. Goals – and transparent goals at that – play an enormous part in how your team members feel day-to-day, as well as in their long-term success. Strong leaders talk about goals on a regular basis and know the importance of connecting overall organization goals with individual performance goals.

2. Create a Training Program that Empowers Employees.

I’ve spent the last year developing an empowerment training program for the Engineering Research Administration team at Stanford. I began with an initial analysis and assessment of needs before collaborating with subject matters to design and develop ten courses. Classes – each no more than 1.5 hours in length – were then implemented and evaluated for effectiveness through surveys and feedback. Informal
one-hour ERA Connect sessions were also added as way for staff to exchange ideas and further connect with those who may be in seated in different buildings.

It hasn’t all been easy. I’ve faced challenges in integrating training tools and workshops with the workloads, pressures and deadlines that make up so much of the job of a research administrator. But the training program has gone a long way in terms of increasing competency, streamlining processes and empowering our staff members.

Each of us needs to be committed to being lifelong learners. A training program that focuses on positive change goes a long way in terms of building team.

3. Build An Employee Recognition Program.
In his article Recognizing Employees Is Critical to Retention, Chad Brooks discusses a workplace survey of more than 400 employees in various industries. The results of the survey reveal the key to keeping employees happy is to recognize them for their hard work. Nearly half of those surveyed said they would leave their jobs if they didn’t feel appreciated by their managers. We can’t help it…each of us wants to be recognized for a job well done!

Last year, we developed the Gold Star Recognition program in our department to recognize one employee each month for their extraordinary contributions to the organization. We aligned the program according to the three pillars of our mission, namely, to deliver outstanding customer service, ensure compliance and provide solutions. Individuals are nominated by their peers and receive a $50 gift card as well as a printed certificate to hang on their cubicle wall. The results have been terrific. Everyone wants that gold star!

If you don’t already have an employee recognition program in place, considering starting one. If you can’t provide a gift card, perhaps a certificate and announcement will do. Whatever it takes, always celebrate achievements. Recognition is a great way to bring out the strengths of your teams, increase morale and encourage the weak performers to step up to the plate.

4. Encourage and Develop Employee Strengths.
Great leaders know how to instinctively recognize an individual’s strengths and align these strengths to the success of the team. While it’s no easy feat to do this, teams that focus on building and connecting strengths reap far more reward than teams that take the hands-off approach. Who in your department is a strong writer? Who excels at analytic skills? Who can easily discuss the best way to navigate through Fastlane or Grants.gov?

Bring out your employees’ talents and strengths by encouraging them to lead a committee, develop new tools, apply for a conference, give a presentation at an upcoming staff meeting, etc. This is the way employee gain awareness not only of their strengths but also of the strengths of their colleagues. It’s your job as a leader to tie individual strengths and goals with overall organizational goals. Doing so creates something of a happy and healthy village whose members cannot help but want to keep making things better. As Henry Ford once said, “If everyone is moving
forward together, then success takes care of itself.”

5. Create an Unforgettable Employee Retreat.

Last summer, we had an employee retreat for the purpose of simply building team and learning something new about ourselves and each other.

Our theme was: Amazing You. We spent months planning for the retreat and decided that rather than hire an outside company who would charge us well into the thousands, we’d do it all ourselves. We booked a room in a location that was filled with natural light and away from our normal workstations. We sent out invitations and encouraged everyone to attend. We had specific goals and a task plan for the event and stuck with them.

On the day of the retreat, we served breakfast and lunch, had an Amazing Race, a guest professor, games and activities. We gave away One Day Off prizes and t-shirts. We did all this on a shoestring budget, creating our own riddles, finding a guest speaker who’d present for free, and serving healthy but simple food. The result? Our staff were talking about the retreat for days, even months later. People learned more about each other from one day than they had all year. I encourage you to develop your own retreat…it’s a perfect way to get employees out of their cubicles, learn new things together and just have fun.

In summary, the five strategies I’ve mentioned here can be effective ways to build team in almost any workplace. Change of course is never easy for people and many of the suggestions I’ve given here are indeed that – change. Some people won’t understand the value of a mission statement or won’t understand the need for goals or simply won’t see the reason for training. And just when you think that everyone has heard the same message and clearly understands it, you’ll likely see that you’re wrong. That you’ll need to communicate your message again. And again. And again….

You’ll need to be committed on educating employees on the reasons for the change and how it benefits each of them as well as the organization. You’ll need to be committed to maintaining a transparent leadership by encouraging a feedback-rich culture and addressing the tough questions. Keep people informed. Talk about moving forward together, leaving the past behind. Doing so builds the sort of trust and respect between leaders and employees that is in fact at the very core of every outstanding team.

Donna Obeid is a Training Specialist in the School of Engineering at Stanford University. She has served as an instructional designer for more than fifteen years, developing learning programs for government offices, private corporations and universities. She served as a visiting university lecturer in Northern Thailand where she lived for two years. Donna earned a B.A. in English Literature from the University of Michigan as well as both an M.A. in Teaching and M.F.A. in Creative Writing from American University. She enjoys yoga, magical realist stories, and photography, maintaining her own website at www.donnaobeid.com
Leadership of One: How to be a Leader at a Predominantly Undergraduate Institution

Jeanne Viviani, New College of Florida

It isn’t hard to find all manner of leadership resources these days. From the well-known ones such as Stephen Covey and John C. Maxwell, to more recent ones by Sheryl Sandberg, it seems everyone has something to say about leadership. There are books, magazines, journals, and blogs. In fact, I own a few prominent books myself. They are sitting quite majestically on my bookcase right now, with a thin layer of dust coating them. I promise myself that one day, I’ll get to them. Instead, I troll Twitter, tumblr, YouTube, Facebook and other sketchy platforms and content to glean what I can to stay current (or at least appear to be) and motivated (always). Take for example, writing an article on leadership. I start by Googling “leadership resources”. Sixty-seven million hits is pretty respectable, but I work in a Primarily Undergraduate Institution (PUI) so I adjust the search and look only for “leadership resources in small organizations.” Five million hits! Great, but as I skim the first few pages of hits, I realize the links focus on small business. Small departments or organizations? I get nada, nothing, zero, zilch. The quantity of resources on leadership in a small organization or office such as a college or university is lacking or practically non-existent (not a scientific study, but I’m at a PUI and I don’t have lots of time to do a literature review, okay?). I guess the expectation is that leadership doesn’t exist if you are a party of one (or two).

As research administrators, our professional organizations are not just a source of professionalism; we commiserate and socialize just as much as we ask questions and offer advice. In fact, the PUI group has the most discussion posts out of any list on Collaborate (nearly 300 more discussions than the next highest, in fact). Does this mean research administrators at PUIs are just more inquisitive, confused (both?) or does it mean that they know they have to reach-out and connect to be better at what they do? Does anyone really care about your leadership when you also have to be the manager, the accountant, the contract reviewer, the meeting scheduler, and at times, even the caterer for your campus events? When you are pulled from one meeting to the next, writing up email after email, filing a myriad of forms (some you made up too!) and trying to work on important projects, leadership skills are not only necessary, but crucial especially if you have to “go it alone.” Although there are copious resources on leadership, in our field, I have found that four specific areas make the biggest impact. Constant and effective communication skills, building strong campus and community relationships, maintaining content expertise and being able to stretch way outside of our comfort zones are critical to strengthening your leadership.

Effective Communication

A typical day of “leadership” might include: following up on a proposal and review (aka create) a budget and justification for a stressed Principal Investigator (PI), setting up an ad hoc committee to review National Endowment for the Humanities (NEH) proposals, negotiating with a vendor to get a better price on a small contract,
reserving campus space to host an information session for students applying for internal grants, and finally, meet with the Provost to discuss institutional metrics. Communication: Rinse, repeat.

All of these things are just activities — things you have to do every day to get the job done. What you are specifically doing in the process is communicating your leadership every day to a variety of groups. From the faculty and students to boards of directors and vendors, they look to you as the source for all things sponsored research. Being a small operation, I like to think of PUIs more like a “boutique” department. We may not have all the answers for complex things like clinical trials or technology transfer, but we are great at working with our PIs on a one-to-one basis. Know your strengths in communication and use them to building upon your leadership. For instance, do you hate email but your PI always asks questions that way? Try spending a little more time on that email, but pick up the phone to talk with others. We all like to be communicated with in our preferred way and that builds up trust and stronger relationships.

Building Relationships

Closely aligned with communication, relationship building is crucial in our positions at small places. Not only do we depend on the work of others to accomplish our department’s goals, but we have to foster good relationships and work on more difficult ones, if we want continued success. Much like the PI that prefers email when you would rather meet face to face, try scheduling a meeting once a month with the PI to just check in and see how things are going.

Externally, we often find ourselves forming relationships with other institutions and vendors for our awards. We have to work with our internal audience (although sometimes begrudgingly) just as much, if not more than with our external audiences. At a PUI, we often times work with local businesses. Even though some of these mom and pop stores have a hard time working on a line of credit, a positive working relationship can mean positive returns in other ways (for instance, campus delivery of a quick needed item for a PI). It means taking extra time and effort to cultivate the relationships for the sake of your department but also for the institution as a whole.

Maintaining Expertise

If you go it alone (or in my case, with one other person), then who are you leading? Is it really just a time management function or are you being strategic with your resources? Being a leader at smaller organizations means being observant, learning about the other systems and needs on campus and making time for professional development. In our strapped budgetary times, it may mean we cannot attend conferences or travel as much so it requires being creative. Online webinars, books and taking time to talk and work with others at PUIs goes a long way for maintaining our expertise (given our particular institutions of course). As mentioned earlier, it should be no surprise that the PUI community is the most active community. With limited resources, PUI members reach out to one another far more often. Think of it like the office water cooler — by not having other research administrators or senior staff to bounce ideas off, we jump onto Collaborate and reach out.
Stretching the Zone

Finally, as an extrovert, people perceive me as not needing help in this area. It is true that I can get up in front of hundreds of people and speak, but I do have comfort zones that introverts are better equipped to work. For instance, introverts tend to be better listeners. I recognize that to get out of my comfort zone, sometimes I have to take a back-seat which pushes me out of my comfort zone of being in charge all the time. Stretching out of your zone might also be more difficult when you go it alone and have to get the day to day job done. However, while we may be at small institutions, we have the advantage of learning about other parts of the institution easier. If you have strong campus relationships (see area two mentioned above), you could spend time with a colleague in the business office, the development office, facilities or student affairs or attend campus search committees for new faculty to see who may be a future PI! Stretching doesn’t consume a lot of time, but you will have a much broader knowledge of your own institution and capabilities to be a better research administrator.

If you focus only on one of the areas listed above, you still are working on your leadership. What is most important is that you are intentional about it. Make the decision to work on your communication for a week or call up a colleague in accounting and take her out to lunch to ask about what challenges she is experiencing with the audit (come on, you know you want to know about that!). No matter what, don’t just assume you are doing these things — know you are doing them. Even though there are plenty of leadership resources you can access, when going things alone, sometimes the best advice is just do it!

About the Author

Ms. Jeanne Viviani is the Director of the Office of Research Programs and Services (ORPS) at New College of Florida, the State’s Honors College. Since developing and establishing the office in 2003, ORPS has processed hundreds of grant applications, developed college-wide programs and projects, cultivated donors and sponsorships, and worked closely with faculty, staff and students in securing external funding for various needs and projects. She and her staff manage all grant and contract funds to ensure proper compliance with all federal and state audit requirements. Additionally, she is the Human Protections Administrator for the NCF Institutional Review Board which is responsible for ensuring all human subject research on campus is reviewed for ethical conduct. Finally, her office promotes and encourages scholarship and research presentations by students, faculty and staff. Events such as the New College New Scholars Showcase and the Academic, Research and Creative Scholarship Conference provide community-wide attendance and understanding of the academic and research efforts of our students, faculty and staff. She received her Master of Public Administration in 2000 and a Bachelor of Arts in International Studies and Economics in 1993 from the University of South Florida. Prior to New College, she has worked in many different government offices such as the Department of Navy with the U.S. Marine Corps, the U.S. District Court in the Middle District of Florida, Psychosocial Oncology at H. Lee Moffitt Cancer Center and the Hillsborough County Public Defender’s Office. She can be reached at jviviani@ncf.edu
Leadership and Work-Life Balance
Laura Letbetter, Georgia Institute of Technology, Robyn Remotigue, University of North Texas Health Science Center in Fort Worth

Stress is endemic to the profession of research administration. Many leaders struggle to balance the competing demands of their work and personal lives. Leaders must also consider their impact on the work-life balance of those who look to them for direction or guidance. Work-life balance is so essential that it was selected as one of eleven measures of country well-being for the Organization for Economic Cooperation and Development (OECD)'s Better Life Index. According to this study of 34 democratic market-based economies, work-life balance is as important a measure of well-being as housing, income, jobs, community, education, environment, governance, health, life satisfaction, and safety.

Unsurprisingly, the United States ranks well in most of these areas, but below average in work-life balance. This pattern seems to hold true in research administration, a profession in which members can reasonably expect to attain decent housing, health coverage, some sense of community, relative safety, and a certain level of job security, but are likely to struggle with work-life balance due to the high pressure nature of the work. Christine Katsapis (2012) found that research administrators experience high levels of occupational stress and role ambiguity. Perpetual deadlines, heavy workloads, intense competition, and high levels of risk and accountability are familiar features of the work environment. Jennifer Shambrook (2012) examined research administrators’ perceptions of stress and found a significant increase in perceived work stress, number of hours worked, work/family conflict, and working while sick between 2007 and 2010. She concluded that there is a great need to develop strategies for raising awareness about stress resiliency among research administrators.

As work environment sociologist Tracy Brower (2014) observed, “We’re faced with unprecedented time poverty – too many demands and too little time to meet them all.” Our use of technology to overcome time poverty solves some of our problems but creates new ones. E-mail, text messages, voice mail, video conferencing, electronic application and grant management systems, and smart phones enable us to be away from the office without ever really being away. As Boris Groysberg and Robin Abrahams noted, constant juggling prevents meaningful engagement, hampers initiative, and erodes performance, both at work and at home (2014). So while technology offers us a way to be physically present in our personal lives, it can also be quite invasive. Leaders must also consider how their own ability or inability to manage technology impacts the team. Unlimited accessibility creates an unrealistic model for the team and implies a lack of trust in others’ decision making abilities. Rather than strive for twenty-four hour availability, Groysberg and Abrahams advise leaders to make careful, conscious choices about how, where, and when to be available.

It is increasingly popular in business and academic contexts to speak of work-life integration as opposed to work-life balance. Brower described the concept of balance limiting in its either/or focus and prefers the concept of integration: “Bal-
ance sets up unfortunate trade-offs. A better alternative is the concept of work-life integration. With work-life integration, we can accomplish abundance in all the aspects of our lives – in our careers, with our partners, with the children in our lives, in volunteer and community events, and for ourselves.” Wharton management professor Stewart Friedman declared “balance is bunk;” similarly arguing that integration is a much better metaphor for what we are trying to achieve. A Michigan State University team has even suggested that by providing employees with some training on how to better integrate work and life, managers can magnify positive work experiences in ways that enhance individuals’ personal and family lives. Ilies, Wilson, and Wagner (2009) explained the phenomenon of spillover as follows: “Affective work-family spillover typically means that work-related moods or attitudes are carried home, or that family-related moods or attitudes are carried to work.” The team conducted a study of 101 university employees who, with their spouse or partner, participated in surveys of how their job satisfaction affected their feelings and attitudes about their family role. The team found evidence of spillover not only in employees’ self-reports, but in what their spouses or partners reported as well. This finding suggests that leaders would do well to consider the ripple effect of work-life balance issues on the lives of those to whom their employees are closely connected.

Friedman described specific skills, suggests exercises, and offers other simple techniques for leaders to become more real, whole, and innovative in ways that have a positive impact on their own lives and the lives of those who look to them for leadership. Leaders can use these exercises themselves and can provide opportunities for their teams to do the same. One exercise developed by Friedman to help individuals work toward work-life integration is called four circles. This exercise invites us to take a closer look at the various roles and responsibilities in our lives. The first step is to draw four circles representing work, home, community, varying the size of the circles to represent the relative value of each. The next step is to move the circles around, thinking about how they overlap and whether they are compatible or in opposition. The purpose of the exercise is to allow individuals to reflect upon and consider adjusting their priorities based on their values, goals, interests, and actions. Those who are interested in trying it can use the free online website: www.myfourcircles.com. Friedman also suggested simple, straightforward tips for creating separation from work, such as prohibiting phones at the dinner table, as well as tips for merging work and home life, such as inviting a co-worker to a neighborhood party.

While integration might be a more novel and complex metaphor than balance, it is not necessarily better in all cases. When we discuss on-the-job stress in informal conversations with our colleagues, we are not likely to comment that we’re not feeling very integrated today. Moreover, leaders who seek integration must respect the perspective of others who may find a binary or segmented approach more appropriate for their own lives. Regardless of the language in which we choose to express it, we are all seeking a similar endpoint, a sense that our lives are well managed and that we are fulfilling our responsibilities to our colleagues and to our loved ones.

In addition to reflective exercises and options for personal development such as
the four circles activity, leaders need a repertoire of specific and practical strategies for supporting work-life balance in the lives of those who look to them for leadership. Kouzes and Posner’s five practices of exemplary leadership offer a useful framework for leaders who want to consider implementing specific strategies for creating a more balanced and/or more integrated work environment (2011). These oft-cited practices are modeling the way, inspiring a shared vision, challenging the process, enabling others to act, and encouraging the heart.

*Modeling the way,* of course, means leadership by way of example. As Brower observed, “Leaders send important cues through their own behaviors and choices so how they approach their work sets the tone for how their team members will perform.” Kouzes and Posner noted that leaders’ simple daily acts, such as telling stories, are key to showing others what is expected. For example, the leader who briefly mentions that she will be away from the office on Tuesday to attend a child’s school play or to take an elder to the doctor sends a message that the organization understands that caregivers have important responsibilities. Another simple, everyday example of modeling is the timing a leader chooses for sending emails about tasks that need to be accomplished or issues that require resolution. A leader who finds it convenient to send those emails early Saturday morning might consider the expectations created by the time stamp. He or she could choose instead to hold that email as a draft and click send on Monday morning, or even automate an email rule that releases the message at a more appropriate time for the team member. Modeling the way can be subtle, yet powerful.

Leaders should also *inspire a shared vision* of balance and/or integration. Inspiration is more subjective and therefore more elusive than modeling. As Kouzes and Posner described it, “Leaders engage others in tying their personal dreams to the aspirations of the group to create a shared vision.” For example, a leader who is a staunch believer in work-life integration may need to engage with others who actually embrace a more either/or approach and find segmentation preferable to merging. In this case, the leader should be less focused on a shared metaphor and more focused on a shared sense that the time and energy we devote to various aspects of our lives is proportionate or otherwise appropriate.

Sharing an *inspired vision* can also involve collaborating with your partner and/or family. Leaders with strong family lives mention time and again the importance of sharing a vision of success for everyone at home and not just for themselves. Many successful leaders have partners or spouses who share common goals that include both their home life and career. In fact, leaders emphasize the importance of complementary relationships for creating balance in their lives. In many cases, the emotional support and participation of families or loved ones gives leaders the courage to take risks or embrace new opportunities in their careers. Spouses or partners can also provide guidance in decisions and help them keep each other’s eyes on what matters. More important during tough times, deliberate choices can be made about work, travel, and the household.

Including one’s entire family on a five-year plan is a way to bring balance to one’s career goals in a deliberate and conscious way. For those who have children,
involving them in the process of goal setting can provide valuable life experience. In a 2011 concurrent session on career planning, NCURA member Sue Rivera, Vice President for Research and Technology Management, Case Western University, explained that five-year plans are really important for focusing on one’s goals in a balanced way. Her family has a five-year plan, and they revisit it annually to make adjustments. Sue strongly recommends factoring in family milestones that may affect one’s career timeline. For example, if you can’t move for a job until your children graduate high school, pencil it in. If your partner is about to start a medical residency, factor that in as well. Writing it down makes it real. Once you draft your plan, with one row for each family member, look for potential conflicts and adjust accordingly. Then, put your family plan somewhere visible. It will be a healthy reminder of what you are striving for, and it will make you a more empathetic leader when you consider that the lives of your staff are equally complex.

*Challenging the process* means disrupting the status quo when it is productive or appropriate to do so. Kouzes and Posner have said this means experimenting and taking risks. Telecommuting and flexible scheduling are considered risky in some organizations, and work culture remains more office-centered than it needs to be. Anne Marie Slaughter described the culture of “time macho” as “a relentless competition to work harder, stay later, pull more all-nighters” remains prevalent among today’s professionals. If the culture of time macho is prevalent in your work environment, it is a process worth challenging for your own sake and for the sake of those you lead. Slaughter noted that in-person meetings can be far more efficient than phone or e-mail tag; trust and collegiality are much more easily built up around the same physical table; and spontaneous conversations often generate good ideas and lasting relationships. While her focus is women in the workplace, her observations about why the culture of “time macho” is damaging to work-life balance are applicable to both genders. Leaders may find that the risk of offering a telecommuting option even one day a week or allowing staff to adjust their schedules around local traffic patterns pay off in terms of productivity and esprit de corps.

*Enabling others to act* means involving others in decision-making and goal-setting in order to foster teamwork, trust, and strong relationships. Groysberg and Abraham suggested that truly prospering involves integrating work and family in making decisions about work and activities. Ilies, Wagner, and Wilson suggested that managers can enhance their employees’ well-being at home by deliberately scheduling positive events and interactions toward the end of the work day. An obvious application of this idea would be to invite staff input on when to schedule certain work events and interactions. For example, if employees find team meetings to be a positive and energizing experience, those would be better scheduled toward the end of a workday. If, on the other hand, such meetings cause additional stress by causing employees to worry about how they will manage their workload when part of their day is occupied in a meeting, then it would be best to get the meeting out of the way early in the day. Leaders strengthen their teams sharing the power and discretion while building trust among members. This can also be fostered by listening to their personal needs.
Encouraging the heart means supporting our basic human need to be valued and appreciated. It means recognizing when team members feel frustrated and exhausted, acknowledging those feelings, and making sure people understand that their contribution really matters. Jennifer Shambrook (2012) showed that while responsibilities have increased due to the greater competition in research funding and the decrease in staff support, changes are taking place in research administrators’ perceptions of respect and appreciation. Her 2010 survey respondents reported feeling more appreciated and respected by colleagues than her 2007 respondents; however, the percentage who reported not feeling appreciated was still quite high at 38.15%. We believe leaders should be aware of this finding and should pay careful attention to creating a work environment where people feel valued and appreciated. Kind words go a long way toward making people feel valued. Besides the intuitively obvious reasons for being kind, the latest data in organizational research supports the idea that showing compassion significantly increases productivity and reduces turnover and health care costs (Seppälä, 2014).

Today’s leaders must make deliberate choices about which opportunities to pursue, which to decline, how to use their time, how to utilize technology without allowing it to be invasive, and how to empower their teams to do the same. By making careful, deliberate choices, they can meaningfully engage in their relationships and responsibilities at home, at work, and in their community.

Laura Letbetter is a contracting officer at the Georgia Institute of Technology in Atlanta, GA. She holds a Master of Arts in English from Southern Illinois University at Carbondale. Her background includes teaching, editing, and program administration. She began her research administration career in 2004 at Kennesaw State University and is a 2012 graduate of NCURA’s Executive Leadership Program.

Robyn Remotigue is Research Manager, Dean of the School of Public Health at the University of North Texas Health Science Center in Fort Worth. She has been in the field of research administration since 1994. She is a graduate of the 2012 NCURA Executive Leadership Program and 2010 NCURA Leadership Development Institute. She is actively involved with NCURA serving as Pre-Award Contributing Editor for the NCURA Magazine, and serving as a Presidential appointee on the NCURA National Board (2015). Robyn also continues to volunteer in various capacities at the regional level.
People First, Business Second — The Building Blocks Needed to Achieve Research Compliance
Roseann Luongo and Denise Moody, Harvard University

Research administrators are continuously challenged to develop, communicate, manage, and enforce institutional policies and federal regulations with many internal and external constituents to include faculty, researchers, central and department administrators, peer institutional collaborators, sponsors, agencies, and auditors. As a prime example, the 2014 Office of Management and Budget (“OMB”) Uniform Guidance has recently gone into effect, and research administrators have been collaborating nationwide to ensure their institutions are fully compliant. However, at the same time, faculty and researchers are faced with burden as described in the National Science Board report on Reducing Investigators’ Administrative Workload for Federally Funded Research (2014), which recommends changes such as modifying proposal requirements and annual progress reports, eliminating ineffective regulations, streamlining requirements across federal agencies, and increasing efficiencies at universities.

What is the key to achieving research compliance while not overburdening our faculty and fellow administrators? In our experience, we feel that there are five (5) key competencies that a research administrator needs to establish to effectively balance customer service and compliance:

◆ Strong working relationships
◆ Trust
◆ Collaboration/teamwork
◆ Communication
◆ Customer service focus

The competencies will be further discussed in the following sections.

Strong working relationships

If trust is our foundation, then strong working relationships are the mortar that helps us to build effective and productive organizations to help us achieve the research mission. Strong working relationships are strong internal or external partnerships, developed over time. The need for these relationships should not be underestimated. In our field of research administration one must leverage both technical expertise and relationship building skills to be the most effective in their roles. Our work, whether we are in pre- or post-award, is so collaborative that it requires us to work with people from different departments, agencies, companies, countries, and schools.

We invest time into developing strong levels of expertise through training and other methods, and we must have that same commitment to developing working relationships. Developing and managing our relationships help institutions build strong internal control systems of compliance. These systems include strong com-
munication, clear roles and responsibilities, collaborative business processes, and effective monitoring procedures.

Strong relationships and trust enhance our customer service ability, facilitate enforcement of policies and procedures, and help us accomplish tasks. They can make having a difficult conversation about unallowable costs, write-offs, or non-compliance a little easier. In another example, an established relationship with an IRB administrator may help when you need a protocol expedited — you won’t only know who to call, but you will also know the person on the other end of that call who may be more willing to go that extra mile to help you in an urgent situation.

Keys to developing strong working relationships include the following:
◆ **Focus on people 1st, business 2nd.** It is important to make a personal connection first; once you have established the basis of your relationship, the business naturally follows. You must build relationships and mutual respect with administrators and faculty FIRST before trying to enforce compliance.
◆ **Respect opinions.** We may not always see eye to eye with colleagues or administrators, but it is important to try to understand their point of view on issues. Once you take the time to understand where they are coming from, you can hopefully come to an objective conclusion, whether agreeing, agreeing to disagree, or negotiating a compromise.
◆ **Listen and communicate.** Active listening, or being present in a conversation and paying attention to what someone else is trying to say is essential to creating a valued partnership. Effective working relationships also need frequent, open, relevant and direct communication. Our colleagues and faculty need information, in varied forms and times, depending on the situation. We need to be flexible and adapt our communication styles according to the individual and the need at any given time.

**Trust**
Warren Buffet once said, “Trust is like the air we breathe. When it’s present, no one really notices... when it’s absent, everyone notices“. Trust is as critical to working relationships as air and breath is to life. Trust is the foundation of our relationship with our sponsors. If sponsors do not trust that our institutions could manage research funds with care nor were committed to following through with the work that was proposed, then they would not grant us research funding. The same methodology is also critical to our relationship as research administrators with Principal Investigators (PIs) and collaborators. If PIs and collaborators did not trust our expertise and commitment to the work, then they would not rely on us for advice nor invest in our relationship. The foundation of our relationships with sponsors, PIs, employees, and collaborators is trust and is as important as the “air we breathe”.

How can we build trust? There are many ways to build trust in a working relationship, including the following key areas:

1) Build a network of collaboration and teamwork through time and shared experiences
2) Communicate openly, frequently, and honestly
3) Provide a high-level of customer service through responsiveness and following through

Without the framework of these key areas, there can be no trust.

**Collaboration/teamwork**

Forming strong working relationships and building trust with your colleagues and faculty fosters a more collaborative, team-building environment that lends itself to accomplishing the task at-hand. Federal regulation updates often result in an institution’s need to develop new or update existing policies, procedures, and/or systems. Often, institutions are provided a short turnaround time for development, communication, training, and implementation in response to a federal mandate. Therefore, people and resources must be rapidly and strategically organized to problem-solve and implement the necessary changes. Policy, procedures, and/or systems updates must be implemented in full collaboration with the key constituents. NCURA’s Cynthia Nichols states “Regulatory compliance and excellence in the conduct of research can only be achieved by cooperation between the research office, the principal investigator, the compliance officer and committees, and an institutional climate that fosters a high level of integrity” (2013).

Successful teamwork and collaboration will result in better understanding of and a higher compliance rate for adherence to the new regulation. Successful teamwork is a result of a consensus-driven approach rather than a top-down approach and must be formed on the basis of trust. A team leader must be strong and have the ability to steer a team in the right direction while producing timely and effective results. However, Scott Spreier states, “A leader’s hunger to achieve…fuels innovation, productivity, and growth… But taken to an extreme, overachievers command and coerce employees rather than coach and collaborate with them… eroding organizational performance, demolishing trust, and undermining morale” (2006). In other words, collaboration is essential. Ronald A. Heifetz states that while “It’s tempting to go it alone when leading a change initiative…It’s also foolish. You need to recruit partners, people who can help protect you from attacks and who can point out potentially fatal flaws in your strategy or initiative” (2002).

When new policies, procedures, or systems are developed, ensure that the team is thoroughly represented and that there is sufficient time to allow for feedback from an even wider constituency. If a policy or system is released without vast user input, the likelihood that people will support, understand, and adhere to the requirements is reduced. Alternatively, successful teamwork and wide collaboration foster mutual understanding and support for even the most onerous of new federal mandates.

**Communication**

Effective and thorough communication is essential as a research administrator, especially when conveying a new policy in response to a federal regulation update, which can often be perceived as onerous or contentious. First, communication internally within the research administration office is essential, since these “front-liners”
are the staff members who must fully understand the policy and/or systems updates, respond to any questions from external constituents, and ensure compliance with the new federal regulations. Internal staff training should focus on the reasons behind the policy (the “Why”) in order to clearly communicate and provide an explanation to other administrators and faculty.

Next, communication externally to faculty, department administrators, and other central offices must be effective and efficient. The media type, timing, and content for communication must all be taken into account when conveying a message such as a release of a new research policy. The communication must reach a broad audience, contain the most relevant points, and be easily understood. How often have you received an email blast at your institution that conveys a new institutional policy, but you stop reading after scrolling once or twice down the page? Not only should a policy be easily understood, but the communication message regarding the policy should be even more succinct. Otherwise, the audience and the message are lost altogether.

**Customer Service Focus**

Successful research administrators view all of their constituents, including sponsors, faculty, administrators, and collaborators as their customer base. Knowing who comprises your customer base, or circle of key stakeholders, is important. This circle could be much broader than initially thought. Placing primary importance on customers’ needs helps to develop and sustain positive customer relationships, which is essential when attempting to develop and release a new policy in response to a federal mandate.

A positive customer service attitude requires social skills, one of Daniel Goleman’s components indicating Emotional Intelligence at Work. According to Goleman, “Socially skilled people are proficient in managing relationships and building networks and able to find common ground and build rapport… which leads to effectiveness in leading change, persuasiveness, and expertise in building and leading teams.” Social skill is “not just a matter of friendliness but friendliness with a purpose: moving people in the direction you desire” (2004).

Finally, good customer service requires the research administrator to listen first to the needs of the customer. NCURA’s Robert Holm and Tony Ventimigilia state “A leader should seek input, must want to listen, and must ‘actively’ listen” (2006/2007). The same traits apply to successfully developing and implementing a new policy or system in response to a federal update. Successful research administration and research compliance oversight involves first listening to the customer needs and then balancing those needs with maintaining compliance with the federal regulations.

**Conclusion**

The five key competencies serve as building blocks for a research administrator to achieve research compliance. Without these competencies in place, policy enforcement is nearly impossible. The common theme with all competencies is that people
come first, and the business side of research administration and compliance will follow. Mutual respect, greater listening skills, and collaborative teamwork can, over time, build effective relationships and trust. In the end, research administrators might (just might!) achieve full compliance through a collegial and even enjoyable process.

About the Authors
Roseann Luongo currently serves as the Associate Director for Training and Compliance at Harvard University. In this role she coordinates a wide range of sponsored administration activities for the Office for Sponsored Programs which includes direction and oversight for University training initiatives, developing and implementing policy, maintaining an environment of research compliance, and serving as liaison for private and federal audits.

Denise Moody is the Director of Research Compliance in the Faculty of Arts and Sciences Research Administration Services at Harvard University overseeing IRB, IACUC, and COI. She is currently the NCURA National Secretary, contributing magazine editor in the compliance track, member of regional and national program committees, and a 2007 graduate of NCURA’s Leadership Development Institute.
Creating a Richer Life

Christine Pacheco, University of New Mexico

In this fast paced world, we often over-extend ourselves both personally and professionally and may feel there isn’t enough time to achieve many of the goals we set. As Research Administrators, we love our work despite the constant onslaught of complex issues, deadlines, liabilities, and pressures that come with the job. As we do our best to juggle work, families, community, and improvement of self, perhaps we wonder if there is a better way to successfully integrate all of these areas at once.

Stewart D. Friedman’s article, “Managing Yourself – Be a Better Leader, Have a Richer Life,” contains a number of insightful ideas and proven solutions for how to be a leader in all aspects of our lives. Friedman reasons that we can and should all work to be excellent leaders within the four realms of our lives: work, home, community and self. Integrating the four different parts of life, versus giving up one or more parts to have success in another, is how you can make sustainable changes. This is what he terms as the “four-wins” and leads to “Total Leadership.” “Total” because it involves the whole person and “Leadership” because it involves creating sustainable change to benefit you AND the most important people in your life.

To rack up four-way wins, consider what is important to you and what you would like to accomplish in the long run. Consider the most important people (“key stakeholders”) and the expectations you have of one another. Then, create a basic outline of small changes that will help you achieve the bigger picture. The bigger picture will affect all four realms (work, home, community, self) in a positive way and the smaller steps will guide you in pursuing your best leadership self. It sounds simple enough, but how do we achieve fulfillment by developing short-term changes?

The process that Friedman describes involves thinking, writing and talking about your values and vision, clarifying what is important to you as a leader, spouse, parent, community member, etc. and then determining how your actions and decisions impact your primary stakeholders. He suggests designing mini experiments that are tried for a fixed period of time and evaluated by you and your stakeholders. To help you craft experiments for your own situation, Friedman provides additional tools, success stories and linked information on his website at http://www.totalleadership.org. To be practical, he suggests narrowing down your first list to only two or three possibilities that are tried for short periods of time. Stretch and challenge yourself, but avoid creating experiments that are too daunting and over which you have little control to make adjustments as you move along.

Just as creativity, curiosity, controls and adaptability (and even fortuitous mistakes) are involved with the success of many research projects, so will be the case with many of the small experiments you might choose to undertake. If the experiment is not going well, you can stop and make adjustments. If it is going well, then

---

you’ve just scored a win! Over a period of time, you find that you are spending your
time and energy on the people and activities that you’ve deliberately named as your
priorities. Other bonuses in the process are your growth as a leader in all realms of
your life, and the support of those around you (those key stakeholders, again), all
without excessive risk.

Is your experiment having the impact that you envisioned, or will you have to
regroup in order to focus on reaching your desired outcome? In designing an exper-
iment, you must chose to reflect on what will have the most impact and ultimately
benefit you in a positive manner, both professionally and personally. Friedman’s
Total Leadership concept describes successful experiments as those that combine
components of nine categories:

1. Tracking and Reflecting: journal habits, thoughts, and feelings for reflection and
to assess your progress. Examples: record the times that you provide positive
feedback to your employees or colleagues, record the number of times you exer-
cised during the week, your feelings about how you may have handled yourself
in requesting assistance from your team, or your plan for an upcoming project.

2. Planning and Organizing: develop a plan to better utilize

3. Rejuvenating and Restoring: set aside time to rejuvenate by focusing on your
mind, body and spirit. Examples: take time to participate in a fun activity (group
sport, yoga, reading, or hobby), quit unhealthy habits (smoking, drinking to
excess, or watching too much television), take a daily 20-minute walk on campus,
or take a vacation.

4. Appreciating and Caring: develop relationships and compassion for others in or-
der to respect and understand the whole person. Examples: encourage coworkers
to sign up for an aerobics class as a group, volunteer in your community, help a
colleague work on an area of concern within your university or schedule a retreat
for your team.

5. Focusing and Concentrating: stay psychologically focused and physically present
for those who matter most in your life. Prioritize, organize, and take action on
requests so that your important stakeholders feel appreciated and understood.
Examples: honor your commitments by sticking to your scheduled meeting
times, set aside time to return calls and emails, turn off your PDA while at home,
or schedule time daily for an open door to address issues that arise.

6. Revealing and Engaging: encourage communication by sharing more of yourself
with others and make yourself available to hear others’ concerns. Your values
will be better understood and you will gain explicit support from your stake-
holders if you are understood as a person. Examples: mentor a junior staff mem-
ber, share your vision with your team, or have weekly discussions with your
spouse about spirituality.

7. Time Shifting and “Re-placing”: think outside of the box by adjusting your
schedule to fit in desired activities while increasing efficiency. Examples: request
a flexible work schedule, work remotely, or take a class during your lunch hour.
8. Delegating and Developing: reallocate, reduce, or completely eliminate activities to free up time, work smarter, develop skills in yourself and others, and increase trust. Examples: hire an assistant, a work-study student, or delegate tasks to other employees.

9. Exploring and Venturing: implement steps and participate in activities toward a new job, more challenging work, or other activities that align your work, home, community, and self with your core values and aspirations. Examples: re-evaluate your current job and take steps toward job enrichment (becoming a subject matter expert, cross-train others), obtain a mentor or perhaps consider a new job or career, volunteer within your NCURA region, or join your children, family and/or friends to engage in the activity of your choice on National Service Day.

As you begin to consider areas within the four domains of your life that you would like to improve, realize that your experiments are works in progress. Measuring improvement and continuously reassessing your experiment will help improve your leadership skills. Friedman’s assessment tool will also enable you to reassess as your life changes and your commitments change.

Quoting Barack Obama in his speech on November 4, 2008:

“And above all, I will ask you to join in the work of remaking this nation the only way it’s been done in America for 221 years – block by block, brick by brick, calloused hand by calloused hand.”

This fundamentally represents Friedman’s “Total Leadership” concept. As a leader of change, you often have to take small steps and continually reassess and make further changes in order to overcome big obstacles and to witness benefits for the good of all. Small experiments are the small steps toward fulfilling the goals in all realms of your life.

Replenishment Enhances Leadership Success

Riddick Smiley, East Carolina University, and Denise Moody, Princeton University

“Play so that you may be serious.”

—Anacharsis

As we embark on a new year with a fresh perspective and make resolutions to ourselves and to others, we decided to focus our first LeadershipTips article on the concept of Replenishment. Barbara Mackoff and Gary Wenet’s book “The Inner Work of Leaders: Leadership as a Habit of Mind” discusses the importance of leaders’ inner lives and cultivating the ability to recognize how our “habits of the mind” transform our natural personality traits. These habits form one’s leadership style; therefore, if we recognize the connection between and importance of personal habits and leadership, we can become more skilled and successful leaders.

Mackoff and Wenet defines the five habits of mind as:

◆ Reflection: The capacity to examine and appraise one’s own behavior and impact on others.
◆ Framework: The creation of an optimistic narrative that helps to interpret negative events in a way that encourages resilience and proper response.
◆ Attunement: The practice of setting aside assumptions, reversing roles and learning from every person in the organization.
◆ Conviction: The ability to trust, value, speak, and act from one’s own experience.
◆ Replenishment: The act of restoring perspective and renewing resources through finding and indulging in counterpoint activities that are dramatically different from one’s normal routine.

The LDI class realized that leaders in research administration do not often seek replenishment, which is an extremely important aspect of leadership. During our leadership studies, we regularly noted that a significant limitation on leadership success could be attributed to low reserves of emotional energy. Most people recognize the practical importance of patience, active listening, and looking beyond the immediate problems of the day. The difficulty comes in accomplishing these higher order tasks when we are so hurried and harried by our daily grind that we lack the mental and emotional energy to practice leadership behaviors we know are appropriate. Because we lack this reserve of positive energy, we sometimes fail to make allowances for the stress-related behavior of our colleagues, to rise above the fray in a heated meeting, or to lead calmly and efficiently under time pressure.

From a leadership standpoint, these failures are a significant issue. A leader’s goals must go beyond merely getting through the trials of the moment. Ultimately, leaders are expected to seek, create, and move their staff toward a larger vision or mission. When a leader becomes overly stressed or tired, she or he may lose the

1 This article is reprinted from NCURA Magazine, Volume XL, No. 1, February/March 2008. It is used with permission of the publisher.
motivation and ability to work toward these larger goals. Instead, the leader becomes reactive, narrowly focused, and short-sighted – precisely the opposite of what is needed. In short, the leader stops leading! When this happens, the tendency is to blame the circumstances and to lose sight of the crucially important roles that leaders play in creating long-term success. The best place to short-circuit this vicious cycle is right at the beginning by regularly replenishing inner reserves of patience, perspective, and energy so that leadership roles are more often met with vigor and enthusiasm.

**Replenishment: Inner Self**

Mackoff and Wenet recognize that replenishment is found through “counterpoint activities that are entirely separate from our jobs.” These separate activities should inspire our inner selves, whether it is in the form of regular exercise, adequate sleep, additional academic study, spiritual renewal, or fun hobbies. Leaders who replenish their inner selves regularly develop a more balanced perspective on life and a more practical sense of self. They more readily recognize what circumstances drain their energy reserves and are able to replenish themselves proactively versus reactively, thus preventing the physical abuse or negative addictions we might force on our bodies.

The counterpoint activities that we engage in can also provide additional sources of meaning and satisfaction in our lives – so that our work life does not have to bear this burden. The more areas of interest we have, the more likely we will be to see progress in at least one of the activities we engage in. Challenges and setbacks at work do not have to define all our productive efforts if we find success and meaning in other areas of our lives.

Indeed, the success we find in these other areas can give us the energy we need to confront and overcome challenges at the office.

Restoring our inner perspective and healthy sense of self increases our leadership integrity, confidence, willingness to strategize and take risks, and readiness to assume additional leadership roles and responsibilities.

**Replenishment: Interpersonal Relationships**

In addition to finding sources of replenishment within our inner selves, leaders often find restoration in their interpersonal relationships. Spending time with friends and family members, becoming involved in a church, or building a professional network outside of your primary institution can be essential counterpoint activities for leaders. In addition, inspiration can come from various role models who reassure us, foster a positive attitude in us, or provide assistance and encouragement. Our LDI class found that one of the greatest benefits of the LDI program was not only the leadership skills and knowledge gained throughout the year, but the relationships we developed with our advisors and colleagues. Leaders who recognize the importance of interpersonal relationships often deepen their communication skills, increase their mutual respect for their colleagues, and manage more capably and effectively.
Replenishment: External Giving

The final area of replenishment can be found in external giving to society, such as volunteering in an organization or becoming actively involved in your community. Volunteering in service to others is a defining characteristic of NCURA and is strongly correlated with health and happiness. Volunteering generates satisfaction and energy, which translates into more effective leadership when you return to your day job. Leaders who unselfishly give of themselves to the cause of others are more able to keep their day-to-day concerns in perspective and to work productively on higher order tasks. Such leaders find time to advance the mission of their organization, rather than simply conduct its business.

As leaders we need to take the knowledge gained from the past, use the “habits of the mind” formed from past circumstances, and continuously look honestly within ourselves to become better leaders. The field of research administration continues to become more complex, and leaders in research administration are constantly facing tough challenges and stressful situations. Success in this environment comes from innovation and adaptation by well-led teams – not by repeating the same processes more often. Our institutions cannot support the continual expansion of resources that approach would require. We need to understand that our leadership skills are crucial to the success of our teams and institutions. These roles and responsibilities must not take a back seat to short-term problem solving. It is more important than ever that leaders maintain the energy level needed to make leadership their key responsibility. We must remember the importance of replenishment!

As you begin a new year with a fresh perspective, we challenge you to make a commitment to yourself to replenish your energy sources – and you can start this process in small ways. Remember – your institution will not shut down if you walk away from your desk and take a stroll during your lunch hour!

Riddick Smiley and Denise Moody are alumnae of the Leadership Development Institute, Class of 2007. Riddick Smiley serves as a Grant and Contract Officer, East Carolina University. Denise Moody serves as Assistant Director of Grants and Contracts, Princeton University. We would also like to acknowledge the contributions of the entire 2007 LDI class in developing ideas for and editing this article.
Encouraging the Heart: Being a Positive Leader during Stressful Times

Tammy J. Custer, Cornell University

With all the news regarding budget-cuts across campus, and hearing of colleagues in other departments either being let go or taking early retirement, I find that at times like these it can be challenging to consistently be a positive leader.

Change is inevitable and with the economic situation, many of us have greater challenges in our lives or know of friends, family or co-workers having troubles and more stress. Albert Einstein said “In the middle of every difficulty lies opportunity.” As leaders, how do we turn difficulties into opportunities and consistently manage the stress in our environment? In NCURA’s LDI Program, we learned that successful leadership involves encouraging the hearts of ourselves as well as others. This involves finding authentic ways to counteract negative feelings and situations that exhaust, frustrate and even make people want to give up. The good news is that several practical and inspirational approaches to managing stress and encouraging the heart are quick, easy and inexpensive to implement.

“Encouraging the heart” often happens when you read and share uplifting articles or books with colleagues. In his article, “Leadership Techniques: Five Leadership Secrets for Challenging Times,” Ed Sykes discusses five leadership techniques for difficult times: Integrity, Knowledge, Decisiveness, Vision, and Unselfishness. Acting unselfishly is important, but especially so during these times. In tighter economic times, resources, including people resources, are usually spread thin. Remind yourself that faculty, staff or others are scrambling to find reliable and timely information and help. Taking the time to listen and provide support and guidance are great ways to help reduce stress for others while promoting trust and good leadership.

In his article, “Use Stress to Your Advantage” Peter Bergman, uses the term “Stress Reaction” to describe what we do to manage ourselves through ongoing stressful periods versus a single stressful event. Stress reactions can be constructive or destructive. Bergman describes a variety of approaches one can take to maintain focus and provide a sense of control when we lack real control. Constructive approaches could include cleaning and organizing one’s environment, reading and thinking about different viewpoints in order to gain insight, eating healthy foods, getting plenty of rest, meditating, and connecting authentically with others. Common destructive stress reactions are withdrawal, competitiveness or micromanagement. As leaders, being aware of these reactions is important.

After reading Bergman’s article, I asked myself what my stress reactions generally are. Two things I commonly do to relieve the stress are: 1) I find ways to resolve the problem at hand; and 2) I go shoe shopping. I may not get the problem resolved, but I know I will always find that great pair of shoes to make me happy. Levity aside, Bergman encourages these steps:

1 This article is reprinted from NCURA Magazine, Volume XLI, No. 3, July / August 2009. It is used with permission of the publisher.
◆ Stop – Become aware of how you are handling the stress. Continuing to think of the problem can intensify the stress reaction.
◆ Take a few deep breaths to clear your mind and to become more focused.
◆ Reassess the situation – with time, or after talking with others, solutions may become apparent.

In my role in research administration, I have found many options to help deal with day-to-day process challenges and difficulties. One option might be to review office practices for possible efficiencies or improvements. Consider requesting a group effort where the team comes up with better practices. Other options might be re-assessing workload, delegating for greater efficiency, or implementing a cross-training program for those employees who want to advance or learn more.

Encouraging the heart also involves recognizing people for extra and thoughtful things they do and thanking them for jobs well done. It is amazing to see how practicing these simple courtesies can motivate and effect positive relationships. For example, when I worked at a part-time job many years ago, the company required all employees watch a video on behavior and the ripple affect either positive or negative behavior has on customer service and on relationships in the workplace. The lessons learned from that video remain with me to this day.

Other important ways to help encourage the heart and help manage stressful times include taking time to laugh and celebrate. In a book by Matt Weinstein “Managing to Have Fun”, he states, “The intentional use of fun at work can be a positive force in team building, in customer service and boosting employee morale”. Because of the busy environment we work in, we sometimes forget to stop and take a break. Recently, I shared Edward M. Hallowell’s article “Overloaded Circuits – Why Smart People Underperform” with colleagues, which gives helpful information on why at times we need to shut off the constant stimulation to our brains. This article inspired my office to have lunch sessions called “Reboot Your Mind”. Each session has a theme and participants bring a dish to share based on the theme. We reserve a conference room, and block out time to get away from our desks, have lunch together and talk about non-work related topics. Our office recently invited our Financial Services office to join these sessions, which has further increased collegiality.

No matter what your role is at your institution, just remember that you can always succeed in setting a leadership example by better managing your stress and looking for ways to implement practical ways to decrease stress in your environment. Consider the ideas discussed in this article, brainstorm with friends and colleagues, and you, too, can turn your challenges into opportunities.

Using Nonviolent Communication in the Research Office

Cheryl Anderson, University of Texas Southwestern Medical Center at Dallas; Carolyn Elliott-Farino, Kennesaw State University; and David Ngo, University of Wisconsin

Nonviolent Communication (NVC) is a way of communicating that can help deepen and improve relationships on a personal and a professional level. NVC is a powerful tool for developing the trust and respect that are essential for effective leadership. Clinical psychologist Marshall B. Rosenberg developed the NVC process in the 1960s, in response to his observation that humans are naturally compassionate and his lifelong contemplation of two related questions: What happens to make a person turn away from his compassionate self and become violent? Why do some people remain compassionate even under very difficult circumstances?

In chapter one of his book, Nonviolent Communication: A Language of Life, (2003) Rosenberg explains what he means by nonviolence and outlines the elements of NVC. He says that he uses the term nonviolence as Gandhi used it – “our natural state of compassion when violence has subsided from the heart.” Rosenberg was struck by the role that language plays in one’s ability to remain compassionate. We don’t think of language as being violent, but our words often hurt and bring pain to others. If we both speak and listen by giving from the heart, we enable our natural state of compassion – when violence is absent from our hearts – to take root, and we are more likely to get the results we are seeking. What does it mean to give from the heart? According to Rosenberg, “When we give from the heart, we do so out of a joy that springs forth whenever we willingly enrich another person’s life. This kind of giving benefits both the giver and the receiver.”

At the LDI closing retreat in Washington in October, the 2009 class explored the concepts of Nonviolent Communication and how NVC can be used in the context of research administration. We learned that there are six principles that frame the NVC process: (1) all human beings have the same universal needs; (2) all behavior is an attempt to meet these needs; (3) our feelings are messengers of met and unmet needs; (4) disconnections between people are tragic expressions of unmet needs; (5) we are each responsible for meeting our own needs; and (6) by focusing on our needs and differentiating these from the strategies used to meet our needs, we can better prevent, reduce, and resolve conflicts. The NVC process can be summed up using the acronym OFNR – Observation, Feeling, Needs, and Request.

Step one, Observation, refers to making a non-judgmental observation about concrete actions that are affecting our well-being. Consider the following hypothetical situation: Professor Plum is submitting a proposal in response to a federal RFP that lists a number of contract clauses to be incorporated into a contract, if awarded. The Research Administrator has reviewed the proposed clauses and realizes that some are unacceptable; she will need her legal office to help her prepare a list of

---

1 This article is reprinted from NCURA Magazine, Volume XLII, No. 2, March/April 2010. It is used with permission of the publisher.
contract exceptions for the proposal, due in two days. She has left three voicemails and sent two emails in the past week without any response. Remembering her NVC training, the Research Administrator modifies her approach. Her next message begins, “I have called you three times and sent you two emails about these contract clauses and you haven’t contacted me.” There is no evaluation of the legal office’s behavior, no judgment being rendered.

The second step in the process refers to how we are Feeling in relation to what we are observing, and that usually involves emotions: I feel happy / sad / relieved / angry / optimistic / nervous. Feelings differ from thoughts in that the latter express what we are thinking and are often introduced by “I feel like” or “I feel that.” If the Research Administrator were to say, “I feel like you are ignoring my requests,” she would be making a statement about how she thinks her legal contact is behaving. NVC practitioners stress that if we keep our emotions bottled up inside, we lose our ability to connect with ourselves and others. Consequently, the ability to express our feelings to others is an important facet of conflict resolution. In the above scenario, the Research Administrator would express her feelings by adding, “I feel nervous when I don’t receive any response from you for a week.”

Step three is the Needs, values, and desires that create our feelings; everyone has needs, and whether or not our needs are met determines how we feel. We often mistakenly believe that the actions and words of others cause us to feel the way we do, good or bad; but NVC teaches us to take responsibility for our feelings and to be aware of our needs. If we ignore our needs, they go unmet and we become uncomfortable, and then we start to lose our connection with ourselves and others. When our needs are met, we are in a better position to connect with others and give from the heart. Thus, it is important that we express our needs when we communicate with others; too often, we ignore our own needs. In our hypothetical situation, the Research Administrator would say, “I need your help in preparing the contract exceptions because they must accompany Professor Plum’s proposal that is due in two days.”

The fourth step in the NVC process is Request. Making specific requests is how we meet our needs. If the Research Administrator says, “Please contact me as soon as you can,” she may not get a response until next week and that will be too late; but the legal office may not know that. She needs to let them know that this proposal is due in two days and that she needs their help now. Otherwise, the list of exceptions will have to be sent without legal guidance, the Research Administrator will be dissatisfied, and there will continue to be conflict in this relationship. A request that conveys what she wants from the legal office would be, “Please call me this morning so that we can set up a time to meet later today or tomorrow to prepare the contract exceptions.”

Having NVC skills and using them on a daily basis can be an asset for Research Administrators because we spend most of our work day interacting with others, and these interactions require productive communication. As Research Administrators, we work with internal customers – faculty, department administrators, business office personnel, deans, as well as external customers – primarily sponsors and
collaborating institutions. Each party has its own needs and agenda, sometimes in conflict with one another; and it is left to the Research Administrator to make peace and keep everyone happy.

When we interact with faculty as Research Administrators, our needs become the needs of the institution and the sponsor (i.e. adherence to institutional and sponsor policies and procedures). On the other hand, when we interact with non-faculty institutional personnel, our needs become those of the faculty – to implement our project with a minimum of roadblocks. Finally, when we communicate with sponsors, our needs are those of the faculty and the institution; e.g., retaining intellectual property rights and having an adequate budget with some flexibility in spending. To say one needs to be nimble in these interactions is an understatement, and a magician, only a slight exaggeration.

Successful interactions with constituents are critical to Research Administrators, successfully handling their responsibilities. Leaders, in particular, need to be able to communicate effectively with internal and external customers. Adopting the four-step process of Nonviolent Communication as a tool to help manage conflict can be a productive strategy. The key is to communicate observations free from any evaluation or judgment (O); express our feelings in order to enhance our ability to connect with ourselves and others (F); state our needs and thereby take responsibility for our own feelings (N); and make specific requests about what we want (R).

Difficult People: How to Know Them, How Not to be Them

Leerin K. Shields, The Johns Hopkins University, School of Medicine, and Anita Mills, University of Pennsylvania

“What you do speaks so loud I cannot hear what you say.”

— Ralph Waldo Emerson

Let’s face it, we can all be difficult. We would constantly be on the move if we tried to run away from every difficult person. The first “difficult person” we have to deal with is ourselves, one of the first exercises taught in the NCURA Leadership Development Institute, and certainly one of the most beneficial, is that leaders must learn their own personality types before they can gain an understanding of others. In doing so, leaders learn that good communication requires working through fears and becoming aware of “blind spots” in their own behavioral patterns. Effective management of difficult interpersonal relationships requires the ability to communicate honestly within ourselves, as well as with others. When a leader begins to understand her or his own psychological drives and desires, he/she is able to avoid behavioral stumbling blocks and unknowingly encouraging difficult behavior within themselves or others. Whether you are a leader in a formally defined leadership position, or simply someone whom others seek out, you can benefit from an understanding of how your behavior influences others.

The behavioral and communication habits of leaders greatly influence the environment in which they lead. Their actions communicate their personal values and their vision for the organization. As Kouzner and Posner discuss in “The Leadership Challenge Workbook,” good leaders understand that their “voice” as a leader is closely related to their own personal values. Leaders’ actions set the tone and the expectations of the people that they lead. Because leaders are looked up to as role models, it is important for them to consider the impact of their behavior. Leaders who model negative behaviors are setting an unhealthy example and may cultivate bad behavior in others, thus creating an environment in which difficult people thrive and congenial people become difficult. If a leader is unclear about his or her personal values or he may appear chameleon-like. Chameleon-like behavior erodes a leader’s credibility and gives the impression of inconsistency and indecision, thereby undermining effective communication and the image of strong leadership. Whether or not the person is conscious of his or her negative behaviors, the result is the same. It is most important for leaders to explore their behavior and underlying psychological motivation when dealing with difficult people.

There is an old saying: “People treat you the way you allow them to treat you.” Becoming a strong leader means overcoming common blind spots such as fear of rejection and confrontation. If a leader’s behavior is centered on the avoidance of fear it will be hard for him or her to project a strong and confident voice. Good communication skills are essential for leaders who must deal with a variety of difficult

---

1 This article is reprinted from NCURA Magazine, Volume XL, No. 2, April/May 2008. It is used with permission of the publisher.
people. When leaders “model the way,” as Kouzner and Posner describe, by communicating consistently with team members and colleagues, they are able to connect with people in a way that demonstrates competence, credibility, and a genuine respect for others. Additionally, leaders who demonstrate competence and respect for others are able to build a culture based on mutual trust.

It is important that leaders not only explore their inner world, but also consider a variety of techniques to deal with difficult people. Leaders will be well served if they choose to build their knowledge of different personality types and learn techniques for diffusing and dealing with difficult behavior. There is no silver bullet for dealing with difficult people, but a number of helpful books are available and worth consulting.

It is not necessary to be a psychologist to implement the suggestions in “Coping with Difficult People” by Robert Bramson, but readers will need a willingness to develop better communication skills. Bramson suggests using a coping approach that does not seek to control or demand change from a difficult person – of which Bramson identifies seven different types and outlines techniques to diffuse their behavior. Just be careful that you’re not “typecasting” a difficult person and thereby closing off communication. A key concept of the book is that difficult people use their behavior to get a desired result because they have learned it works – picture a child throwing a temper tantrum in a store and getting a cookie to calm them down. An adult’s behavior may be less dramatic, but no less damaging. The book outlines communication techniques that can be used to consistently convey the message that the difficult behavior is unacceptable.

Bell and Smith, in their book “Winning with Difficult People,” describe difficult people as Sources of Pain, which they humorously describe as “SOP’s.” The techniques and scenarios outlined in the book are based on 500 interviews with difficult people and the people their behaviors have affected. The book discusses twelve different types of difficult people and describes their behavior in detail. The book is a great source of real-world examples and specific techniques that can be used with performance appraisals, disciplinary conferences, terminations, and exit interviews.

Bell and Smith suggest that exploring our own judgmental voices will better enable us to understand our reactions to the difficult person. Effectively dealing with a difficult person requires anger management – since anger destroys communication. The book discusses techniques that can be utilized to remain objective and keep the lines of communication open. The authors argue that exploring our own inner world is the way to build our knowledge and listening skills to achieve better communication.

Reading Sam Horn’s “Tongue Fu” reminds us of a sign posted on an IRB administrator’s desk that reads, “It is nice to be important but it is important to be nice.” We are so often centered on our own feelings and accomplishments that we feel entitled to get our way. The lesson to be learned is that, despite our title, degrees, family name, or affiliations, the world does not revolve around any one individual. It is only by working cooperatively that we achieve great things. This book explores a variety of techniques that will help even the most self-centered person step outside themselves. The reader is encouraged to communicate better with a difficult
person rather than wallowing in hurt feelings or bruised egos. In Horn’s view, our own impatience is often the by-product of ignorance. Horn outlines techniques that help the reader explore situations and gather objective facts required to communicate with difficult people.

The bottom line is that good communication is critical when dealing with the behaviors of difficult people. Leaders need to understand themselves as well as the various types of situations and personalities that trigger bad behaviors. Leaders who explore their inner worlds and understand themselves first will be empowered to deal confidently with difficult people.

We hope that readers are inspired to explore their inner world as well as build their knowledge of ways to deal successfully with their own and others’ difficult behavior. Unexpectedly, difficult people can teach us things about ourselves that we would not have otherwise considered. We hope that when faced with difficult people you will confidently approach them with a willingness to grow and expand your knowledge about human behavior. No leader is an island and we hope that everyone consults the resources discussed in this article to build better communication skills so that you are able to work better with others. Ultimately, a person cannot force another to change. But by altering our own behavior, we can change the dynamic and possibly the outcome of any situation.

We would like to thank the LDI class of 2007, NCURA, and other colleagues for their support, inspiration, and willingness to provide honest feedback. Without contributions from others this article would not have been possible.

Self-Examination
Here’s a brief exercise to get you started on examining your own attitudes and behaviors.

Scenario:
Professor Frazzle is one of the top researchers at your institution. He is used to getting his way and having everyone cater to his every need. You have never warmed up to Professor Frazzle and find yourself boiling with frustration just at the sight of him.

Professor Frazzle pops in your office just as you are about to shut down your computer and head off to a long and well-deserved vacation. You are exhausted. You need to leave the office so that you can finish packing, make family arrangements, and tie up a multitude of other loose ends. Professor Frazzle insists that you are the only one who can help him. You know if you do not help Professor Frazzle you will spend your entire vacation filled with anxiety and frustration.

Mental Practice:
Do you have a Professor Frazzle in your life? Think about this person and jot down everything (We mean everything!) that comes to mind when you think of this person.
◆ What do your notes reveal about your thoughts and or judgments about your difficult person?
◆ How are these judgments affecting your communication with the difficult person?
◆ Are the judgments valid?

Contingency Theory: An Alternative for Identifying Effective Leadership in a Constantly Changing Higher Education Landscape

Thomas J. Roberts, Florida Gulf Coast University

The field of research administration is constantly changing. Not only in terms of compliance, rules, regulations, and societal events, but in terms of institutional profiles, organizational structures, demographics and leadership.

Take into account that the professional field of research administration emerged in the late 1950’s as a result of several exploratory planning meetings by small groups of university administrators who collectively agreed it was time to look beyond business and fiscal matters and into the broader aspects of research administration (Wile, 1983). According to Wile, the first official meeting of the National Council of University Research Administrators was held on January 26, 1960 at the University of Chicago with forty-five (45) persons attending representing forty (40) institutions from across the country. A 1968 survey conducted by a research committee of the Society of Research Administrators (D’Agostino, 1968) revealed that the professional field of research administration was dominated by men to the tune of ninety-seven percent (97%), ranging in age from 30-39 years, with the majority of research administrators holding a Bachelor’s degree. Fast forward to 2015 where the professional field of research administration is comprised of eighty-five percent (85%) women, ranging in age from fifty (50) to fifty-nine (59) years of age, with the Master’s degree being the dominant educational level for the majority of research administrators (Shambrook, 2015). Not only have the demographics of the professional field of research administration changed, so have the institutions themselves.

In 1970 the Carnegie Foundation for the Advancement of Teaching established the Carnegie Commission on Education to develop a classification system of colleges and universities to support its program of research and policy analysis (Carnegie Foundation for the Advancement of Teaching, 2015). The Commission originally published data in 1973 and have updated six times since then with the latest update being in 2010. The 2010 data reflected a total of 4,633 institutions with 483 institutions being added between 2005 and 2010. Of the additional institutions, seventy-seven percent (77%) were private for-profit, nineteen percent (19%) private non-profit, and four percent (4%) public institutions. Furthermore, there was a significant rise in two year colleges (Associate’s classification) offering four (4) year degrees, rising from twenty-three percent (23%) in 2005 to forty-nine percent (49%) in 2010.

The Carnegie Foundation for the Advancement of Teaching transferred responsibility for Carnegie Classification of Institutions of Higher Education to Indiana University Bloomington’s Center for Postsecondary Research on January 1, 2015 (Carnegie Foundation for the Advancement of Teaching Newsroom, 2015). The Lumina Foundation awarded $500,000 to the Center for Postsecondary Research to update and enhance the Carnegie Classification to reflect and accommodate an evolving higher education landscape. Substantial updates and revisions are anticipated to be completed by the end of 2018. The data collected is widely used in the study of postsecondary education and represents and controls institutional differences.
Considering the demographic changes of the thousands of people employed in the field of research administration, and the ever changing landscape of postsecondary institutions themselves, it would be wise for institutions to hire leaders who are best suited for the particular situation they face. The contingency model of leadership effectiveness was originally developed by Fred Fiedler in 1967 and offers a theoretical model for identifying effective leadership. The theory hypothesizes that leadership effectiveness depends on two factors. The first is the degree to which the leadership situation gives the leader control over the group process and group performance, and the second factor is concerned specifically with if the leader’s primary concern is task performance or with interpersonal relations (Chemers & Ayman, 1993). In short, the contingency model of leadership effectiveness matches the leadership style of an individual to the situation they face in leading a group, organization, or institution.

Fiedler’s contingency model of effective leadership asserts that your natural leadership style is fixed, there is no one best style of leadership, and that a leader’s effectiveness is based on the situation they face. The effectiveness of a group or organization depends on the interaction between the group leader’s personality and the situation (Fiedler, 1967).

The leader’s personality is determined through the “Least Preferred Coworker Questionnaire,” and examines two motivational systems which include “primary” and “secondary” goals. Primary goals identify what is most important to the individual, and secondary goals are the ones individuals pursue once their primary goals are satisfied (Matteson & Ivancevich, 1996). An individual is determined to be either “relationship-oriented” or “task-oriented.” A relationship-oriented individual is primarily concerned with good inter-personal relationships and will seek out others to gain their support and admiration. An individual who is primarily concerned with esteem and admiration of superiors is considered task-oriented, sometimes at the expense of relationships with subordinates.

The aforementioned orientations are determined through “The Least Preferred Coworker Questionnaire” (Fiedler & Chemers, 1984). This questionnaire asks eighteen (18) questions having the respondent rate their least preferred co-worker on an eight (8) point scale. Fiedler (1971) indicates that as a rule anywhere between sixteen (16) and twenty-four (24) items may be used in the scale depending on the specific circumstance. Respondents are asked to think of the person with whom they work least well, the person with whom they had the most difficulty in getting a job done, and to describe the person as they appear to them by responding to the questions posed accordingly. “The description of the least preferred coworker is made on a short, bipolar eight-point scale, from sixteen (16) to twenty-two (22) item-scale of the semantic differential format” (Matteson Ivancevich, 1996). For example, the respondent is asked to view the least preferred coworker as unfriendly (1) or friendly (8), rejecting (1) or accepting (8), or disagreeable (1) or agreeable (8). Any whole numerical value between one (1) and eight (8) may be selected based on the degree to which the respondent believes the least preferred coworker fits the specified characteristic. The least preferred coworker score is the sum of the item score.
The questionnaire developed by Fiedler and Chemers (1984) includes eighteen (18) questions (or personality characteristics of the least preferred coworker as perceived by the respondent) that the respondent provides a rating for on the aforementioned eight (8) point scale. If the sum of item score is fifty-seven (57) or below, the respondent is identified as having a least preferred coworker (LPC) score as low (Low LPC). A low score suggests that the respondent is psychologically distant, or has a primary task orientation. If the sum of the item score is sixty-four (64) or above, the respondent is identified as having a high LPC score (High LPC), suggesting the respondent is psychologically close with a high human relations orientation. Should the sum of the item score fall between fifty-eight (58) and sixty-three (63) the respondent is identified as independent.

The second primary element of Fiedler’s contingency model of effective leadership pertains to the situation a leader will face within any given group, organization, or institution. Situational favorableness is conceptually defined as “the degree to which the situation itself provides the leader with potential power and influence over the group’s behavior” (Fiedler, 1971). Fiedler’s (1967) original work postulated three components of situational favorableness which include: 1) leader-member relations; 2) task-structure; and 3) position-power. All three components affect the degree to which the situation provides the leader with potential power and influence (1971). Leader-member relations is the level of trust, loyalty, and confidence the group has in you, or the degree to which employees accept the leader. This variable is rated as good or poor as specified in the matrix below (Figure 1). Task-structure assumes that it is easier to lead a group that is highly structured or has clear tasks to accomplish, rather than situations in which structure is ambiguous, requires some level of creativity, or is generally unstructured. This variable is identified in Figure 1 as structured or unstructured. The position-power variable assumes that it is easier to lead when the leader has direct formal power to reward or significantly impact subordinates through hiring, firing, promoting, and/or impacting subordinates in a significant way. In short, the leader has the power to extend reward or punishment and is represented in Figure 1 as strong or weak. One might assume that is rare for a leader to not have such formal authority, but this is not necessarily the case. For example, a chairperson of an important institution-wide research committee may not have formal authority to hire or fire, yet is still filling an important leadership position. This example could be extended further to the chairperson of a board of trustees at a university. While responsibilities are significant and extremely important, in many instances such individuals do not possess direct, formal, or broad individual power to hire or fire.

In terms of postsecondary education in the United States, and specifically pertaining to a research administrator leading an office of sponsored research, we are faced with a multitude of different situations. Postsecondary institutions are different in terms of classification, organization, mission, and even aspirations. For example, a doctoral granting institution with very high research volume is likely to have an organizational structure that is already clearly defined, as opposed to a baccalaureate college that may or may not significantly emphasize faculty members’ pursuit of external research funding opportunities. It all depends on the specific situation
for any given institution, of which there are many.

Utilizing Fiedler’s contingency model for identifying effective leaders in the field of research administration may be worth serious consideration. To provide specific examples of the theory in practice, consider the example of a doctoral granting institution with very high research volume. In such a situation the task-structure variable will likely be considered structured due to a comprehensive infrastructure with well-defined tasks already in place. Assume further that a trusted and much loved director of sponsored research is retiring after thirty (30) years of service to the institution. In this situation, leader-member relations for a newly hired director are likely to be poor since subordinates would probably view the new director with a sense of angst and trepidation. The position-power variable, as it pertains to situational favorableness, is likely to be strong since the new director will presumably have the same power as the previous director in terms of extending reward or punishment to subordinates. In this example, and in line with Fiedler’s contingency model, the most effective leader should have a high LPC score focusing on building relationships (Figure 4120.24-1).

Conversely, consider the example of a baccalaureate institution with very little sponsored research activity. Assume the institution has a desire to place greater emphasis on sponsored research, invest in it, and move up institutional rankings in terms of research volume. In this scenario, the task-structure variable would be considered unstructured due to the fact that a comprehensive infrastructure in support of research would need to be established utilizing creativity and flexibility. The institution decides to appoint a well-liked, trusted, and highly respected individual from within the institution to lead the effort. In such a situation, leader-member relations would more than likely be good since the leader is well-liked, trusted, and respected. Finally, assume the incumbent of this new position would have power to hire, fire, promote, and reward or punish. In such an instance, the position-power would be strong. In this example, the most effective leader should have a low LPC score focusing on the tasks at hand and being psychologically distant.

*Adapted from “The LPC Questionnaire,” in Fiedler & Chemers (1984)*

Scenarios are presented above that reflect the most effective leadership style for both high and low LPC leaders. Fiedler’s contingency model asserts that there is no
one best style of leadership, rather a leader’s effectiveness is based on the situation (Fiedler, 1964). Therefore, it neither good nor bad to score high or low on the LPC scale. The scale simply defines an individual’s natural leadership style and predicts the most effective leadership style for a given situation based on leader-member relations, task structure, and position-power. Effectiveness of a leader is determined by the degree of match between a dominant trait of the leader and the favorableness of the situation for the leader.

Most postsecondary institutions face a unique set of circumstances as it pertains to research and sponsored programs. Some institutions set goals to be ranked in the top twenty in terms of research and development expenditures, while others simply have a desire to place a greater emphasis on research and sponsored programs. Other institutions have a primary focus on teaching and pay little attention to rankings or prestige as it pertains to research and sponsored programs. Additional complexities for the research administrator are anticipated due to the changing landscape of postsecondary education. The increase of associate colleges offering baccalaureate degrees and dabbling with placing an emphasis on research and sponsored programs will create challenges for the institutions themselves, while at the same time creating opportunities for research administrators to build research infrastructures from scratch. Different types of leaders are necessary for different situations and circumstances. Knowing an institution in terms of classification, organizational structure, and aspirations is vitally important for any research administrator. Regardless of the particular situation, one needs to be prepared and aware of expectations and challenges they may face. Fiedler’s contingency model may be able to assist with the identification of the most effective leader for a given situation.

About the Author

Dr. Thomas J. Roberts is the founding Chief Research Officer (CRO) and authorized institutional representative at Florida Gulf Coast University (FGCU). He established the office of research and sponsored programs and led the development of a complete and comprehensive research infrastructure. He served in this capacity for fourteen (14) years and until July 2012. Currently, he is an Associate Professor of Educational Leadership in FGCU’s College of Education. Dr. Roberts has twenty-eight (28) years of experience in higher education and has served various types of institutions including comprehensive, doctoral granting, medical school, and major research university environments. He authored the first doctoral dissertation focusing specifically on the field of research administration, published numerous peer reviewed manuscripts, and has given dozens of conference and other invited presentations.
Achieving Leadership by Moving “YOU” Out of the Way: A Personal Journey into Leadership Discovery

Derick Jones, Los Angeles Biomedical Research Institute at Harbor-UCLA Medical Center

Taking the leadership journey is one of the most life-changing experiences for the research administrator. It is that moment in your professional matriculation that you move from being “one of the team” into becoming a critical player within your organization. That journey into leadership can be a powerful experience for those who are birthing the leader within. It is the full cycle of professional evolution that will transform you from the caterpillar into the beautiful butterfly. This process will ultimately dictate the trajectory of the rest of your professional career. It is the ultimate journey of self-awareness that will also impact every aspect of your life on a go-forward basis. Many struggle with this evolutionary progress because they are stifled by the negative energy that has blocked their ability to morph into the leader within.

What defines the “YOU”

In order to reach your highest level of leadership discovery, you will have to do more than just master the proficiency of task oriented job duties. It will ultimately require you to do some self-discover and realization to understand how you are ultimately wired for leadership and success. All of us have had life experiences that have defined us as individuals. Some of them were great experiences and others were not. Whether good or bad, every experience is coded into the DNA of your existence and ultimately defines who you are as a person. Part of your leadership discovery is learning how to understand what defines you as the person you are. Discovering your leadership makeup is essential to your ultimate success.

Self-Awareness

Defining the YOU will always start with self-awareness. This is the process of your journey to leadership discovery where you will dissect the experiences that have defined you as an individual. Was it when you were in 3rd grade and had to recite a poem in front of the class and you froze? Was it the first time you asked someone out on a date and were rejected? Was it the time when you tried your hardest to win at something but failed? Where you the last person picked for dodge ball? Take the time to think about it. All of these experiences became part of the fabric of you. According to Maaher Sayeed, “We all are shaped by our experiences in our lives. And the memories, good and bad have permanently altered our outlook towards our lives and future. We are nothing but a mind over matter that is a product of our experiences under specific circumstances in our lives. If our circumstances were any different our experiences would have been very different as well and would result in a different memory that will remain with us forever.”

Owning Your Experiences

Take ownership of your life experiences. They are what makes you who you are as a person. Learn to navigate through the complex maze called you. If you see a path
that is a dead end, pull out your leadership tools and change your course. You own your experiences. One must develop the ability to learn from them. You have to choose the path that will benefit you versus going through life blindly controlled by past experiences. A successful leader will master their inner being to always see the bigger picture. Is it a simple process? Honestly, no. For some, this is a life’s journey, for others, it may be a shorter process. Ultimately, work and time must be allocated for the process for ultimate success. Taking ownership could have you go through some gray moments of self-affirmation. Just stay focused to the end result.

**Honesty**

My Grandmother would always say, “Tell the truth to yourself, even if the truth hurts.” I always chalked it up to just another of one of her many sayings but while I was going through my own leadership journey, these very words came back and resonated within. Being honest about who I was, my frailties as a human, conducting my own strengths and weaknesses analysis, lead me to the new discovery that there will always be areas of growth that must accompany my leadership journey. I had to be honest about my likes and dislikes, limitations and social behaviors. As the workplace has changed into a multi-generational and multi-cultural melting pot, the aha moment was that not everyone sees life and situations the same. What defined me will not be what defines another. The acceptance of one’s leadership DNA will allow you the ability to acknowledge your limitations in order to understand someone else’s.

**Trust**

Life experiences and events can sometimes make it difficult for a developing leader to trust themselves through the process of self-discovery. It’s part of our human DNA to question the process as a result of situations. Am I making the right decision? Do I have the right qualifications to make this choice? What if I make the wrong choice? It’s life’s funny irony that it is filled with so many choices. In every aspect of our lives, we make choices. What do I have for breakfast? What should I wear today? All choices. Making choices is ultimately like standing at a crossroads. You have to decide which path will lead you to ultimate success. Trusting one’s instincts as a leader is a pivotal inclusion to leadership discovery. As a leader, you will be constantly faced with making decisions that have impact on yourself and others. Your choices cannot be based on fear but on trusting your learned instincts gained from past experiences. You’re wiser than you give yourself credit. Tap into your experiences and use wise counsel of others. Trust your instincts and own them.

**Empathize**

In a multi-generational and multi-cultural workplace; leaders must remain empathetic toward the life experiences that define the modern workforce. A leader must be accepting and understanding of cultural and generational diversity. Learn to maximize the varying diversity to aide in the success of your office versus it being dividing factor. It starts with YOU. As the leader, model the way and set the climate of collaboration for your workplace. Do not allow your own experiences, or the lack their of, to...
negatively affect your leadership. A compassionate leader is a desired leader.

*Inspire*

In the modern era, one who is considered charismatic can be looked at either positively or negatively. Regardless of the perception, people are attracted and drawn to inspirational and charismatic individuals. A popular game as a child was follow the leader. Some children where naturally selected. Some reluctantly selected and some never selected. I’d like to believe that wherever you ranked in the selection process, your leadership potential remained intact. Some got to exercise it at an early age while others may be late to blossom into leadership awareness. The question I pondered for years was why was I often selected to be the leader? What was it about me that made others naturally look up to me for leadership? This unknown characteristic that was seen by others remained a mystery to me for most of my early adult years. It was somewhere hidden in the self-doubt birthed by life’s events that defined me as an individual. My leadership journey opened my perception to embrace the fact that I had a natural ability to connect with others and to inspire them. My leadership gift was the ability to encourage others to reach their fullest potential. A leader inspires others to greatness while a manager oversees task. It wasn’t until I started my leadership journey that I realized that there are gifts that every leader must humbly accept in order to reach their leadership potential. Some are inspirational, some are visionaries, some are even motivational. Whatever your gift is for leadership, embrace it because it will ultimately define you.

Your personnel journey into leadership may take many twist and turns. At times it may be uncomfortable and may ultimately force you to step out of your comfort zone. Leadership is not easy. If it were, everyone would be the leader. It is ultimately obtained by those who are willing to do the work to overcome self and aspire to the greater good, be it humanity or the workplace. Some have obtained this through adversity like Dr. Martin Luther King, Jr. and Mahatma Gandhi. Some became leaders by circumstance such as Rosa Parks. Some aspired to leadership like President Obama. However you get to your leadership potential, the commonality is that they all transcended “You” and evolved into “We.”

Tools for Assessing Your Leadership Skills
Michelle Schoenecker, University of Wisconsin-Milwaukee

Making the decision whether to pursue a leadership role in an organization is often fraught with concerns: Am I up for the task? Will I be a good leader? What are my strengths as a leader and how can I maximize them? What are my weaknesses and how can I improve them? While these are natural concerns, navigating a leadership role without first understanding who you are, the abilities you possess, and the values that are important to you in leading and working with others is like exploring the Himalayas without a compass and a map: you don’t have the tools you need to guide your way and avoid the pitfalls. This is especially important in research administration, where the diversity of our work requires leaders who can work with a broad range of personalities and skill sets. To help understand yourself better, the use of a leadership inventory can be an excellent first step, as it can provide you with valuable insight into who you are and how to start your leadership journey.

The purpose of leadership inventories is to determine your personal values, working style, behaviors, and personality traits, and categorize them in ways that will help you understand how you can lead and work with others most effectively. There are many leadership inventories available, ranging considerably in detail, length, and price. While some inventories are simple and provide an informal assessment and others are much more complex, they share common goals: to help you see yourself and how others see you, and to determine actions that you can take to improve or modify your behaviors to be an effective leader.

This article describes two well-known, reliable inventories that provide basic and in-depth assessments: the Leadership Practices Inventory® and the DiSC® Profile. My experience with these inventories is based on my participation in NCURA’s Executive Leadership Program, in which my classmates and I and completed these inventories to identify our personality types and working preferences in order to better gauge our current strengths and weaknesses. Both inventories provided a different perspective of my personality and work preferences, and both were greatly valuable—it was fascinating and exciting to see myself from different angles, and I felt that I had the compass I needed to help navigate my future as a leader in research administration.

Leadership Practices Inventory®
Developed by James M. Kouzes and Barry Z. Posner, the Leadership Practices Inventory (LPI) seeks to measure the frequency of your leadership behaviors in the following five key indicators of effective leaders:1,2

◆ Model the Way: Leaders establish principles concerning the way people (e.g., constituents, peers, colleagues) should be treated and the way goals should be pursued. Examples of questions in this section of the inventory include “I follow through on the promises and commitments I make” and “I build consensus around a common set of values for running our organization.”

◆ Inspire a Shared Vision: Leaders believe that they can make a difference,
envision the future, and create an ideal image of what the organization can become. Questions in this section include “I describe a compelling image of what our future could be like” and “I appeal to others to share an exciting dream of the future.”

◆ Challenge the Process: Leaders look for innovative ways to improve the organization, experimenting and taking risks. Questions in this section include “I experiment and take risks, even when there is a chance for failure” and “I seek out challenging opportunities that test my own skills and abilities.”

◆ Enable Others to Act: Leaders foster collaboration and mutual respect, making team members feel empowered and capable. Questions in this section include “I treat others with dignity and respect” and “I actively listen to different points of view.”

◆ Encourage the Heart: Leaders recognize contributions that individuals make, sharing in the rewards of their efforts. Questions in this section include “I praise people for a job well done” and I find ways to celebrate accomplishments.”

Taking the LPI
The LPI is available in basic and complex assessments. The most basic, the LPI Self-Test® ($20, John Wiley & Sons, Inc.) provides a simple assessment of your behaviors. The Self-Test is a paper assessment that has 30 statements, which are divided equally into the five key indicators described above. After reading each statement, you indicate your response by answering the question “How frequently do I engage in the behavior described” using 10-point Likert scale: (1) Almost never do what is described in the statement; (2) Rarely; (3) Seldom; (4) Once in a while; (5) Occasionally; (6) Sometimes; (7) Fairly Often; (8) Usually; (9) Very Frequently; and, (10) Almost always do what is described in the statement.

Self-Test Scoring
To obtain the results of your Self-Test inventory, the score sheet identifies which questions correlate with each key indicator. Enter your self-score for each question in a key indicator and add up each section (you will have five separate scores, one for each key indicator). The key indicator with the highest score indicates which leadership actions and behaviors you exhibit most prominently; the key indicator with the lowest score indicates those you exhibit least prominently, providing you with a clearer picture of your leadership strengths and challenge areas. Because this is a basic self-administered test, the Self-Test does not provide advice for strengthening your skills or for working with people who exhibit behaviors more strongly in other key indicators. It also does not provide insight on how others may see you and how they can best work with you.

What I Learned from the Self-Test
The results of my Self-Test revealed that I scored highest in the “Enable to Act” indicator and lowest in “Inspire a Shared Vision.” While I was not surprised with
my highest score, I was puzzled about my lowest score. I certainly want people I work with to feel that I inspire and motivate them to achieve a vision of success, so why wasn’t that reflected in my score? I realized it was because I haven’t yet had the opportunity to develop a vision for an organization and be responsible for sharing it and inspiring a team. Thus, the Self-Test helped me to realize that when such an opportunity arises, I will be much more aware of the importance of this skill, and I will take the steps necessary towards achieving it.

DiSC® Profile

For a more in-depth assessment of your leadership behaviors, the DiSC Profile aims to measure the tendencies and priorities that shape your “behavior style.” Based on the work of psychologist William Moulton Marston, DiSC identifies four basic working styles, each with its own priorities, motivations, fears, and limitations.

◆ **D = Dominance:** Direct, results-oriented, firm, strong-willed, forceful. Key priorities for people in this category are challenge, action, and results.

◆ **i = Influence:** Outgoing, enthusiastic, optimistic, high-spirited, lively. Key priorities are action, enthusiasm, and collaboration.

◆ **S= Steadiness:** Even-tempered, accommodating, methodical, patient, humble, tactful. Key priorities are stability, collaboration, and support.

◆ **C = Conscientiousness:** Analytical, reserved, precise, private, deliberative, systematic. Key priorities are accuracy, stability, and challenging assumptions.

Like the LPI, there are several different types of DiSC Profiles at various prices. In my Executive Leadership Program we completed the **Everything DiSC® Workplace Profile** ($59.25, Personality Profile Solutions, LLC), which focuses on “team building, employee communication, conflict management, motivation, productivity, and career development,” all of which are necessary for effective leadership. Unlike the LPI Self-Test, the DiSC Workplace Profile is quite complex in terms of its development, scoring, and results; therefore, a high-level summary is provided.

**Taking the DiSC Workplace Profile**

The DiSC Profile is conducted online and takes about 20 minutes to respond to a wide range of statements based on the four categories above, such as “People think of me as a really good listener,” “I can be pretty forceful with my opinions,” and “I love meeting new people.” To respond to the statements, answer each with the response that best corresponds with your opinion: “Strongly Disagree,” “Disagree,” “Neutral,” “Agree,” or “Strongly Disagree.” Results are available online upon completion of the assessment.

**Scoring**

Based on your responses to the statements, DiSC Workplace synthesizes and summarizes your “unique behavioral style, your tendencies, needs, preferred environment and strategies for effective behavior.” The result is a comprehensive 20-page report that identifies your primary DiSC style (Dominance, Influence, Conscien-
tiousness, or Steadiness) and describes your preferred work style and environment. The report identifies aspects of your work that are motivating as well as stressful, and identifies the priorities that shape your workplace experience. The report also shows nuances in your style that overlap with other DiSC styles. For example, your primary style is Steadiness (S), but you also exhibit behaviors consistent with the Influence (i) style, and thus you are identified as having an Si style. The report describes the work preferences for people who are Si and how to best work effectively with them, and it also provides this information for all of the combinations of DiSC styles.

A particularly interesting feature of the DiSC Workplace report is the discussion of each DiSC style and how your style can best work with each of them. For example, if you primary DiSC Style is Influence (i), the report identifies the ways in which you can best work with someone who exhibits primarily Dominance (D) behaviors. The report discusses the motivations for D (results, action, challenge), how you as an i may perceive those behaviors, and strategies for adapting, or “flexing” to the D style. It also gives advice on how to connect with people in each different style, when to solve problems, and how to respond when tensions begin to arise. Lastly, the report provides three key strategies for working more effectively with everyone in your workplace.

What I Learned from the DiSC Workplace
The depth of information provided in the report was surprising, and, to me, surprisingly accurate. I was identified as having an S (Steadiness) style, which prioritizes giving support, maintaining stability, and valuing collaborations, and is motivated by cooperation and opportunities to help. I agreed with these statements, along with some of the more stressful aspects of being an S, such as a dislike for making forced decisions and dealing with argumentative people. The report was well organized, and the colorful graphs made the information easy to interpret. I also like the tone of the report: professional, factual, and non-judgmental. Each style was represented equally and resulted in a balanced presentation.

While the report provided a great deal of information about how I as an S see the world and my working environment, most valuable to me were the discussions on the traits of each of the other styles and how S people can best work with them. For example, S people are reflective thinkers and do not like to make decisions quickly; however, D people thrive on rapid progress and find cautious and predictable environments tedious. Thus, to best work with D people, I need to provide my ideas and opinions early in a conversation and remember that they appreciate a direct approach. It was very eye-opening for me to learn what makes each DiSC style tick and how to work with their strengths and weaknesses. By understanding what values and priorities each style holds compared with my own, I’m much more confident about my abilities to work with and lead people who have work styles very different from mine. Furthermore, I was surprised to gain so much useful information with practical recommendations for improving my effectiveness and overcoming my challenges.
Conclusion
Leadership inventories are excellent tools for gauging your effectiveness as a leader by identifying the behaviors, values, and priorities in our workplaces and in working successfully with others. Depending on their type and complexity, leadership inventories can help reveal the gaps in our understanding of ourselves and others who are very different from us, and provide strategies for bridging those gaps. While it can be difficult to confront our limitations and weaknesses, knowing ourselves better is often the first step to becoming a confident, competent, and effective leader.

Discovering The Leader in YOU

Diane Ross Nelson, Drew University; N. Elaine Moya, Loma Linda University; Nannette Pettis, Kaiser Permanente Southern California; and Sandra Purves, Los Angeles Biomedical Research Institute

Lead Me Mentorship Program: Discovering the Leader in You

How we are formed into a leader is a journey we can initiate at any point in our careers. “Lead Me” is a NCURA Region VI/ VII based professional development program that affords Region VI and Region VII members a constructive environment to explore your inner leader. The program welcomes all types of research administrators, from directors to grant administrators, from a few years of experience to advanced. Lead Me aligns interests between a mentee and a mentor to guide professionals towards their specific aims and goals. Applications are accepted every Spring and the cohort is kept small to enhance success in the program. The program was conceptualized and founded by Linda Patton. Since its maiden launch in 2010, Lead Me has graduated 41 mentees from the program. The benefits are vast and plentiful, but don’t just take our word for it. Here is what participants had to say about their experience:

Why did you join the program and what did you find encouraging about it?

I joined the program because I saw it as an opportunity for professional development and I had a desire to improve the communication processes in our department.

– Irina Cozianu, Assistant Manager, Training & Compliance, Cedars-Sinai Medical Center

I was at a point in my life where I felt I needed a different perspective on where I was and where I would like to be short and long-term as a leader in research administration.

– Felicia Mayes, Research Manager, Neurosciences, Cedars-Sinai Medical Center

I joined in 2011 and my reasons were two-fold – 1) participation in an educational leadership to provide opportunity for personal professional growth, 2) mentoring

– Stacy Miller, Sr. Grant and Contract Officer, Cedars-Sinai Medical Center

What caused that self-discovery (aha) moment and what have you done or will you do about it?

My aha moment came when I connected a situation I had experienced personally that had also been experienced from someone in the group.

– Rashonda Harris, Associate Director, Emory University

Finding my cheese was an excellent allegory for some of my past experiences and truly being able to put all of that learning into perspective. I learned that I am responsible for framing my career and working toward the successes I desire.

1 This article is reprinted from NCURA Magazine, Volume XLVIII, No. 1, Jan/Feb 2016. It is used with permission of the publisher.
– Theresa Caban, Sr. Contracts & Grants Administrator, Kaiser Foundation Hospital
Who moved my cheese gave me a very clear insight to myself and the way I conduct my home life and work. Due to this self-awareness I strive more to have a balance in each since I found that I was the opposite for each segment of my life.
– Erika Blossom, Research Grants & Compliance Officer, California State University, Fullerton

Some of the program aspects challenge you, how did you handle this?
The program challenged me to think outside of my comfort zone. I still think to this day that they didn’t realize they awakened a roaring lion within. My confidence in my skills was realized. The Lead Me program, through our leadership project, challenged me to trust in my instincts for the industry. I conquered my fear of public speaking which boosted my confidence level tremendously as an ultimate result.
– Derick Jones, Program Manager, LA BioMed

I found it to be challenging when I changed positions mid-way through the program. However the support of the program leader allowed me to continue along to the end.
– Rashonda Harris, Associate Director, Emory University

What are the benefits of going through this program?
The benefits of the program are seeing early career research administrators grow within their institution and grow within NCURA.
– Rosemary Madnick, Executive Director, Office of Grants & Contracts Administration and Mentor/Dean of the Lead Me Program

The networking growth is phenomenal. Learning outside of just getting my job done as well was a very enlightening experience.
– Erika Blossom, Research Grants & Compliance Officer, California State University, Fullerton

The program acts as both a mirror and window – much of the studying requires one to reflect on self and past/current behaviors while you have engage with the mentors (window) and see where you can be with the proper attitude and skills. Even as a mentor, I felt the impact of the mirror and window. The program works for everyone!
– Theresa Caban, Sr. Contracts & Grants Administrator, Kaiser Foundation Hospital

What would you tell someone contemplating about applying?
Take a leap of faith and jump into the program with your mind open to a journey toward self-discovery. If you have an experience even as close to mine, you will develop more confidence as a leader.
– Felicia Mayes, Research Manager, Neurosciences, Cedars-Sinai Medical Center
Just do it! It is the best investment that you could make for your career.
– Derick Jones, Program Manager, LA BioMed
DO IT! The Lead Me program can change your professional life if you let it.
– Theresa Caban, Sr. Contracts & Grants Administrator, Kaiser Foundation Hospital

The program has changed since its initiation. Do you think it’s still relevant and beneficial today?
Absolutely! Just like the field of research administration has changed, so must the program in order to be relevant and beneficial.
– Rosemary Madnick, Executive Director, Office of Grants & Contracts Administration and Mentor/Dean of the Lead Me Program

Absolutely. I had the privilege to attend the Lead Me presentations at the NCU-RA Regional meeting in Salt Lake. In my opinion the program has grown and it is even more relevant and beneficial...
– Teeny Ellis, Sr. Contract & Grant Officer, University of California Riverside

Yes, the program has changed and reflects more of its leadership each year. It is still a viable program for motivated, thoughtful and interested participants.
– Stacy Miller, Sr. Grant and Contract Officer, Cedars-Sinai Medical Center

How has this program enhanced your career?
It’s made me a more thoughtful leader and manager for my staff and my institution.
– Nancy Lewis, Director of Sponsored Projects, University of California Irvine

The program enhanced my career by helping me find more personal satisfaction in my work and the work of others. It increased my opportunity for advancement as evident by my promotion to research manager overseeing three departments and it showed me how to serve as a role model to others.
– Felicia Mayes, Research Manager, Neurosciences, Cedars-Sinai Medical Center

My career improved tremendously within my organization and beyond. I went from being a post award accountant to managing a research institute doing cutting edge whole genome sequencing. In addition, I am now serving as chair for Region VI for 2016. It was the volunteer spirit that was instilled into me that allowed me the ability to grow within the organization. I encourage everyone to take full advantage of volunteer experiences, even if you cannot attend conferences. You have a part to play in making not only the Lead Me program success but the organization as a whole.
– Derick Jones, Program Manager, LA BioMed

This program is a great stepping stone for those wanting to discover more about themselves or the next step in their career. It allows for open discussion on your active career goals and may enlighten you on leadership strategies. Lead Me is chicken soup for the career soul. Join us on the leadership journey. To learn more about the Lead Me Program check out http://www.ogrd.wsu.edu/r6ncura/leadme.aspx or contact us directly.

Introduction
Working in research can be exciting. The research team, including administrators, support innovation, discovery, and exploration in diverse fields crossing boundaries of health, the environment, education, justice, technology, and the arts: everything from the depths of space to tiny atomic bits. In addition, research administration is a field ripe with growth potential and opportunities both in the private and public sectors.

While exciting and fulfilling, research administration also involves a lot of responsibility. “At any given time [grant administrators are] the recipient, the interpreter, the translator and the deliverer of information, documentation, requests, questions and answers pertaining to the conduct of research project[s]” (Marshall 8). Grant administration can be stressful: factors such as poor leadership, lack of support from an organization or investigators, and the ambiguity of the work can leave folks feeling burned out (Marshall 8).

Because of our demanding work, we need strategies and solutions for motivating and retaining staff that can engage in complex work while achieving set goals. This article addresses some strategies for creatively engaging and motivating staff.

Hicks and Monroy-Paz have pointed out that as research administration becomes more intense, it is more important than ever to have engaged and productive employees (78).” One engagement strategy is to nurture and encourage creativity and discovery. Barbara Dyer specifically argues, “promoting a culture of creativity requires honing the skills of observation and invention – generally the purview of artists and designers – throughout your organization and aligning core systems to reinforce the creative process” (Fortune).

Defining Creativity: Value for Work
“Creativity involves breaking out of established patterns in order to look at things in a different way.”

– Edward Do Bono

Creativity is looking at things in new ways by connecting the potentially unexpected to form new ideas and concepts that can be applied to our work to achieve the outcomes we want. Or as Steve Jobs said even more simply: “Creativity is just connecting things.”

Although we work with thousands of regulations in research administration, there exist gray areas where we are called on to interpret and consult with others: researchers, sponsors, and team members. These potentially stressful situations can be opportunities for creative intervention. In fact, a study commissioned by Adobe on how encouraging creativity paid off in “creative dividends,” found “that companies that embrace creativity outperform peers and competitors on key business performance indicators, including revenue growth, market share, and talent acquisition. They enjoy a high performance working environment, driven by progressive
leaders and managers…” (Adobe Report, August 2014).

Even with these positive benefits, it can be hard to unleash creativity in the workplace. Brian Clark of Copyblogger.com says a major block is “denying your own creativity [which] is like denying you’re a human being.” He goes on to say, “We’re all limitlessly creative, but only to the extent we realize that we create our own limits with the way we think.” Other blocks include fear of judgment from peers, fear of failure, self-doubt, groupthink, and indifference (@ValaAfshar, Sept. 28, 2015, Twitter), poor leadership, being overworked, and not feeling part of the mission of the organization. But, the biggest creativity killer may be role mismatch, because “when people are assigned to tasks/jobs/roles/creative projects that they have no interest in or passion for their creativity takes a hit.”

**Being Prepared: It Starts with You**

The number one thing you must be ready for is to change yourself and commit to making the change. Nothing will be received more poorly than an individual prescribing how others should work when they themselves do not engage in the same practice. The same goes for a manager/leader who says they embrace new work styles, but rewards the status quo. Being prepared means reading relevant books and journal articles, going to training, watching videos, brainstorming, networking with others, journaling, and other exercises.

Getting prepared also may mean taking inventory, and using—as Dyer says—the tools of observation to “learn how to look at situations from multiple angles, removing blinders and opening possibilities” (Dyer, Fortune). Take time to listen and watch what is happening in your workplace. Invite individuals out for coffee to get their take and talk with and observe other teams.

Be thoughtful, and determine what will be of value to you, to your teammates, and to your workplace. Creative change may start small: taking more breaks, coloring at your desk, or asking other team members to join you in putting together a puzzle at lunch. Small actions done consistently can have profound impact. Or, it may start big: re-evaluating team members’ roles, thinking about how responsibilities can be aligned with the things that bring team members satisfaction. Either way, you should check in with your supervisor and possibly your HR team before implementing any change.

Finally, be sure you are ready for this undertaking and that you are flexible. As you begin to implement creative change, recognize that something that worked for you as an individual may not be right for everyone on your team. Also be certain to provide an environment where folks can be authentic, take risks without feeling judged, and feel comfortable providing feedback. But also remember that change is hard, even positive change. There are going to be nay-sayers. You’ll need to have the honesty and willingness to sort through and search out real and valuable feedback that is based on something other than general resistance to new ways of working.
Creating a Safe Space

“If you think colorful furniture and a casual dress-code constitutes as ‘creative’ — think again.”

— Barbara Dyer

What does it mean to create a safe space? It means making the environment ripe for an individual to express themselves authentically, without fear of judgment or other repercussions. It means creating an environment where you do not give lip service to authenticity, honesty, new ideas, and being different. It does not mean adding a Ping-Pong table or having pizza delivered on Fridays. Those things can be a nice part of a holistic plan to improve the work environment, but they’re not enough on their own.

Creating a safe space is about encouraging folks to actually express their curiosity, their ideas, to be themselves, to buy in to what is going on, and to feel that their contributions make a difference. The result will be team members who experience personal satisfaction and fulfillment and an organization that is more innovative and is better able to retain employees.

“People are not afraid of failure, they are afraid of blame. To cultivate an innovative culture, anticipate failures and minimize blame.”

— @ValaAfshar

So what has the culture of your organization been and where should it go? How do you encourage a creative workplace while making it a safe space? Start by asking some of the following questions of yourself and of your team:

◆ What problems are we trying to solve?
◆ What is missing?
◆ What do we want more of?
◆ What does an ideal day at work feel, look, taste, and sound like?
◆ What helps you think more creatively?
◆ What do you like to do as an individual? As a group?
◆ What does okay failure look like?
◆ What does allowing for failure do to productivity?
◆ Are you okay with failure?
◆ What cannot fail?
◆ What does it mean to have a good day?
◆ What does it feel like when you have a bad day?
◆ What does creativity mean to you?
◆ Are you open to new roles/different job responsibilities?

In addition, since “the most successful managers will be those who take the time to understand their individual employee’s expectations and strive to create
appropriate cultural and policy shifts” (Hicks, Monroy-Paz 92), it’s important to ask yourself and each member of your team the following:
◆ “What makes you feel at the end of a day like you made a difference? Why?
◆ What relationships in your work give you the greatest sense of meaning and energy? Why?
◆ What makes you feel at the end of a day that you grew as a person and professional? Why?” (Hurst, LinkedIn 2015)

**Fostering Creativity at Work**

“Creativity thrives with leadership support. Regardless of type of business or industry, survey results found that executives and business leaders should nurture, fund, and promote programs to increase creative capability”

— Adobe Systems, Inc.

Creativity is innate, but sometimes it needs to be “re-learned” or opened back up. Tools and instruction, plus dedicated time can help us tap into our innate creative selves. In a Business Insider article, Patrick Maggatti of Villanova School of Business lists four things that are essential to fostering creativity at work. He said all workers should:
◆ Seek to have new experiences and expose themselves to new ideas and differing perspectives.
◆ Challenge themselves/their team by putting aside time to set and work on goals that foster new ideas.
◆ Develop relationships with people that are different than them, building a diverse network.
◆ Develop and encourage a workplace where the culture is one that “respects effort and failure.” (Maggatti, Business Insider)

Some other things that can foster creative thinking in the workplace include:
◆ Encouraging exploration and curiosity.
◆ Recognizing that team interaction, fun, and play are not superfluous or silly.
◆ Smiling more and encouraging mindfulness practices.
◆ Listening and observing.
◆ Recognizing that the physical environment – light, color – can help to stimulate creative thinking.
◆ Ensuring the right folks are in the jobs or doing the tasks that are right for them.

**Writing a Mission Statement: Setting Intention and Defining Meaning and Purpose**

Before you begin fostering creativity at work, it is important that you have a mission statement to guide your activities and for your team to rally around. A mission statement is a brief description of what you or your team want to accomplish and
why. We cannot do the work that matters to us and liberate our minds and bodies to enjoy and engage in that work (i.e., use our creativity and ingenuity) if we don’t know what motivates us, what our purpose/calling is, and where we want to go. Writing both a personal-professional mission statement as well as a mission statement for your unit can help to set you on a determined path.

“In the book First Things First, Steven Covey says that mission statements are often not taken seriously in organizations because they are developed by top executives and there’s no buy-in at the lower levels” (Hansen, Live Career Blog). For this reason, be sure to give your team an opportunity to help draft the mission statement. If you do this, the mission statement can become something the whole team can rally around.

A mission statement done correctly will provide you and your team guidance and make everyone feel that they are on part of a team that is doing something meaningful and important. It will define not only your goals, but also your values. Once the statement is written and agreed upon, everyone should have a copy and it should be revisited at least yearly or anytime programmatic planning occurs.

Avoiding Things that De-Motivate and Sabotage Your Efforts

There are a number of things that can sabotage your creative efforts including: lack of communication, consistency, or empathy, and too much change too soon.

Communication, feedback, and recognition are key to motivating your team in their creative efforts. Teresa Amabile says that praise and positive feedback are especially important for creative people, who “thrive on having their ideas impact the lives of others” (qtd. In Ciotti, Business Insider). A leader fails when they do not let folks in their organization know what is going on. When people do not understand what is going on, they feel distant from the organization’s mission, and do not see how they fit in. Having employees “hear through the grapevine” is de-motivating for the whole team.

Make sure you allow enough time for change to take effect before switching strategies. Most people have worked with or for managers who love to implement change, read leadership and development books, and love personality and work style tests. These same managers often experiment on their staff with an ever-rotating buffet of techniques and new ways of working. These managers may also get distracted, lack follow through, or find something newer, shinier and different to try out before giving time for pervious change to happen. Do not be that person. It is easy to get excited and want to do things for your team that look valuable, but after a while, people will not take you seriously when you are on the seventh motivation/productivity activity of the year and it is only June.

Be careful to make time to analyze change that has been implemented and make sure you are giving time for that change to happen – too much change at once can overwhelm, confuse, and upset folks. Think like a scientist, and use the scientific method for inspiration.
<table>
<thead>
<tr>
<th>Action</th>
<th>Outcome</th>
</tr>
</thead>
<tbody>
<tr>
<td>Observe</td>
<td>The team does not feel motivated on Fridays</td>
</tr>
<tr>
<td>Formulate a hypothesis</td>
<td>Fridays are when the results of our work are published on the internet and often we are behind in our workload</td>
</tr>
<tr>
<td>Develop testable predictions</td>
<td>If we raise morale and get people talking, in particular near the end of the week, Fridays will feel better</td>
</tr>
<tr>
<td>Implement steps</td>
<td>Every Friday we will have a creative team building exercise early in the day</td>
</tr>
<tr>
<td>Gather data</td>
<td>We’ve done team building on Friday for a month and the following has occurred…</td>
</tr>
<tr>
<td>Make adjustments</td>
<td>Continue as is, make changes, develop new steps</td>
</tr>
</tbody>
</table>

Be sensitive to the fact that change is hard, even fun change like lunchtime chess or volleyball. Even when it’s change you implemented yourself. It is hard not to let the day-to-day pressures of grant administration distract you from your mission. There will be times when you find yourself judging an employee who has a large workload but is currently taking a break and sitting at their desk doodling. There will be times when you wonder why your team took an hour to discuss longer term goals when there is so much work to be done right now. But be gentle with yourself and others. Not every day is shiny; growing pains and setbacks are normal.

**Summary**

“Ultimately, the operations and incentives of the organization should reinforce creativity. People at every level of the organization must be supported as they develop and apply the tools of observation and invention in their jobs. Everything from the company’s vision to its HR procedures and financial management structure, when properly aligned, can encourage creativity in the workplace.”

— Barbara Dyer

In summary, creativity should be a high priority at every workplace. All managers should actively explore ways to maximize their team’s creative thinking. Powerful and positive outcomes are possible if there is an authentic and well-intentioned initiative to change the culture at work. By providing tools and resources to foster creative thinking, managers can help achieve better quality work, higher retention, less stress, a better work environment, and more job satisfaction.

¶4120.34 Budgeting Professional Development for Sponsored Research Staff: A Scaled Approach
David Lynch, Benioff Children’s Hospital Oakland Research Institute

Many organizations provide budget support for the professional development activities of staff. The allocation is typically used for non-salary expenses and might compete with other uses, such as supplies, services, materials, and other unit expenses. Unfortunately, there are rarely sufficient funds to fully support staff participation in all professional development activities. Therefore, it is important that we manage these limited funds wisely. One way of doing this is by implementing a scaled approach to supporting professional development.

Staff development may include internal training opportunities, webinars, and external conferences and workshops offered by professional organizations. It makes sense for early career staff to begin with fundamentals and move into intermediate and advanced topics, while increasing their participation in their professional organizations over time. Special consideration should be given when licensure is a job requirement. Many sponsored research offices have staff that must be certified in various ways, including notaries, JDs or in some cases CRAs (Certified Research Administrators) and CPAs (Certified Public Accountants). If so, professional licensure can be supported by a special set aside of professional development funds outside the scope of elements considered below.

Distribution of support, planning, specializations, guidelines, professional organizations, and expectations should be taken into consideration, depending on the unique circumstances in your organization.

Consider distribution of support

Of the total funds available, set aside a reserve to pay for recurring, non-salary expenses. These can include general office supplies, services, and licensures. The remainder can then be split between work units, based on the number of FTEs. There may be other variables to consider, but the following shows one method of allocating professional development support:

FY17 funds will be split proportionally between both teams, based upon overall FTE
4 FTE are on Team A, 40% share
6 FTE are on Team B, 60% share
Prepare a planning calendar
Create a planning calendar for the entire fiscal year, including observed holidays, major deadlines, other key dates (i.e., fiscal year close), and all professional development opportunities, including anticipated cost, location, and the suggested job level of attendees. Include internal training opportunities, as well as local, regional, national, and international meetings. Add all NCURA training meetings and workshops, as well as those from other professional organizations, such as the Council on Governmental Relations (COGR), the Federal Demonstration Partnership (FDP), Association of University Technology Managers (AUTM), National Association of College and University Attorneys (NACUA), MAGI (Model Agreements and Guidelines International) east/west, Society for Clinical Research Administration (SCRA), and Society of Research Administrators International (SRAI). Keep in mind that many of these organizations offer recurring meetings from one year to the next, which allows the planning calendar to be copied into subsequent years with only minor revisions.

Account for specializations
Each member of the staff should be given the opportunity to grow professionally and align their interests with a part of the existing research portfolio. An individual’s competency and expertise have a direct impact on individual job performance and on their work unit. Staff should be encouraged to become the “resident expert” or specialist on a sponsor, organization, or resource. Be sure to emphasize that staff are each responsible for reading sponsor notices, newsletters, and websites, and for reporting changes or other developments to the work unit. Doing so will allow the entire work unit to broadly monitor the research administration environment in order to be aware of, anticipate, and manage change. This approach also allows you to stretch professional development funds further, ensuring that a resident expert covers each area.

To begin, start with a list of internal and external organizations, newsletters, listservs, training classes, and other opportunities that regularly affect the unit. Staff can then choose which of the opportunities they will monitor in order to broadly and collectively scan the environment. Individuals should avoid unnecessary overlap and align themselves with a particular organization and its communications, giving regular updates at staff meetings. For example:

Each year, teams will identify organizations which offer professional development opportunities, decide which are of greatest benefit and assign which job roles are appropriate for
Assignments should be based on amount of research activity and job level:

- COGR – AVP, Director
- NCURA – AVP, Director, Managers, Supervisors and Grants Specialists
- National meeting (August)
- Pre-award Research Administration (March)
- Financial Research Administration (March)
- Regional meeting (April)
- FDP – AVP, Director
- AUTM – Patents/Licensing manager
- MAGI – Clinical Research staff
- UIDP – Corporate-sponsored research staff
- PCORI – Grants Specialists
- NCMA – Contracts Specialists
- NACCA and NACUBO – Grants Accountants
- NACUBO – Research Controller, Research Finance Director
- NACUA – Legal staff

Establish guidelines

All staff should take advantage of on-campus or internal workplace learning, webinars, general research administrative meetings, clinical research administrative meetings, and other learning opportunities. The class descriptions should directly support the mission of the work unit. Time away from the office must be requested in advance, approved, and recorded in the professional development calendar. Staff should also document an objective they want to accomplish as a result of the training.

Hourly or classified staff can attend classes offered by Human Resources and take advantage of other low/no-cost learning opportunities. Again, the class must be directly related to the job role and annual performance objectives for the current fiscal year. The anticipated cost and time away from the office should be addressed in the request. Supervisory staff will review all requests and approve based upon:

- Anticipated workload and staffing levels
- Alignment with job responsibilities
- Performance objectives
- Years of service, and
- Availability of funds

Salaried or unclassified staff are encouraged to attend internal classes and external local, regional, and national meetings. Costs can be minimized by attending nearby workshops and daylong seminars that do not require overnight travel. It is possible that the approved budget will not support all requests. Newly hired staff should first demonstrate competency in the job role (~6 months into position) prior to submitting a request.
**Professional development organizations**

Each team will need to determine which organizations offer the greatest benefit to the work unit so that limited funds can be put to the best use. Funds can be used for internal and external training opportunities and those that require overnight travel. Look for low- and no-cost alternatives, apply all discounts to maximize the use of limited budget dollars, and apply for travel awards when offered. Additionally, consider:

◆ Coordinating ride/room sharing, institutional registrations, etc. with other personnel. Review the attendee roster and identify individuals from your institution.

◆ Learning progressively, by starting with the basics, then moving into intermediate and advanced topics, corresponding to job level.

◆ Identifying learning opportunities appropriate to the job title and responsibilities.

After your professional development program has been in place for a few years, consider asking each job class to develop its own guidelines. In future years, guidelines can be reviewed/refined annually by those in a particular job class. Special considerations can be made for:

◆ Being an elected official in the organization

◆ Participating as a committee member

◆ Presenting on a topic, individually or as a panelist

◆ Being invited to speak/attend

**Set Expectations**

Work unit supervisors should determine who should attend the various learning opportunities. Those selected should review meeting materials, registration fees and deadlines, and conference hotel room rates. There are often discounts available for early bird conference registration and host hotels often offer a discounted room rate to conference attendees. Staff should always consider other cost-saving opportunities, such as early registration waivers or discounts for presenters, ridesharing, room sharing, and travel awards.

Attendees on larger campuses can determine who else from their campus is attending the event and coordinate the best coverage of sessions for the campus. This can be done through an online survey that solicits session attendance plans.

Upon return, staff should be expected to present a trip report to their work units and others on campus as applicable. Encourage staff to take the lead on implementing one thing that will improve sponsored research operations at your institution.

**Gradual immersion**

Consider gradual support and and corresponding expectations. Documentation of participation year-to-year will be essential. Below is an example of a gradual immersion schedule for attending NCURA annual and regional meetings:
Immersion Schedule | Expectation(s)
--- | ---
1st meeting | Attendance only
2nd meeting | Volunteer (e.g., registration desk, session evaluator, committee assignment)
3rd meeting | Apply to lead a discussion group or for a basic/entry-level role in the program (e.g., program committee, volunteer coordinator, dinner group coordinator)
4th meeting | Apply to present a concurrent session or be a panelist
5th meeting | Apply to present a half-day workshop
>5th meeting | Apply to become involved in organizational leadership (e.g., Regional board member) or to serve on specialty programs (e.g., traveling workshop, peer review, etc.)

Consider an additive immersion schedule in which attendees build upon meeting expectations each year. For example, during the third meeting, attendees are expected to fulfill the expectations for meetings 1 through 3; for the fourth meeting, attendees should meet the expectations for meetings 1 through 4, and so on.

Encourage employees to not spread themselves too thin, limiting participation to 2-3 activities annually. Over time, staff should consider inviting new presenters to join their panels and presentations, bringing new ideas and perspectives to presented topics.

**Closing Thoughts**

Through the responsible use of professional development funds, demonstrating the direct benefit to the work unit/institution and measuring operational improvements, you will be able to justify the continued support of staff professional development. In the annual report of activities, be sure to touch upon meetings attended, presentation titles and improvements resulting from professional development support. By demonstrating positive impacts in research administration, you will be able to sustain professional development support when competing with other uses for funds.

Challenging Traditional Ways: Leadership, Trust, and Reducing the Administrative Burden

Anita Mills, Evisions; Susan Sedwick, Attain, LLC; Annie Lenfest, Smithsonian Institution; Robert Prentiss, University of Texas at Austin; Joseph Andrews, Wake Forest University School of Medicine; Paula Means, Wake Forest University School of Medicine; and Krystal Toups, University of Texas Health Science Center at Houston

In an effort to alleviate administrative burden, many federal agencies have granted more freedom to institutions when managing their federal grants. The overhaul of the OMB Circulars and issuance of the Uniform Guidance (2 CFR 200) was meant to alleviate administrative burden by loosening the regulations in some instances (e.g., effort reporting) and by providing clearer guidance in others (e.g., subrecipient monitoring). This freedom and clarity created a greater need for tighter internal controls to help institutions stay in compliance. However, greater freedom does not always translate into less oversight. Federal oversight often comes in the way of audit findings. This has led to the need for balancing risk with oversight and internal controls, thus research administrators are in a predicament. How do we develop better internal controls without increasing administrative burden? With limited resources, how do research administrators balance risk with compliance? How can best practices built around internal controls so as to not increase administrative burden?

Many of us struggle to reduce administrative burden within our offices. For research administrators looking to make changes at their institution, we find The Five Practices of Exemplary Leadership® (Kouzes and Posner) to be an excellent guide. Jim Kouzes and Barry Posner have been gathering data from their leadership practices for over 30 years. The data they have collected has helped shape The Five Practices of Exemplary Leadership, which provides a leadership model that can help leaders establish a vision for best practices. This article explores how leaders in research administration have applied these principles and exemplified the practices outlined by Kouzes and Posner.

INSPIRE A SHARED VISION

Leaders who provide a path for staff promotion create an environment for them to flourish. Supporting and retaining qualified employees is vital to any organization. Susan Sedwick, formerly of the University of Texas at Austin, inspired a shared vision when she developed a career ladder and secured competitive pay for her team. In order to be successful, Susan had to inspire her leadership to support her vision. Securing competitive pay for one team member is impressive, but securing competitive pay for an entire team is monumental—this is exactly what Susan was able to do by inspiring a shared vision.

Inspire a Shared Vision: Susan Wyatt Sedwick, PhD, Consulting Associate, Attain

When a leader gets people excited about the future, they inspire a shared vision. First, a leader must know what their vision is and then must be able to communicate
that vision to others. To create a unified mission, a leader must inspire the people they report to as well as the people who report to them.

**Leadership Challenge:**

What is your vision?

How will you communicate your vision to your leadership?

How will you communicate your vision to your followers?

Employees rise to the level of expectations set by leadership. If we want our research administrators to behave as professionals, we must treat them as professionals by setting expectations and examples for performance and by also providing professional development opportunities to assure advancement.

Ibarra (2005) states, “Growing your own leaders sends a positive message throughout your workforce. Promoting people within is good for morale and essential to a positive organizational culture.” But it takes more than rhetoric, it takes a commitment to sustainable funding, planning, mentoring, and consciously seeking ways to provide developing leaders the opportunity to gain experience with increasing levels of responsibility. Our profession is increasingly specialized, making it essential that emerging leaders have the opportunity to gain experience outside their area of expertise.

One of the hallmarks of a profession is licensure or examination. The Office of Sponsored Projects (OSP) at The University of Texas at Austin based its career ladder on the attainment of Certified Research Administrator (CRA) status. Our OSP facilitated a group study program to prepare staff members for the CRA examination. Since the examination fee was a barrier to some seeking certification, the office paid the fee on behalf of those who completed the study program. Additionally, staff that attained CRA status were assured of attendance at national meetings to fulfill the continuing education requirements required for the CRA. The study program was open to research administrators from across the entire campus.

Certified administrators are a valuable commodity on campus, and many of these professionals were being recruited to work in other offices. In response to this retention challenge, a career ladder program was developed that provided salary and promotion incentives for CRAs in combination with normal performance feedback requirements. This required an institutional commitment to that salary program. In its first 10 years, the program resulted in more than 75 professionals across the campus achieving the professional distinction of CRA, including all senior level and management staff in the OSP.

Turnover in research administration offices can exacerbate administrative burdens on researchers and create inefficiencies on multiple levels. A customer satisfaction survey at the University of Texas at Austin revealed the single biggest issue contributing to principal investigator dissatisfaction arose from frequent turnover in the central office (often caused by poaching of highly trained personnel by departmental units that offered much higher salaries). As a result, the university funded a one-time, permanent equity increase of salaries in the central office to bring salaries to a competitive level with departmental salaries.
MODEL THE WAY

Being a leader and trusting people to do the right thing can be a challenge. Fear of failure is one reason why we may not trust someone to act on our behalf. If we want to be trusted as a leader, we must model the way of trusting others. Would you allow principal investigators to submit their own Federal proposals? This question often creates panic when asked, however Krystal Toups of the University of Texas Medial School at Houston shows us there is nothing to be afraid of when we have faith in ourselves and reasonable business practices in place. When Krystal modeled the way for a change in how proposals were submitted at her institution, she freed up valuable resources and was able to provide a greater level of customer service to her faculty.

Model the Way: Krystal Toups, CRA, Director, Grants, University of Texas Health Sciences Center at Houston

A leader who knows who they are, and whose voice is in sync with their beliefs, will instill trust in their followers. People follow those they believe in and respect.

Leadership Challenge:

What do you stand for as a leader?
What are your personal/professional visions?

On a late Friday afternoon early 2012, my executive director asked me “Why can’t PIs submit their own grant proposals?” I paused to think about what she asked. I had just spent an hour telling her how PIs needed to get us their information sooner because we had several applications that almost did not make the deadline as we were waiting on their final application components. As the assistant director for grants at the time, major deadline days were trying. My team and I

would often spend the entire day corresponding with departments requesting final narratives for the grant submissions with only a few minutes to spare. Often we had to seek help from other authorized signing officials to get applications submitted in the remaining minutes before a deadline.

My first reaction to her question was protective, assuming we would not be able to ensure applications were submitted on time and as approved. Her response, “What if we could find a way to ensure the applications are not changed once approved?” Thinking there was no way we could do this, I agreed. “Great,” she replied, “I want you to lead the project and make it possible.”

My experience is that great ideas and innovations come with letting go of what is comfortable and challenging yourself, your staff, and university leaders to think in new directions. This process takes trust and modeling of the behaviors we want to see in others. In June 2012 we presented to the university a new mandatory process using our system-to-system submission software. Once the central Sponsored Projects Office reviewed the application, the administrative components are locked, and the proposal is routed back to the PI and their department to upload the final narrative and submit the application. To get this point, we had to have the support and buy-in from executive leadership. We contacted other universities that had similar processes and worked with our system provider to create a test environment that allowed us to lock down critical components of the application (e.g., budget, budget narrative) following approvals.

Because we took a chance, and put trust into our people and processes, we have tremendously reduced review time and created efficiency in our submission process. Now we spend deadline days facilitating reviews and providing better customer service instead of worrying about collecting documentations and panicking about making deadlines. Our PIs and departments are accountable for their submissions (i.e., trust) and are thankful to have the extra time to work on their narratives.

And it all started by asking a simple question, “What if?”

**CHALLENGE THE PROCESS: CASE 1**

Thinking outside the box and finding ways of balancing risk with quantifiable data is critical to successful operations. Subrecipient monitoring has become a necessary part of daily life for institutions of all sizes. Being able to assess risk for a subrecipient and then apply monitoring standards based on risk level is key to reducing the amount of administrative burden associated with subrecipient monitoring. Robert Prentiss of the University of Texas at Austin challenged the process when he created a risk assessment tool to manage subrecipients efficiently and effectively.

*Challenging the Process: Robert Prentiss, Senior Grants and Contracts Specialist, University of Texas at Austin*

The fear of failure may be the #1 reason people do not employ the leadership practice of Challenging the Process. Embracing mistakes and creating a safe place for people to fail is critical to foster this practice. Very few people like change, but resistance to change may lead to failure.
Leadership Challenge:
What would you do if you were not afraid?
Is there a good idea you can support? Can you create a safe place for this idea to fail/improve/succeed?

Uniform Guidance requires that risk assessment be performed on subawards to evaluate the subrecipient’s risk of non-compliance while documenting an institution’s efforts to mitigate risk. At first glance, the requirement seems straightforward and commonsensical. But institutions face a number of challenges implementing this requirement. First, how can risk be consistently identified and evaluated? Uniform Guidance offers a handful of examples but nothing systematic or easily quantifiable.

Second, because institutions are not directed to focus primarily on any particular type of non-compliance—unallowable costs, for instance—the number of potential risk factors is almost endless. Some risks, such as the results of the subrecipient’s most recent audit, are relatively uncontroversial. Other risks, however, like non-compliance involving human subjects, pose a much greater threat to the institution and to the research community. So how should risks specific to a project be considered? How do institutions develop an environment of risk tolerance in some areas when non-compliance involving human or animal subjects is not easily commensurable with risks of a purely financial variety?

Lastly, not all institutions have the same variety of subrecipients with the same set of potential risks. Some institutions issue a large number of subawards to a wide variety of foreign entities, while other institutions work almost exclusively with domestic partners. In-depth questions about the subrecipient’s location might be appropriate for the former, but overkill for the latter. Similarly, many pass-through entities work primarily with large, established academic institutions that undergo an annual single audit. A high-dollar subaward to a non-academic entity may be considered higher risk.

Because of these variances, when building a risk assessment questionnaire (RAQ), the Federal Demonstration Partnership (FDP) took an unusual approach. Unlike many other FDP forms, the RAQ is modifiable. An institution may add to or revise the questions and answers to more accurately assess the types of subrecipients common to their institution. And while each RAQ generates a set of numerical scores, the form does not dictate a single set of thresholds to determine a subaward’s risk level. Two sets of thresholds currently in use are published in the RAQ’s guidance, and institutions are free to adopt them or develop their own.

Is there risk in allowing modifications to the RAQ and of not declaring a straightforward threshold for high-risk subawards? Undoubtedly. But the broader goal of accurately identifying risk remains paramount. Improving accuracy of risk assessments—and reducing the related administrative burden on all parties involved—requires letting institutions experiment and learn from their mistakes.

CHALLENGE THE PROCESS: CASE 2
Being part of a community and looking outside our organizations can be key to
solving problems. Wake Forest School of Medicine was faced with the challenge of reducing the turnaround time for IRB review. Wanting to make their process more efficient, they looked outside their organization for a model of excellence. As necessary adjustments to IRB reviews were made, metrics were employed to evaluate and to educate. Joseph E. Andrews and Paula Means at Wake Forest Medical challenged the process and reduced turnaround time for IRB reviews.

Challenging the Process: Joseph E. Andrews, Jr., PhD, MA, CIP, Director, Human Research Protection Program & Institutional Review Board and Paula M. Means, MPA, Assistant Dean for Research, Wake Forest School of Medicine

Changing critical administrative systems that work in order to try something that may not work make even experienced researchers nervous. Yet in late 2011, we identified a problem regarding turn around time for our IRB that needed to be addressed. The average Institutional Review Board (IRB) review time was just that—average. It had been a long time since the process at Wake Forest had been reviewed, and we realized we were operating within a model developed many years ago for a paper-based world. Expectations of senior leaders and faculty members had evolved dramatically, though our processes had not. We needed to increase efficiency while maintaining quality.

The graphic below illustrates how we challenged and changed the process.
Once the problem was identified — the most critical step in problem solving — the IRB leadership team looked to see what we could learn from IRBs that were successful at achieving better than average review times. We discovered that commercial IRBs had the most modern, efficient systems able to handle reviews with speed and accuracy. Although we couldn’t identify an academic medical center that had adopted a similar model, the IRB leadership team developed a plan for redesigning the number, membership, and schedule of IRB panels based on commercial IRBs and presented it to the Assistant Dean for Research.

Leaders empower individuals by presenting a problem and trusting them to find solutions

Our plan consisted of splitting the four current IRB panels into eight with membership of 10 to 12 on each board. Panel expertise was selected to ensure we had appropriate reviewers for each of our high-volume research areas on at least two panels. By modifying the schedule so that each panel met every other week, we could rotate through the boards every Monday through Thursday, with experts in our major research areas available each week. With this model, a study could be reviewed the week after it was received on nearly every occasion. With smaller agendas, meeting duration would be reduced from ~3 hours to an hour, leaving more time for discussion. Although these changes were a radical departure from the status quo, the Assistant Dean gave us permission to move forward. We were entrusted to find a solution and we did that by presenting our research to the IRB Chairs, committee members, and stakeholders, allowing us to conduct a full-scale pilot of the proposed model.

Leaders motivate individuals to come up with innovative ways to challenge the process

Prior to proposing our plan to the research community and senior leadership, we knew that we had to be prepared to answer tough questions. The Assistant Dean supported our efforts to develop an innovative solution and encouraged us to work with IRB members to finalize the process. It was important that we put our idea through the same type of scrutiny researchers use when developing a study protocol. We were completely reconstructing a key part of the university’s infrastructure; therefore we needed to present leaders with a compelling rationale, a viable hypothesis on why this would work, and clear rules for disengaging if the new process was unsuccessful.

In developing our presentation, metrics and questions related to ethical and logistical issues were prepared in advance. Advanced preparation paid off. Senior leaders were impressed with our role-out plan and the buy-in garnered from IRB members. Faculty support bolstered our credibility with leaders and earned the trust necessary to secure their agreement to a four-month pilot.

Leaders encourage individuals to take risks and learn from the process

The Assistant Dean accompanied the IRB leadership team to a meeting with the Dean of the School of Medicine to present the new process. This show of support encouraged the IRB leadership team and signaled departmental support for the project. With encouragement from the Assistant Dean and support from the Dean,
the pilot was conducted. Our new process was successful and we subsequently published on the new model and transformation journey, as well as the sustained benefits years after the process changed:

**ENABLE OTHERS TO ACT**

Great leaders foster collaborations and create an environment for people to work as a team. Leadership requires being a good communicator and creating an environment where people feel safe to share opinions and information. When people openly share, team members get the information they need to do their jobs. At smaller institutions, research administrators often wear several hats often leaving staff feeling overwhelmed. At Western Michigan University, Annie Lenfest enabled others to act by creating an informal process of face-to-face meetings between central and departmental administrators. Face-to-face meetings improved relationships and kept information flowing between units, ensuring critical information did not get lost in translation. This process led to improved customer service for the faculty at Western Michigan University.

*Enable Others to Act: Annie Lenfest, MRA, Grant/Contract Administrator, Smithsonian Institution*

Trust creates a common bond between people and ensues when we feel others have our best interests at heart. The leadership practice of Enabling Others to Act is a cornerstone to building trust. When a leader enables others to act, they foster collaboration and create a team environment in which people feel empowered.

**Leadership Challenge:**

Do you trust those you lead and who lead you?
Do they trust you?

In a university setting, departmental administrators (DAs) are not only responsible for routine duties related to the academic arm of the department, they also act as grant managers—supporting graduate research appointments, reconciling budgets, tracking cost share and effort, and so on. Without adequate, specialized training, DAs can become overwhelmed by the regulations that accompany sponsored research.

In an effort to alleviate some of the DA’s grants management burden, an informal process was established to share information between the central RA office and the
departments. The pre-award administrator for the College of Engineering scheduled routine, face-to-face quarterly meetings with each departmental office administrator. During these meetings, the pre-award administrator shared relevant information regarding changes in university and sponsor policies and procedures related to grants within that department. The departmental staff person discussed current grants that had upcoming action items. Both administrators discussed questions, concerns, and came up with an action plan for anything requiring immediate attention.

The goal of these meetings was to keep information flowing between departmental and central support personnel. This collaboration reduced the administrative burden on the departmental administrator by providing access to information that was readily available in the pre-award office, thus freeing up DA time to complete other tasks. The quality of service the DAs were able to provide their faculty improved, resulting in researchers feeling more capable and supported in their quest for research funding.

ENFORCE THE HEART

Encourage the Heart: Anita Mills, MA, CRA, Solutions Consultant, Evisions

Before becoming a solutions consultant at Evisions, I was a researcher and research administrator for 20 years. As a solution consultant, I am no longer involved with the day-to-day research management. I stay connected to research administration by going to conferences and learning from my peers.

A research psychologist at heart, I am an educator who enjoys sharing ideas and information. My idea for helping our industry reduce administrative burden grew from a poster session to panel discussions and now an article. The journey and evolution has been personally rewarding and fun.

Leadership Challenge:
What business process can you make fun?
Who can you recognize for their contribution?
What can you do to create community spirit?

Assembling panels and sharing the information that led to “Challenging Traditional Ways: Leadership, Trust and Reducing the Administrative Burden” has been one of the best professional experiences of my career. Panelists were encouraged to speak from the heart and share about how they made changes at their institutions. This sharing was meant to inspire others to make changes at their institutions by challenging traditional ways. Having a platform for people to share ideas honestly resonated with our audiences, and we were amazed at the reception we received.

The creation of this article grew out of a poster session and panel discussions, with input by many people along the way. It has been a welcome surprise to see how an idea for a simple poster grew into something larger as different people contributed—truly an act of encouraging the heart. We encourage readers of this article to apply the basic concepts outlined here to develop and share best practices to reduce administrative burdens while facilitating scientific discovery.

Below we recognize everyone who contributed to this process:
2015 Society of Research Administrators Annual Meeting, Las Vegas, Nevada
Poster session: Challenging Traditional Ways: Leadership, Trust and Reducing the Administrative Burden: Anita Mills, MA, CRA, Senior Solutions Consultant, Evisions; Susan Wyatt Sedwick, PhD, Consulting Associate, Attain; Robert Prentiss, Senior Grants and Contracts Specialist, University of Texas at Austin; Annie Lenfest, MRA, Grant and Contract Administrator, Smithsonian Institution

2016 Society of Research Administrators, Northeast and Southern Section Meeting, New York, NY: Challenging Traditional Ways: Leadership, Trust and Reducing the Administrative Burden

Anita Mills, MA, CRA Senior Solutions Consultant, Evisions; Susan Wyatt Sedwick, PhD, Consulting Associate, Attain; Paula M. Means, MPA, Assistant Dean for Research, Wake Forest School of Medicine; Karen Mitchell, Senior Director, Grants Management, Temple University

Anita Mills, MA, CRA, Senior Solutions Consultant, Evisions; Susan Wyatt Sedwick, PhD, Consulting Associate, Attain; Brian N. Squilla, MBA, Vice President for Administration & Chief of Staff, Office of the Provost; Thomas Jefferson University; Kim Small, CRA, Director Sponsored Programs Services, Washington State University

2016 Society of Research Administrators, Western/Midwest Section Meeting: Portland, Oregon May 15-18, 2016)

Anita Mills, MA, CRA, Senior Solutions Consultant, Evisions; Susan Wyatt Sedwick, PhD, Consulting Associate, Attain; Domenica G. Pappas, CRA, Director, Sponsored Research and Programs

2016 Evisions Research Conference, Portland Oregon, July 17-19

Anita Mills, MA, CRA, Senior Solutions Consultant, Evisions; Jon Teuber, MA, Director, Office of Sponsored Programs, Ann & Robert H. Lurie Children’s Hospital of Chicago; Anne P. Schauer, MA, CRA, Director of Research and Sponsored Programs, Miami University; Stephanie Lezotte, CRA, Director, Office of Sponsored Programs, Rowan University

About the Authors

Anita Mills, MA, CRA, is a self-proclaimed technology geek and recognized expert in electronic research administration (eRA) systems, presenting frequently at NCURA, SRA and other industry association events. A 2007 graduate of NCURA’s Leadership Development Institute, Anita has severed on regional and national program committees, participated in standing committee for NCURA and FDP, and served as session evaluator at regional and national meetings. She has over 50 presentations and publications and currently is a Solutions Consultant for Evisions. Anita can be reached at anita.mills@evisions.com

Dr. Susan Wyatt Sedwick, PhD, CRA is a consulting associate for Attain, LLC with over 22 years of experience in research administration. Retired in 2015 as an associ-
ate vice president for research and director of the Office of Sponsored Projects at The University of Texas at Austin, she was responsible for both pre- and post-award financial administration units with oversight of over $630 million in annual sponsored projects expenditures. Dr. Sedwick served as chair of Phase V of the Federal Demonstration Partnership (FDP), was active in the Council on Governmental Relations (COGR), and received the National Council of University Research Administrators (NCURA) Distinguished Service award in 2012 and the NCURA Region V Distinguished Service Award in 2014. Dr. Sedwick is a frequent speaker on the topic of research data security; export controls as they apply to universities, human capital development, and strategic planning. Susan can be reached at ssedwick@attain.com

**Annie Lenfest** is a Grant and Contract Administrator for the Smithsonian Institution. She began her career as a contract coordinator for the University of Central Florida after earning her Master’s in Research Administration from them in 2013, and developed a love for proposal development through her role as the sole research officer for Western Michigan University (WMU) College of Engineering. Annie will complete a second graduate program this fall in Organizational Learning and Performance from WMU. She is as passionate about helping her organization improve its quality of service, as she is about helping each PI achieve their research goals. Annie can be reached at lenfesta@si.edu

**Robert Prentiss** is a Senior Grants & Contracts Specialist at the University of Texas at Austin. He is a member of the FDP Expanded Clearinghouse Working Group and participant in the subgroup on Subrecipient Risk Assessment. Robert can be reached at rprentiss@austin.utexas.edu

**Joseph E. Andrews, Jr., PhD, MA, CIP,** is the Director of the Human Research Protection Program (HRPP) and Institutional Review Board (IRB) at Wake Forest School of Medicine. Dr. Andrews leads the ethical and regulatory oversight of approximately 2600 active biomedical research projects and co-teaches research ethics at the Wake Forest University Graduate School of Arts and Sciences. Joseph can be reached at jandrews@wakehealth.edu

**Paula Means** is currently the Assistant Dean for Research at Wake Forest University School of Medicine in Winston-Salem, NC and has been in this key leadership position since October of 2004. Paula has been in Research Administration for over 27 years and areas of expertise include: pre- and post-award sponsored programs, research integrity, research compliance and oversight and research policy. Paula has been a very active member of the International Society of Research Administrators (SRA), and the National Council of University Research Administrators (NCURA) international organizations dedicated to the education and professional development of research administrators and has presented on a variety of topics both regionally and nationally. Paula has held leadership positions in SRA such as Midwest Section Secretary and President, Member-at-Large of the Executive Committee of the Board, and at large member of the SRA International Board. Paula can be reached at: pmeans@wakehealth.edu

**Krystal Toups, CRA,** is the Director of Grants at The University of Texas Health Science Center at Houston (UTHealth). She leads the Grants Team for UTHealth’s
central administration pre-award office in Sponsored Projects Administration. Krystal has over 12 years of experience serving various roles in Research Administration. Krystal joined National Council of University Research Administrators (NCURA) in 2005 and is currently an At-Large Executive Committee Member for Region V. Krystal can be reached at Krystal.Toups@uth.tmc.edu.

### 4120.36 Authentic Leaders, Effective Leaders
Shari Harley, Candid Culture

People listen to, follow, and trust strong leaders. But what do strong leaders look like? What do they do? What if strong leaders look and sound different from what we typically expect?

We often think of strong leaders as charismatic, decisive visionaries who can captivate a room and galvanize a group, and perhaps much of this is true. But are these also the behaviors that allow employees to trust leaders, thus making them effective leaders? Employees tend to stay longer with organizations, be more committed, and do better work when they trust the organization’s senior leaders.

So what creates trust in a leader?

People trust people they know — people whose actions and words are consistent and congruent— people who care about others. Below are five leadership practices that create strong and trusted leaders.

**Effective Leader Practice #1: Be Yourself.**

People want to work with other real people. Worry less about how you think you’re supposed to look, sound, and be, and just be yourself. Authenticity goes a long way toward engaging with others. Bring your humanity to work.

**Effective Leader Practice #2: Be Humble.**

Strong leaders aren’t perfect. They admit mistakes and adjust accordingly.

Years ago, I worked with a CEO who could often be heard saying, “I’m not the smartest guy in the room, but…” In truth, he usually was the smartest guy in the room and everyone knew it. He was attempting to be humble but his attempt fell flat, and instead of ingratiating himself as ‘one of the people,’ he appeared arrogant.

No one likes to make a mistake, and sharing our mistakes with others is even less desirable. It takes strength to admit an error.

Strong people don’t need to be seen as perfect. They admit fault and fess up to things they don’t know. I suspect that many of us think that admitting we made a mistake or don’t know how to do something makes us appear weak. This couldn’t be further from the truth. Provided that you’re competent and do a good work, people respect others who are willing to tell one on themselves and admit when they are wrong or in need of help.

If you wish you’d done something differently, tell people. And communicate to them the changes you’ve made as a result. If you go down the wrong path and it’s evident, talk about it openly. Everyone’s talking about it anyway so you may as well set the expectation and manage perceptions as best you can.

Strong people fess up when they make a mistake. Weak people cover their mistakes or blame others.
Effective Leader Practice #3: Be Visible.
Spend time with employees. One thing that leads to trusting leaders is getting to know them, at least a little bit. Encourage leaders to walk around offices, go to skip level meetings in which the manager’s manager meets with employees, and say hello to people in the hallway.

As a leader, it’s important to remember that the people who really know what’s happening in your organization are the people closest to the work. Spend time out of your inner circle, hang out in cube land, walk the floors, and talk with people in the breakroom. At company-wide meetings and events, don’t sit with your peer group, but don’t sit alone either. That’s how you’ll be seen as accessible, gain trust, and find out what’s really going on in the organization.

A few months ago I lead a daylong training that an entire organization attended. People were seated at round tables, with eight people to a table, except for the CEO. No one sat with him. He sat alone all day. People were afraid of him, didn’t like him, or were concerned about how it would appear if they sat with him. What a missed opportunity.

Senior leaders hire consultants like me to find out what’s really happening in their organizations because employees are afraid to give bad news to a senior leader. The better your title, the less information you may get. Many employees are convinced that if they speak up and share bad news they will be fired or marginalized. When leaders are visible to employees, fear is reduced and communication increases.

Effective Leader Practice #4: Be Consistent.
A few years ago, I worked with a charismatic, extremely likable CEO who employees distrusted. I was an outside consultant and couldn’t figure out why the organization’s managers didn’t trust him. When I asked, the managers gave me a few examples of how the CEO said one thing and did another. For example, he put a safety policy in place prohibiting employees from talking on their cell phones while driving during work hours, but he was regularly seen talking and driving. That’s a problem. The CEO also put cost cutting measures in place and told employees to stay at inexpensive hotels when they traveled for work. He then took the senior leadership team on a retreat at a very expensive resort. That doesn’t work. You can’t say one thing and do another, and expect people to trust you.

Effective Leader Practice #5: Be Human.
I worked with a fellow leader for four years before learning he was married and had children. He finally brought his wife to a company event, and his direct reports almost fell over. Because he never talked about his personal life, no one knew anything about him.

Don’t overshare about your personal life. Employees don’t want or need to know the play-by-play about your home life. But not knowing anything is equally odd. Strike the balance of sharing about your life without over sharing or treating work as therapy.

I had my first baby last year and never told clients I was pregnant. I am a key-
note speaker and trainer who travels. I was afraid people would worry I wouldn’t show up when they learned I was pregnant or worry that I would never travel again after I had my son. Neither was or is true. I never missed an engagement while I was pregnant, and I still travel every week. (Look for my son at book signings!)

After my son was born, I sent an announcement to our clients and was overwhelmed by the positive response and support. Now when I do speaking engagements, it’s natural to talk about my son and the challenges of working and raising a child—a challenge that many others are facing and can connect with.

The people you work with want to know you. They want to know what’s important to you. They want you to know what’s important to them. Take an interest in people. Ask questions. Listen to the answers. Be visible. Walk around. Be vulnerable. Admit mistakes, missteps, and failures. You’ll gain respect by doing so.

Remember: People want to work with other real people, people they can come to know and trust. Those are the people we follow.

Shari Harley is the founder and President of Candid Culture, a Denver-based communication skills training firm that is bringing candor back to the workplace, making it easier to give feedback at work. Shari is the author of the business communication book How to Say Anything to Anyone: A Guide to Building Business Relationships that Really Work. She is a top rated keynote speaker at conferences and does training throughout the U.S. Learn more about Shari Harley and Candid Culture’s communication training programs at www.candidculture.com
Once, when starting a new position, I held office hours so that any member of the staff could drop in and spend 15 - 20 minutes chatting with me about what they do. The staff was about 95% female, as is the case nationally in university research administration (Shambrook, et al, 2015). One of the very few male employees came into my office armed with a list of questions. He began with, “How do you think your leadership style will be different since you are female?” Without thinking much, I replied, “For one thing, I get asked questions like this that my male counterparts do not, which might make me a bit grouchier than them.”

Upon reflection, I wish I had been more patient and considered the deeper implications of his question. By “different” did he mean “than all my previous supervisors” or “than the status quo?” Or did he mean “than my ideal leader” or something else? I wonder if the fact that I am also Hispanic, and was then a relatively young leader, emboldened him to regard me with more familiarity and less deference than he might have otherwise? I’ll never know. And because I didn’t have a meaningful conversation with him about the nature of his question, I missed an opportunity to learn something about him and—potentially— about the environment in which I was expected to lead.

To be fair, this employee was not breaking new ground with his question about differences in leadership styles. Many people will tell you that women lead differently than men. In fact, an email I received just last month invited me to attend a workshop called “What Feminine Leadership Looks Like.” The basic premise is that men and women are fundamentally different and that their differences manifest themselves in different approaches to leadership. For example, there’s a common belief that men are especially decisive and women are more likely to be consensus-builders. Whether this belief is supported by research or not, I’ve known male leaders who were excellent at building consensus and plenty of female leaders who were authoritarian, top-down decision-makers.

Along my own leadership journey I’ve been subjected to many assumptions about how I would lead differently than a man. Those assumptions likely shaped the way people have interacted with me, and my awareness of those assumptions may have caused me to adjust my behavior in ways about which I’m not even conscious.

As a wife and mother, I am expected to juggle work and home duties and fuss endlessly about said juggling in ways my male counterparts are not. That’s not to say that men don’t juggle. They simply are not scrutinized in the same way—by men or women— for their choices, priorities, and juggling techniques. On more than one occasion, I have been asked in interview settings whether the travel would be a problem for my family. I’ve also been advised upon receiving a job offer to go home and talk it over with my husband. My anecdotal observation is that this happens less frequently to men, perhaps because they are presumed to know what’s

1 Encountering racism in the workplace is a topic that could fill a whole separate article.
best for them. A male candidate may volunteer, “I’d like to talk this over with my spouse,” but it’s my impression that they are not as likely to be instructed by a potential employer to do so.

Being female in an executive role at a university is tricky for a variety of reasons. For one thing, despite the meritocracy ideal in higher education, gender bias still exists. Universities are not exempt from narrow-minded thinking, by men or by women. If you let it get you down, you can be paralyzed by the weight of people’s prejudices. I’m not talking about frank discrimination or sexual harassment, though both of those also occur, and they are very serious issues. I’m talking about that #everydaysexism of Twitter hashtag fame which is so pervasive as to almost be accepted as normal.

Sometimes sexism is overt, like when I convene a meeting and, despite sitting at the head of the table, clutching an agenda, I am asked by male attendees for coffee. Or when men interrupt me and talk over me (and the other women in the room) but listen attentively to other men. Other times, it’s more subtle. For example, when a man shakes hands with all the other men in the room and merely says hello to me without shaking my hand, or when attendees—male and female—arrive at an event, look at me and ask, “So, when will Dr. Rivera be getting here?”

Because #everydaysexism is so ubiquitous, some women in executive roles feel they need to overcompensate by behaving more like their male counterparts. A female coworker once told me that I should learn golf, so I can be “one of the guys.” The line of thinking is that many decisions get made informally when off the clock and, if you’re not there, you miss out on important opportunities. The fact that nobody ever has invited me to play golf suggests to me that my own lack of knowledge about the game is not the salient factor. It’s possible that being true to myself in this regard has been a liability of sorts, but I have no way to quantify whether I would have moved up the career ladder more quickly with an impressive golf swing.

Another thing women sometimes feel they need to do in order to get ahead is to put work before everything else, even if it means not having children. This is ironic since virtually all of the male executives I know have children. This implies that the key to getting ahead is not actually foregoing children but rather having a partner at home who can raise the kids. Of course, the belief that childrearing is mostly “women’s work” may not be as pervasive as it used to be, but the force is still strong with this one. Meeting scheduled before 9:00 am and after 5:00 pm will disproportionately burden female employees. The same goes for large projects assigned over weekends. I’ve seen modest changes to office culture in this regard over the last 20 years (hello, lactation rooms!) and I hope that as more women climb the executive ladder, reasonable approaches to blending home and work life will become the norm.

It’s also the case that women aspiring to leadership roles run the risk of becoming the following clichés: office mom, team nurse, guidance counselor, social director, and relationship expert. Nobody expects a male CEO to do any of those things. Ask yourself—and be honest—in your office, when a cake needs to be ordered for a birthday or shower: who does it? When somebody needs a couple of Advil for a headache: who do they ask? When it’s time for that annual picnic: who organizes
the games? When teens are unruly or marriages get shaky: who gives the best advice? I’ll bet good money that women fill most of these roles in your office, and I’ll also wager that doing so somehow makes them seem less like executive material. When our male counterparts step up and start ordering cakes, employee nurturing will not be seen as an exclusively feminine domain. Until then, volunteering for this sort of thing can be a liability for a woman who aspires to lead.

Plainly put: women leaders are in a tough spot. At its most extreme, they are forced to choose between affirming the value of human relationships (and, in so doing, undermining their own authority) or learning golf. This has got to change.

Fortunately, despite the many challenges of gender bias in the workplace, even in higher education, research administration is a profession that provides rich opportunities for career growth and a ladder to executive leadership for women. Assistants can become Coordinators. Specialists can become Managers. Directors can become Assistant Vice Presidents, and so on. The ability to move sideways, from pre- to post-award or from IRB to biosafety, means job changes can add breadth to your resume and not merely specialization. There also are numerous opportunities for movement from central administration to a department (or vice versa) and between universities. This is good news for women who aspire to executive leadership because, unlike many other professions, there are various pathways to increasing responsibility.

My first job in research administration had the unlikely title, “Human Research Education and Review Officer.” I arrived at that position, like so many of my research administration colleagues, by accident or, rather, by serendipity. It wasn’t as though I had been planning a career in research administration. In fact, I didn’t even know it was a profession. I just happened to be a trailing spouse looking for work at a time when a university was looking for someone with research experience and federal regulatory knowledge. I had both, but I didn’t know a thing about human research protections. Armed with freshly printed copies of the Code of Federal Regulations obtained from a public library (pre-internet), I taught myself enough to speak persuasively during the interview, knowing I was woefully underqualified. But they took a chance on me and, as many of us do, I learned what I needed to on the job. Over the course of seven years, I grew in the position and was handed increasingly more responsibility until, eventually, I was made Director of Research Protections. There’s a lesson in that, especially for women. Studies show that men routinely apply for jobs when they lack some of the required qualifications in the vacancy announcement, while women tend to hold back and apply only for those jobs for which they have 100% of the stated qualifications. In this regard, self-belief is a valuable tool.

Self-belief was important when I found myself trailing again, this time moving to a state where I didn’t know anyone. Audaciously, I blanketed my new metro area with resumes by emailing every NCURA member, and every alumnus of my high school, college, and grad school. I then followed up by cold-calling the Deans of all the local Universities to ask if I could come meet them. None of them had openings, but one medical school Dean agreed to see me only because a dozen or so recipients
of my email had forwarded my resume to him. After our meeting, he created a new position for me, taking the risk that I would prove useful. This was powerful evidence of the value of networks.

But self-belief and strong networks are not the only things a woman needs to advance to leadership. Sometimes making the leap from supporting roles (also known as “pink collar” jobs) to executive roles requires more education. And this is especially true at universities, where degrees are the coin of the realm. Fortunately, many of us work at schools with tuition benefits that allow the completion of a bachelor’s degree or the acquisition of a master’s or doctoral degree while on the job. I had been a research administrator for 10 years when I realized I would need to further my education in order to advance. Going back to school at age 35 with a working spouse, two children, and a full-time job was not easy for me or for my family. I relied heavily on my husband to be the primary parent during those years and I missed many events: teacher conferences, doctor appointments, holiday pageants, and soccer games. But I had reached a career plateau and the Ph.D. I earned opened up a whole new set of positions for which I could qualify. Despite the numerous sacrifices, I know the investment was a good one. I trust that our children will not remember the games and pageants I missed and will instead carry with them the values of hard work and partnership that both their parents provided.

This is not to say every woman in research administration needs to return to school in order to become a leader. I’ve worked with and been mentored by many women who rose through the administrative ranks without having to go back for another degree. However, additional education can be helpful for expediting advancement, as well as for inspiring others to entrust you with more responsibility. Also, there’s no denying that faculty members accord research administrators with more respect when they feel we can speak their language. This is not just academic snobbery. Completing an independent research project for a master’s thesis or a doctoral dissertation provides a window into the life of a faculty member that is helpful for relating to—and empathizing with—our primary clients. The ability to relate can make the difference between finding a win-win solution and watching a minor conflict escalate into a federal case—sometimes literally.

It’s also important to note that degrees are not the only form of education or professional development that can be useful. Through NCURA, I was fortunate to receive formal training in leadership that has been invaluable for my development as an executive. NCURA’s Leadership Development Institute (LDI) program (which evolved into the ELP - Executive Leadership Program) provided career coaching, feedback on effectiveness and style, and other helpful insights I draw upon every day. It also provided a cohort of other emerging leaders, many of whom have become my most trusted advisors and lifelong friends. This has been critical to my success because I draw upon these relationships—for advice, for support, and for commiseration—in a way that I cannot draw from among other colleagues on my campus. There is only one person at my university who has my job: that’s a very small circle.

In addition to trusted colleagues at other universities, I have learned so much
from important mentors throughout my career. Some were formal and assigned, while others evolved organically. It’s important to note that very few of my mentors have been women. Contrary to the notion that mentors must look like or identify with the struggles of mentees, my most effective advocates and role models have been mostly older men. They could not advise me well about the elusive “work-life balance” ideal or how to handle a sexist joke at the office. They were not especially sensitive about how scheduling meetings at 7:00 (whether am or pm) might disproportionately disadvantage a junior female employee. And, yet, they went to bat for me, in big ways and small, all of which have made a difference in my ability to achieve my career goals. These men helped open doors that made it possible for me to prove I was capable, and I owe them a debt of gratitude.

I’m now 20 years into this accidental career, and at my third university post. From where I sit, as the Vice President for Research and Technology Management at an AAU (Association of American Universities) campus, I am deeply grateful for the opportunities to grow in my research administration career. I love my profession because it allows me to learn new things every day and to help other people achieve greatness in their fields of expertise. Don’t get me wrong; it is a hard job and I am never off-duty. A fire in a lab, an injured research subject, or an unexpected audit finding can turn the whole office upside-down in an instant. And I accept that being the only woman in the room affects the way some people perceive the job I do—this is a distraction my male colleagues simply don’t have. But rising to the challenge has been enormously rewarding.

In reflecting on this subject for the purposes of writing this piece, I have tried to distill my thoughts into lessons learned, sometimes from making big mistakes. I share them here as advice for women aspiring to leadership in research administration or wherever your path leads you. By-the-way, all of the following pieces of advice are meant to be practiced, like yoga. Don’t worry about getting them right. Instead, aspire to train your leadership muscles and get a little stronger each day. And forgive yourself when you fall short. You’re only human.

1. Say yes to new opportunities as much as possible, even when you don’t feel you are 100% qualified. Step outside your comfort zone. When invited onto new paths of your leadership journey, be ready and willing to take the next step.

2. Hone your judgement about what non-essential tasks can be ignored. Things will get assigned to you because somebody thinks it’s woman’s work or you may be offered a responsibility that would bog you down in ways that actually harm your career growth. Don’t let extraneous things distract you from your goals.

3. Work harder than you should have to. We are not living in a post-feminism society. There are still people who will expect less from you because you’re a woman. Don’t give them any evidence to support their bias. It’s not fair, but you knew that already.

4. Act like you belong— even when you feel like you’re crashing the party— especially when you feel like you’re crashing the party. When you act like you
belong, people are more likely to treat you like you belong.

5. Networks are important. Foster them. Use them. Give back to them. Not just the professional ones—also the ones that feed your soul. Professional networks can advance your career; personal networks can help you keep your sanity.

6. Choose your battles. Every real or perceived slight need not be dignified with a response. You have every right to take offense, but you don’t have to fight foolishness every time you encounter it. There also can be grace in giving people the benefit of the doubt. We all make mistakes.

7. Let go of the fantasy. You cannot “have it all” at the same time—none of us can. You can focus on work for a time and neglect your family a bit. You can focus on family for a time and put your career on auto-pilot for a bit. But you can’t—and nobody can—be excellent at everything at the same time. (*A supportive partner is key—thank yours, frequently and profusely.)

8. Expect some loneliness. The higher you climb, the fewer women will be in the room for most of your day. You may not get invited to play golf. Your direct reports will want to socialize without you. You will probably eat lunch alone at your desk more often than you imagined. That’s true for all executives, regardless of gender. Get your emotional needs met somewhere else.

9. Be open to the better idea. As a woman, you may sometimes feel you have something to prove—and often you do—but that doesn’t mean other people don’t also have great ideas or that you’re not sometimes flat-out wrong. Seek input and feedback from trusted advisors and don’t be reluctant to pursue someone else’s better idea, even if it means changing your own mind about the best path forward. Then give them credit.

10. Set goals and periodically take stock of your accomplishments. Sometimes you have to stop and look back in order to appreciate how far you’ve come. Conversely, if you don’t know where you’re headed, it’s hard to know if you’re getting there.

¶4120.38 Managers as Leaders: Delivering the “Why?”
Kerry Peluso, Emory University

A manager manages. The things they manage include, but are not limited to, the management and development of processes, procedures, and applications. They manage the completion of tasks. They educate and communicate. They provide the What, When, Where, and How to their staff and to those who are responsible for conducting the tasks or projects they manage. A manager’s ability to effectively provide the What, When, Where, and How is essential to creating a successful work environment. Without effective management, offices and staff falter.

A leader provides vision. They provide the inspiration that seeds motivation. They show people the path to moving forward. They provide the Why. If a group of people have the What, When, Where, and How, progress can theoretically occur, but achieving anywhere near full potential and true staff satisfaction cannot occur without effective leadership and understanding Why. Without the Why, without effective leadership, an organization can expect low morale, low to mixed performance, and staff turnover.

When reviewing the organizational chart for their unit, a manager will see their position with a line reaching out to the position they report to. The largest mistake a manager can make is to assume they provide the “management role,” while the person they report to provides the “leadership role.” Managers who don’t realize they need to provide both management (What, When, Where, and How) and leadership (Why) will struggle in meeting their goals over any period beyond short term. Sadly, even for managers who understand their area’s need for leadership, when time and staffing are limited, responsibilities are numerous, and deadlines are many, providing the “Why” is often put on the back burner or near fully abandoned. In the field of research administration, these circumstances are all too common, so lack in leadership in the research administration office is, unfortunately, not rare. Sadly, this dynamic only further reduces productivity in the already resource-stretched organization. It does not need to be this way.

To achieve any level of success as a manager, one must lead as well as manage. It is a big mistake for a manager to look to someone else to provide leadership for their area. As a manager, one needs to determine what leadership their area needs and how to best provide it. They need to evaluate whether they are effectively leading their area. If they agree that leadership is important, but place it on the back burner due to lack of time, their area will continue to struggle. They need not be surprised when the people who report to them (or handle the tasks they provide oversight for) are frustrated, lack motivation, and have low morale. Managers need to expect turnover. People are not machines. Even with the most organized procedures, state of the art systems, and reasonable staffing levels, without leadership, staff will fail to meet desired objectives. Hard working and well-intentioned managers who are not providing leadership will be left wondering and struggling to get the work done.

So how can a manager manage while leading? How do they lead if they are not
“born leaders?” What leadership do they need to provide? How do they accomplish effective leadership when they have little-to-no time to lead?

Leaders are not born

Some are born with personality attributes that align better with the commonly accepted role of leader and, yes, there are people who are so dynamic that they have the potential to become powerful leaders with little effort. While many of us may not be born with these attributes, we all have the potential to become effective leaders. Similar to musicians, some may be born with a gift that increases their potential to be a fabulous musician, but this does not mean that others cannot learn to successfully play an instrument, and play it well. It is extremely important to keep in mind that even those who were born with a musical gift still need to work hard to develop and refine their skills. Focus, time, and attention are required to achieve success as a musician or as a leader – no matter who you are or what strengths you were born with.

Perhaps the most important trait of a leader is the ability to lead themselves – seeking to continually develop and improve. Similar to a musician, it is a matter of refining skills and learning from experience. This is not accomplished easily or through a three-day leadership course. While a course can provide direction, it is the leader’s focus, experience, and direct application of utilizing what is learned that will develop a successful leader. Leadership development is a lifelong, intentional process.

Successful leaders do the following:

1. **Seek to better understand what leadership is.** The first part of developing a plan to become a successful leader is to understand what people need from a leader. Leaders are:
   
a. **Strategic** – Leaders need to be able to identify what is needed from them within the current environment. The approach that worked very effectively last year may be a disaster in the current situation. They also need to realize that their approach often needs to be multi-faceted. If they are leading a larger group, what is effective for some may not be effective for others. For example, a leader needs to realize that when they present an idea or upcoming change to a group, individuals may hear very different messages. The room may include people who are motivated by change, others who are apprehensive, and others who may have personal situations that impact the message they hear. The room may include people who are reading their emails or thinking about their child’s school problems instead of actively listening. The effective leader plans with these thoughts in mind. They know that saying things once, in one particular way, is not effective for delivering the message to several or many.

   b. **Courageous** – Being a leader sometimes means appearing brave even when you don’t feel brave. While a leader may have their own concerns and fears, others need to know their leader can and will address challenges that may appear. They need to effectively communicate this confidence to the individuals they are leading so that these individuals can feel safe and move
forward. If people sense that their leader is nervous and afraid, their angst will only grow. It can be appropriate for the leader to let people know that they have concerns and that not everything may go perfectly, but at the same time instill confidence they will address issues as they occur.

c. **Honest and transparent** – Leaders need to have integrity and need to be transparent. However, this does not mean that they should or can communicate everything they know at all times. They need to be strategic in their communications. There are times that they are provided information they cannot share. For example, there may be times when issues involve certain personnel whose information must remain confidential. There are other times when a large-scale process or change is being developed where it would cause a roller coaster of unnecessary emotions to communicate every change that is being considered during the development phase. For example, in the process of developing a new organizational structure, there will be many ideas discussed. At one day/point in the discussions, it could appear that the final decision is leaning one way while the next meeting may sway a completely different direction. Sharing details of each discussion can bring near panic to those who could potentially be impacted by the ultimate decision(s). Alternatively, a more appropriate approach would be to let people know that a change is being evaluated, why it is being considered, what some end points could look like, and when they can expect to hear more. A leader needs to be honest and transparent, but they also need to manage how and when they communicate so that the staff can feel secure.

d. **Vision builders** – Leaders need to be able to build a vision. When the word vision is used, some may think of what their University’s President is responsible for – building a vision for the institution. The fact is that a vision is needed even for a process change. People need to understand what is changing, why it is changing, and what the change is expected to accomplish. They need to understand the Why. By building a vision rather than simply providing a new procedure to follow, managers are leading. Through this, they are going to significantly improve their ability to achieve success, and to build a staff who are committed to the organization’s goals and who feel they are valued.

2. **Plan for (and own) their leadership development.** Planned leadership development is accomplished through self-introspection and observations, as well as feedback from external resources. The manager must take some time to observe their own behaviors and to evaluate where their strengths are in order to build upon and identify where there may be opportunities for refinement. From there, they can prioritize their focus for the upcoming period. When developing a plan (often updated annually with monthly or quarterly reviews), the plan needs to be realistic. A manager-leader shouldn’t expect to go from novice to inspirational leader within one year AND shouldn’t plan to address all gaps within one year.

a. Self-observations can come from memory but, ideally, maintaining a journal, puts one in a much stronger position to develop a strong plan. Maintaining
a journal does not mean that one needs to walk around with a leather book documenting their experiences with everyone they come in contact with. Rather, it can be as simple as having a word document that is opened after both successful and less successful leadership moments to document what went right and what one would have changed. Taking a few moments to evaluate how the leadership moment could have went better and documenting the high level details provides material for later reference. Upon review of the journal entries, one will likely see patterns and the areas that require focus.

b. For external feedback, information may be gathered through the use of personality assessments (such as DISC or similar) or a 360-review tool. Feedback from one’s supervisor can also be extremely valuable and should be included, if possible.

c. The plan should include only two, maybe three, areas of focus over the course of a year. It should include how the manager will develop these skills. Courses or books on leadership, communication, or related areas can be a very measureable and realistic part of these development plans, but they will do almost nothing by themselves. It is essential that the manager think about how they will apply these skills through experience and how they will hold themselves accountable. For example, one could include the plan to begin monthly meetings with their staff and add an additional hour of preparation before that meeting to evaluate where their staff are at that time and determine what their staff need to hear about at that point. Ideally, they should also commit to journal a few notes after each meeting about what they did and how it went. They should document what their preparation was and how that impacted the outcome of their meeting. Managers who do this almost always find that the days where they did not spend some time on advance preparation went far less successfully.

3. **Leaders continually develop.** Effective leaders understand the importance of their continued development (as a leader and otherwise). Our world continues to change for us, for our organizations, and for those we lead. As a result, it is important that leaders stay sharp and continue to develop and refine how they approach situations. What worked well last year may not work well this year with a different situation and/or group. Effective leaders understand that they are never fully developed, but rather, it is a continual growth process throughout their career.

**The leadership that managers need to provide**

As a leader, we need to (1) identify the path, (2) clear the path (as much as possible), and (3) determine how to move people towards and down that path. Leaders need to be creative and strategic as defined above.

---

1 https://www.discprofile.com/what-is-disc/overview/
2 https://www.thebalance.com/what-is-a-360-review-1917541
1. **Identify the path.** Sometimes managers are handed the path by the organizational leaders to whom they report. More commonly, the destination is provided. The manager needs to strategically determine what the path to that destination needs to be. This will include defining many of the What’s, When’s, Where’s, and How’s of the path.

2. **Clear the path.** Next is determining how to simplify the journey down the path. This includes identifying what tools (procedures, systems, etc.) are needed, identifying what adjustments need to be made to certain work areas, and identifying and planning for potential challenges that may arise.

3. **Determine how to move down the path.** It is critical that the leader evaluate the emotional journey that the individuals involved may follow. There may be multiple individuals, so multiple emotional journeys. It would be unrealistic to believe that a leader can effectively address every concern that is put in front of them. However, this evaluation allows the leader to determine how to best prepare staff to move down the path.

**Leading with no time to lead**

The items discussed above may come as no surprise to many managers-leaders and many may have these items on their to-do lists. However, the time to do or address their lists never comes available. With a lack of leadership, staff meander through their daily tasks, turnover occurs as staff become frustrated, and the cycle of “too much work, not enough staff” is only exacerbated. The time dedicated to leadership does not need to be significant, but it does need to be methodically planned. If managers don’t make leadership a priority, they and their staff will flounder and struggle.

While, unfortunately, many research administration managers feel that they can’t afford the luxury of dedicating time to leadership, the fact is that they cannot afford to overlook their leadership role. Leadership is a key requirement of management. These roles are not distinct from each other, but, rather, are interwoven. Learning how to weave the two together is essential to successfully managing a task or staff.

In the end, managers need to be leaders. Leaders are not simply born, but are developed over their lifetimes—and they need to own that development. They need to be strategic, courageous, honest, and transparent. They need to build a vision, whether it is for a new task or a new organizational structure. Those who understand Why will follow.

Introduction

Conscious Leadership is the practice of self-awareness and choice in our business relationships. It all begins with a knowledge and choice in how we manage ourselves, and then an awareness of how we impact others. We can’t change anyone. That said, when we change, everything changes. As Conscious Leaders, we will accept the present moment as it is without wasting energy struggling against it, and set an intention for what we want to create. We can let go of whatever does not serve us, and put our attention on what we want to grow. Where our attention goes, our energy flows. Wherever we put our energy expands and where we set our intention, transforms. Because a problem cannot be solved at the level of consciousness that created it, below are tips and practices to support us on our Conscious Leadership Journey. We will begin with an understanding of the self and then move into our business relationships.

Consciousness = Awareness

So much of our day, we respond to the people, situations and experiences we are having on autopilot. The practice of Conscious Leadership allows us to see and be in the present moment, which allows us to meaningfully connect with those around us, assess a situation without judgment, accept the present and set an intention for the future. It allows us to stay grounded and lifted in our own self, even though things may be swirling around us.

Following are some strategies for success to consider:

◆ Be gentle with ourselves

When considering our leadership practices, it is easy to judge ourselves and focus on what we are not doing. There is always a lot to learn, so it’s important to keep an open, relaxed mind without judging ourselves.

◆ Notice...everything is good data!

Some areas of leadership make us feel uncomfortable. These are the areas to pay special attention to for they are likely the areas that could be the most transformative for us. When you feel that discomfort, it is something to take notice of.

◆ What CAN we do?

When pursuing leadership strategies, we sometimes believe those strategies could never work where we are. It is easy to come up with a list of what we can’t do and why. Instead let’s focus on what we CAN do.

◆ Up Until Now…

Outside of “I love you,” these are my three favorite words. They create a space between the past and the future without putting a label on people or situations that can impede the potential of what could be. For example, instead of thinking or saying, “Your monthly analysis report is always late,” we could think and say,
“Up until now, your monthly analysis report has been late.” It creates a space for possibility and a chance to change. If people believe we have given up on them, they can give up on themselves. We can never underestimate a person or groups’ ability to grow and change if we create the space and optimism for them to do so.

◆ Replacing “Should” with “Could”

Replacing “should” with “could” is a game changer when you are talking to yourself and others. Should has all kinds of judgments wrapped up in it. You should do this..you should do that. Replacing “should” with “could” opens up space and possibility without judgment. For example, “You could do that,” rather than “You should do that.”

◆ Replacing “But” with “And”

Replacing “but” with “and” changes the whole tone of what we are saying. When we say “but” we are negating everything that comes before it. For example: “Jill is really strong in her reporting skills, but she needs to bring attention to her office communication.” In order to acknowledge Jill’s reporting skills while guiding her success, we can say, “Jill is really strong in her reporting skills, and she needs to bring attention to her office communication.” By taking “but” out of our vocabulary and replacing it with “and,” we change the tone of our conversation.

You may be thinking this is already a lot and we are still in the introduction! You also may be thinking if you just left the job you are in, it would all be better. If we leave that person or situation behind and move on to another organization, our challenges will be waiting for us again in a new body at our new institution! Therefore, cultivating our awareness is critical.

Let’s try it on!

With Conscious Leadership practices, let’s think of our self in a dressing room, trying on the concepts and practices introduced here. We can try them on, we can take them home and to the office, we can return them or we can keep them in our closet until we are ready to don them. We can fully consider the concepts and practices without pressure, as we consider which will work for us. Remember where you feel the most reticence or discomfort is an interesting area to notice and be curious about.
“We Don’t Attract What We Want, We Attract What We Are”
Dr. Wayne Dyer

Our conscious leadership journey will cover 4 main areas, with practices for your consideration.
◆ The Self
◆ One-on-One Communication
◆ Listening
◆ Relational Agility

The Self
Let’s Begin!
As with any change we are hoping to create, we start with ourselves:
◆ Accessing our natural state of balance
◆ Asking the question “Who am I?”
◆ Meditation

Accessing Our Natural State of Balance
Our natural state is balance. Many times we are trying to find our balance or maintain our balance, as if it were something external to attain. We access our natural state of balance through the breath, which is the connector of the mind to the body. Conscious breathing is the first and fundamental practice in Conscious Leadership. We are breathing on autopilot all day long, and often we are breathing shallowly in our chest. Deep breathing with awareness brings us into the present moment and calms the central nervous system. We can access and return to our natural state of balance through conscious breathing at any time of the day. It brings into our awareness an automatic pause button that we can enact when we need it. This pause button can mean the difference between reacting and choosing our response. Simply closing our eyes, breathing deeply and slowly, for even a minute, can bring healing benefits. Conscious breathing can soften our resistance and strengthen our resolve.

For further exploration, following are three deep breathing techniques from the Chopra Center in Carlsbad, CA.

**Complete Belly Breath:** With one hand on your belly, relax your abdominal muscles, and slowly inhale through the nose, bringing air into the bottom of your lungs. You should feel your abdomen rise. This expands the lower parts of the lungs. Continue to inhale as your rib cage expands outward, and finally, the collarbones rise. At the peak of the inhalation, pause for a moment, then exhale gently from the top of your lungs to the bottom. At the end of exhalation, contract your abdominal muscles slightly to push residual air out of the bottom of your lungs.

**Alternate Nostril Breathing:** When you are feeling anxious or ungrounded, practice Alternate Nostril Breathing, known as *Nadi Shodhana* in the yogic tradition.
This will immediately help you feel calmer.

◆ Hold your right thumb over your right nostril and inhale deeply through your left nostril.

◆ At the peak of your inhalation, close off your left nostril with your fourth finger, lift your right thumb, and then exhale smoothly through your right nostril.

◆ After a full exhalation, inhale through the right nostril, closing it off with your right thumb at the peak of your inhalation, lift your fourth finger and exhale smoothly through your left nostril.

◆ Continue with this practice for 3 to 5 minutes, alternating your breathing through each nostril. Your breathing should be effortless, with your mind gently observing the inflow and outflow of breath.

Ocean’s Breath: When you feel angry, irritated, or frustrated, try a cooling breathing technique such as Ocean’s Breath, or Ujjayi (pronounced oo-jai). This will immediately soothe and settle your mind.

◆ Take an inhalation that is slightly deeper than normal. With your mouth closed, exhale through your nose while constricting your throat muscles. If you are doing this correctly, you should sound like waves on the ocean or if you are a Star Wars fan, like Darth Vader.

◆ Another way to get the hang of this practice is to try exhaling the sound “haaaaah” with your mouth open. Now make a similar sound with your mouth closed, feeling the outflow of air through your nasal passages.

◆ Once you have mastered this on the outflow, use the same method for the inflow breath, gently constricting your throat as you inhale.

Asking the Question, “Who Am I?”

(here is a hint...you are not a research administrator!)

A few years ago if you asked me who I was I would have said I am John Robert’s mother, John’s wife, my parents daughter, my sibling’s sister, friend, and a staff member at NCURA. Now I realize that is not who I am, rather these are some of the precious and sacred roles that I play in my life. These are roles I want to bring my best to and play exquisitely. In Conscious Leadership we consider and keep in our awareness of who we actually are outside of our titles. We are not the roles or relationships we have. The ego can stay wrapped up in our position and titles. When those things aren’t going so well, then we are not doing so well and our spirit suffers. Who we are does not change with people and situations. When we realize our careers are what we do, and not who we are, we can be less rigidly tied to outcome and open to possibilities. We have a more spontaneous balance of ease and effort. We are then best prepared to support and take care of all the people and roles in our life, as we are grounded in our own being. For example, when I began asking this question of who am I, the things that came up for me were: I am strength, I am perseverance, I am kindness, I am compassion, I am optimism. When you consider yourself at your core, what things resonate most with you? As I continued this daily
conversation, I came to the simplicity of “I am.”

Meditation
Before we can take care of others as a leader, we need to take care of ourselves. In addition, when we take care of ourselves, we model the way and give permission for our staff to take care of themselves. Getting 7-8 hours of restful sleep, staying hydrated, eating foods that nourish our body, moving each day and spending some time each day breathing deeply in silence are self-care practices to support our conscious leadership journey.

Meditation is a healing practice that allows us to experience inner calm and deep relaxation. Meditation helps us move beyond the “busyness” of our minds into our inner stillness and peace. We are not our thoughts and silence is the supreme detoxifier. Meditation is an entryway into health and wellness.

The benefits of meditation are tremendous! To name a few:
◆ Strengthens the immune system
◆ Lowers high blood pressure
◆ Decreases tension-related pain, such as, tension headaches, ulcers, insomnia, muscle and joint problems
◆ Increases serotonin production
◆ Brings the brain into a state that promotes healing
◆ Decreases anxiety
◆ Improves emotional stability
◆ Increases creativity and happiness
◆ Develops intuition
◆ Improves mood and behavior

Meditation is not about forcing our mind to be quiet, it’s about experiencing the silence that’s already there and bringing it into our daily life. The goal of meditation is not to stop our thoughts. The thoughts will come. Our mind will wander. We want to gently, easily, effortlessly and without judgment, let the thought pass and come back to following our breath. Have no expectations. There is no such thing as a “good” or “bad” mediation. Anything can happen. Be easy with yourself. Meditation isn’t about getting it right or wrong. Just the practice of allowing your thoughts to pass, and gently returning to your breath, creates a muscle memory to help us not attach to thoughts during the day, to allow them to pass and return to our breath. our center.

I liken learning to meditate to The Karate Kid. Young Daniel wanted to learn Karate. Mr. Miyagi promises to teach Daniel Karate. Daniel comes to his house and spends a day waxing the cars...wax on, wax off in the same circular motion over and over. The next day he painted fences with his wrist flexing up and then down with each stroke. On the third day he sanded the deck, with another circular motion.
Daniel was frustrated, he wanted to learn Karate! Then Mr. Miyaga began to advance on Daniel and Daniel instinctively responded with his defenses side to side, up and down, and left to right. He now had a muscle memory that was instinctively there for him when he needed it. It is the same for breathing and meditation. By entering into the silence each day in deep breathing and meditation, we strengthen this muscle memory. During the day, when distracting or distressing thoughts come into our awareness we can let them pass and return to our breath. We are not our thoughts. Spending time in breathing and meditation creates space between our thoughts so our mind, body and spirit are in union. We can be in peace, regardless of what is happening around us.

There are four soul questions we ask ourselves each time before we go into meditation. We ask these questions and we listen for our responses without judgment. There is no right or wrong way to answer them. We do not want to suppress what comes up for us, rather listen to whatever comes. Over time the answers will become more refined, and will help us discover our essential nature.

*Who am I?*

In the question of who am I, we let go of all the roles we play such as our title at work and, even the most precious roles of spouse, child, parent, sibling or friend. We are asking ourselves who we are outside all of the roles we play. Even if you don’t have an answer yet, asking the question opens up the space.

What do I want? (What do I really, really want!)

What am I grateful for?

How can I help? How can I serve?

We then release the questions and answers, and come into the silence. They are now seeds planted in our consciousness that will influence our choices and possibilities.

We then bring our awareness to the breath. We can use a mantra to help us go inward. A simple mantra is “I am.” We can silently repeat our mantra, easily and effortlessly, following our breath. When we are distracted by a thought, a sound in our environment or sensation in our body, we gently and effortlessly come back to our mantra. A meditation practice in the morning and in the evening after your busiest part of the day, can help you tap into your inner stillness and calm that will support you when turbulent thoughts and emotions are present during the day. As little as 5 minutes, and up to 30 minutes in the morning and the evening, will help you cultivate this stillness.

*Communication Practices for One-on-One*

Now that we have spent time accessing our own spirit and inner stillness, and have heightened our self-awareness, we are ready to bring our awareness to our business relationships. We’ll look at 4 practices for one-on-one communications:

◆ Self awareness of our impact on others
◆ Every compliant is an unasked request and P-R-S
◆ Intention setting
◆ Listening

Self-Awareness and Our Impact on Others

An exercise created and shared with permission by Gale Wood, Comet Consulting from NCURA’s Leadership Development Institute is the perfect place to take a pulse on where we are today. I take this self-assessment a few times a month and can then see trends and patterns and be intentional on things I want to work on in my business relationships. It can also be a powerful tool to use for staff teams to take a pulse on where they are. These are not intended to be shared with anyone. They are intended to increase people’s own self-awareness on an ongoing basis of how we impact others. There is a notes section for thoughts and examples that are coming up for you as you complete the self-assessment.

1: never 2: seldom 3: sometimes 4: usually 5: always

I maintain confidences and don’t spread gossip. 1 2 3 4 5

I don’t “micromanage” the activities of those in my team. Instead, I establish clear expectations and seek to ensure mutual understanding of what needs to be done by when. 1 2 3 4 5

Notes:

Every Complaint Is an Unasked Request and P-R-S

In addition to taking into account our own responsibility in our business relationships, it is important to recognize that everyone is doing the best they can from their level of consciousness or awareness. We want to meet people where they know that flexibility is the key to our business relationships and leadership practices. Staying fluid and responsive, rather than constricted and reactive creates the perfect balance between effort and ease. Now that we are coming from a place of awareness of how we impact others and where our own growth areas are, here are two tools
to use to enhance your own communication and model for staff who have, up until
now, had difficulty expressing themselves.

Susan Dunlap (Susan Dunlap and Associates and a faculty member from NCU-
RA’s Executive Leadership Program) shared that every complaint is an unasked
request. What a revolutionary concept! When we hear a complaint, we can ask
what is the request that needs to be made. It helps frame thoughts towards a solu-
tion. When there is a complaint, taking the opportunity to encourage staff to iden-
tify their request, is a step forward. They may need time to think about it and come
back, and that is great, too. We can also consider, who is the person we are com-
plaining most about, and what is the request we need to make of them?

Another helpful tip comes from Kimberly Pace, who is a professor at Vanderbilt
University’s Owen School of Management, CEO of Executive Aura, and also faculty
in NCURA’s Executive Leadership Program. If that person is coming into our office
who, up until now, has taken a great deal of time to express themselves here is an
effective framework to consider.

P – R – S

Invite the person to try something you just read about in the NCURA Sponsored
Research Guide, giving one sentence each for:
◆ What is the problem?
◆ Why is it relevant?
◆ What is your proposed solution?

This is another opportunity where people may need to think about it and come
back. I would recommend doing it yourself with the person, that up until now, has
been taking excessive time to express themselves, and then you can invite them to
begin their discussion in this manner. We need to model the behavior first that we
want to see in others.

Setting an Intention
We all know the meetings that, up until now, have not been as productive or effec-
tive as they could be. By setting an intention before the meeting, it can transform the
meeting. If not everyone was able to contribute in the past meetings, you can state
your intention of ensuring everyone has an opportunity to share their thoughts.
Then when you ask those that have already contributed to hold until we have heard
from everyone, it is not personal. People may naturally seek out those that haven’t
spoken yet. Intention setting is transformative as it can impact naturally the choices
we make as a group. We also need to release our attachment to outcome and em-
brace the uncertainty, which is an essential ingredient of our experience. If we are
too rigidly attached to the outcome we want, we are missing the possibilities that
we haven’t even imagined.

“What You React to in Another You Strengthen in Yourself”
Eckhart Tolle
Listening
The most important part of listening is to realize whatever we are really thinking is coming through, no matter what we are saying or not saying. People can sense what we are thinking so it is important to listen with an open mind, without judgments, and without interrupting. People will either be giving up or pushing harder when they sense our impatience to speak. Three practices for effective listening to consider are:

- Listening with honor
- Literal listening
- Relational agility

Listening with Honor
Listening with honor is listening without planning what we are going to say next, not interrupting, not finishing other people’s sentences or asking questions. Listening with honor is receiving all that they are saying without speaking while giving them our full attention. When they stop speaking then there is space to respond and ask questions after we have fully received what they needed to share. This is a powerful practice to set an intention to listen fully, with honor and see how much information you receive. We can often times try to be impressive and interesting in a conversation rather than be being impressed and interested in what others are saying. If we want to relate well to others we need to give our focus to the speaker, and less on ourselves allowing silence to do the heavy lifting in a conversation. We don’t need to fill every moment.

Literal Listening
Literal listening is the practice of believing what people say to us. We can get into a habit of not saying what we mean and expecting people to know what we mean, and conversely, not taking people at their word and building in all sorts of subtext. Literal listening creates more peace in the mind and harmony with others. We can stop looking for the subtext assuming everything is about us! This also teaches others how to communicate with us. If someone says they are fine, then we will take them at their word and move forward without continuously asking them, “Are you sure you’re fine?” People will know if they are fine. If they are not, then they actually need to say so. This saves a great deal of emotional energy for all.

Relational Agility
Relational agility is when it is easy! It is easy to share a mistake, easy to ask a question, easy to talk through a complicated issue. When there is little or no relational agility, it is hard! It is painful to share a mistake, painful to ask for an accommodation, painful to ask a question or work through a complicated issue. When a business relationship is low in relational agility, we can trip and fall into the same unproductive communication patterns time after time. They become a caricature of a person to us and that caricature is all we see. We no longer see them as a whole person, and our perspective narrows to just the problem we are having with them and that is who we begin to interact with. We can fall into stale rituals finding our-
selves saying the same the same thing each day.

To build and strengthen relational agility, it is important to remember this is a person. This is a person with a family, with friends, a person who has insecurities and fears just like you and just like me. Below is a Metta Meditation you can practice to strengthen the relational agility you experience with a colleague that, up until now, has been difficult. The other person doesn’t even need to know. I can assure you, they will feel a difference.

Metta Meditation
Loving Kindness Meditation

*Put yourself in your heart space and say:*
May I be safe
May I be healthy
May I be happy
May I be free from suffering

*Put someone in your heart space who you love...Your beloved, your spouse, your child, your parent, a soul mate, a friend and say:*
May you be safe
May you be healthy
May you be happy
May you be free from suffering

*Put someone in your heart space, who is a great colleague that you work amazingly with and say:*
May you be safe
May you be healthy
May you be happy
May you be free from suffering

*Put the person in your heart space, who, up until now, it has been hard... hard to work with, hard to collaborate with, hard to supervise or report to and say:*
May you be safe
May you be healthy
May you be happy
May you be free from suffering
You have fears...just like me
You have insecurities...just like me
You have known pain...just like me
You have hopes...just like me
May you be safe
May you be happy
May you healthy
May you be free from suffering

Namaste (the light in me, sees and honors the light in you)

The Metta Meditation helps us see the individual as a person first. When people feel a genuine good energy from someone, the issues to work out become separate from whom we are, and we are all better able to address them. We find it easier to go along with their wishes when it feels right and to come back in conciliatory mood if things get to be too much and we need to walk away. We can be hard on the problem and good to the person.

Conclusion

We have connected on practices for self-awareness and awareness of our impact on others. As you are now leaving the dressing room, you can choose what you would like to take with you, knowing these conscious leadership practices are here for you in your dressing room whenever you would like to try one on. Take it one thing at a time. The intention is not to feel overwhelmed by trying to implement everything at once. Be easy with yourself. Be easy with others. Our next day at work, we can simply start with a smile when we see people in the morning, when someone comes into our office, when we walk into someone else’s office and when we leave for the evening. Never withhold the human connection. We need to give that “good night” especially when the day has been difficult. Conscious leaders are generous, magnanimous and forgetful. They never hold a grudge and never underestimate a person’s ability to grow and change, including ourselves.

Namaste

4120.40 Perspectives on Leadership Opportunities from a University Research Administrator and Faculty Member
James T. Oris, Ph.D., Miami University

When I first started my career in academia, the furthest thing from my mind was becoming a university administrator. All I thought about was my teaching and research programs. The university did not provide opportunities for faculty to learn leadership or administrative skills, and I was never offered the opportunity to explore those options outside of the university. Thus, my approach to leadership and university research administration are the result of integrating my life experiences, modeling best practices based on observations of what I considered effective leaders, and (frankly) trial and error.

I grew up in a household that valued education and how it can empower choice and freedom. My upbringing enforced independence, hard work, and striving to do the very best job one can do on every task one was assigned. My parents believed in providing their children with Opportunity, with a capital “O” – the opportunity to succeed and the opportunity to fail – without judgment. I was drawn to my research discipline (aquatic toxicology) from a very early age after reading newly posted signs at Lake Erie declaring that fish were no longer safe to eat, literally a day after my extended family had a fishing trip and a huge fish fry dinner. I was drawn to teaching through my love of water, liquid and solid, by gaining certification for and teaching swimming lessons and SCUBA diving and by offering snow skiing lessons for over 10 years.

In college, I had a professor and advisor who dedicated his life to aquatic research and to the professional development of young scientists and ecologists. At that time, undergraduate research was not as popular or in vogue as it is today, but I sought out the opportunity to do research on the effects of fuel oil on fish eggs. My advisor provided me the Opportunity to do that for two academic years. He helped me identify and gain admission to a top-notch graduate program and major professor.

In graduate school, the focus was on research, and only research. My advisor’s motto was “if you don’t publish your work, it didn’t happen”. He led by example and to this day remains one of the most well-known and prolific researchers in his field. He set high expectations and provided his students with measured mentoring and the Opportunity to define their own projects, to be independent researchers but work within collaborative teams, and to seek ways to fund their research. He also enforced the importance of being active in our professional society – participating in meetings and committees as well as being part of the governance of the society. As important as research productivity was in our lab, in my hopes to become a teacher/scholar I requested and was given the Opportunity to teach a lecture section of an aquatic toxicology class as a senior level graduate student.

These experiences prepared me to be a faculty member, but not a leader. Following best practices I observed in undergraduate and graduate school, I sought to develop students into professional colleagues by the time they graduated. It is through this mentorship and working with a large group of diverse students at different
levels of professional development that I began to formulate my own approach to people management and leadership. As a major advisor, my goal was helping students to become practicing professionals in a normative time frame and then helping them find employment where their passions took them. My former students and postdoctoral fellows now work in all sectors of the environmental profession, as professors, government researchers and policy managers, industrial scientists, private consultants, and non-governmental organization scientists and managers. Developing students into high-performing scientists and managers, and seeing them grow in their roles in their jobs and society was the most rewarding part of my job as a faculty member.

Managing, mentoring, and training students led to the appreciation of different personality types and how each person’s engrained personality preferences need to be mentored in different ways, and my approach with them as individuals was tailored to their specific needs. Whether a student needed more or less direction, was more contemplative and introverted or more impulsive and extroverted, or was more self-insecure versus over-confident needed to be determined before I could be a good mentor. This kind of mentoring does not occur by assigning a postdoctoral fellow or senior graduate student to train new graduate students. It took a significant amount of one-on-one time with each student to be a good major professor. Understanding the strengths of different personality preferences can also be directed toward establishing diverse, cross-functional teams. Each student on a team for our group projects was given a role that they could excel in, but each was expected to learn roles of others on the team that took them out of their comfort zone. In my 28 years as a faculty member, this approach was successful with 14 PhD’s, 13 MS’s, and 7 postdoctoral fellows, with nearly $5M in extramural funding, and resulted in over 100 peer-reviewed publications. To this day, all of these individuals remain good friends and colleagues.

In addition to teaching and research, I was very active in university-wide service as a professor, serving among other roles as director of my department’s graduate program for 10 years, as chair of the animal care and use committee for 8 years, and as a member and then chair of University Senate. I also was extremely active in my professional society, involved at all levels including six years on the Board of Directors and three years in the executive board, which included serving as president.

It was in my service to the professional society, however, that I learned the most about motivating peers and professional staff. I was elected president at a particularly challenging time with regard to finances and management. Instead of focusing on the academic side of the society, I was given the Opportunity to pull a $25M/year society out of a serious financial hole and to transition a 3,000+-member society and its staff of 10 from a long-term and deeply entrenched executive director to a new executive director. Needless to say, there was no training in my background as an aquatic toxicologist that prepared me for that, but it was one of the most formative experiences I will ever have.

In 2008, I moved from full-time faculty member to full-time administrator as the associate dean for research. In 2012, I was promoted to be the university’s chief
research officer and dean of the graduate school. I lead a professional staff of over 20 persons, nearly half of which are in the research office. Until 2016, I also maintained my laboratory research program and continued to mentor students. I have one current PhD student conducting field research, who is scheduled to graduate in 2018, and I still work with students and serve as a research consultant on several projects led by colleagues and former students.

After nearly 8 years as a research administrator, I look back and see that my role as a faculty mentor compared to my role as an administrator to have a tremendous amount of overlap. My approach with mentoring and managing my staff are little different than mentoring students and managing my research program. I am not “The Boss”. I treat students, faculty, staff and administrators at all levels with respect and dignity. I am part of the team and we are colleagues. However, I set clear goals and high expectations, and everyone is evaluated on a regular basis to ensure they are performing at a high level.

I manage projects and people with attention to teamwork, detail and collegiality. I am a delegator, and I believe in the power of diverse, interdisciplinary teams and committees. I lead by example and take full responsibility for the results of the activities I direct or delegate. I listen to the opinions of others and seek evaluation and peer-review at all levels. While I often have opinions on the best way to do something, I am always learning and will continue to learn how to better accomplish the goals of a project or task. I am not afraid of peer-review, critique, challenge or change.

Elements of this approach include the following:

**Vision:** A leader must set the vision for the operation. I believe in a team-based, forward thinking strategic planning process that consistently updates the plan as time goes by. This includes defining a mission, goals, action steps, challenges and opportunities.

At Miami, we use elements of the LEAN approach for strategic planning and process management. This includes a full characterization of the current state, evaluating all elements for their value and necessity, defining an optimal, desired future state, conducting a gap analysis between current and future, and defining actions needed to close the gaps.

**Respect:** A leader must earn the respect of his or her team. This begins by respecting and valuing the contribution of each member of the team. People model their behavior and work ethic based on what they see in their peers and their supervisors. Everyone, including the leader, needs to work at 100%. The leader doesn’t need to know the details of every operation in the group, but s/he must understand each process to ensure efficient and effective outcomes. A leader must listen to her or his team, and be ready to make changes in processes or procedures if the person who does the operation all day every day identifies a better method. In my experience, micromanagers are rarely respected by their staff. However, neither are managers who are hands-off, aloof, and uniformed.

**Motivation:** A leader is only as good as her or his team. If the team is not motivated, no one succeeds. In sponsored research offices, there are often very few
pathways to promotion, so it is critical to find ways to allow staff members to grow personally and professionally. At Miami, we created professional pathways for all areas in our pre-award administration group that allows for promotion through the ranks in sponsored programs, proposal development, research communications, technology transfer, and compliance. These pathways allow for expansion of specific areas as needed. In addition, staff is expected to participate in professional development activities and in their respective professional societies. This allows them to grow and become better at their jobs and provides them with professional visibility and networking opportunities. Great staff are hard to find and even harder to keep. A good leader may be disappointed if, but is not afraid of, when staff members leave the team for an enhanced professional opportunity arises. This approach was derived directly from my experience as a faculty member and how I mentored students, where students were expected to develop into colleagues, complete their projects, and then move on to the next stage of their career.

**Team Mentality and Collegiality:** It is easy in an administrative office for each person to go to their corner and get their work done, but it is not an effective way to operate a complex unit. We meet formally and informally on a regular basis, sharing daily experiences and how we solved a particular problem or took a different approach. Meetings intentionally include both operational and strategic topics. I use the same, cross-functional team approach with professional staff as I did with students – taking advantage of different personality preferences to build diverse teams.

We have fun at work. I like to have fun and so does most everyone I know, so why should work not be fun? Social time, casual conversations, finding humor in most situations, and being flexible with people’s personal lives are all important to me as a leader to build and boost spirits. Happy people are better workers, are willing to share their opinions about their jobs to make them better, are more efficient and effective, are better customer servants, and leave for different job opportunities less often than those who are not.

As with many professionals, life experiences formulate one’s approach to leading and managing others. In my case, experience has led me to a melding of mentorship styles for both students and staff. Providing Opportunities, and making sure others can be successful leads to personal satisfaction and success. I wouldn’t change a thing.

**About the Author**

Dr. James T. Oris holds a Ph.D. in Environmental Toxicology and Fisheries & Wildlife and is currently a University Distinguished Professor in the Miami University Department of Biology where he has been on faculty since 2008. Currently he is the Associate Provost for Research & Dean of the Graduate School. With over 120 peer-reviewed publications and over $4.5M in government and corporate funding, Dr. Oris is well versed in scholarship and research administration. In 2015, he received the Benjamin Harrison Medallion for his service to Miami University and to his profession.
14120.41 **Strengths Based Leadership Development**
Megan Gerhardt, Ph.D., Miami University

Think back to your last performance evaluation meeting, one you either gave to an employee or received. What percentage of that meeting focused on your areas for improvement compared to the elements of your work where you excel? Now go back a few decades further and think about the last report card you remember. Did the subsequent discussion focus more on the A in English or the C- in algebra?

When it comes to traditional approaches to development, in both schools and the workplace, we have been conditioned to focus on our deficits. As a society that seems to value well-roundedness above all else, having areas where we are weak is seen as a threat to our potential for success. Conversely, we tend to minimize or ignore the areas where we excel. If something comes easily to us, we somehow take it for granted and train our focus on areas of struggle.

Much of this conventional development approach can be linked to the desire to be well-rounded. While well-roundedness has a positive connotation in our society, it is an unproven determinant for high levels of effectiveness or success. Given the finite time one can invest in development, striving to be well-rounded achieves mediocrity at best. As Tom Rath put it in his best-selling *Strengths Based Leadership,* “If you focus on being good at everything, you will never be great at anything.”

**Strengths Theory**
The strengths theory of development turns the conventional development approach upside down: Investing in strengths and managing weaknesses creates a stronger return on investment than focusing primarily on shortcomings. Empirical research supports that individuals have more growth potential in areas of natural talent than in areas of weakness. In addition, organizations that focus on development of employee talents rather than weaknesses have significantly higher levels of employee engagement. According to a recent meta-analysis conducted by Gallup, “Almost seven in 10 employees (67%) who strongly agree that their manager focuses on their strengths or positive characteristics are engaged. When employees strongly disagree with this statement, the percentage of workers who are engaged in their work plummets to 2%.”

Yet, ignoring weakness altogether is not a valid success strategy. However, there is a difference between ignoring and managing weaknesses. If you lack public speaking ability, cannot balance your checkbook, or offend people every time you speak, those weaknesses will likely hold you back from being successful and must

2 media.gallup.com/documents/whitepaper--investinginstrengths.pdf
be addressed. If your child is failing algebra, that may jeopardize college acceptance, and s/he should manage this weakness to minimize its impact on the child’s success. However, managing this weakness should not receive greater attention than the attention that is given to your strengths.

According to Rigoni & Asplund, “A focus on employee strengths proceeds from the simple notion that we are all better at some things than others and that we would be happier and more productive if we spent more of our time doing those things.” The strengths-based approach almost seems too idealistic to be valid. Suggesting you spend your time doing more of what you enjoy and are talented at rather than toiling away on work that drains you and underscores areas of weakness seems indulgent. Yet substantial empirical research supports the effectiveness of the strengths approach. According to a study conducted by Gallup, individuals who utilize their natural strengths daily are six times more likely to be engaged on the job. According to a 2015 Gallup meta-analysis: “The relationship between strengths-based employee development and performance at the business/work unit level is substantial and generalizable across organizations. Strengths-based development is related to each of six different performance outcomes. This means that practitioners can apply strengths-based employee development in a variety of situations with confidence that strengths-interventions capture important performance-related information.”

**Pinpointing Talents**

Talents are defined by Gallup as “naturally recurring patterns of thought, feeling, or behavior that can be productively applied” (Hodges & Clifton, 2004, p. 257). Talents are high-potential raw material. However, the only way to truly activate a talent into a strength is through investing time and resources into its practice and development. Gallup defines a strength as a talent that is “consistently and productively applied”.

**Investing in Talents**

Investing in talent is essential to developing strengths. To do so, Gallup suggests focusing on a three-stage cycle: **Name, Claim, and Aim**.

**Naming Your Talents**

While using your talents every day sounds appealing, most of us may not know what our natural abilities are. The discovery of these talents is a critical first step in pursuing a strengths-based approach to development. Gallup’s Clifton StrengthsFinder™ assessment is a research-validated tool to help individuals discover their greatest talents. As of 2017, over 15-million individuals had utilized this tool to

---

5 strengths.gallup.com/help/general/125543/difference-talent-strength.aspx
identify their top talent themes. For those without access to such an assessment, there are other ways to begin “strengths spotting.” Clifton and Nelson (1992) identified five characteristics that can help to pinpoint one’s strengths. The authors emphasize that because a strength is an internal ability, it manifests in performance:

1. **Listen for Yearnings**: What is it that you want to do when you have no constraints on your schedule? What do you do in your free time?

2. **Watch for Satisfaction**: One of the easiest strategies is to identify what activities give you energy when you do them. This energy comes from utilizing your natural talents at work.

3. **Watch for Rapid Learning**: Because natural, raw talent is at the heart of strengths, knowing what comes easily to you can be an excellent clue regarding your strengths. While strength building does require investment of time and resources, it always begins with natural talent and ability, or the things you seem to pick up quickly.

4. **Glimpses of Excellence**: If you recall times you have experienced peak performance in your work or personal life, these instances almost always stem from a natural talent that is has manifested as a strength. These glimpses of excellence are also the key to the next phase of talent investment: claiming your talents.

**Claiming your Talents**

Remembering experiences where you felt you performed at your personal best and pinpointing which talents you utilized to achieve such success allows recognition of the innate potential that exists when you operate from your strengths. Once you identify your inherent talents, it is useful to begin watching for opportunities to use them in your everyday life and work.

This can be as straightforward as choosing one of your talents and simply watching for instances where using it helps you succeed. Perhaps you have identified that Input is a top talent theme, but you are unsure how it shows up in your daily life. Gallup defines Input as a theme for someone who is a “utilitarian resource collector,” who collects information and knowledge they believe will be useful personally and to others. While you may recognize the role of Input® in your extensive collection of books, you may be less aware of other ways it affects you. By focusing on your Input® for a few days, you may notice its impact on other aspects of your life. Perhaps you consult a number of trusted colleagues for additional perspectives before making an important decision. This is another less obvious example of gathering valuable information, and your tendency differentiates

---

6 [gallupstrengthscenter.com](http://gallupstrengthscenter.com)
8 [www.gallup.com/businessjournal/688/input.aspx](http://www.gallup.com/businessjournal/688/input.aspx)
your decision making approach from others.

Another way to “claim” your talents is to ask how others see you using different approaches. Consulting people who know you from different areas of your life about when they have seen your talents displayed can further reveal how you use your strengths to succeed.

**Aiming Your Talents**

Coaching focuses on identifying goals that are personally or professionally important to a client. Once these goals have been identified, it is essential to pinpoint which talents might best help to accomplish these aims. According to Gallup, all talents can potentially help any role or goal. However, individuals often feel certain talent themes they possess lend themselves better to particular goals. A well-trained coach or insightful manager can also help you recognize which talents might most complement your goal.

Goal setting is one of the most well-supported motivational mechanisms. Simply put, goal setting affects performance by directing and energizing effort, and leading to greater persistence and use of relevant knowledge. Goal setting focuses your efforts in a concentrated direction that you have identified as being important to you. This results in increased effort and persistence, resulting in higher likelihood of goal achievement. Utilizing your natural talents in tandem with goal setting is a powerful combination.

Aiming your talents also involves finding more vehicles where you can use them. This often means pursuing opportunities where you believe your talents can add value. When you become well-practiced in aiming your talents, they can powerfully guide your career choices as you seek out roles and environments where you can utilize your talents more frequently.

Above all else, aiming talents represents an intentional and conscious decision to invest time and resources in areas that have the potential for the most return. However, focusing more time on your talents also means there is simply less time to improve your weaknesses. In his book *Outliers*, Malcolm Gladwell discusses the concept of the 10,000 hour rule: To achieve a world-class skill, you must not only possess a natural talent for it, but you must also spend an average of 10,000 hours over a period of 10 years perfecting your craft. This phenomenon can be seen with top athletes, musicians, artists, and chefs; while they possess inherent raw talent, they also spend significant time practicing and honing that talent over their lifetimes. Such an investment yields a rarely seen level of excellence. This kind of achievement is possible for people who are willing to employ strengths-based approaches.

To invest such time in our talents, we must be able to efficiently and smartly manage our weaknesses so they do not consume the time and energy we need for...
developing our strengths. The management of weakness must be intentional and strategic.

Managing Weaknesses

One frequent misconception about the strengths-based approach to development is that weaknesses should be ignored. Yet, neglecting weaknesses can preclude success. We want to instead manage weaknesses by recognizing them and mitigating the extent to which they can limit our success. The strengths-based approach instead emphasizes investing greater time on strengths than we do on worrying about weakness for the simple reason that our potential for growth is much greater in the areas where we are inherently strong. From a simple return on investment perspective, investing our development resources on talents gives us a higher ROI than investing those resources where we are naturally weak.\(^\text{11}\)

Types of Weakness

How do you manage your weaknesses to ensure they don’t limit your success while not squandering time you could use for strength building? First, it is useful to determine whether you are dealing with a knowledge or skill weakness, as opposed to a talent weakness. Training or education can help overcome knowledge or skill deficits. For a talent weakness, the strategies are more complex.

Strategies for Managing Talent Weakness\(^\text{12}\)

Delegate and/or stop doing the task

There are only 24 hours in a day. Logically, to invest more intentionally in strengths, we must step away from areas of weakness that compete for time with areas of talent. While the ability to delegate to others is often a function of our place in the organizational chart, a useful strategy is to step away from tasks that either drain us or ignore our natural talents.

Use a Strength to Overcome a Weakness

An employee who is feeling overwhelmed by a great volume of tasks may aim to prioritize work and improve time management skills. On the surface, certain talents like discipline or focus seem best suited for this. But what if the employee lacks such skills? Consider the utility of other themes, such as Strategic\(^\text{TM}\), in accomplishing this goal. Those with Strategic talents may be able to identify an approach that eludes others, accomplishing tasks with less time or effort than others. Another talent that could be applied would be Maximizer\(^\text{TM}\), someone who is excellent at determining which tasks are worth pursuing because they are most likely to be important or successful. Another role would be Arranger\(^\text{TM}\), someone skilled at organizing tasks in the most efficient or effective order.

\(^\text{11}\) media.gallup.com/documents/whitepaper--investinginstrengths.pdf
\(^\text{12}\) www.gallup.com/businessjournal/101665/debunking-strengths-myths.aspx
Find a partner/utilize your team

To have adequate time to truly invest in your talent, you must spend fewer resources on your weaknesses, yet you also don’t want specific shortcomings to hinder your success. One powerful strategy to create this balance involves finding complementary partners who contribute talents that others lack. Gallup calls this the “Power of 2”.

Think about who your most valuable partners have been at work and in life. Consider the similarities you share and your differences. What do these people have that you need? Why do you call upon them to help you? What is it that they bring? The answers to these questions can help you identify what your relevant weaknesses may be.

The inverse side of this line of inquiry asks who actively searches you out as a partner and why. The answer to this question can illuminate themes of your potential value within partnerships.

The power of partnership becomes even more complex when extended to a team context. The dynamics of two people integrating similar talents or capitalizing on complementary differences are powerful, yet the potential benefit grows exponentially when these dynamics are expanded to a team of people.

The Well-Rounded Team

Gallup says that a well-rounded individual is at best mediocre in a range of areas, as opposed to being truly extraordinary in a key few. However, the concept of being a well-rounded team can signify excellence represented in the team across different areas of needed talents.

The CliftonStrengths™ approach identifies four key domains of talent: executing, influencing, relationship building, and strategic thinking. Each domain is best understood as the framework through which one tends to lead. One analogy helpful to understanding the concept of domains of talent is the idea of a toolbox: each domain represents a type of tool (hammers, screwdrivers, wrenches, drills) that can be used to get a job done effectively. In this analogy, leading is like building a house: one person would approach that task by grabbing a hammer while another may go straight for the drill, depending on which tool we have the most talent and experience using, and which tends to bring us the most success.

However, while we would advise individuals to focus their time on becoming proficient with the tools they possess, a large-scale project like building a house likely requires excellence across a wide range of tools, and for this we need a well-rounded team. The concept of an effective strengths based team relies on two key understandings: that individual team members identify their singular talents as potential value for their team, and that members understand that team success relies

on an awareness and appreciation for the different “tools” that a team acquires collectively. By recognizing the unique value we each add as individual members with complementary and distinct talents, we can create synergy in teams that far exceeds what one individual alone is capable of producing.

The Sport of Leadership
Katherine Durben, Marquette University

This article highlights select leadership concepts while reflecting upon the theme “The Sport of Research Administration.” Leaders and great players are leaders and great players no matter what “sport” they play.

Teamwork

“People who work together will win, whether it be against complex football defenses, or the problems of modern society.”

— Vince Lombardi

In the sport of research administration, all of the players are part of a team. As Mark Johnson, head coach of the University of Wisconsin-Madison Women’s Hockey Team and member of the “Miracle on Ice” Olympic Hockey Team pointed out – it doesn’t make a difference whether you play two minutes or twenty-two minutes. Each member of the team makes a valuable contribution. Too often we focus on the star players or the starting line-up. Don’t forget that the closers, the subs, and even the bench have a critical role.

Principal Investigators (PI) have an expertise in their science. Research administrators may have a special knowledge of pre-award, post-award, human subjects, animal care, export controls, financial conflict of interest, etc. There is too much complex information that changes too quickly on both sides of the equation for any one person to be an ultimate authority on everything. And while PIs need research administrators and vice versa, research administrators need other research administrators as well for these same reasons. If we want to solve the problems of modern society, we absolutely must work together as a team to do so.

Know the Rules

It’s good sportsmanship to not pick up lost golf balls while they are still rolling.

— Mark Twain

It is important in any sport to understand the rules and play within them (or play around them). Often, there are rules that are not clear or simply don’t make sense. They may have been developed when the world was different and haven’t been updated. They may also have been developed with another agenda in mind and make perfect sense to someone else. In any case, rules and guidance must be followed or there could be significant consequences, including fines and other penalties.

In both research administration and in sports, it is important to get clarification of rules that fall into a grey area. A colleague once said to me, “Why speculate when you can find out?” Keeping this in mind has saved countless hours of wasted time guessing. This statement empowers me and allows me to give myself permission to ask critical questions.
**Develop a Strategy**

If you don’t know where you are going, you might end up somewhere else

— Yogi Berra

Coaches and players prepare their strategies long before they set foot on the field or court. They do their homework and scout other teams. By game time, they are well-prepared. If they have to switch up the game plan and wind up in a different place, it is intentional.

In preparing a proposal, developing a budget or starting a negotiation, you need to arrive at a strategy for getting it done. You need to think about what must be accomplished, if it can be broken out into pieces, who will do those pieces, how it will come together in the end and what you expect the final product to be. This plan must be clearly communicated to all involved. And while it is critical to have a strategy, have a plan B. Things don’t always go right, despite best efforts. There are outside factors that interfere with your best laid intentions. Leaders need to be able to come up with a Plan B or C or even D.

For example, during a recent meeting, one presenter was not able to attend for medical reasons. This was brought to the attention of the program planning committee shortly before the session was due to begin. What happened next was fairly amazing and required multiple people to quickly mobilize to form a new strategy. The topic of the session was a rather niche area. A colleague made a call to a faculty member who just happened to be available and was able to serve as a panelist. The planning committee was able to identify two other meeting attendees with expertise in the area. In the end, the Plan B for the session turned into a robust panel of three experts dialoguing with the attendees and got us where we wanted to go, albeit through a slightly different route.

**Understand Your Role**

That’s the beauty of coaching. You get to touch lives, you get to make a difference. You get to do things for people who will never pay you back and they say you never have had a perfect day until you’ve done something for someone who will never pay you back.

— Morgan Wootten

Sometimes we are active players, sometimes we provide assists, sometimes we are coaches, and sometimes we are referees who need to enforce rules. At all times, you need to contemplate which role is the most appropriate and which role will best benefit the team. Making these decisions is challenging and you need to take a critical look at your own strengths and weaknesses to make a good decision. As a player you have the skill set and have learned and practiced for so many years. You know you can finish a job and get the results you want.

Assisting is the most unselfish role you can play. You are passing the ball to a colleague so that he or she can score. You are letting someone else take the lead in order to make the team stronger.
There are times when you need to coach and let others grow and develop their own skill set and gain their own experience under guidance. It is helpful to give others a safe or perhaps not so safe environment in which to practice. Learning can be tough. When things go well, you accomplish what you want, but you learn a single way, which you likely knew already. Most people don’t fail enough. And perhaps fail is a harsh word. But you learn the most when things don’t always go right. All good coaches see things in their players that the players don’t always see in themselves. The best coaches are not afraid to give their players opportunities that will make them stronger.

As a referee, you need to be neutral and enforce the rules. The courage to enforce the rules is sometimes difficult, but the neutrality can be as well. When my daughter was about 13 years old, she took a class on how to referee soccer games for six, seven and eight-year old players. She loved soccer, loved children, could have a flexible schedule and could make good money. After three games, she said she hated it and never wanted to referee again. Interestingly, it wasn’t because she had a bad experience with parents or coaches or with enforcing the rules. It was because while she loved kids and soccer, as a referee she needed to be completely neutral. She couldn’t have the teachable moments or interact with the kids in the way that she wanted. She would have much rather been a coach in this scenario.

Leaders often need to play all four of these roles. It may not always be comfortable and there are certainly roles that you will prefer. Knowing yourself and your limitations will make it easier to accept the more challenging roles as you need to do so. The motivating factor is keeping what is best for the team as a whole in mind.

Perform Under Pressure

I’ve missed more than 9000 shots in my career. I’ve lost almost 300 games. 26 times, I’ve been trusted to take the game winning shot and missed. I’ve failed over and over and over again in my life. And that is why I succeed.

— Michael Jordan

We all have submitted that last minute grant application with minutes to spare. Or labored over important documentation that would determine some fate. The field of research administration is deadline-driven by its nature. We, just like athletes, compete against the clock all the time. The stakes are every bit as high – an error free application must be submitted and awarded or the professor’s research career could be stalled.

A strange phenomenon that I have noticed is that the closer my office gets to a deadline, the more focused everyone becomes. We have gone through this drill too many times and panic is a waste of energy. There is a point person who leads the effort, but then other team members jump in offering to help in various ways with whatever they can contribute. No task is too small or unimportant. Anyone who can’t contribute simply gets out of the way. There is a certain tension, but it is a quiet, laser precise tension. This tension heightens our skill and helps step up the intensity of the game.
Love the Game

It is not up to me whether I win or lose. Ultimately, this might not be my day. And it is that philosophy towards sports, something that I really truly live by. I am emotional. I want to win. I am hungry. I am a competitor. I have that fire. But deep down, I truly enjoy the art of competing so much more than the result.

— Apolo Ohno

In our own way, we have all shot that three-point buzzer beater from the half court line. And, in all honesty, we work miracles to move research forward on a regular basis. Our recognition won’t be a Super Bowl ring or a Heisman trophy, but we receive our own very satisfying rewards each day.

Passionate leaders, much like passionate athletes, appear to be on a much higher playing field than those who simply go through the motions. There are definitely many individuals who are naturally skilled at one thing or another. But without the passion, what is the point? For example, it is painfully obvious to read through a proposal written by a disinterested PI. There is no enthusiasm and even the best idea seems flat. Reviewers pick up on that in a heartbeat. The bottom line is that you need to love the game – no matter what your game is.

Conclusion

Teamwork, knowing the rules, developing a strategy, understanding your role, performing under pressure and loving the game will culminate in team success and a winning career. Sometimes there are losing seasons or heartbreaking losses but we move on and look toward the next win. The best part about the sport of research administration is that there are far more wins than losses. And to be a winner, there doesn’t always have to be a loser.

Leadership and Good Sportsmanship
Sue Kelch, University of Michigan

It’s always about winning -- and losing -- that’s how you play the game
As the saying goes “it’s not about winning or losing but how you play the game.” This comes from the widely held belief that the completion of the game is in itself an end. But the end of each “game” is hardly the end at all – it’s actually a beginning. Kings and queens inherit the throne and begin their reign. After government elections the winning candidate begins governance. In the workplace, the selection process for that highly selective and rare post has completed and the new hire begins to perform their responsibilities.

In research administration, as in life, accomplishing our goals is never about the destination, it’s about the journey. But even more importantly, it’s what we choose to do upon arrival that truly counts. And it is here that the real challenge occurs. We may not have realized it yet, but with awards, promotions, or elections come high expectations. You have risen to the top of the pool of candidates and are now expected to begin your new role. Or perhaps you lost the challenge and having anticipated or even expected the new opportunity to be yours, you are left at a loss.

Naturally, most of us are thrilled when we are in the winner’s circle. The crowd is cheering, the confetti floats and falls, and we stroll into the arena to embrace our hard-fought prize. Afterwards, we display our framed award in our office, put the trophy in the case, or finally take a seat at the elite management table. Of course, for every winner there are the losers. Accepting the outcome, win or lose, with humility and grace is a reflection of a good leader and a good sport.

But winning awards, promotions, or elections comes with high expectations. Are you prepared to handle the victory? And if you are not in the winner’s circle, how will you handle the defeat? For the professional research administrator, we need to be prepared for both winning AND losing in order to be effective leaders. Because in both the winner’s circle and the loser’s demise, the true challenge is how we handle what comes next.

Leadership training - don’t gloss over the losing
Most research institutions invest in leadership training for its employees, either as an aspect of professional development or as a requirement for management positions. Training topics typically include developing and enhancing leadership skills through team building, work-life balance, and emotional intelligence. Yet, with all of this leadership training, are we truly prepared to handle professional victory or loss?

Whether we won or lost an election or a promotion, we need to be prepared to lead in both outcomes, not only as the winner but as the “also-ran,” “runner-up,” or dare we say “loser?” Managing defeat in a positive and healthy way is critical, because poor sports ultimately make poor leaders and can cause otherwise strong teams to deteriorate.

In the book Bad Leadership, author Barbara Kellerman discusses how leaders cannot lead without enablers. For example, referring to the accounting fraud scandal
at Enron Corporation in 2001 and what led up to it, Kellerman asserts that Enron’s leaders “…were agents of change. These men were not just a few rotten apples. Rather, they created, indeed encouraged, an organizational culture that allowed many apples to spoil and, in turn, ruin others.”

Work for the win
Since winning that highly coveted spot is the ultimate goal, be sure that you are taking all the necessary steps to reach that goal.

When applying for a job position or volunteering effort, ensure that you can fulfill your commitments with both skill and effort. Understand the meaning between desired and required qualifications, and be honest when submitting your applications materials. If you have only five years of experience but eight are desired, don’t fudge the numbers. Instead, explain or expand upon your experience and add other credentials that would serve to enhance your background. Remember, reviewers are also looking at your potential.

Furthermore, if the position requires a certain level of education that you do not currently have, work to achieve that goal so that you are qualified to apply for the post at a later time. If you are dishonest and end up getting the position, you will always be looking over your shoulder and worried when the truth may come out. These cases are not considered mere omissions of error—they often end up in disgrace and abrupt resignation.

Be careful for what you wish
What if you should get that long sought-after position, but later find yourself unable to fulfill your responsibilities? For example, you are in the middle of planning a conference for more than 200 people, but a crisis suddenly occurs in your life. As soon as the problem arises make this clear to everyone involved. Do not try to convince yourself that you can do the impossible or be dishonest to others. Remember, this is about having a successful conference, it’s not about you. The more colleagues you involve and share in your concerns, the faster you will get the help needed for the event to run smoothly. Find a way to ensure that the conference is a success, even if it means gracefully stepping aside.

Or, what if you have finally achieved that top spot and are immediately overwhelmed with your new responsibilities? You now find yourself questioning your wisdom of accepting this role. Melanie Bolke’s article “So You Got the Job. Now What…” outlines eight steps to take from Day One. The first step, “Think of the reputation you want to have as you exit your new role,”- sage advice. What do you want to achieve and what are the resources you need to marshal to support you? If you immediately assess your situation and chart your plan, you will take better control for a positive outcome. Start something the way you mean for it to end.

Win as if you lost
Winners and leaders should not take their hard-won victories for granted. Rather than resting on their laurels, they should strive to not only achieve original goals but
seek out new opportunities and challenges. There is a well-known expression that second place “tries harder.” Never become complacent, but continue to work hard and challenge yourself as if someone were watching, because there is always someone watching.

**The art of losing gracefully**

“When one door shuts another one opens.” What does this mean for you? In some instances, it may mean that this opportunity may come along again. If that is the case, use this time wisely to explore what needs to be in place in order to enhance your qualifications. Do you need further credentials, such as a CRA or a Master’s degree? Perhaps more experience is recommended?

If a search and screen committee tells you that you were not selected for a position, reach out and ask what your weak and strong points were. Most times you will get a response that will help you gain insight and further improve yourself. Keep your eyes on the prize, and try again.

**Lose like you won**

We all know that losing a prized position can really hurt. For most of these cases, there can be weeks or months of background work for the application process alone. As we apply and interview for the post, we practice answering what we would do if we were selected. Naturally by this time we have all put ourselves in this role and dream of what we would do, not even knowing the outcome.

A great example of a lengthy and contested selection process is the 2000 U.S. presidential election. This was one of the most contended and emotional elections in our nation’s history. Although Democratic candidate Al Gore won the popular vote by a narrow margin he lost the electoral vote, therefore the election was won by Republican candidate George W.H. Bush – by a mere electoral vote.

As the timeline of events unfolded, chaos flooded the story lines. Beginning in the early hours of the day after the election, Gore conceded that he lost the election. Upon learning that the ballot tally in the state of Florida was too close to call, he immediately retracted his statement.

Next came the highly debated recount. Eventually the battle went to the U.S. Supreme Court, which decided in favor of Mr. Bush in the Bush V. Gore case. The timeline of events reads like a thriller tale with blow after blow of details and constant turn of events. The fact that the election results went all the way to the Supreme Court proved that this election was truly unprecedented in American history.

Ultimately, Gore conceded that he lost the presidential election. In his concession speech, he recognized that the election process was bigger than he was and that the country needed to move on, stating, “Now the U.S. Supreme Court has spoken. Let there be no doubt, while I strongly disagree with the court’s decision, I accept it… And tonight, for the sake of our unity of the people and the strength of our democracy, I offer my concession. I also accept my responsibility, which I will discharge unconditionally, to honor the new president elect and do everything possible to help him bring Americans together…”
Al Gore painfully but graciously conceded defeat and pledged his full support of the winner. This not only served to validate President-Elect Bush but encouraged the nation to support him as well and move on.

Without skipping a beat, Gore then went on to use his talents and skills to serve as a champion for the environment, and eventually won the Nobel Peace Prize in 2007 for his acclaimed work. Not bad for an also-ran. Be like Al Gore.

Support your opponent

Taking your cue from Al Gore -- when informed of your loss, it is important to take a moment and extend your sincere congratulations to the winner. Take it upon yourself to help them succeed as you would have wanted to succeed. Remember that you are working for the greater good and avoid focusing on your own self. The more you move into the role as the also-ran, the easier it will become.

Throw yourself directly into the pain, pitch in and help, and learn to smile through it. Although at first it may not come easily, studies show that smiling (i.e., putting on a happy face) helps to boost your mood, increase happiness, and lower stress.7 Your body and emotions soon take the cue and start going along with your actions.

That is how you rise above your loss. And there is nothing wrong with grieving and working it out by confiding with a friend or consoling yourself. This is a real loss, as you likely have invested many hours of your time and other’s time in supporting you with letters of nomination or other documentation. Learn to use your grief to support those who won the prize. Even though you weren’t selected, there is consolation in knowing that you were a strong and qualified candidate. Support the winners as they succeed and offer your talent and skills, and you will become a part of their success.

Lose like a winner and win like a pro

Realize that while the game may be over, the process is never complete. Leaders are constantly evaluated and watched, and you are asking those whom you lead to emulate your actions. As others assess our behavior, we should also continue to assess our own behavior and view the impact it has on others. Show others what we would like to see in ourselves.

**Strengthening our Capacity to Build Long Lasting “Semi-Perfect” Relationships in our Multi-Generational Workplaces**  
Carolin Rekar Munro, Eye of the Tiger Consulting

One of the preeminent challenges that we grapple with in our organizations is bridging the gap between multi-generations. With five generations working alongside each other – Traditionalists, Baby Boomers, Generation X, Generation Y, and Generation Z - we have witnessed not only a unique synergy of gifts and talents, but also a spike in workplace conflicts. These conflicts, stemming from generational differences in attitudes, priorities, expectations, and work styles are pervasive, persistent, and polarizing. They permeate all aspects of organizational life from informal exchanges in the hallway to formal discourse in the boardroom, and they chip away at relationships with others, affecting how we listen to and respond to each other. If left unattended, these conflicts seep into the bloodstream of an organization’s culture and threaten the sacred grounds of productivity, profitability, job satisfaction, and employee turnover. Consequently, the sustainability and prosperity of our organizations are at risk.

To further complicate the situation, we are inundated with literature about generational differences, which may cause inadvertently more harm than good. Even though researchers have good intentions to educate us, they may be perpetuating the generational gap by putting the spotlight squarely on how we differ from each other. As a result, many stereotypes abound in the workplace about the generations. Resultantly, we view the work world dichotomously as us versus them, with its spiralling downward assumptions about one being better than the other.

In the midst of this quandary is a call-for-action to you – practitioners in the workplace who, at any stage in your career, can play an instrumental role in shaping how multi-generations work together. You are invited to not only advocate for multi-generational harmonization in your organizations, but also become a co-creator in cultivating strong workplace relationships. However, as we venture into this new territory, the intent is not to expect, or to push for, quantum change. For most people, change is a delicate and difficult transition. Let’s not expect to wave a wand and transport ourselves magically to the promise land of multi-generational synchronicity. Change of this magnitude is more likely achieved when we incrementally, unhurriedly, and patiently lean into working with others.

Offered in this article are tools you can apply immediately to navigate the richness and complexity of communication in multi-generational workplaces. These tools are the outcome of my ten years studying the chemistry of relationship-building between generations. Specifically, the purpose of this article is two-fold: 1) to examine the top *connection crushers* which constrain our ability to engage *fully* and *thoughtfully* with others; and, 2) to guide you in harnessing your leadership to contribute to a culture of multi-generational inclusivity, engagement, and collaboration in your own organizations.

You might be curious as to why the title of this article refers to *semi*-perfection. In reality, it is a fallacy to think we can achieve *perfection*, especially as it pertains to
human relationships. By seeking semi-perfect connection, we set our sights more realistically on being the best we can be. We’ll aim for the best, realizing we won’t always be in perfect sync with others. Occasionally, we might strike the wrong cord and cause conversations to go awry. That’s perfectly fine. Be willing to learn from this and keep building your capacity for stronger workplace relationships.

Fostering Generational Synchronicity: A Paradigm Shift

At the starting gate of exercising our leadership, we are encouraged to develop and hone one of the most misunderstood and underestimated competencies under the umbrella of communication – the ability to connect with others. As easy as this may seem, it is fraught with layers of complexity. I only fully understood this when I found myself in a culture radically unlike my own – the world of the Maasai tribe on the open plains of the Serengeti.

In 2014, I was blessed to spend most of the year living and working in Tanzania, where I have three roles: co-owner of a safari company which custom designs safaris in the Serengeti; visiting professor at Mount Meru University teaching in the Master of Business Administration program; and, researcher and volunteer with Education Beyond Borders collaborating with an international team on a teacher leadership development project. On a blistering hot October afternoon, sitting with friends in a Maasai boma (hut) in the middle of the Serengeti, an email arrived (yes, there are occasional moments of internet euphoria when one’s modem finally and briefly kicks in). The message was an invitation to be the keynote speaker at an international conference. I turned to my dear Maasai friend, Meleji, to share the news, to which Meleji asked, What will you speak about? I replied the conference organizers want a presentation about connections. Without hesitation, Meleji asked if I will talk about Africa. Sensing my perplexity, Meleji explained that it was Africa that schooled me in how to connect. He proceeded with great candidness and care to tell me that, when I was a newcomer in Tanzania seven years ago, my skills were rusty in this area.

In hindsight, I agree with Meleji that I was clumsy and inept at connectivity when I first set foot in Tanzania. I made endlessly embarrassing blunders in a culture that prides itself on establishing connections first and doing business second. Whether I was speaking to tribal elders, youth in the village, or vendors in the marketplace, people dismissed or ignored me. I was trying desperately to offer ideas, opinions, and recommendations, and each offering landed unceremoniously flat with predictable regularity. I couldn’t understand why I was not acknowledged, appreciated, or heard. As distressing and diminishing as these encounters were, they were my humbling and life-changing awakenings. The steep learning curve shapes every aspect of my life whether I am working with corporate clients, taking families on safari, teaching my MBA students in Tanzania who speak English as their third language, or volunteering in remote villages where community members are initially hesitant about the work we are doing.

I share this story with you for two reasons. First, at no point do I want you to think I am walking perfection as a connector. I stumbled, and continue to stumble,
with connections. I continue to learn, and I sincerely hope you will join me in the quest for understanding connectivity. Second, if you accept the invitation to exercise your leadership to cultivate a culture of multi-generational harmony in your own organization, then connectivity is a key skill to add to your repertoire. The ability to connect with others is a signature skill honed by the folks around us who soar to unimaginable heights personally and professionally. When we commit to becoming exemplary connectors, the result is a rare and golden union with others which surpasses learning how to communicate well.

However, do we really understand what connection is and what it entails? The term *connection* is ubiquitous and rather clichéd in our workplace language. We recruit, hire, promote, and even terminate employees based on their prowess as connectors. We write organizational mission, vision and value statements and team charters steeped in mantras about our collective commitment to building connections. Yet, how often do we unpack the meaning of connectivity and the set of behaviors associated with connecting well? We make assumptions about what it is; hence, leaving ourselves open to a slew of problems because we do not have a common language of understanding.

From my conversations with people in each of the generational cohorts, connectivity is differentiated from communication by its magnetic and magical qualities. It focuses on identifying with people authentically, deeply, and meaningfully, and it leaves us feeling nourished and enriched mentally, spiritually, and physically. Cope (2017) uses the term *soul friends* to capture the essence of connectivity: elicits feelings of safety, inspires a deep feeling of belonging, is irreplaceable in our life journey, yet capable of challenging, opposing, and frustrating us. In his book, *Social Intelligence*, Goleman (2007) refers to this interconnectedness as “the glow of simpatico” and draws our attention to the discovery by neuroscience that our brains are hardwired for intimate brain-to-brain hook up with others. Christakis and Fowler (2009) argue provocatively that connection is a contagion in which we are constantly shaped by, and shaping, our network. The reverberations of our connectivity extends into the universe beyond our control, which is reminiscent of Stanley Milgram’s famous experiment which concludes all people are connected by an average of six degrees of separation.

What would happen if each of us mastered the art and science of connectivity? Imagine the benefits to be reaped for our multi-generational community and for each of us, personally and professionally.

### 3 D’s of Connection Crushing

We begin the journey toward becoming better connectors, by first looking at the behaviors which need to be purged from our interpersonal engagement with others. Based on my research on multi-generations in the workplace, there are three *connection crushers*, which all five generations concur are counterproductive to connectivity.

*Devaluing the Awesomeness of Others*

One of the fastest ways to sabotage any possibility of connecting well with others is to make people feel devalued in our presence. Yet, this is seldom on our radar.
screen. For the most part, we go through each day unaware of the relationship footprint we leave behind. Devaluing others, whether intentional or unintentional, often is the damaging outcome of our preoccupation with the incessant and frenzied spin of activity in our lives. We become so fixated on our own agenda and consumed with completing the infinite number of tasks on our to-do-list, that we often brush aside and ignore many people. If folks around us are not integral to our personal or professional mission, they unlikely get much, if any, of our attention. The feverish race through the day has become our norm; and, in many cases, our driving force, especially for those of us who equate the visibility of our busyness with earning coveted rewards, such as promotions in the workplace.

Irreparable damage can be done to relationships when we signal verbally or non-verbally to someone that we perceive them to have diminished value. I understood the full-on offensiveness of this a few years ago when my safari business partner, Allen, and I were interviewing candidates for the position of safari guide in our company. As part of our interview process, Allen suggested each candidate be asked to wait 15 minutes in the lobby with our receptionist prior to the interview. At first, I was puzzled by this, but the motive soon became apparent when we interviewed our first candidate. Into the interview room came a super-star with several years of experience leading safaris and treks up Mount Kilimanjaro, impeccable knowledge of eco-systems, and fluency in four languages. Everything was progressing well until Allen asked the alpha question - What is the name of our receptionist? The room fell silent; the candidate was gobsmackingly aghast and then offended by the question. He responded haughtily, “How am I supposed to know the name of your receptionist?” He didn’t get the job.

Was that question enough to not hire him? Yes. It was the most significant and revealing question we asked. We can train someone to fulfil the technical aspects of a job, but it takes considerably longer to train someone how to value people. Valuing people is first and foremost, regardless of the job title you have, the rank you occupy, or the industry you are in. Nothing trumps valuing the awesome of others. However, the caveat is to refrain from being strategic in your approach to valuing others; that is, playing the role of caring about others by using scripted platitudes and gestures, instead of being genuine and spontaneous. Being genuine is of paramount importance, because people can quickly ascertain whether or not you are sincere. If people perceive you to be disingenuous, then they are less likely to want to be in your presence. They are likely to avoid you at all costs and they are less likely to give you a chance to work your magic to impress them with your knowledge, skills, and forward thinking ideas. Long term, you have lost your ability to connect with them for whatever is on your work agenda in the future. This inability to connect with others is career suicide; there are very few milestones in our careers that we can achieve without the guidance, support, and sage advice of others.

**Dominating Conversations with an Overinflated Ego**

If we are not mindful, we might show up in conversations with a disproportionate sense of our own importance; and, as a result, we might dominate conversations.
This shows up as overzealousness to showcase our expert knowledge and to prove to others – and ourselves – that we are equally, if not more intelligent and worldly than others. Given the depth and breadth of knowledge and experience in our portfolio, we sometimes bring this into conversations as platform presentations, where we expect others to listen and refrain from interrupting or changing the topic. We end up talking at people about what we know and what we have done, instead of talking with people. When we consume the space to communicate what we know, rather than exploring what others know, we are labelled as attention-seeking, egocentric, and selfish. While a dominant person may be popular and successful in the short term, according to Rosenthal and Pittinsky (2006), they are likely to “falter over time due to their impairments in self- and interpersonal functioning” (2006, p. 624).

People who are on the receiving end of domineering conversationalists are exhausted from the exchange. They have run the gamut of emotions from shock to anger as they try to manage conversations with a person who has a bulldozer-approach to engagement. As well, they likely spent the entire conversation jockeying to make a point, ask a question, or refute the legitimacy of a claim. Because it is too taxing to be in the presence of a domineering conversationalist, people will go to great lengths to avoid them. People are not attracted to, warm up to, or rally behind people who are domineering. As a result, any possibility of a long-term connection with this person is destroyed.

Descending into the Darkness of Evaluative Language

Being cognizant of our internal dialogue is one of the primary determinants of whether connections with others will be arms-length transactions or meaningful alliances. Our inner voice, with its intricately woven web of values, beliefs, attitudes, and assumptions, shapes not only our thinking, but also our speech and our behaviors. For the most part, we don’t realize the domino effect our private thoughts have on how we act and react to others, and how others experience us in conversation. Awareness of the power of our internal dialogue helps us explain why some conversations disintegrate in front of us.

When we show up predominantly with an evaluative presence, we can potentially become a conversation crusher. We play the role of a critic who weighs in with judgment and criticism about others and the world around us. Spending most of our time in the evaluative arena and putting a rightness or wrongness spin on what we see or hear, shuts down our ability to learn new things about others and about the world. Once we are in the evaluative zone, it is hard to move out of it. When evaluative people come together the conversation tends to divide and disengage them because, for the most part, they focus on finding fault, refuting the beliefs of others, and seizing centre stage to showcase their expert knowledge instead of leaving space for others to contribute. When evaluative conversations are in full swing, there rarely is a member amongst them who is willing to, or has the interpersonal poise, to shift the conversation into the zone of positivity (Holtgraves, 2013).

Evaluation can play a salient role, but only in moderation. Reserve it for occasions when it makes a constructive and critical contribution to organizational or
personal change; for example, when an expert critique of a workplace policy or practice is required or when assessment of performance is expected. The evaluation that has the potential to be a conversation crusher is that which does not add value. It is simply commentary for the sake of voicing one’s opinion, and it does more harm than good.

3 C’s of Connectivity

Discarding connection crushers from our approach to engaging with others sets the stage for adopting healthy behaviors, which promote connectivity at the deepest and most meaningful levels. Connectivity at its finest is the fusion of curiosity, courageousness, and cultivating leadership to create an unforgettable experience for everyone you have the pleasure of meeting.

Curiosity

Becoming a consummate conversation connector in our multi-generational workplaces starts with developing an inquiry-based approach to engaging with others. At the heart of an inquiry-based approach are curiosity and genuine interest in better understanding others and the world around us. An inquisitive presence means we enter into dialogue with wonder about the world, and strive to comprehend and appreciate others, regardless of how divergent their beliefs and values are from our own. This takes the form of:

◆ asking more questions instead of having all the right answers (filling our vocabulary with questions such as what is, why, and what if);

◆ leaving space in conversations for others to share their stories rather than dominating with our own (when we talk, we reinforce what we know; when we listen, we learn);

◆ actively listening to others by keeping all distractions in abeyance and showing genuine interest in getting to know them;

◆ listening deeply for that which binds us rather than focusing on what divides us;

◆ viewing conflict as a relationship builder (disagreements are part of life and authentic relationships develop when we share candidly our thoughts and feelings); and,

◆ parking our judgment and being unconditional in our regard for others.

I offer a tool to help enhance awareness of our internal dialogue and to guide us in transitioning away from evaluative language. For the rest of the day, let’s take our judgment temperature; that is, every time we catch ourselves being evaluative, let’s follow it up by making three statements or asking three questions that are inquiry-based. For example, when someone cuts us off on the freeway, instead of the usual expletives under our breath, we’ll replace them with inquiry-based statements, such as she may not have seen me, he could be rushing to an emergency, or someone’s had a really bad day and just needs to get home to the comfort of family. At first, this is agonizingly painful and awkward; it sounds like we are speaking a foreign language. Yet,
with patience and practice we can train our mind to shift from being evaluative to inquiry-based. On occasion, we might wander back into evaluative messaging, but I encourage us to continue to bring unconscious thinking into full spectrum awareness. Eventually, inquiry-based messages transfer from our thinking into our speech and then into our actions and reactions to others. The original awkwardness, in time becomes natural.

Imagine the impact of having an inquiry-based presence when we show up for conversations with our multi-generational colleagues. It can leave an indelible mark on how we present ourselves and how we are perceived, and it can infectiously model the way for others.

**Courageousness**

Do you have the courage to show up perfectly imperfect in conversations with others? Do you show your authentic self, with its juxtaposition of confidence and insecurity, expertise and ignorance, and eloquence and incoherence? Some of you might be thinking that showing vulnerabilities is the seat of demise for us as professionals. In actuality, it is the opposite. When we aim for a perfect presentation of ourselves, we are less sought-after as team members and for leadership roles. Specifically, perfectionism is associated with problems involving control, negative rumination, emotional over-expressiveness and assertiveness (Flett et al., 2016).

In reality, people don’t gravitate to our perfection; they gravitate to our brokenness. They are drawn to those of us who have the courage to be fearless about imperfection and show our foibles and warts. It is in this brokenness that people realize they share more in common than they ever thought imaginable. Suddenly, you are just like them.

Since each of us is extraordinarily unique, it would be inappropriate to prescribe a specific pathway for becoming courageously imperfect. I can’t think of anything more unbefitting than giving you a checklist of behaviors that we collectively adapt. Instead, here are a few questions to guide your reflection that, hopefully, inspire you to take your own first step toward being perfectly imperfect:

- How much of yourself do you let others get to know?
- If you aren’t revealing your true self, what are you holding on to and why? What would happen if you simply let this go?
- What is one incremental step you can take today that would reveal more of yourself to others?
- If you follow through with this, what do you envision might change for you and for others?
- How can you sustain your commitment to personal change?

When you commit to even slight changes, notice what happens. Suddenly there is a shift in how others engage with you. This is especially appealing as we exercise our leadership to close the generational divide in our workplaces. Revealing more of our authentic selves enables us to find the universalities that have the power to
unite us. In this union we are positioned to become the engaged, high-performing and productive teams that can slice through relationship-based challenges to reach organizational mandates and goals.

*Cultivating Leadership*

No one is perfect in making connections, and everyone carries a hint of apprehension about whether they will humiliate themselves. Hence, many of us wait for someone else to initiate conversations. Regrettably, if neither party musters the courage to make the first move, both parties run the risk of missing a rare and golden opportunity to connect with someone with whom there might be unimaginable gains. For this reason, *you go first*; that is, you take the lead to introduce yourself and launch into a conversation. It doesn’t need to be a deeply philosophical and big brain starter; lead with any topic which strikes you as an appropriate icebreaker in the moment. Simply share whatever has crossed your mind. In doing so, you model the way for others in how to exercise their leadership in striking up conversations.

However, there will be occasions when you are in the presence of someone with whom you have nothing in common. You volley from topic to topic in search of one nugget of commonality, but nothing is forthcoming. As tempting as it may be to conjure up an excuse for a fast exit, please stay in the conversation and *hold the polarities*. Amidst the mounting differences between you and someone else, you might unexpectedly find one gem that excites both of you. Added to this, you might discover partnerships in the least likely places. I chuckle as I write this statement. Six years ago, if someone would have said I would become co-owner of a safari company taking travelers from around the globe on their dream vacation and driving a Landcruiser across the open plains of the Serengeti to chase cheetah and search for the illusive black rhino, I would have asked them what they were inhaling.

Holding the polarities will be especially advantageous in our workplaces which are characterized by generational differences in attitudes, priorities, expectations, and work styles. Imagine the possibilities for engagement, inclusivity and collaboration, if we can put differences and assumptions about each generational cohort in abeyance and stay in conversations long enough to play in the sandbox of possibilities.

*Conclusion or Beginning?*

There is a teachable moment in every conversation we have with others. In order to grow to be effective in managing connections, take time to reflect on what transpired in your conversations. What do you need to:

◆ *continue doing* because it is constructive and supports a culture of multigenerational collaboration and inclusivity?

◆ *stop doing* because it is counterproductive to engaging well with others?

◆ *start doing* because fostering workplace connections is ongoing work-in-progress?

In the weeks and months ahead, I envision you at work exercising your exemplary leadership and managing the many challenges and opportunities you face leading forward and leading by example. Armed with a few new tools, I hope you
will exercise your leadership in partnering with others to choreograph a culture of multi-generational unity where we connect in extraordinarily semi-perfect ways. With heaps of patience, unfaltering commitment to doing things differently, and a willingness to be immensely courageous and curious, stretch into a new reality of what your organization can look like. It’s just the beginning.

**Bibliography**

**About the Author**

**Dr. Carolin Rekar Munro, CHRL, CTDP**: As a leadership consultant managing Eye of the Tiger Consulting, Carolin collaborates with leaders on change management, employee engagement, and developing high performing teams. Carolin is also professor of leadership (Faculty of Management, Royal Roads University, BC), adjunct professor (MA Education, Central Michigan University), and visiting professor (MBA program, Mount Meru University, Tanzania). She is also co-owner of Tanzania-based Monarch Safari Guides, which custom designs the perfect safari experience.
