Efficient Algorithm for Computing Einstein Integrals

Junke Guo\(^1\) and Pierre Y. Julien\(^2\)

**Abstract:** Analytical approximations to Einstein integrals are proposed. The approximations represented by two fast-converging series are valid for all values of their arguments. Accordingly, the algorithm can be easily incorporated into professional software like HEC-RAS or HEC-6 with minimum computational effort.

**Introduction**

The Einstein bed load function is a landmark of modern sediment transport mechanics. It provides the first theoretical framework for sediment transport calculation, which guided many of the following researchers. Nevertheless, the computation of Einstein bed load function requires an estimation of two integrals \(J_1\) and \(J_2\), which cannot be integrated in closed form for most cases and are very slowly convergent for direct numerical integration because of singularity of the integrands near the bed (Nakato 1984). Einstein (1950) provided a numerical table and graphs to facilitate the calculation. Some mathematical software, such as MatLab and Maple can also be used to integrate them numerically. However, both methods cannot be easily implemented in professional software. For example, the widely used HEC-RAS and HEC-6 do not include Einstein bed load function (U.S. Army Corps of Engineers 1993, 2003) probably because of the complexity. The purpose of this article is to provide a fast-converging algorithm to estimate Einstein integrals \(J_1\) and \(J_2\).

**Einstein Integrals**

In his bed load function, Einstein (1950) defined

\[
J_1(z) = \int_0^1 \left( \frac{1 - \xi}{\xi} \right)^z d\xi
\]

where \(E=\)relative bed-layer thickness to water depth. Eq. (1) originates from Rouse’s sediment concentration distribution; and \(z=\)Rouse number that expresses the ratio of the sediment properties to the hydraulic characteristics of the flow (Julien 1995, p. 185). Eq. (2) comes from the product of the logarithmic velocity profile and Rouse sediment concentration distribution. For the purpose of manipulation, the above two integrals can be rearranged as

\[
J_1(z) = \int_0^1 \left( \frac{1 - \xi}{\xi} \right)^z d\xi - \int_0^E \left( \frac{1 - \xi}{\xi} \right)^z d\xi
\]

and

\[
J_2(z) = \int_0^1 \ln \xi d\xi - \int_0^E \ln \xi d\xi
\]

**Integral \(J_1\)**

After using Beta function, Guo and Hui (1991) and Guo and Wood (1995) found that for \(z<1\),

\[
\int_0^1 \left( \frac{1 - \xi}{\xi} \right)^z d\xi = B(1+z, 1-z) = \frac{\Gamma(1+z)\Gamma(1-z)}{\Gamma(2)} = \frac{z\pi}{\sin z\pi}
\]

(5)

On the other hand, the second term on the right-hand side of Eq. (3) is defined as

\[
F_1(z) = \int_0^E \left( \frac{1 - \xi}{\xi} \right)^z d\xi
\]

It can be solved using integration by parts as

\[
F_1(z) = E \left( \frac{1 - E}{E} \right)^z + zF_1(z) + zF_1(z - 1)
\]

or
\[ F_1(z) = -\frac{1}{z-1} \frac{(1-E)^z}{E^{-1}} - \frac{z}{z-1} F_1(z-1) \] (7b)

Multiple applications of the above recurrence formula results in

\[ F_1(z) = -\frac{(1-E)^z}{E^{-1}} \frac{1}{z-1} + \frac{(1-E)^{z-1}}{E^{z-2}} \frac{z}{z-2} + \frac{z}{z-2} F_1(z-2) \]

\[ = \frac{(1-E)^z}{E^{z-1}} - \sum_{k=1}^{\infty} \frac{(-1)^k}{k-z} \left( \frac{E}{1-E} \right)^{k-z} \] (8)

Thus, from Eqs. (3), (5), (6), and (8), one can get \( J_1 \) for \( z < 1 \)

\[ J_1(z) = \frac{z \pi}{\sin z \pi} \left( \frac{1}{E^{z-1}} - \sum_{k=1}^{\infty} \frac{(-1)^k}{k-z} \left( \frac{E}{1-E} \right)^{k-z} \right) F_1(z) \] (9)

Similar to Eq. (7b), applying integration by parts to Eq. (1), one gets

\[ J_1(z) = \frac{1}{z-1} \frac{(1-E)^z}{E^{-1}} - \frac{z}{z-1} f_1(z-1) \] (10)

Therefore, for \( 1 < z < 2 \), one obtains

\[ J_1(z) = \frac{1}{z-1} \frac{(1-E)^z}{E^{-1}} - \frac{z}{z-1} \left( \frac{z-1}{\sin z \pi} \right) \frac{(1-E)^{z-1}}{E^{z-2}} \]

\[ + \left( \frac{z-1}{\sin z \pi} \right) \sum_{k=1}^{\infty} \frac{(-1)^k}{k-z} \left( \frac{E}{1-E} \right)^{k-z} \]

\[ = \frac{1}{z-1} \frac{(1-E)^z}{E^{-1}} + \frac{z \pi}{\sin z \pi} \frac{1}{z-1} \frac{(1-E)^{z-1}}{E^{z-2}} \]

\[ - \sum_{k=1}^{\infty} \frac{(-1)^k}{k-z} \left( \frac{E}{1-E} \right)^{k-z} \]

\[ = \frac{z \pi}{\sin z \pi} - \frac{(1-E)^z}{E^{-1}} + \sum_{k=1}^{\infty} \frac{(-1)^k}{k-z} \left( \frac{E}{1-E} \right)^{k-z} \] (11)

which is identical to Eq. (9). Furthermore, one can recognize the self similarity of Eq. (9) for any noninteger value of \( z \).

For any integer \( z = n \), a closed solution can be obtained by applying the binomial theorem to the integrand

\[ J_1(n) = \int_{E}^{1} \left( \frac{1-x}{x} \right)^n d\xi = \sum_{k=0}^{n} \frac{(-1)^k n!}{(n-k)!k!} \int_{E}^{1} \xi^{k-n} d\xi \]

\[ = \sum_{k=0}^{n-2} \frac{(-1)^k n!}{(n-k)!k!} \frac{1-E^{k-n+1}}{n-k-1} \]

\[ + n(-1)^{n+1} \int_{E}^{1} \xi^{1} d\xi + (-1)^n \int_{E}^{1} d\xi \]

\[ = \sum_{k=0}^{n-2} \frac{(-1)^k n!}{(n-k)!k!} \frac{1-E^{k-n+1}}{n-k-1} + (-1)^n (n \ln E - E + 1) \] (12)

For example, when \( n = 3 \), it gives

\[ J_1(3) = -3 \ln E + \frac{1}{2E^{2}} - \frac{3}{E} + \frac{3}{2} + E \] (13)

To avoid computational overflow, it is suggested to apply Eq. (9) to any noninteger \( z \) value, and use Eq. (12) for any integer \( z \) value. In practice, an integer \( z \) can be considered \( z = n \pm 10^{-3} \). For example, if \( z = 2.998 \), Eq. (9) is used; if \( z = 2.999 \), it can be considered \( z = 3 \) and Eq. (12) is then applied. Besides, from Fig. 1, one can see that Eq. (9) converges to Eq. (12) when \( z \) tends to an integer \( n \). In fact, this convergence can also be analytically demonstrated, the proof being beyond the scope of this note.

**Integral \( J_2 \)**

Guo and Wood (1995) and Guo (2002) also showed that for \( z < 1 \), one has

\[ \int_{0}^{1} \left( \frac{1-x}{x} \right)^z \ln \xi d\xi = \frac{z \pi}{\sin z \pi} \left( \psi(1-z) - (1-\gamma) \right) \]

\[ = \frac{z \pi}{\sin z \pi} \left( \psi(z) + \pi \cot z \pi - (1-\gamma) \right) \]

\[ = \frac{z \pi}{\sin z \pi} \left( \pi \cot z \pi - 1 - \frac{1}{z} + \sum_{k=1}^{\infty} \frac{1}{k} \frac{1}{1 + z + k} \right) \] (14)

where \( \gamma = 0.577 215 \ldots = \text{Euler constant} \); and \( \psi(z) = \text{psi function} \), a special function (Andersson 1985). Defining

\[ F_2(z) = \int_{0}^{1} \left( \frac{1-x}{x} \right)^z \ln \xi d\xi \] (15)

in Eq. (4) and applying integration by parts gives

\[ F_2(z) = E \left( \frac{1-E}{E} \right) \ln E + zF_2(z-1) + zF_2(z) - F_1(z) \] (16a)

or
\[ F_2(z) = \frac{(1 - E)^2 \ln E}{E^{1/2} z - 1} - \frac{z}{(z - 1)} F_2(z) + \frac{F_1(z)}{(z - 1)} \quad (16b) \]

This result is similar to Eq. (7b). After a complicated derivation, one can show that

\[ F_2(z) = F_1(z) \left( \ln E + \frac{1}{z - 1} \right) + \sum_{k=1}^{\infty} \frac{(-1)^k F_1(z - k)}{(z - 1)(z - k - 1)} \quad (17) \]

in which \( F_1(z) \) is estimated by Eq. (8). Finally, Eq. (4) becomes

\[ J_2(z) = \frac{\pi}{\sin \pi z} \left\{ \pi \cot \pi z + 1 + \sum_{k=1}^{\infty} \left( \frac{1}{k} - \frac{1}{z + k} \right) \right\} \]

\[ - \left\{ F_1(z) \left( \ln E + \frac{1}{z - 1} \right) + \sum_{k=1}^{\infty} \frac{(-1)^k F_1(z - k)}{(z - 1)(z - k - 1)} \right\} \quad (18) \]

Like Eq. (9), Eq. (18) is valid for any noninteger \( z \) although it is derived for \( z < 1 \). For integer \( z = n \), the following closed solution exists

\[ J_2(n) = \int_{E}^{1} \left( 1 - \frac{\xi}{E} \right)^n \ln \xi d\xi = \sum_{k=0}^{n} \frac{n!(-1)^k}{(n-k)k!} \int_{E}^{1} \xi^{-k-n} \ln \xi d\xi \]

\[ = \sum_{k=0}^{n-2} \frac{(-1)^k n!}{(n-k)!k!} \int_{E}^{1} \xi^{-k-n} \ln \xi d\xi - (-1)^n \int_{E}^{1} \ln \xi d\xi \]

\[ + (-1)^n \int_{E}^{1} \ln \xi d\xi \]

\[ = \sum_{k=0}^{n-2} \frac{(-1)^k n!}{(n-k)!k!} \left[ \frac{E^{1+k-n} \ln E}{n-k-1} + \frac{E^{1+k-n} - 1}{(n-k-1)^2} \right] \]

\[ + (-1)^n \left\{ \frac{n}{2} \ln^2 E - E \ln E + E - 1 \right\} \quad (19) \]

For the interest of application, the convergence of Eq. (18) to Eq. (19) is only shown in Fig. 2.

\[ \sum_{k=1}^{\infty} \left( \frac{1}{k} - \frac{1}{z + k} \right) = f(z) \approx \frac{\pi^2}{6} \left( \frac{z}{1 + z} \right)^{3/2} (20) \]

which is shown in Fig. 3 where the maximum relative error is 0.26% for \( 0 < z < 6 \).

The above analysis can be summarized in the form of a computer algorithm. First, for an integer value \( z \), i.e., \( \lfloor z \rfloor = \text{round}(z) \) or \( \lfloor z \rfloor < 10^{-3} \), Eqs. (12) and (19) are directly applied. Otherwise, the following algorithm is used.

- **Step 1**: Estimate \( F_1(z) \) from Eq. (8) using a maximum of 10 terms, \( k = 10 \).
- **Step 2**: Estimate \( J_1(z) \) from Eq. (9).
- **Step 3**: Estimate the first series in Eq. (18) by using the approximation (20).
- **Step 4**: Estimate \( F_2(z) \) from Eq. (17) using \( k = 10 \) terms.
- **Step 5**: Estimate \( J_2(z) \) from Eq. (18).

A Fortran subroutine or Excel spreadsheet can be downloaded from [http://courses.nus.edu.sg/course/cveguoj/ce5309/pierre.html](http://courses.nus.edu.sg/course/cveguoj/ce5309/pierre.html) for the above algorithm. The results of applying this algorithm are plotted in Figs. 1 and 2 where the symbol of a cross indicates the exact values from Eqs. (12) and (19). In addition, the exact values of \( J_1 \) for \( z = n + 1/2 \) can be found with Maple and are also plotted in Fig. 1. For example,

\[ J_1 \left( \frac{1}{2} \right) = \frac{\pi}{4} - \frac{1}{2} \sin^{-1}(2E - 1) - E \sqrt{\frac{1}{E} - 1} \quad (21a) \]

\[ J_1 \left( \frac{3}{2} \right) = -\frac{3\pi}{4} - \frac{3}{2} \sin^{-1}(2E - 1) + (2 + E) \sqrt{\frac{1}{E} - 1} \quad (21b) \]
\[ J_1\left(\frac{5}{2}\right) = \frac{5\pi}{4} - \frac{5}{2} \sin^{-1}(2E - 1) + \left( \frac{2}{3E} - \frac{14}{3} - E \right) \sqrt{\frac{1}{E} - 1} \]  
\[ J_1\left(\frac{7}{2}\right) = -\frac{7\pi}{4} + \frac{7}{2} \sin^{-1}(2E - 1) + \left( \frac{2}{5E^2} - \frac{32}{15E} + \frac{116}{15} + E \right) \sqrt{\frac{1}{E} - 1} \]  
\[ J_1\left(\frac{9}{2}\right) = -\frac{9\pi}{4} + \frac{9}{2} \sin^{-1}(2E - 1) + \left( \frac{2}{7E^3} - \frac{58}{35E^2} + \frac{156}{35E} - \frac{388}{35} \right) \sqrt{\frac{1}{E} - 1} \]  

One can see that Eqs. (9) and (18), respectively, converge to Eqs. (12) and (19), the results for integer \( z \) values from Eq. (21) also coincide with those from Eq. (9). Thus, one can consider that Eqs. (9) and (18) correctly represent the accurate values of \( J_1 \) and \( J_2 \), respectively. The numerical calculation shows that the presented approximations are computationally efficient and can avoid computational overflow. Therefore, they can be incorporated into professional software like HEС-RAS or HEС-6.

**Conclusions**

This note presents an effective approximation to Einstein integrals \( J_1 \) and \( J_2 \) that are valid over the entire range of the Rouse number \( z \) and the relative bed-layer thickness \( E \). The approximations can be readily implemented using widespread tools such as programmable calculators, spreadsheets, Fortran, or MatLab. In particular, it may provide a simple way to incorporate Einstein bed load function into widely used hydraulic software. The numerical experiment shows that the proposed algorithm rapidly converges to the exact values of \( J_1 \) and \( J_2 \).
