ECE 579 Global Navigation Satellite Systems

Spring 2023

Time: Wednesday 4:00-6:15PM  
Location: ENGR E104  
Credit Hours: 3  
Office hours: TBD  
Instructor: Jian Yao, Electrical and Computer Engineering  
jian.yao@colostate.edu

Course Description:
This course provides a fundamental understanding of Global Navigation Satellite Systems (GNSS), including GNSS satellite constellations, satellite orbits, ground monitoring stations functions, GNSS receivers, GNSS measurement errors and correction techniques, recent advancements in GPS and other international GNSS, and applications of GNSS. Students will learn to use originally collected GNSS data to compute receiver position, velocity, and time.

Objectives:
At the completion of this course, the students will be able to:
1. Apply knowledge and skills acquired from calculus, linear algebra, mechanics, and electromagnetics to the analysis of radio navigation systems and principals.
2. Implement navigation solutions based on time-of-arrival, time-difference-of-arrival, and Doppler measurement methods.
3. Understand the three segments of satellite navigation systems, their functions, interconnections, and key characteristics.
4. Design and implement algorithms to compute satellite orbit using almanac and ephemeris information.
5. Use the collected raw GNSS receiver data for post-processing and analysis.
6. Design and implement algorithms to characterize various satellite range measurement errors and to mitigate the errors.
7. Implement linear model to solve range measurement equations to obtain receiver position, velocity, and time (PVT) solutions.
8. Analyze satellite geometry contribution to PVT solution errors.
9. Design and implement high accuracy position systems such as wide-area and local-area differential GPS.

Topics Covered:
Week 1: History of navigation and radio navigation techniques  
Week 2: GPS system architecture  
Week 3: GPS signal structures  
Week 4: Reference systems, coordinate frames, and conversion algorithms  
Week 5: Time standard and GPS time  
Week 6: GPS orbits and satellite position determination  
Week 7: GNSS measurement models  
Week 8: GNSS signal propagation errors and mitigations: ionosphere  
Week 9: GNSS signal propagation errors and mitigations: troposphere  
Week 10: Multipath and receiver noise effects  
Week 11: Linear model for position, velocity, and time computation  
Week 12: Precise position using carrier phase measurements
Week 13: Analyze the real GNSS-receiver data; RINEX data format
Week 14: GPS modernization and the next generation GPS
Week 15: International GNSS: GLONASS, Galileo, and Beidou

Required Textbook:

Prerequisite: ECE 311, MATH 261, PH 142, and CS 152/162/163/164 with C or better.

Assignments
There will be ~10 assignments. These assignments will need to be turned in for grades.

Final Project
There will be one final project. Student will get raw GPS receiver measurements and ephemeris over extended time period; design a complete navigation signal process algorithm to compute the receiver’s position and time with a high accuracy.

Exams
There will be one written midterm exam.

Grading Policy
<table>
<thead>
<tr>
<th></th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignments</td>
<td>50%</td>
</tr>
<tr>
<td>Final project</td>
<td>25%</td>
</tr>
<tr>
<td>Midterm exam</td>
<td>25%</td>
</tr>
<tr>
<td>Total</td>
<td>100%</td>
</tr>
</tbody>
</table>

Letter grades are supposed to be assigned according to the following distribution, though some adjustments might be made under scrutiny:
A  [90, 100]
B  [80, 90)
C  [70, 80)
D  [60, 70)
F  [0, 60)

Honor Code
This course follows the CSU honor code (https://tilt.colostate.edu/integrity/pledge/). For assignments and final project, students need to indicate what help they get from other students or online resources, if there is. An honest statement is more important than a beautiful assignment/project result.
