CSU Course Syllabus: Fall 2022

ECE411 - Control Systems

TR 2:00 - 3:15pm    Engr B105

Instructor:  Dr. Bill Eads, Engr C103D
Home: 970-667-6914, Office: 970-491-0717
BEadsinCO@gmail.com

TA:  Anshika Mishra
Anshika.Mishra@colostate.edu

Office Hours: R 12:30 - 1:30 and TR 3:30 – 4:00+

Book: Feedback Control Systems
Phillips and Parr, 5th Edition

Prerequisite: ECE312

Grading and Exams:
(tentative∗)
Midterm Exam 25%
Final Exam∗ 35%
Computer Projects 20%
Homework Assignments 10%
Quizzes∗ 10%

Course Schedule: Homework problems will usually be assigned every other week (due two weeks later). In addition, there will be a series of computer experiments. You are expected to work on all these problems yourself, but reasonable collaboration is allowed.

No collaboration is allowed for Quizzes or Exams. These will all be in class. Exams are open book and open notes.

Course Objective: Control system analysis and design for continuous-time linear systems: stability and performance; time and frequency domain techniques.
ECE411 Course Outline

PART I: ANALYSIS

Introduction and Background Chapter 1 and Appendices
Introduction to feedback and control system concepts. Review of Laplace Transforms, transfer functions and linear systems. Interconnection of systems

Mathematical Modeling Chapter 2
Mathematical modeling of physical systems. Examples of mechanical and electrical systems. Approximation of nonlinear systems with linear ones.

System Response and Characteristics Chapters 4-5
Time and frequency domain performance of linear systems. Tracking and disturbance rejection. Steady state accuracy and transient response.

Stability Analysis Chapter 6
Stability for open and closed loop systems. Tests for stability: characteristic equations and the Routh Hurwitz array.

REVIEW AND MIDTERM EXAM Early October

PART II: DESIGN

Root Locus

Frequency Domain Methods Chapters 8,9
Frequency domain performance analysis: Nyquist and Bode plots. Introduction to frequency domain design techniques via root locus, Nyquist, and Bode methods. Relationship between time domain and frequency domain performance. Design of PI, PID, lead, lag, and lead-lag controllers.

State Space Methods Chapter 3
State Space representation of linear systems. State equations and similarity transformations. Relationship to transfer function models.

Advanced Controller Design Chapter 10 and Handouts
Introduction to modern control design techniques for multivariable systems. State estimation and pole placement design. Design case studies.

REVIEW AND FINAL EXAM December 13, 6:20pm
